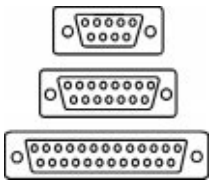
Bath/Circulators *Accessories*



Remote Tether Cables

These cables can be used to extend the distance between the remote controller and the base unit on our bath microprocessor controllers. Available in two lengths, 5' and 10'.

For Models

RTE and EX Series Bath/Circulators with microprocessor controllers

Flowthru Coolers - FTC350

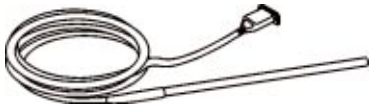
With a NESLAB Flowthru Cooler you have the versatility of operating your Heating Bath/Circulator at or below ambient temperatures. These cooling systems have a built-in refrigerated flow through heat exchanger. Simply connect tubing from the bath pump to the Flowthru Cooler.

Specifications

Cooling capacity	450 Watts	373 Watts, 50Hz	
Dimensions	14 x $8^{3/4}$ x 12 in	35.8 x 22.2 x 30.5 cm	
Power	115V, 60 Hz, 5A	220-240, 50Hz, 3A	
Shipping weight	30Lbs/14 Kgs		
Low temperatures achievable for:	7 Liters	12 Liters	22Liters
	-10°C (50 min.)	-10°C(80 min.)	-10°C (140 min.)

For Models

EX and GP Series Baths



Remote Sensor

When circulating externally, the remote sensor allows the user to monitor the fluid temperature at a remote location. Your setpoint will be maintained automatically by the circulator at your application. Standard probe is stainless steel and is 3/16" in diameter and 6" in length with a 6' lead. Custom sizes available.

For Models

RTE and EX Series Bath/Circulators with digital and microprocessor controllers

NEScom

NEScom allows you to use your computer to fully automate the temperature control process of your Bath, Circulator, or Chiller. Temperature ramping, status monitoring with alarms, graphing, and recording are a few of the features of NEScom Windows 95 based software

For Models

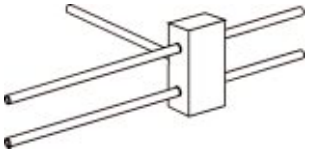
RTE and EX Bath/Circulators with digital and microprocessor controllers, HX Series chillers with TC-400 controllers

Sealed Cover

For low temperature applications where moisture build up in the fluid must be minimized. Also useful when the circulator may be moved frequently. Easily installs onto the bath area and includes a nitrogen purge port.

For Models

RTE/EX-111 and RTE-140



Leveling Device

The NESLAB Leveling Device is used to maintain a constant fluid level in an open container. The leveling device allows consistent force and suction of fluid flow while eliminating the risk of overflow.

For Models

RTE, EX, and GP Series Bath/Circulators

see page 44 for more accessories.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 1000-4-2:1995
	IEC 1000-4-3:1994
	IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact Thermo NESLAB for more information.

After-sale Support

Thermo NESLAB is committed to customer service during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please obtain the following information from the unit's serial number label:

- BOM number _____

- Serial number _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department.

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the bath before moving the unit.

Never operate equipment with damaged line cords.

Never operate the unit without fluid in the bath.

Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

The CB-60/CB-80 Cryobath low temperature baths are designed to be an all purpose cold bath providing continuous operation at temperatures as low as -50°C (-80°C for the CB-80). Temperature stability of ±0.5°C can be obtained by using the optional Cryotrol Temperature Controller.

Each unit consists of an air-cooled refrigeration system, a magnetic stirring mechanism, a stainless steel bath, bath parts, a gasketed PVC bath cover, and stainless steel brackets for mounting auxiliary equipment.

Specifications

	CB-60	CB-80
Lowest Temperature[1]	-50°C	-80°C
Temperature Stability[2]	±0.5°C	±0.5°C
Cooling Capacity[3]		
60Hz	75 Watts @ -30°C	120 Watts @ -50°C
50Hz	60 Watts @ -30°C	100 Watts @ -50°C
Bath Work Area (Diameter x Depth)		
Inches	6 ½ x 6	7 ¾ x 7 ¾
Centimeters	16.5 x 15.2	19.7 x 19.7
Bath Volume		
Gallons	1.0	2.0
Liters	3.8	7.6
Unit Dimensions (H x W x D)		
Inches	19¾ x 11¾ x 13¾	40 x 16 x 22½
Centimeters	50.2 x 29.8 x 34.9	101.6 x 40.6 x 57.2
Shipping Weight		
Pounds	75	176
Kilograms	34	80

1. Under no heat load. Temperatures will vary with use of magnetic stirrer.
2. Using optional Cryotrol Temperature Controller.
3. Operating using bath fluid with specific heat of 0.5.

Section III Installation

Site

Locate the unit on a sturdy table or bench top. Ambient temperatures should be within the range of +55°F to +95°F (+13°C to +35°C).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. Air is drawn through front of the unit and discharged through the rear. The unit must be positioned so the air intake and discharge are not impeded. A minimum clearance of 12 inches (30 centimeters) on the front and rear of the unit is necessary for adequate ventilation. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section VI, Cleaning).

The unit will retain its full rated capacity in ambient temperatures to approximately +75°F (+24°C). Above +75°F, reduce the cooling capacity 1% for every 1°F above +75°F, to a maximum ambient temperature of +95°F. In °C, reduce the cooling capacity 1% for every 0.5°C above +24°C, to a maximum ambient temperature of +35°C.

Electrical Requirements

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord in connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Make sure the voltage of the power source meets the specified voltage, ±10%.

Fluids

Never use flammable or corrosive fluids with this unit.

A non-freezing fluid is required.

The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Filling Requirements

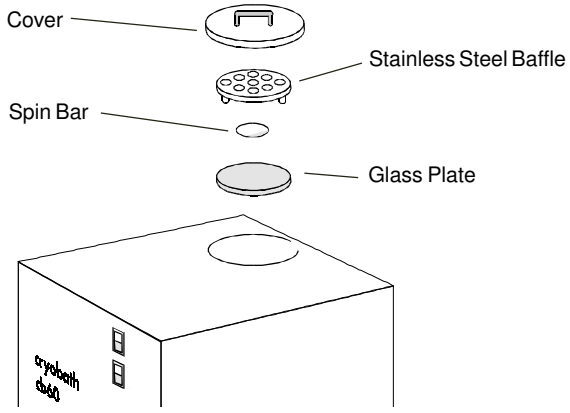
Fill the bath to within 1 inch of the top.

Bath Parts

The bath parts are the glass plate, spin bar, and stainless steel baffle that are included with the unit. The installation of the bath parts is necessary for proper operation.

Place the glass plate in the bottom of the bath. The glass plate prevents the spin bar from wearing a hole in the bottom of the bath.

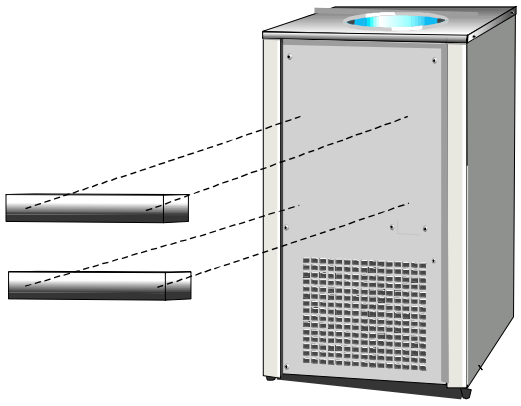
Set the spin bar on the glass plate and the stainless steel baffle over the spin bar and coils. The feet of the baffle should rest on the bottom of the bath.



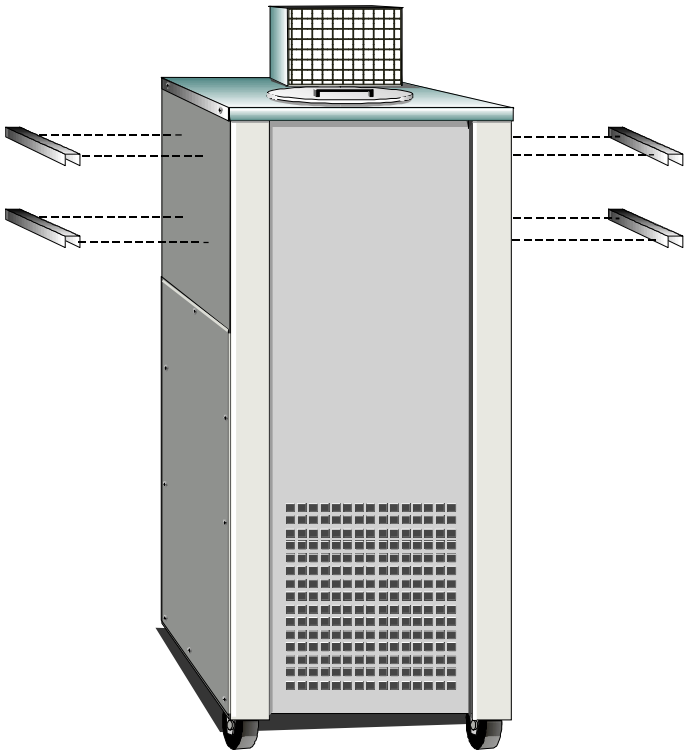
Replacement bath parts are available from Thermo NESLAB. Contact our Sales Department for more information (see Preface, After-Sale Support).

Mounting Brackets

The unit is equipped with two stainless steel mounting brackets (not installed) that are designed to allow auxiliary equipment to be mounted on the unit. Installation of the mounting brackets is optional.



CB-60



CB-80

Locate the four screws on the unit. The CB-60 screws are on the rear of the unit, for the CB-80 they are on the sides. Remove the screws. Align the holes in the brackets with the screw holes in the unit. Secure the brackets using the original screws.

Section IV Operation

Start Up

Before starting the unit, double check all electrical connections and make sure the bath has been properly filled with cooling fluid.

All the functions of the unit are governed by front panel controls. The upper COOLING ON/OFF switch controls power to the refrigeration system and the Cryotrol receptacle. To start the unit, place the COOLING ON/OFF switch in the ON position. The green light behind the switch will light.

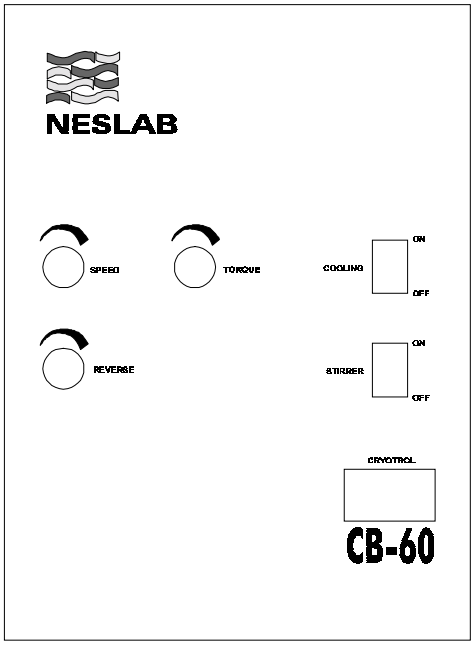
Once the unit is on, the refrigeration system will reduce the temperature of the cooling fluid to the lowest achievable temperature under the existing heat load conditions.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

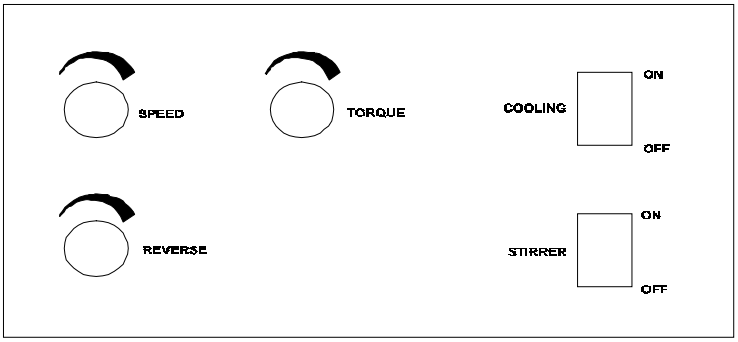
Temperature Adjustment

If temperature control is desired, a Cryotrol Temperature Controller is required. Refer to the Cryotrol Temperature Controller Instruction and Operation Manual for installation and operation instructions.

The CB-60/CB-80 is designed for continuous low temperature operation. Do not operate either unit above -25°C.



CB-60



CB-80

Stirring

The lower switch, labelled STIRRER ON OFF, controls power to the stirring mechanism in the unit. Power to the stirring mechanism is independent from the COOLING ON OFF switch; the stirrer can operate if the COOLING ON OFF switch is in the OFF position.

The knob labelled SPEED controls the speed of the stirring mechanism. The speed is adjustable from 0 to 1000 RPM. Turn the knob clockwise to increase the speed.

The knob labelled TORQUE controls the power of the stirring mechanism. Turn the knob clockwise to increase the power. Adjustments to the power may be required to maintain proper stirring in the bath as the cooling fluid becomes more viscous.

NOTE: The heat input in the bath increases as the torque increases. To ensure maximum cooling capacity, use the minimum power (torque) needed to maintain adequate stirring.

The knob labelled REVERSE, controls the period of the reversing feature of the stirring mechanism. The reversing feature automatically reverses the direction of stirring to minimize vortexing in the bath. Turn the knob fully counterclockwise to disable the reversing feature. Turn the knob clockwise to decrease the period of reversing and increase the speed (RPM).

Section V Maintenance and Service

Service Contracts

Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Always turn the unit off and disconnect the line cord from the power source before performing any service or maintenance procedures.

Cleaning

Condenser

The unit pulls substantial amounts of air through a finned condenser. A build up of dust or debris on the fins of the heat exchanger will cause a reduction in cooling capacity, and, in extreme cases, compressor failure.

Periodic vacuuming of the heat exchanger is necessary. The frequency of cleaning depends on the operating environment. We recommend making a monthly visual inspection of the heat exchanger after initial installation. After several months, the cleaning frequency will be established.

Bath

Periodically clean the case and stainless steel bath using a mild soapy solution. Do not use steel wool; it is too abrasive and can initiate rusting. Dry the bath using a soft cloth.

Cooling Fluid

The cooling fluid should be replaced periodically when operating at low temperatures. The concentration of water in the cooling fluid will increase over time, causing a reduction in cooling capacity.

Refer to Section III, Filling Requirements for cooling fluid replacement instructions.

Section VI Troubleshooting

Checklist

Unit will not start.
Check power source. Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit. Make sure the voltage of the power source meets the specified voltage, ±10% (see Section III, Electrical Requirements).

Unit will not cool.
Make sure the unit has adequate ventilation. Air is drawn through the front of the unit and discharged through the rear. The unit must be positioned so the intake and discharge are not impeded. A minimum clearance of 12 inches (30 centimeters) on the front and rear of the unit is necessary for adequate ventilation. Inadequate ventilation will cause a reduction in cooling capacity, and, in extreme cases, compressor failure (see Section III, Site; Section V, Cleaning).

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur (see Section IV, Operation).

Check for ice build up in the bath. If ice has accumulated, replace the cooling fluid (see Section V, Cleaning).

Spin bar does not operate.
Contact Thermo NESLAB service department.

Service Assistance

If, after following these troubleshooting steps, your units fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

Part number
Serial number
Voltage of unit
Voltage of power source
Ambient temperature where unit is located

Technical Support

Our Service Department can provide you with a wiring diagram and complete list of spare parts for your unit (see Preface, After-sale Support). Before calling, please obtain the following information:

Part number
Serial number

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. Thermo NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Thermo NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

Immersion Coolers Cold Baths

Adding one of our Immersion Coolers or Cold Baths to your laboratory is a wise investment. Both are designed to eliminate the use of dry ice or liquid nitrogen, and feature durable, heavy-duty refrigeration systems that can operate continuously without trouble. Choose an Immersion Cooler, with its cold finger probe, or a Cold Bath, with the cold finger built into a self contained reservoir. If you calculate the cost of buying a year's worth of dry ice or LN_2, and compare it with the cost of running either, you'll be pleasantly surprised. Our systems often beat the price of chemical refrigerants.

Immersion Coolers - CC Series

When we pioneered the concept of an immersion cooler years ago, ur aim was to provide convenient, efficient cooling to replace hemical refrigerants and to free-up the time required for the con- tant feeding of cold traps. Two models of cold-finger coolers, the CC-65 and CC-100, deliver low end temperatures to - 90°C, with a hoice of three different cooling probes, each delivering the maxi- mum amount of cooling area possible. Designed to run continuous- y, the CC Series eliminates the need for frequent feeding of chemi- al refrigerants. You'll have no more trips to the storeroom and no more waiting for the dry ice delivery. Heavy-duty refrigeration systems employing complete CFC-free refrigerants provide quick cool downs and repeatable temperatures, which translate to more accurate results. Choose our accessory Cryotrol Temperature Controller for control of temperatures and stability to ±0.5°C. We've been building immersion coolers longer than anyone and with thousands in use in the field, you can trust a NESLAB Cryocool to deliver consistent, trouble free cooling.

R probe

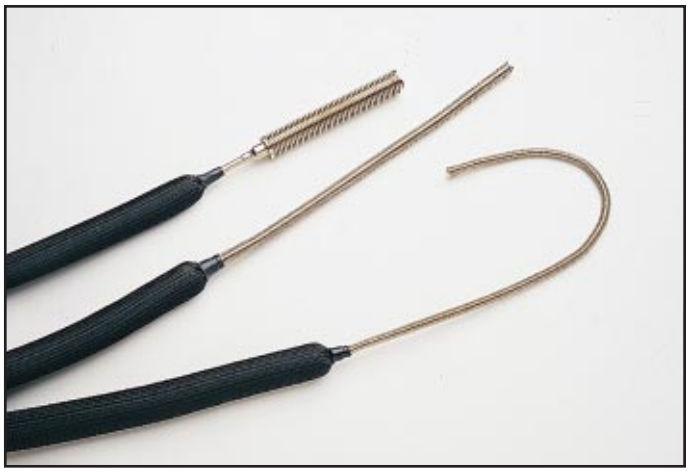
This short, rigid probe is excellent for immersion in containers such as dewars. It is available on both the CC-65 and CC-100

F probe

This small diameter cooling probe is flexible and designed for cooling vacuum traps, vapor traps, or containers with small diameter openings. A flexible design allows for coiling. This probe is available on the CC-100

FV probe

This probe is similar to the F probe but has a smaller diameter. It is available on both the CC-65 and CC-100



Immersion Cooler Specifications

SHIPPING WEIGHT	41 Lbs/18.6 Kgs	130 Lbs/59 Kgs

Specifications obtained using fluid with specific heat of 0.5, in a 2 liter container, at ambient 20°C. Time to temperature determined once fluid temperature stabilized, for 60Hz, 50Hz may vary. Specifications subject to change.

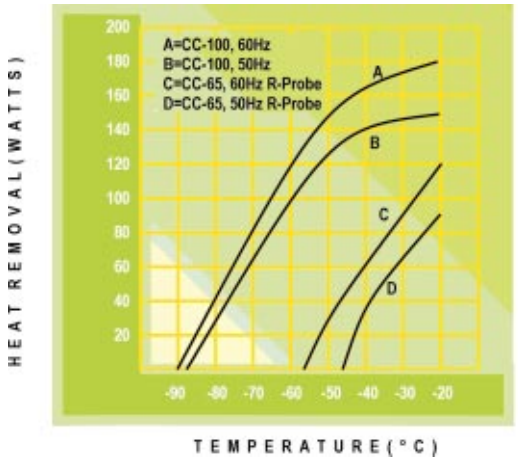
APPLICATIONS

- Vapor Trapping
- Vacuum Pumps
- Solvent Trapping
- Lyophilization
- Freezing Points
- Impact Testing

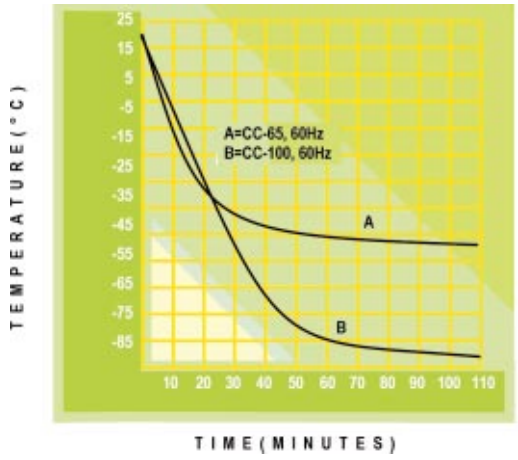
ACCESSORY

- Cryotrol Temperature Controller

Cooling Capacity



Time to Temperature



Immersion Coolers

PBC/IBC Series

Use a PBC or IBC when you need quick cool-down or below ambient temperatures in a fluid vessel. Easy-to-use, these cold finger coolers provide temperatures to -25°C and are ideal for replacing dry ice use. Choose from three models depending on your heat oad removal requirements. Each is designed for continuous duty with a trouble-free hermetically sealed refrigeration compressor. For applications requiring temperature control, use our accessory Cryotrol Temperature Controller.

Accessory Temperature Controller

Cryotrol

Enhance your low temperature work with a NESLAB Cryotrol. Designed for use with NESLAB Immersion Coolers and Cold Baths, this electronic temperature device allows you to control cooling of your application, a major improvement if you currently use dry ice or other chemical refrigerants to achieve low temperatures. To cool your fluid to a selected temperature, plug the Cryotrol into the socket of the NESLAB Immersion Coolers and Cold Bath. Simply immerse the controller sensing probe into the fluid and set the control dial to the desired temperature.

Optimum Cooling-Efficiency
Efficient nickel-plated bronze cooling probe design allows for optimum cooling and the proper surface area for optimum efficiency

Flexible Hose
The cooling head is mounted on a flexible insulated hose which aids in positioning the probe in hard to reach spots.

Immersion Coolers Specifications

MODEL	IBC-4	PBC-2	PBC-75

±0.5°C Stability
A Cryotrol Temperature Controller can produce excellent stability from -90°C to +20°C. Improve your results with predictable, even temperatures

Cold Baths - CB Series

NESLAB's Cold Baths are convenient, all purpose baths that eliminate the inconvenience of using dry ice or liquid nitrogen in a dewar flask. Simple to operate, the units quickly cool-down to low end temperatures, or can be controlled with an accessory Cryotrol Temperature Controller, which plugs directly into the Cold Bath and allows you to set the temperature via an analog control dial see page 25).

NESLAB Cold Baths are equipped with a seamless, stainless steel reservoir for excellent fluid compatibility. A rugged, solid state magnetic stirrer ensures excellent fluid mixing and temperature stability and is designed to handle increasing fluid viscosity at low end temperatures. A PVC reservoir cover is included and features a gasket to provide a tight seal and reduce fluid evaporation or ice build-up from condensation.

No More Dry Ice
NESLAB Cold Baths can pay for themselves within one year by eliminating the cost of handling and storage problems associated with liquid nitrogen and solid CO_2

Excellent Stability
The CB-60 and CB-80 feature a solid state reversible magnetic stirrer and a user adjustable torque control for temperature uniformity

Gasketed Cover
The PVC reservoir cover features a gasket to provide a tight seal and reduce fluid evaporation or ice build-up

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact Thermo NESLAB for more information.

After-sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, *please* refer to the serial number label on the rear of the case top to obtain the following information:

- BOM number _____

- Serial number _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department (see After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged equipment.

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

The CryoCool Series of immersion coolers is designed as a refrigeration source for sub-ambient work in liquid baths.

CryoCools employ mechanical refrigeration systems constructed with full-hermetic refrigeration compressors. The CC-65 employs a single stage refrigeration system with one compressor. The CC-100 has a dual stage refrigeration system using two compressors in cascade configuration. An insulated coaxial hose assembly carries refrigerant to the cooling probe.

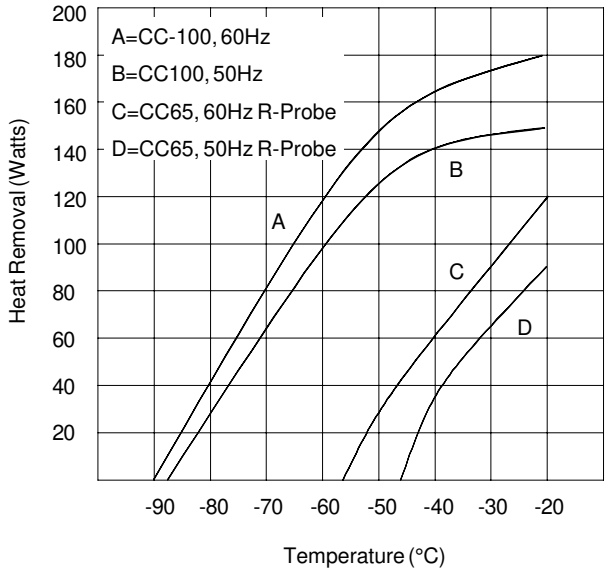
Specifications

	CC-65	CC-100
Temperature Range[1]	-20°C to -55°C	-25°C to -90°C
Temperature Stability	±0.5°C	±0.5°C
Evaporator Head Dimensions[2] (Length x Diameter)		
F-head		
Inches	N/A	18 x 5/8
Centimeters	N/A	45.7 x 1.6
FV-head		
Inches	25 x 1/2	25 x 1/2
Centimeters	63.5 x 1.3	63.5 x 1.3
R-head		
Inches	7 1/4 x 1 1/4	7 1/4 x 1 1/4
Centimeters	18.4 x 3.2	18.4 x 3.2
Minimum Bend Radius[3]		
F-head		
Inches	N/A	1 1/2
Centimeters	N/A	3.8
FV-head		
Inches	1	1
Centimeters	2.5	2.5
R-head		
Inches	N/A	N/A
Centimeters	N/A	N/A

1. Low end specifications listed for "no load" conditions.
2. See Section III, Cooling Probes for a description of the evaporator heads.
3. The minimum bend radius is the smallest radius that the cooling probe can be bent without suffering damage at room temperature. Never bend the probe when it is cold.

	CC-65	CC-100
Evaporator Hose Dimensions (Length x Diameter)		
Inches	44 x 1 1/4	65 x 1 ½
Centimeters	111.8 x 3.2	165.1 x 3.8
Unit Dimensions (H x W x D)		
Inches	15 1/4 x 7 1/2 x 10 1/4	20 1/2 x 14 1/2 x 17 3/4
Centimeters	38.7 x 19.1 x 26.0	52.1 x 36.8 x 45.1
Weight		
Pounds	41.0	130.0
Kilograms	18.6	59.0

Cooling Capacity[4]



4. Specifications obtained in a 2 liter container at +20°C ambient with cooling fluid specific heat of 0.5.

Section III Installation

Site

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +55°F to +95°F (+13°C to +35°C).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. On the CC-65 air is drawn through the top of the unit and discharged through the sides and bottom of the unit. On the CC-100 air is drawn through the front of the unit and discharged through the rear. The unit must be positioned so the intake and discharge are not impeded. A minimum clearance of 12 inches (30 centimeters) on all vented sides is necessary for adequate ventilation.

Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section V, Cleaning).

The unit will retain its full rated capacity in ambient temperatures up to approximately +75°F (+24°C). Above +75°F, reduce the cooling capacity 1% for every 1°F above +75°F, up to a maximum ambient temperature of +95°F. In terms of Celsius, reduce the cooling capacity 1% for every 0.5°C above +24°C, up to a maximum ambient temperature of +35°C.

Electrical Requirements

Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit.

Make sure the voltage of the power source meets the specified voltage, ±10%.

Make sure an adequate ground connection is provided.

Fluids

The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Never use flammable or corrosive fluids with this unit.

Cooling Probes

Three cooling probes (or evaporator heads) are available with CryoCool units: F (flexible), FV (flexible, very), and R (rigid). Refer to Section II, Specifications to determine the specific cooling probe on your unit.

Place the cooling probe in the work area. For maximum cooling efficiency, the probe should be fully immersed in the fluid and should be located as close as possible to the agitator or stirrer motor (if so equipped).

Care should be taken not to stretch or bend the probe beyond it limits or exceed its minimum bend radius. Bend the probe only at room temperatures, never bend it when it is cold.

Section IV Operation

Operation

Before starting the unit, double check all electrical connections and make sure the cooling probe is properly immersed in the work area.

All CryoCools are operated by a single power switch.

The CC-100 has three lights: one indicates the unit is operating, a second indicates the high stage compressor is operating, and a third indicates the low stage compressor is operating.

Once the unit is turned on, the refrigeration system will reduce the temperature of the cooling fluid in the work area to the lowest achievable temperature under the existing heat load conditions.

For best results, stirring or agitation in the work area is recommended. When not stirred, cooling capacities will be reduced and the work area will show temperature layering, with the coldest, most dense zone at the bottom.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Temperature Adjustment

If temperature control is desired, a Thermo NESLAB Cryotrol Temperature Controller is required. Refer to the Cryotrol Temperature Controller Instruction and Operation Manual for installation and operation instructions.

Never operate any CryoCool unit above -25°C.

Older Cryotrols are equipped with a round 8 pin connector. If you wish to connect your older Cryotrol unit to the CryoCool, an adapter cable is available from Thermo NESLAB. Contact our Service Department for more information (see Preface, After-Sale Support).

A Thermo NESLAB Exatrol Digital Temperature controller may also be used to control temperature. The Exatrol is designed for more precise temperature control and offers tighter temperature stability than the Cryotrol.

Refer to the Exatrol manual for additional information.

Section V Maintenance

Service Contracts

Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Cleaning

For proper operation, the unit needs to pull substantial amounts of air through the condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend making a monthly visual inspection of the condenser after initial installation. After several months, the cleaning frequency will be established.

Cooling Fluid

The cooling fluid in the work area should be periodically replaced when operating at low temperatures. At low temperatures, the cooling fluid may collect water vapor from the air. As the concentration of water in the cooling fluid increases, performance is adversely affected.

Section VI Troubleshooting

Checklist

Unit will not start.

Make sure the voltage of the power source meets the specified voltage, ±10%. Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit.

Loss of cooling capacity.

Make sure the heat load in the work area is not greater than the cooling capacity of the unit. Refer to Section II, Specifications to review the cooling capacity specifications.

Check for ice build up on the cooling probe. A layer of ice will act as insulation and reduce the cooling capacity. Ice build up is often an indication that the cooling fluid needs replacing. Defrost the cooling probe and change the cooling fluid.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, *please* obtain the following information:

Part number
Serial number
Voltage of unit
Voltage of power source

Technical Support

Our Service Department can provide you with a complete list of spare parts for your unit (see Preface, After-sale Support). Before calling, *please* obtain the following information:

Part number
Serial number

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. Thermo NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Thermo NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

380-415V 3 Phase 5 Wire Units

WARRANTY

CFT-300 Quick Reference Operating Procedures

Installation

The unit has an air-cooled refrigeration system. Air is drawn in the front of the unit and discharged through rear and side. Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C.

Make sure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled OUTLET and INLET. These connections are ¾ inch FPT. Remove the plastic protective plugs from both plumbing connections. Connect the OUTLET fitting to the inlet of the instrument being cooled. Connect the INLET fitting to the outlet of the instrument being cooled.

To fill the reservoir remove the reservoir access panel by unscrewing the thumbscrews. Locate the reservoir plug (square nut). Remove the plug and fill the reservoir with clean cooling fluid.

Thermo NESLAB recommends using distilled/deionized water with a 0.05 to 0.1 megohm-cm reading.

If you do not have access to distilled/deionized water we recommend using filtered tap water

Operation

Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

To start the unit, place the Power Switch to the on position. The Power Switch illuminates to indicate the system is operating. To turn the unit off, place the Power Switch to the off position.

The Cool LED indicates the status of the refrigeration system. It illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the setpoint, the LED will flash.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Temperature Adjustment

To display the temperature setpoint, press and hold the NEXT ENTER button on the controller. To adjust the temperature setpoint, press the YES or NO key until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, press the NEXT ENTER key. The display will now indicate the temperature of the fluid in the reservoir.

Periodic Maintenance

Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Before changing the cooling fluid, raise the unit's operating temperature to de-ice the cooling coils.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established. Before cleaning, disconnect the power cord from the power source and drain the reservoir.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

When unpacking the unit, Thermo NESLAB recommends using a hoist. Units are not equipped with handles. Roll the unit on its castors to move it.

If this product has been modified to operate at 0°C or lower, it has been tested with a non-freezing fluid. Although the system has been drained, some residual fluid may remain. This will not hinder your unit's performance.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact Thermo NESLAB for more information.

After-sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label on the rear of the case top to obtain the following information:

- BOM number _____

- Serial number _____

- Software version (see page 21) _____

Section I Safety

Warnings

Warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle and text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, please contact our Sales Department (see After-sale Support).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Never connect the OUTLET/SUPPLY or INLET/RETURN fitting to your building water supply or any water pressure source.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact Thermo NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer’s warranty.

Do not replace reservoir plug with a non-vented type or damage to the tank may occur.

For personal safety and equipment reliability, the following procedure should only be performed by a competent technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Additional Warnings

In addition to the specific warnings listed on the previous page the following general warnings apply to you unit:

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the reservoir.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified technician.

Section II General Information

Description

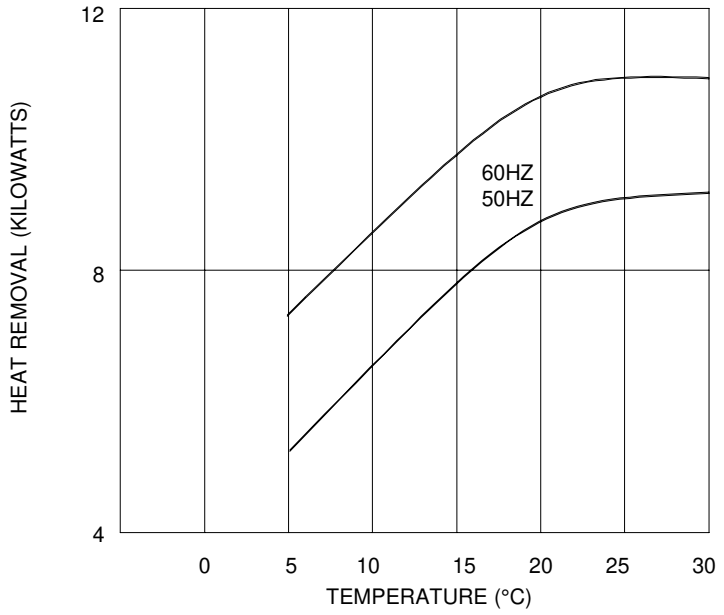
The CFT-300 Recirculating Chiller is designed to provide a continuous supply of cooling fluid at a constant temperature and volume.

The unit consists of an air-cooled refrigeration system, a sealable reservoir, recirculating pump, and a temperature controller.

Throughout the manual, you will be asked to consult the unit's serial number label or the pump identification label for specific information. Both labels are located on the rear of the unit.

Specifications

Cooling Capacity[1]



Temperature Range[2]	+5°C to +35°C
Temperature Stability[3]	±1.0°C
Reservoir Volume	
Gallons	5.6
Liters	21.3
Refrigerant	R22
Pollution Degree	II, IAW IEC 664

1. Circulating water at 20°C, at 20°C ambient. Cooling capacity will vary depending on fluid temperature, ambient temperature, and cooling fluid. A PD-2 pump was used.
2. Modified temperature ranges from -15°C to +85°C are available.
3. With 86% heat load.

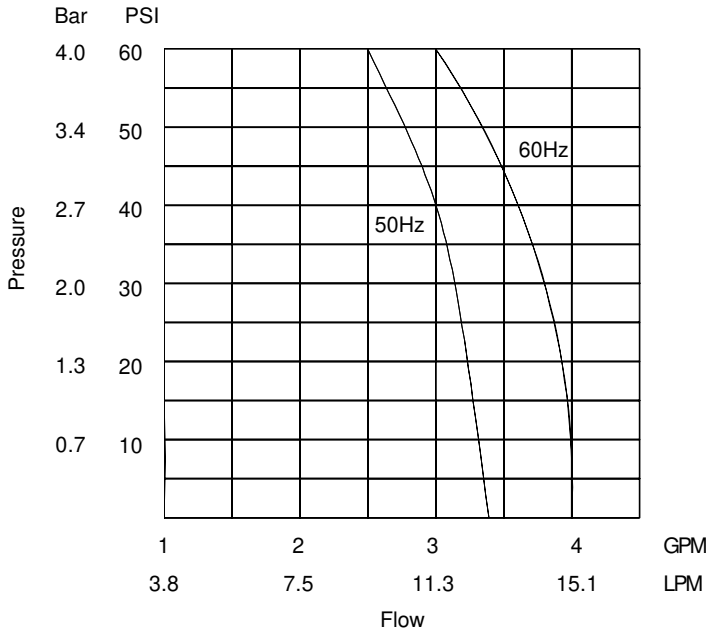
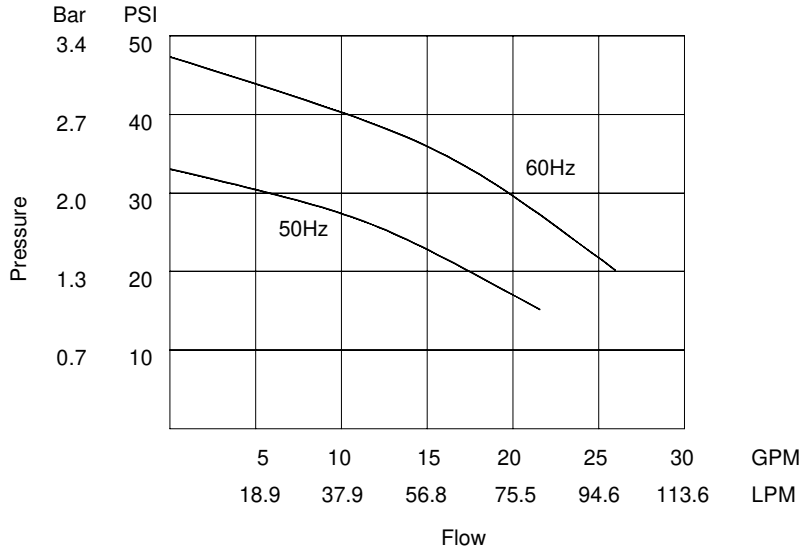
1. Dimensions are inches/centimeters. Dimension A is the height of the unit. The unit width and depth (dimensions B and C) are the case dimensions, add approximately 2 inches (5 centimeters) to include the plumbing connections.
2. Dimension D is the distance from the floor to the bottom of the unit case (height of the castors).
3. Dimension E is the distance from the floor to the center of the DRAIN connection.
4. Dimension F is the distance from the floor of the center of the OUTLET connection.
5. Dimension G is the distance from the floor of the center of the INLET connection.
6. Dimension H is the distance from the unit's left side to the center of the INLET and OUTLET connections.
7. Dimension I is the distance from the unit's left side to the center of the DRAIN connection.
8. Weights are given in pounds/ kilograms.
9. Air intake is given in cubic feet per minute.

Rev 04/12/99

Pump Capacity





Section III Installation

Site

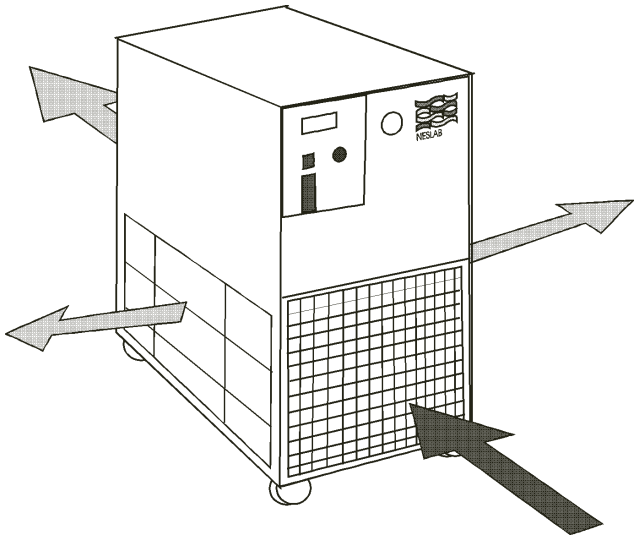
The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +13°C to +35°C, and maximum humidity is below 80%.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. Air is drawn through the front of the unit and discharged through rear and side panels. The unit must be positioned so the intake and discharge are not impeded. A minimum clearance of 18 inches (45 centimeters) on all vented sides is necessary for adequate ventilation. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section V, Cleaning).

The unit will retain its full rated capacity in altitudes up to 6500 feet (2000 meters), and ambient temperatures up to approximately +24°C. Above +24°C, reduce the cooling capacity 1% for every 0.5°C above +24°C, up to a maximum ambient temperature of +35°C.



Direction of Air Flow

Electrical Requirements

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Refer to Section II, Specifications, and to the serial number label on the rear of the unit for the specific electrical requirements of your unit. Ensure the voltage of the power source meets the specified voltage, ±10%. Transient overvoltages must comply with OVERVOLTAGE CATEGORY II. For mains supply, the minimum and normal category is II.

Units are also equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

50 Hertz units are supplied with a junction box located behing the controller panel. Wire the power connections in accordance to local, state and federal electrical codes. For 380-415V 3 Phase 5 Wire units refer to Appendix C for additional information. Double check all wiring to make sure it is properly connected and protected from the elements.

For 50 Hertz units which are not supplied with line cords we recommend a harmonized (HAR) grounded 3-conductor cord, type H05V V - F with conductors of nominal 1.0mm^2 cross section, rated 10 amps or a 5-conductor cord, type H07RN-F rated 20 amps, for the 5-wire units. A suitable cord end is required for connecting to the equipment (IEC 320/C13) and should terminate with an IEC approved plug for proper connection to branch circuit. Cusomer provided circuit protection is suggested. Make sure the voltage of the power source meets the specified voltage, ±10%.

Plumbing Requirements

Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. The manufacturer of the instrument should be able to recommend a cleaning fluid for their equipment.

The plumbing connections are located on the rear of the unit and are labelled INLET and OUTLET. Connections are ¾ inch FPT.

Remove the plastic protective plugs from both plumbing connections. Connect the INLET fitting to the outlet of your application. Connect the OUTLET fitting to the inlet of your application .

Never connect the fittings to your building water supply or any water pressure source.

Flexible tubing, if used, should be of heavy wall or reinforced construction. All tubing should be rated to withstand 80 psig at the highest operating temperatures. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from Thermo NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

Keep the distance between the unit and your application as short as possible, and use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, make them at the inlet and outlet of the instrument being cooled, not at the CFT.

If substantial lengths of cooling lines are required, pre-filled them with cooling fluid before connecting them to the unit.

Fluids

Never use flammable or corrosive fluids with this unit. Do not use automotive anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automotive anti-freeze will void the manufacturer's warranty.

Thermo NESLAB recommends using distilled/deionized water with a 0.05 to 0.1 megohm-cm reading.

Highly distilled/deionized water, above the 3 megohm-cm region, may become aggressive and is not recommended for use with units with wetted parts other than stainless steel. Distilled/deionized water in the 15 megohm-cm region is definitely aggressive and should not be used. Units operating in these regions should be closely monitored. See Water Quality Standards and Recommendations in Appendix A.

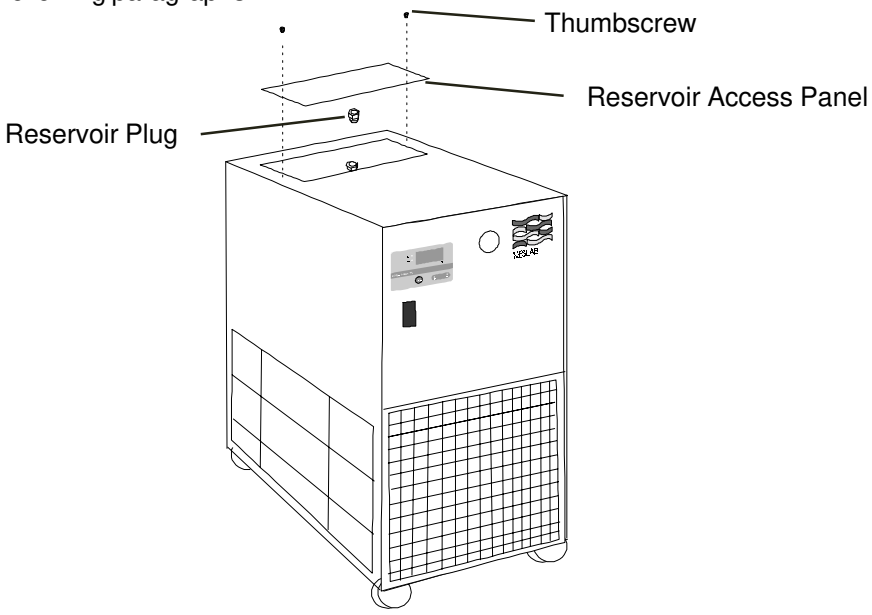
If you do not have access to distilled/deionized water we recommend using filtered tap water. Thermo NESLAB cannot recommend any custom fluids, these fluids are too dependent on your particular application.

Below +8°C, a non-freezing solution is required. The selected cooling fluid must have a viscosity of 50 centistokes or less. A 50/50 mixture, by volume, of distilled/deionized water and laboratory grade ethylene glycol is suggested.

For units with extended temperature ranges above +35°C, we recommend distilled/deionized water up to +80°C. Above +80°C, you are responsible for the fluid(s) used.

Filling Requirements

Remove the reservoir access panel by unscrewing the thumbscrews. Locate the reservoir plug (square nut). Remove the plug and fill the reservoir with clean cooling fluid, following the special considerations outlined in the following paragraphs.



Reservoir filling locations

Circulating to a closed system (closed to the atmosphere)
Fill the reservoir to the bottom of the fill hole threads. Since the reservoir capacity is small compared to many instruments being cooled, have extra cooling fluid on hand to keep the system topped off when external circulation is started.

NOTE: The tank in your unit has a vent which relieves pressure built up from thermal expansion of water. The vent is located on the reservoir plug. It activates when tank pressure reaches 3 - 5 psi.

Do not replace reservoir plug with an non-vented type or damage to the tank may occur.

Circulating to an open system (open to the atmosphere)
Fill the reservoir so ¾ of the fill hole threads are covered. Wrap the tank plug with Teflon® sealing tape. Replace the tank plug and tighten securely to prevent air entry.

When circulating cooling fluid to an open vessel or tank, connect the OUTLET/SUPPLY and INLET/RETURN lines to the open tank. Secure the INLET/RETURN (suction) line below the fluid surface. The INLET/RETURN line should be submerged deep enough to avoid sucking air. Make sure the INLET/RETURN line is free of particles and debris that can block the flow of fluid. A baffle or screen may be required.

Section IV Operation

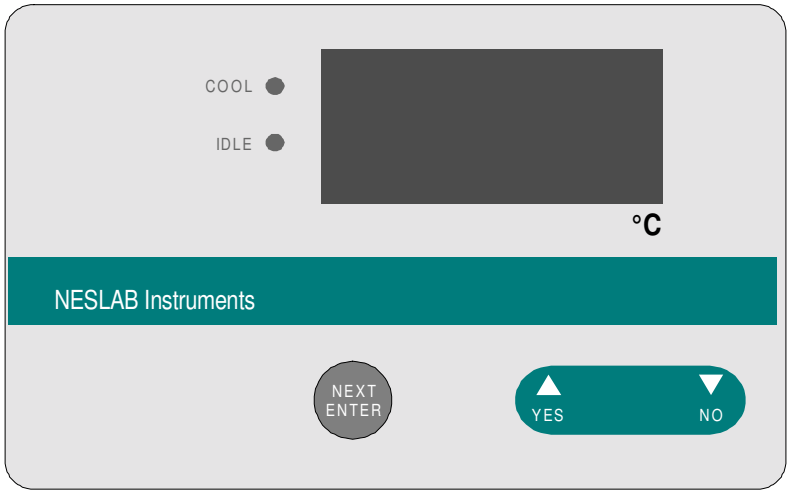
Start Up

Before starting the unit, double check all electrical and plumbing connections and make sure the circulating system (the CFT, the instrument being cooled, and the tubing that connects them) has been properly filled with cooling fluid. On units with a circuit breaker located on the rear of the unit, ensure it is the on position. To start the unit, place the POWER Switch to the on (**I**) position. The refrigeration system and the recirculation pump will start. The POWER Switch illuminates to indicate the system is operating. Units with PD pumps display the pump operating pressure on the RECIRCULATING PRESSURE gauge.

To turn the unit off, place the POWER Switch to the off (**0**) position.

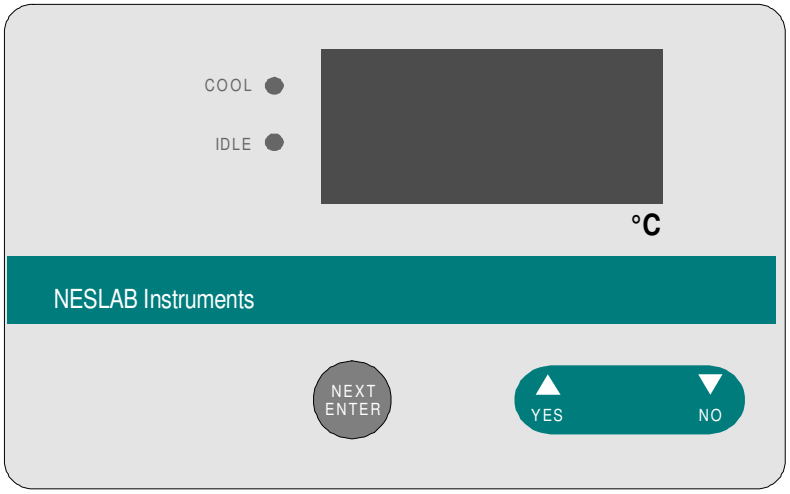
COOL indicates the status of the refrigeration system. It illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the temperature setpoint, the LED will flash. IDLE indicates the unit is in a hot-gas-bypass mode of operation. As the operating temperature approaches the temperature setpoint, the LED extinguishes.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.



Digital Temperature Controller

Digital Controller



Digital Temperature Controller

The digital controller controls temperature using a PID (Proportional-Integral-Derivative) algorithm. It is designed with self-diagnostic features and easy to use operator interface.

NEXT ENTER
Use this key to accept and save changes.

YES, ▲
This key is used to increase numerical values.

NO, ▼
This key is used to decrease numerical values.

When the controller is powered it displays the reservoir fluid temperature. Press the **NEXT ENTER** key to view the setpoint. The display flashs between **SP** and the actual setpoint number. If desired, use the **YES** and **NO** keys to change the setpoint. The display flashes as soon as either key is depressed. Once the desired setpoint is displayed, press the **NEXT ENTER** key.

NOTE: The new value will not be used by the controller until the **NEXT ENTER** key is depressed and the display stops flashing. The controller will not allow you to enter a value above the maximum or below the minimum value, or any illegal value. If you try to enter an illegal value the display will revert to its original value when the last digit was entered.

If the **NEXT ENTER** key is not depressed within one minute, the controller will time out and the new value will not be accepted. The controller will revert to the previous value.

NOTE: Error codes are addressed in Section V, Maintenance and Service.

Temperature Limits

The controller is used to set the high and low temperature limits. If a limit is exceeded the controller will display an error code, see Section V.

With the controller displaying the reservoir fluid temperature, press and hold the **NO** key and then press the **NEXT ENTER** key. The controller will display TUNE. Press the **YES** key to display COOL. Press the **NO** key to display either HEAT or HIT, for high temperature limit. (HEAT is only displayed on units with an optional heater, press NO to display HIT.)

To change the HIT value press **YES**. The display will flash HIT and the actual value. Use the **YES** and **NO** keys to change the value. Once the desired value is displayed press the **NEXT ENTER** key twice. The display will indicate LOT for low temperature limit. Use the same procedure to change the low temperature limit. The display will indicate STOR. Press **YES** to accept the changes, press **NO** to restore the previous values. The controller will again display the reservoir fluid temperature.

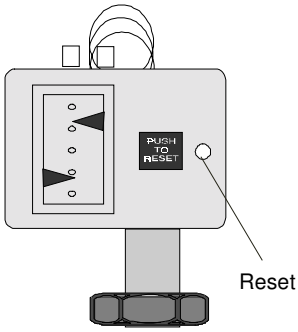
Pressure Relief Valve

Units with PD pumps have a pressure relief valve which establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The relief valve does not determine the actual operating pressure; the operating pressure is determined by the back pressure of the system.

If an adjustment is necessary, contact our Customer Service Department.

High/Low Pressure Cutouts

Units are equipped with refrigeration High Pressure Cutouts (HPC) and Low Pressure Cutouts (LPC). Should either cutout activate the unit will shut down.



HPC/LPC (Typical)

The HPC activates if there is a blockage in the refrigeration lines or if the refrigerant temperature becomes too hot. The HPC is factory preset at 400 psi.

The LPC activates if there is a leak in the refrigeration lines. THE LPC is factory preset at 4 psi.

The cutouts are located inside the case behind the rear panel. Once the cause of the shut down has been determined and corrected, manually depress the white button on the applicable cutout. If a "click" is not heard when depressing the button, the cutout was not activated and the unit shut down for another reason.

High Temperature Cutout (Optional)

The High Temperature Cutout (HTC) is designed to shut down the unit in the event the temperature of the fluid in the reservoir exceeds the HTC setting. The HTC is normally located on the rear of the unit.

NOTE: The HTC temperature scale is in °F.

Heater Package (Optional)

Heaters are controlled by a switch on the temperature controller. The heater itself is accessible through the small service panel on the rear of the unit.

The controller will indicate a low level display if the fluid level in the reservoir drops below proper operating level.

Illustration A shows the desired fluid level for normal operation.

Should the reservoir be filled as shown in illustration B, units designed to operate at high-end temperatures (near boiling) may cause air in the reservoir to become trapped. The air can be vented by slightly tilting the unit forward on its front castors.

Any fluid venting from the reservoir will drain through a hose which feeds to a small hole in the bottom of the unit.

Do not used silicon-based fluids with units designed to operate at high temperatures. These type fluids will damage the hoses and pump seal.

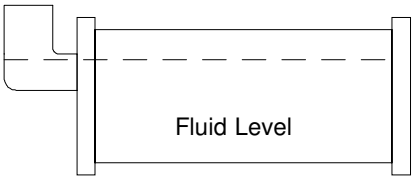


Illustration A

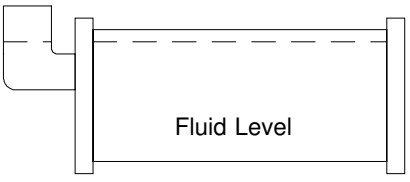

Illustration B

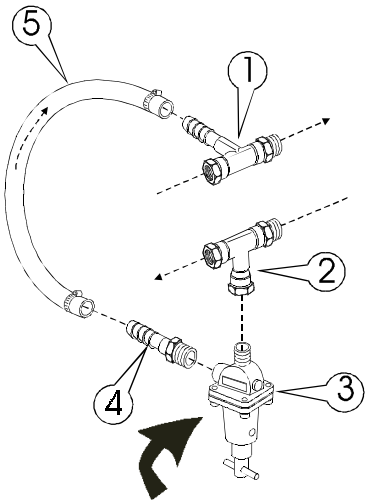
External Pressure Reducer (Optional)

For applications requiring a maximum pressure less than 55 PSI (380 kPa), an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 PSI (70 to 345 kPa). If the pressure of the fluid leaving the chiller exceeds the relief valve setting, the relief valve will bypass excess fluid back into the chiller to relieve the overpressure.

The pressure of the system is determined by the back pressure of the connected equipment and the flow rate of the recirculating fluid to your application. Connect the EPR as described.



NOTE: Install the fittings in the exact sequence shown.

NOTE: Use Teflon® tape on all threaded fittings.

Connect the Inlet Tee Assembly (1) to the chiller. Connect the Outlet Tee Assembly (2) to the chiller. Attach the relief valve (3) to the Outlet Tee Assembly (2). Attach the Hose Nipple (4) to the Relief Valve (3). Attach the Hose (5) between the Inlet Tee Assembly (1) and the Hose Nipple (4).

The EPR is now installed. Connect the inlet (to your application) to the remaining fitting of the Outlet Tee Assembly (2). Connect the outlet (from your application) to the remaining fitting of the Inlet Tee Assembly (1).

Tighten the hose clamps tight enough to prevent leakage. Do not overtighten or the clamps will bite into the flexible tubing and cause excessive wear. If a torque wrench is available, torque hose clamps to 50 in/lbs (280 cm/kg). Nylon-reinforced hose tends to cold-flow, so the clamps will need to be torqued again later. (The hose clamps do not actually loosen, but rather the hose outside diameter decreases.)

The "T" adjustment handle is equipped with a locknut. To adjust the relief pressure setting loosen the locknut and turn the "T" handle to the minimum pressure setting (direction of arrow).

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and the instrument being cooled. Monitor the operating pressure of the unit. Turn the "T" handle until the desired relief pressure is set. (The EPR valve cannot be set lower than the total back pressure of the instrument being cooled or the instrument will not receive any flow.)

Tighten the locknut to secure the position of the "T" handle. Open the hose between the EPR outlet tee assembly and the instrument being cooled.

Section V Maintenance and Service

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Service Contracts

Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Draining the Reservoir

Units are equipped with a ½ inch FPT DRAIN fitting located on the rear of the unit. To drain other CFT reservoirs we recommend the use of a wet/dry vacuum. Remove the reservoir plug and carefully insert the wet/dry vacuum so as not to damage the cooling coils. **NOTE:** Tilting the unit more than 45° may allow compressor oil to seep into the suction line.

Do not blow high-pressure air into the system. Doing so may rupture the reservoir.

Cleaning

Reservoir

Periodically inspect the fluid inside the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Before changing the cooling fluid, raise the operating temperature of the unit to de-ice the cooling coils. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Condenser

For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The lower front of the unit has a one-piece grille assembly. Gently pry the assembly off with a flathead screwdriver. Use care not to scratch the paint.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Algae

To restrict the growth of algae in the reservoir, it is recommended that the reservoir cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

Thermo NESLAB recommends the use of Chloramine-T, 1 gram per 3.5 liters. Other algicides can be harmful to the unit's internal components. Contact NESLAB for additional information.

Pump Strainer

Units with PD pumps have a strainer. Refer to the pump label on the rear of the unit to identify the type of pump in your unit. The strainer is located in the pump suction line.

If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

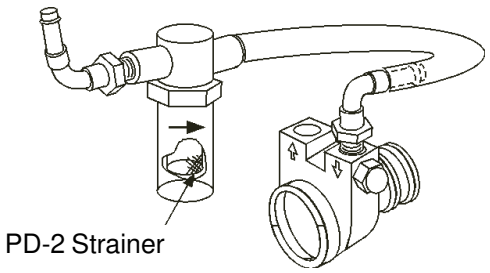
After initial installation, the strainer may become clogged with debris and scale. Therefore, the strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the cleaning frequency will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Remove the wrapper from the unit. Unscrew the black plastic housing and remove the screen.

Clean the screen by rinsing it with water.

When the screen is clean, replace it in the strainer, tighten the housing and replace the wrapper. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.



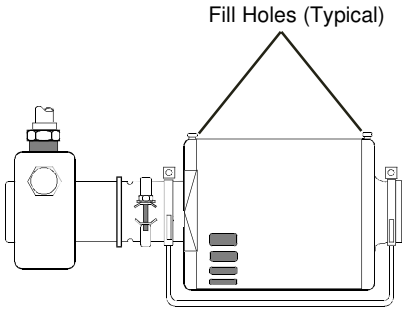
PD-2 Strainer

Pump Motor Lubrication

PD pump motors require periodic lubrication. Refer to the pump label on the rear of the unit to identify the type of pump in your unit.

PD pumps use sleeve type bearings with large reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil to each bearing on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



Hoses

The unit's internal and external hoses and clamps should be inspected and tightened on at least a semiannual basis.

Suction Discharge Pressure Speed Check

Unit	Pump	Refrigerant	Suction PSIG	Discharge PSIG	Speed °C/Min
CFT-300	PD2	R22	88 - 94	265 - 280	6.8
CFT-300	CP-55	R22	85 - 90	268 - 280	6.8

Standard temperature 60 Hertz units, derate 17% for 50 Hertz Units. +20°C fluid temperature, unit in the COOL mode, +20°C ambient. 100% water in the reservoir. Wrapper removed.

Error Codes

The controller also has the capability to display error codes. The codes are:

Display	Indication
16	Bad calibration data
19	Temperature below low temperature setpoint
21	Temperature above high temperature setpoint
22	Excessive high temperature, unit requires immediate attention
23	Shorted RTD2
24	Open RTD2
25	Shorted RTD1
26	Open RTD1
ADD	Reservoir fluid below normal operating level

The unit will continue to run with any of the above codes. If any other code appears contact NESLAB customer service, see Preface.

NOTE: Depressing the NEXT ENTER key may clear error codes 01 through 04. Doing so restores the controller to factory-set default values.

Displaying Software Version

This procedure will display the software version number on the unit's display. In the event the unit is not operational, the software version (and the checksum) can also be read from the label which is on the microprocessor chip itself.

The following chart uses an example of software version 000507.49b

begin in the reservoir temperature display	20.3C
Press and hold NO for at least 10 seconds.	0507
displays software version digits to **left** of decimal. Note the two leading zeros do not display.	
Press NEXT	49
displays software version digits to **right** of decimal.	
Press NEXT	2
displays software version revision letter (as its equivalent number - display cannot show letters. A=1, B=2, etc.)	
Press NEXT	0000
displays checksum - this can be disregarded	
Press NEXT	20.3C
returns to the temperature display	

Section VI Troubleshooting

Checklist

Unit will not start

Check the position of the optional circuit breaker the rear of the unit.

Check the line cord, make sure it is plugged in.

Check the voltage of the power source. Make sure it is within the rated voltage of the unit, ±10%.

Check that the Power Switch/Circuit Breaker has not tripped.

Check the setting on the High Temperature Cutout.

All units are equipped with high and low pressure switches. If either switch activates the unit will shut down. Once the cause has been determined you have to manually reset the switch. The switches are located behind the rear panel. (See Section IV, Operation.)

Unit will not circulate fluid

Check the reservoir level. Fill, if necessary.

Make sure the pump has been purged.

Check the pressure gauge (units with PD pumps). If the reading is 60 psig, check the instrument being cooled for restrictions in the cooling line.

Check the pump strainer (units with PD pumps). A clogged strainer can starve the pump.

For 380-415V 3 Phase 5 Wire units, see Appendix B.

Inadequate temperature control

If the temperature continues to rise, make sure the heat load of the instrument being cooled does not exceed the rated specification. (See Section II, Specifications on page 6.)

Make sure the air intake and discharge are not impeded and the ambient temperature does not exceed +35°C.

Make sure the condenser is free of dust and debris. (See Section V, Cleaning.)

If the compressor short-cycles (a clicking sound), check the line voltage. It should be within the 10% of the specified voltage. Wait 5 minutes before restarting the unit.

For 380-415V 3 Phase 5 Wire units, see Appendix B.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please refer to the serial number label on the rear of the unit to obtain the following information:

- unit BOM number
- unit serial number
- voltage of power source
-software version

Appendix A Water Quality Standards and Recommendations

	Permissible (PPM)	Desirable (PPM)
Microbiologicals		
(algae, bacteria, fungi)	0	0
Inorganic Chemicals		
Calcium	<40	0.6
Chloride	250	<25
Copper	1.3	1.0
Iron	0.3	<0.1
Lead	0.015	0
Magnesium	<12	0.1
Manganese	0.05	<0.03
Nitrates\Nitrites	10 as N	0
Potassium	<20	0.3
Silicate	25	<1.0
Sodium	<20	0.3
Sulfate	250	<50
Hardness	17	<0.05
Total Dissolved Solids	50	10
Other Parameters		
pH	6.5-8.5	7-8
Resistivity	0.01*	0.05-0.1*

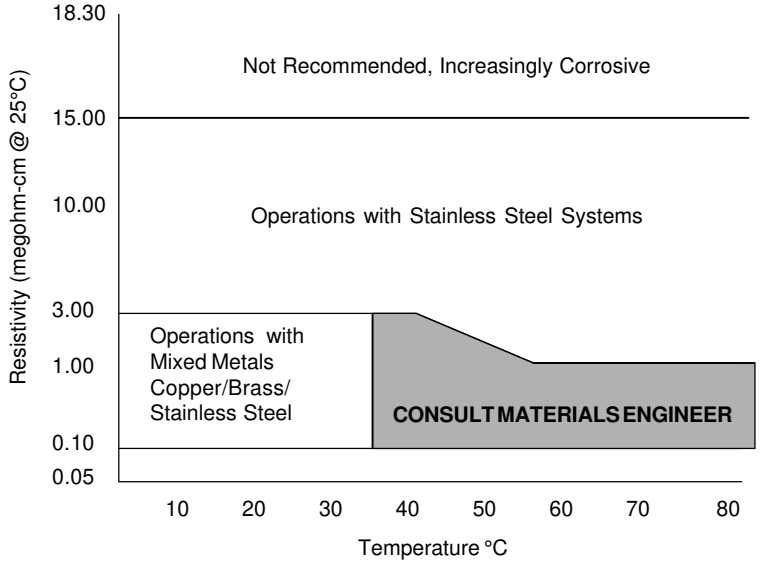
* Megohm-Cm (Compensated to 25°C)

Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (of NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (of NaCl).

Recommendation: Initially fill the tank with distilled/ deionized water. Do not use untreated tap water as the total ionized solids level may be too high. Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated to 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated to 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated to 25°C).

The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



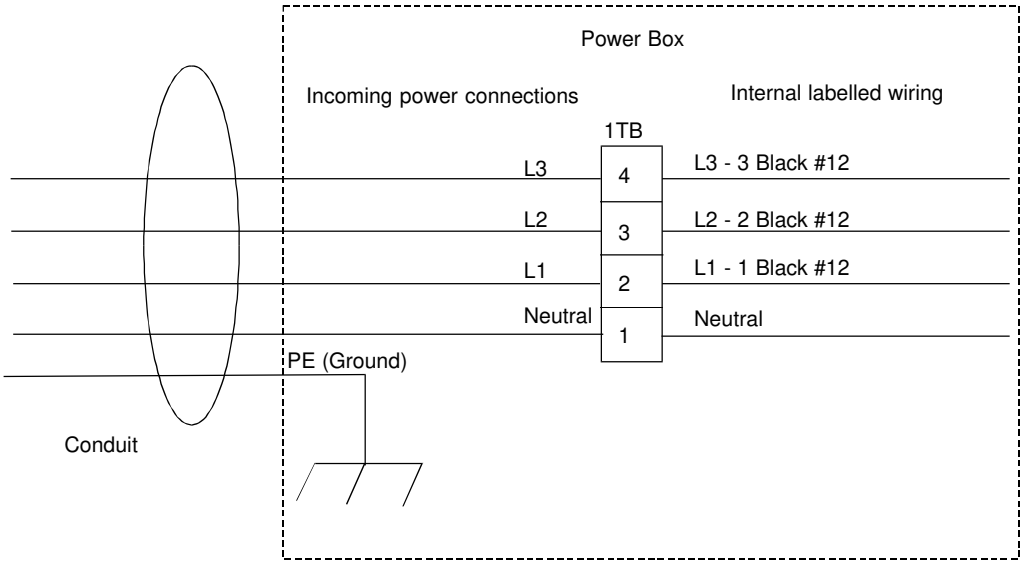
Water Quality Considerations

Appendix C 380-415V 3 Phase 5 Wire Units

The unit is not equipped with a line cord. You are responsible for providing the proper electrical connections.

Run all power connections through the conduit located in the rear of the unit to the unit's power box.

Attach wires to power box as shown below.



Main Power 4-Position Terminal Block

In order to ensure the proper motor rotation conduct the following tests:

Condensing Fan Motor Test
With the unit on, place a piece of paper in front of the condenser. If the paper adheres to the front grill then the rotation is correct. If the paper blows away from the front grill then the rotation is reversed.

Pump Motor Test
With the unit on, observe the flow out of the unit. If the fluid is not exiting the unit's outlet port there is a good chance that the rotation is reversed.
NOTE: While conducting this test make sure that the flow control valve is opened.

To fix an out of phase condition first turn off the main service power and power to the unit. Reverse any two of the three main power leads going into the unit.

Never remove the green and yellow ground wire or, if equipped, the white neutral wire.

Reconnect the power to the unit. If the unit will not start contact our Service Department.

Continued on next page.

Fuses

Three Class J fuses are used to protect the motor, in addition to a thermal overload device. These fuses are located inside the main control panel. In the event of an open fuse, investigate and correct the source of the overload before replacing the fuse(s).

Always turn off the unit and disconnect the line cord from the power source before attempting to do any service.

To replace the fuses, remove the two screws from the main control panel and then open the panel door. For units equipped with a 380V, 3-Phase, CP-55 pump, NESLAB part number 008596, replace the fuses with Class J, 600V, 3A, TDLY fuses only. Do not replace the fuses with an alternate amperage.

Electrical Requirements

Permanently Connected Equipment must be connected to a branch circuit protector of a rated value no less than the Maximum Overcurrent Protective Device (MOPD) which is on the nameplate. In addition there must be an appropriately rated and marked disconnect device within view of the unit.

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. Thermo NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Thermo NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

CFT-75 Quick Reference Operating Procedures

Installation

The unit has an air-cooled refrigeration system. Air is drawn in the front of the unit and discharged through rear and side. Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +38°C.

Make sure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled either SUPPLY and RETURN or OUTLET and INLET. These connections are ½ inch NPT. Connect the SUPPLY fitting to the inlet of the instrument being cooled. Connect the RETURN fitting to the outlet of the instrument being cooled.

To fill the reservoir remove the reservoir access panel by unscrewing the thumbscrews. Locate the reservoir plug (square nut). Remove the plug and fill the reservoir with clean cooling fluid.

Tap water is the recommended fluid for operation.

Operation

Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

To start the unit, place the Main Power Switch to the on position. The Power Switch LED illuminates to indicate the system is operating. To turn the unit off, place the Power Switch to the off position.

The Cool LED indicates the status of the refrigeration system. It illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the setpoint, the LED will extinguish.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Periodic Maintenance

Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

The unit has a pump strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning, disconnect the power cord from the power source and drain the reservoir.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

If this product has been modified to operate at 0°C or lower, it has been tested with a non-freezing fluid. Although the system has been drained, some residual fluid may remain. This will not hinder your unit's performance.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Customer Service Department.

Before calling, please refer to the labels on the rear of the unit to obtain the following information:

- unit BOM number _____

- unit serial number _____

- pump type _____

Section I Safety

Warnings

Warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle and text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, please contact our Sales Department (see After-sale Support).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Never connect the SUPPLY or RETURN fitting to your building water supply or any water pressure source.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer’s warranty.

Do not replace reservoir plug with a non-vented type or damage to the tank may occur.

For personal safety and equipment reliability, the following procedure should only be performed by a competent technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Additional Warnings

In addition to the specific warnings listed on the previous page the following general warnings apply to your unit:

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the reservoir.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified technician.

Section II General Information

Description

The CFT Recirculating Chiller is designed to provide a continuous supply of cooling fluid at a constant temperature and volume.

The unit consists of an air-cooled refrigeration system, a sealable reservoir, recirculating pump, and a temperature controller.

Throughout the manual, you will be asked to consult the unit's serial number label or the pump identification label for specific information. Both labels are located on the rear of the unit.

Specifications

Cooling Capacity[1]	2500 Watts
Temperature Range[2]	+5°C to +30°C
Temperature Stability	±0.5°
Reservoir Volume *Liters* *Gallons*	 6.8 1.8
Unit Dimessions[3,4] (H x W X D) *Centimeters* *Inches*	 67.3 x 37.8 x 65.4 26½ x 14⅞ x 25¾
Power Requirements	208/230V, 60Hz 220/240V, 50Hz
Refrigerant	R134a
Pump Capacity	
1. 2100 Watts at 50Hz. Cooling capacity obtained at 18°C. Cooling capacity will vary depending on fluid temperature, ambient temperature, and cooling fluid.
2. Temperature controller can display from 5°C to 30°C.
3. Unit height is measured from the floor to the top of the case. Add 1.3 centimeters (½ inch) to include the height of the thumbscrews on the reservoir access panel.
4. Unit depth is measured from the front of the case to the rear of the electrical enclosure on the back of the unit.

Section III Installation

Site

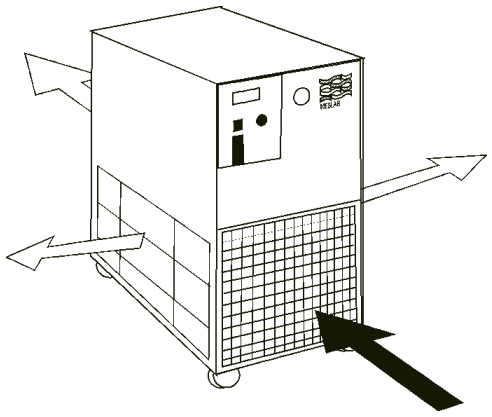
The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +13°C to +38°C.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. Air is drawn through the front of the unit and discharged through rear and side panels. The unit must be positioned so the intake and discharge are not impeded. A minimum clearance of 45 centimeters (18 inches) on all vented sides is necessary for adequate ventilation. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section V, Cleaning).

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C. Derate the cooling capacity 1% for every 0.5°C above +24°C.



Direction of Air Flow

Air Intake Requirements

The approximate air intake required for the unit to retain its full rated capacity is 800 cubic feet per minute.

Electrical Requirements

Refer to Section II, Specifications, and to the serial number label on the rear of the unit for the specific electrical requirements of your unit.

We recommend a harmonized (HAR) grounded 3-conductor cord, type H05, rated 30 amps.

Connect L1 to 1TB1, L2 and N to 1TB3. Connect the grounding conductor to the grounding stud.

Make sure the voltage of the power source meets the specified voltage, ±10%.

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

The unit can operate with either 50 Hertz or 60 Hertz input frequency. To change the frequency remove the wrapper and locate terminal boards 1TB and 2TB at the rear of the unit. For 50 Hertz operation, connect 2TB2 to 1TB2. For 60 Hertz, connect 2TB2 to 1TB1.

Plumbing Requirements

Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. The manufacturer of the instrument should be able to . recommend a cleaning fluid for their equipment.

The plumbing connections are located on the rear of the unit and are labelled SUPPLY and RETURN. The connections are ½ inch NPT.

Connect the SUPPLY fitting to the inlet of the instrument being cooled. Connect the RETURN fitting to the outlet of the instrument being cooled.

Never connect the fittings to your building water supply or any water pressure source.

Flexible tubing, if used, should be of heavy wall or reinforced construction. All tubing should be rated to withstand 80 psig at +30°C. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, they should be made at the inlet and outlet of the instrument being cooled, not at the CFT.

If substantial lengths of cooling lines are required, they should be pre-filled with cooling fluid before connecting them to the unit.

Fluids

The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Tap water is the recommended fluid for normal operation, see Water Quality and Recommendations.

Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer's warranty.

Water Quality Standards and Recommendations

	Permissible(PPM)	Desirable(PPM)
Microbiologicals		
(algae,bacteria,fungi)	0	0
Inorganic Chemicals		
Calcium	<40	0.6
Chloride	250	<25
Copper	1.3	1.0
Iron	0.3	<0.1
Lead	0.015	0
Magnesium	<12	0.1
Manganese	0.05	<0.03
Nitrates\Nitrites	10 as N	0
Potassium	<20	0.3
Silicate	25	<1.0
Sodium	<20	0.3
Sulfate	250	<50
Hardness	17	<0.05
Total Dissolved Solids	50	10
Other Parameters		
pH	6.5-8.5	7-8
Resistivity	0.01*	0.05-0.1*

* Megohm-Cm (Compensated at 25C)

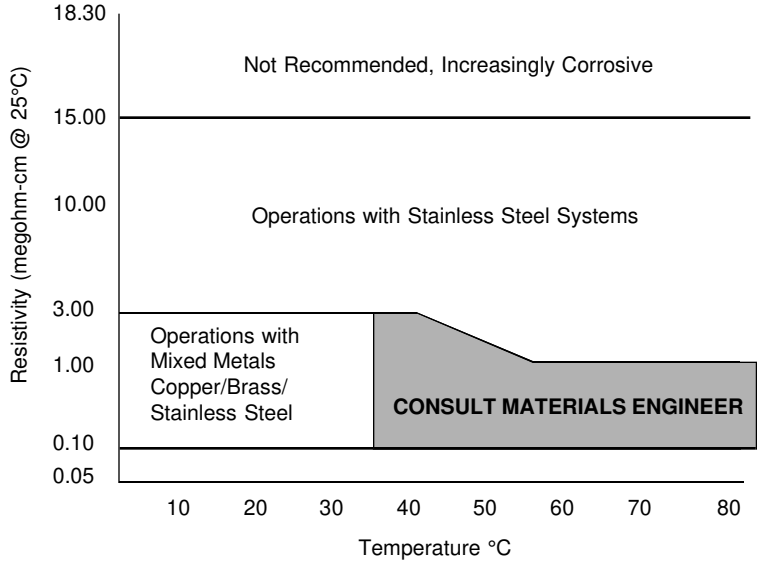
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (as NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (as NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated at 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated at 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated at 25°C).

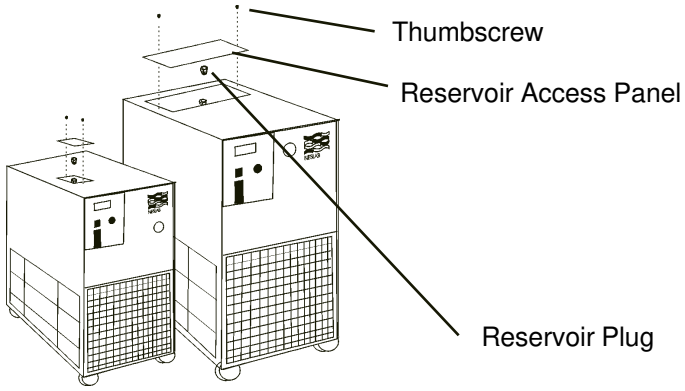
The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



Water Quality Considerations

Filling Requirements

Remove the reservoir access panel by unscrewing the thumbscrews. Locate the reservoir plug (square nut). Remove the plug and fill the reservoir with clean cooling fluid, following the special considerations outlined in the following paragraphs.



Reservoir Filling Locations (Typical)

Circulating to a closed system (closed to the atmosphere)
Fill the reservoir to the bottom of the fill hole threads. Since the reservoir capacity is small compared to many instruments being cooled, have extra cooling fluid on hand to keep the system topped off when external circulation is started.

NOTE: The tank in your unit has a vent which relieves pressure built up from thermal expansion of water. The vent is located on the reservoir plug. It activates when tank pressure reaches 3 - 5 psi.

Do not replace reservoir plug with an non-vented type or damage to the tank may occur.

Circulating to an open system (open to the atmosphere)
Fill the reservoir so ¾ of the fill hole threads are covered. Wrap the tank plug with Teflon® sealing tape. Replace the tank plug and tighten securely to prevent air entry.

When circulating cooling fluid to an open system, connect the SUPPLY and RETURN lines to the open tank. Secure the RETURN (suction) line below the fluid surface. The RETURN line should be submerged deep enough to avoid sucking air. Make sure the RETURN line is free of particles and debris that can block the flow of fluid. A baffle or screen may be required.

Section IV Operation

Start Up

Before starting the unit, double check all electrical and plumbing connections and make sure the circulating system (the CFT, the instrument being cooled, and the tubing that connects them) has been properly filled with cooling fluid.

To start the unit, place the POWER Switch to the ON position. The controller LEDs will illuminate.

Applying power to pins 1 and 2 on the Metrimate receptacle located on the rear of the unit starts the refrigeration system and the recirculation pump. See next page.

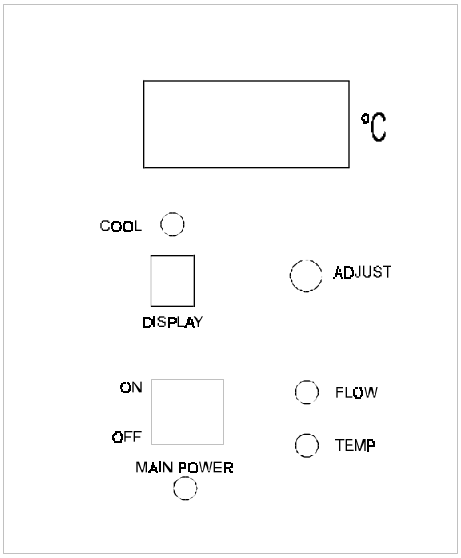
The COOL LED on the front panel indicate the status of the refrigeration system. It illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the temperature setpoint, the LED will extinguish.

Temperature Controller

Temperature Adjustment

To display the temperature setpoint, press and hold the DISPLAY switch. To adjust the temperature setpoint, press and hold the DISPLAY switch and turn the ADJUST knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the DISPLAY switch. The display will now indicate the temperature of the fluid in the reservoir.

NOTE: Inadvertent movement of the ADJUST knob, regardless of the position of the DISPLAY switch, will result in a change in the setpoint. This change will not be immediately reflected on the digital display, unless the DISPLAY switch is pressed. The digital display will eventually change as the unit reacts to the new setpoint.



Controller

Shut Down

To turn the unit off, place the POWER Switch to the OFF position.

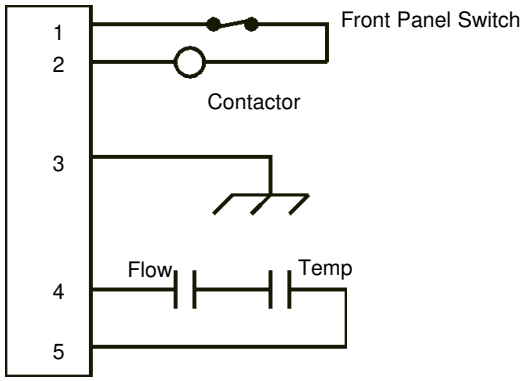
When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Fault Lights

Should the fluid flow drop below 1.6 liters per minute the FLOW lamp will illuminate and a signal will be sent to the Metrimate receptacle on the rear of the unit, see below.

Should the temperature of the fluid in the tank exceed what is set on the High Temperature Cutout (HTC), the TEMP lamp will illuminate and a signal will be sent to the Metrimate receptacle on the rear of the unit, see below. The HTC is factory preset at 30°C (86°F).

NOTE: The temperature scale on the HTC is in °F.



6-pin Metrimate Receptacle
Connector is made by AMP, Part Number 207153-1
Pin Part Number 745652-2

Section V Maintenance and Service

For personal safety and equipment reliability, the following procedure should only be performed by a competent technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Draining the Reservoir

To drain the reservoir we recommend the use of a wet/dry vacuum. Remove the reservoir plug and carefully insert the wet/dry vacuum so as not to damage the cooling coils. **NOTE:** Tilting the unit more than 45° may allow compressor oil to seep into the suction line.

Cleaning

Reservoir

Periodically inspect the fluid inside the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Before changing the cooling fluid, raise the operating temperature of the unit to de-ice the cooling coils. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Condenser

For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The lower front of the unit has a one-piece grille assembly. Gently pry the assembly off with a flathead screwdriver. Use care not to scratch the paint.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. It is recommended that a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Algae

To restrict the growth of algae in the reservoir, it is recommended that the reservoir cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, one gram per gallon.

Pump Strainer

If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

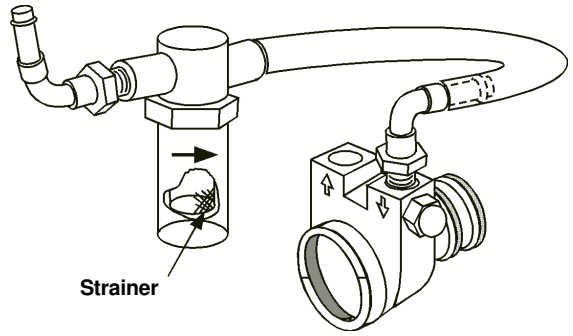
After initial installation, the strainer may become clogged with debris and scale. Therefore, the strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Remove the wrapper from the unit. Unscrew the cannister on the pump suction line and remove the screen.

Clean the screen by rinsing it with water.

When the screen is clean, replace it in the strainer, tighten the cannister and replace the wrapper. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

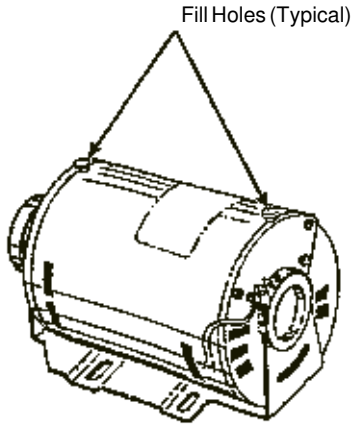


Pump Motor Lubrication

PD pump motors require periodic lubrication. Refer to the pump label on the rear of the unit to identify the type of pump in your unit.

PD pumps use sleeve type bearings with large reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil to each bearing on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



Pressure Relief Valve

A pressure relief valve establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The relief valve does not determine the actual operating pressure; the operating pressure is determined by the back pressure of the system.

If an adjustment is necessary, contact our Customer Service Department.

Section VI Troubleshooting

Checklist

Unit will not start

Check the line cord, make sure it is plugged in.

Check the voltage of the power source. Make sure it is within the rated voltage of the unit, ±10%.

Unit will not circulate fluid

Check the reservoir level. Fill, if necessary.

Make sure the pump has been purged.

Check the pressure gauge. If the reading is 60 psig, check the instrument being cooled for restrictions in the cooling line.

Check the pump strainer. A clogged strainer can starve the pump.

Inadequate temperature control

If the temperature continues to rise, make sure the heat load of the instrument being cooled does not exceed the rated specification. (See Section II, Specifications).

Make sure the air intake and discharge are not impeded and the ambient temperature does not exceed +38°C.

Make sure the condenser is free of dust and debris. (See Section V, Cleaning.)

If the compressor short-cycles (a clicking sound), check the line voltage. It should be within the 10% of the specified voltage. Wait 5 minutes before restarting the unit.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please refer to the serial number label on the rear of the unit to obtain the following information:

- *unit BOM number*
- *unit serial number*
- *voltage of unit*
- *voltage of power source*

Blank page.

Appendix International Quick Reference Guides

CFT - Umlaufkühler Kurzbedienungsanleitung

Installation
Das Gerät verfügt über ein luftgekühltes Kühlsystem. Die Luft wird an der Vorderseite angesaugt und strömt an den Seitenwänden und an der Rückseite aus. Das Gerät muß so plaziert werden, daß weder die Ansaug- noch die Ausströmungsöffnungen blockiert sind. Bei ungenügender Ventilation wird die Kühlleistung reduziert und kann in extremen Situationen zu einem Ausfall des Kühlsystems (Kompressors) führen.

Aufstellorte mit hoher Staubentwicklung sollten vermieden werden, und es sollte eine regelmäßige Reinigung des Gerätes durchgeführt werden. Um einwandfrei zu funktionieren, muß das Gerät große Luftmengen durch den Kondensor ansaugen. Bei Staub- und Schmutzablagerungen auf dem Kondensorheizkörper kommt es zu einem Verlust von Kühlleistung.

Das Gerät behält seine maximale Kühlleistung bis zu einer Umgebungstemperatur von ca. +38°C.

Vergewissern Sie sich, daß die Spannung Ihrer Stromanschlüsse mit der für das Gerät vorgesehenen Spannung übereinstimmt (±10%).

Die Schlauchanschlüsse (1/2 Zoll FPT) des Gerätes befinden sich an der Rückseite und sind mit SUPPLY und RETURN bezeichnet. Bitte entfernen Sie die Gummiabdichtung von beiden Anschlüssen. Schließen Sie den SUPPLY-Anschluß an den Eingang Ihres Instruments und den RETURN-Anschluß an den Ausgang Ihres Instruments an.

Um das Reservoir zu füllen, entfernen Sie den Reservoir-Schutzdeckel, indem Sie die Flügelschrauben lösen. Entfernen Sie den Reservoirverschluß (viereckige Mutter) und füllen Sie das Reservoir mit sauberer Kühlflüssigkeit.

Für den Betrieb im Arbeits-Temperaturbereich von +8°C bis +30°C empfiehlt NESLAB Leitungswasser als Kühlmittel.

Inbetriebnahme
Vor Inbetriebnahme des Gerätes vergewissern Sie sich bitte, daß die elektrischen Anschlüsse und die Rohr- u. Schlauchanschlüsse sachgemäß installiert sind und daß das gesamte System mit Kühlflüssigkeit gefüllt ist.

Um das Gerät einzuschalten, müssen Sie den Hauptschalter auf „ON“ stellen. Der Schalter leuchtet auf, wenn das Gerät in Betrieb ist. Um das Gerät abzuschalten, muß der Hauptschalter auf „OFF“ gestellt werden.

Die „Cool“ LED-Anzeige an der Anzeigetafel auf der Vorderseite des Gerätes leuchtet auf, so lange das Kühlsystem der Kühlflüssigkeit Wärme entzieht. Ist die gewünschte Temperatur erreicht (setpoint), erlischt die LED-Anzeige.

Nach dem Ausschalten des Gerätes sollten Sie vor dem Wiedereinschalten ca. 5 Minuten warten, damit das Kühlsystem einen Druckausgleich durchführen kann. Beachtet man diese Wartezeit nicht, kommt es zu kurzen Schaltfrequenzen des Kompressors und eine Kühlung ist nicht möglich.

Einstellung der Analog-Temperatursteuerung
Um die Temperatur einzustellen (setpoint), drehen Sie den °C-Schalter an der Vorderseite des Gerätes auf die gewünschte Temperatur.

Einstellung der Digital-Temperatursteuerung
Um sich den Temperatur-Setpoint anzeigen zu lassen, drücken Sie den DISPLAY-Schalter und halten Sie ihn gedrückt. Um den Temperatur-Setpoint einzustellen, drücken Sie den Display-Schalter, halten diesen, und drehen gleichzeitig den ADJUST-Schalter so lange, bis die gewünschte Temperatur in der Digitalanzeige angezeigt wird. Wenn die Temperatur eingestellt ist, lassen Sie den Display-Schalter los. Die Digitalanzeige zeigt dann die Temperatur der Kühlflüssigkeit im Reservoir an.

Wartung
Überprüfen Sie regelmäßig die Kühlflüssigkeit im Reservoir. Sollte eine Säuberung notwendig sein, spülen Sie das Reservoir mit einer speziellen Reinigungsflüssigkeit, die mit dem Umlaufsystem und der Kühlflüssigkeit kompatibel ist.

Das Kühlmittel sollten Sie regelmäßig erneuern.

Regelmäßiges Absaugen des Kondensor-Heizkörpers ist erforderlich. Die Reinigungshäufigkeit hängt von der Betriebsumgebung ab. Eine monatliche Überprüfung des Kondensors ist empfehlenswert. So werden Sie nach einigen Monaten einen Reinigungsrhythmus gefunden haben.

Geräte mit PD-Pumpen sind mit einem Pumpenfilter ausgestattet. Der Filter sorgt dafür, daß kleine Teilchen und Schmutzablagerungen nicht in die Pumpe gelangen und so die Pumpflügel beschädigen können.

Nach der Erstinstallation kann es zu einer Blockierung des Filters kommen. Die erste Reinigung sollte daher nach einer Woche erfolgen. Danach empfehlen wir eine monatliche Überprüfung des Filters. So können Sie nach einiger Zeit abschätzen, wie oft der Filter gereinigt werden muß.

Bevor Sie den Filter reinigen, ziehen Sie den Netzstecker aus der Steckdose und leeren Sie das Reservoir.

CFT Serie Kvik Referance

Installation:
CFT Serien er luftkølet. Luft trækkes ind fra fronten og ledes ud på bagsiden. Systemet skal placeres således, at der frit kan indsuges og udledes luft. Såfremt systemet ikke har tilgang til fri luftcirkulation, ind og ud, nedsættes kølekapaciteten og i ekstreme tilfælde fejler kompressoren.

Steder med meget støv skal undgåes, og periodisk rensning skal udføres, hvis utilsigtet nedbrud skal undgåes. Opbygning af støv vil medføre fald i kølekapasiteten og i værste fald overophedning af systemet.

Operationstemperatur ved 100% udnyttelse er fra stuetemperatur til+38° C under forudsætning af, at netspændingen er den nominelle 240V ±10%.

Slangetilgang er på bagsiden mærket „SUPPLY“ (ind) og „RETURN“ (ud). Skruegangen er ½“ FPT-gevind. Inden tilslutning af fittings fjernes plaststøvkappen fra rørstudsene. „RETURN“ tilsluttes det emne, som skal køles.

Fyldning af reservoiret foregår ved at fjerne panelet, som er forsynet med fingerskruer, og påfyld egnet rent kølevæske.

Betjening:
Før opstart checkes elektriske forbindelser, slangeforbindelser og kølevæske stand.

Systemet startes ved tryk på kontakten på forsiden, hvorefter denne vil lyse og systemet gå igang. Skal systemet standses trykkes på knappen igen.

Køledioden på frontpanelet angiver status på kølesystemet, den lyser ved køling og slukker, når den indstillede temperatur er nået.

Hvis systemet slukkes, skal der ventes minimum 5 min., før der tændes igen, ellers virker kompressoren ikke optimalt.

Analog temperatur kontrol:
Drej ^{0}C tasten til den ønskede temperatur og lad systemet stabilisere sig.

Digital temperatur kontrol:
Tryk på „DISPLAY“ tasten for at se den indstillede temperatur. Indstilling af ny temperatur, tryk på „DISPLAY“ og drej på „ADJUST“ indtil den rigtige temperatur vises, slip derefter „DISPLAY“ tasten. Skærmen vil nu vise den aktuelle temperatur i badet.

Periodisk vedligeholdelse:
Check standen af kølevæske periodisk, før skift af væske indstilles temperaturen på „de-ice“. Check med mellemrum vakuummet på pumpesiden, rens systemet og check for aflejringer, vækst, utætheder og evt. filtre. Husk åben aldrig instrumentet uden strømmen er afbrudt, og strømkablet er taget ud!

CFT-Series, Handleiding snelle installatieprocedures

Installatie
Het apparaat heeft een luchtgekoeld koelsysteem. Lucht wordt aangezogen aan de voorkant van het apparaat en weer vrijgegeven via de achterkant van het apparaat. Plaats het apparaat op een zodanige manier, dat de luchttoevoer en afvoer niet worden belemmerd. Inadequate ventilatie kan leiden tot afname van koelcapaciteit en, in extreme gevallen, tot het niet functioneren van de compressor.

Het is aan te raden stoffige ruimtes te vermijden en de condensor regelmatig schoon te houden. Voor een juiste werking dient het apparaat een voldoende hoeveelheid lucht aan te zuigen door middel van de condensor. Een opeenhoping van stof of vuil op de condensor kan leiden tot een verlies van koelcapaciteit.

Het apparaat behoudt haar integrale capaciteit bij een omgevingstemperatuur tot ongeveer +38 Gr.C.

Let erop dat de netspanning gelijk is aan het aangegeven voltage, ±10%.

De slangaansluitingen zijn bevestigd aan de achterkant van het apparaat en zijn voorzien van het label SUPPLY en RETURN. Deze aansluitingen zijn een 1/2 inch FPT. Verwijder de plastic beschermingspluggen van beide slangaansluitingen.

Bevestig de SUPPLY plug met de ingang van het apparaat dat gekoeld wordt.

Bevestig de RETURN plug aan de uitgang van het apparaat dat gekoeld wordt.

Om het reservoir te vullen, gelieve het toegangspaneel te verwijderen door middel van het losdraaien van de duimschroeven. Zoek de reservoirplug. Verwijder de plug en vul het reservoir met koelvloeistof.

Kraanwater wordt in het algemeen aanbevolen wanneer u bij temperaturen werkt van +8 Gr.C.

Operationeel gebruik.
Alvorens het apparaat in gebruik te nemen, gelieve eerst alle elektrische- en slangaansluitingen te controleren. Tevens dient u te controleren of het systeem gevuld is met koelvloeistof.

Om het apparaat te starten, gelieve de schakelaar op “ON” te zetten. De schakelaar zal oplichten als teken dat het systeem in werking is gesteld. Om het apparaat uit te schakelen, gelieve de schakelaar op “OFF” te zetten.

De “Cool LED” aan de voorkant duidt de status aan van het koelsysteem. Het zal oplichten indien het koelsysteem warmte verwijdert van de koelvloeistof. Als de aangegeven temperatuur de set-point bereikt, zal de LED verdwijnen.

Wanneer het apparaat uitgeschakeld is, gelieve ongeveer 5 minuten te wachten alvorens u het apparaat weer in werking stelt. Deze tijd is nodig om de koeldruk gelijk te stellen.

Analog Controller Temperature Adjustment
Om de temperatuur set-point aan te passen, gelieve de Gr.C. knop aan de voorkant van het apparaat te draaien naar de gewenste temperatuur.

Digital Controller Temperature Adjustment
Om de temperatuur set-point af te kunnen lezen, houdt u de DISPLAY knop ingedrukt. Om de temperatuur set-point aan te passen, houdt u de DISPLAY knop ingedrukt en draait u de ADJUST knop, totdat de gewenste temperatuur set-point af te lezen is van de display. Als de set-point is aangepast, kunt u de DISPLAY knop weer loslaten De display zal nu de temperatuur weergeven van het koelvloeistof in het reservoir.

Periodiek Onderhoud

Het reservoir dient regelmatig gecontroleerd te worden. Indien reiniging noodzakelijk is, zal het reservoir schoongespoeld moeten worden met een vloeistof, welke gelijk is aan het koelsysteem en het koelvloeistof.

Het koelvloeistof dient periodiek vervangen te worden.

Het periodiek luchtvrij maken van de condensor is noodzakelijk. Het aantal malen dat dit moet gebeuren, hangt af van de omgeving waar het apparaat staat opgesteld en wordt gebruikt. Wij raden een algemene maandelijkse inspektie van de condensor aan na de installatie. Na enkele maanden zal duidelijk zijn hoe vaak men het apparaat moet reinigen.

Apparaten met PD-pompen hebben een filter. Indien vuil in het systeem aanwezig is, zal de filter ervoor zorgdragen dat het materiaal niet in de pomp terecht komt en daardoor de pomp niet wordt beschadigd.

Nadat het apparaat geinstalleerd is, kan de filter verstopt raken. De filter zal schoongemaakt moeten worden in de eerste week na installatie. Nadat dit gebeurd is, is een maandelijkse inspektie aan te raden. Na enkele maanden zal duidelijk zijn hoe vaak de filter gereinigd moet worden.

Alvorens de filter te reinigen, gelieve het apparaat uit te schakelen en het reservoir te ledigen.

Kortfattad Bruksanvisning för CFT Serie

Installation
Maskinen har ett luft kylt kylnings system. Luft tas in på framsidan av maskinen och släpps ut på sidan och baksidan av maskinen. Ställ maskinen så att intaget och uttaget inte är blockerade. Otillräcklig ventilation leder till minskad kylningskapacitet och i vissa fall kan kompressorn gå sönder.

Undvik dammiga områden och rengör maskinen periodiskt. För att fungera ordentligt måste mycket luft passera genom kondensorn. Damm och smuts i kondensorn leder till minskad kylnings kapacitet.

Maskinen har full kylningskapacitet upp till en temperatur av +100°F (38°C).

Röranslutning finns på baksidan av maskinen och har följande beskrivning: SUPPLY och RETURN. Anslutningarna är 1/2 inch FPT. Ta bort de skyddande plast bitarna från röranslutningarna. Anslut SUPPLY kopplingen till intaget av din anordning och RETURN kopplingen till uttaget.

Lösgör skruvarna och ta bort luckan för att fylla tanken. Ta bort tank pluggen och fyll tanken med ren kylnings vätska.

Vanligt kran vatten är den rekommenderade vätskan vid en temperatur mellan +8°C och +80°C.

Användning
Innan maskinen startas, kontrollera alla elektriska och alla rör anslutningar. Se till att cirkulations systemen har fyllts med vätska.

Sätt start knappen på ON för att starta maskinen. COOL och IDLE på framsidan visar statusen på kylningssystemet. Cool lyser när värme tas bort från köldmedlet. När temperaturen närmar sig den förbestämda temperaturen kommer de två att växla.

Vänta 5 minuter efter att maskinen stämgts av innan den sätts på igen för att låta kylningstrycken att utjämnas. Ingen kylning kommer att utföras om inte trycken tillåts att utjämnas.

Analog Kontroll, Temperatur Ändring
För att ändra den önskade förbestämda temperaturen, vrid °C knappen på framsidan av maskinen tills den önskade temperaturen är nådd.

Digital Kontroll, Temperatur Ändring
Håll Display knappen intryckt för att visa den önskade temperaturen. Håll Display knappen intryckt och vrid Adjust knappen för att ändra den önskade temperaturen. Släpp Display knappen efter att den önskade temperaturen visas på kontroll panelen. Temperaturen på vätskan i tanken visas nu på kontroll panelen.

Periodiskt Underhåll
Inspektera vätskan i tanken periodiskt. Om rengöring är nödvändigt, spola tanken med en rengörings vätska som är förenlig med cirkulationssystemet och kylvätskan.

Kylvätskan bör bytas periodvis.

Periodisk rengöring av kondensorn är nödvändig. Hur ofta rengöring är nödvändig beror på miljön. Vi rekommenderar en visuell inspektion av kondensorn varje månad efter installation. Efter flera månader kan det avgöras hur ofta kondensorn måste rengöras i framtiden.

Maskiner med PD pumpar har ett filter. Filtret måste rengöras efter en veckas användning. Efter första rengöringen bör filtret inspekteras varje månad. Efter flera månader kan det avgöras hur ofta filtret måsta rengöras.

Innan filtret rengörs, drag ur kontakten och töm tanken.

All annan information inklusive felsökning finns beskriven i instruktions manualen.

NOTICE D'UTILISATION
REFROIDISSEURS TYPE CFT

INSTALLATION
Ces appareils ont un système de réfrigération refroidi par air. L'air est aspiré sur le devant et rejeté à l'arrière et sur les côtés

Positionner l'appareil afin que l'admission et l'émission ne soient pas obstruées. Une ventilation insuffisante serait la cause d'une réduction de la capacité de refroidissement, voire, d'une défaillance du compresseur.

Une zone excessivement poussièreuse le nettoyage périodique est recommandé. En mode de fonctionnement, l'appareil aspire de l'air à travers le condenseur. De la poussière et des particules sur la grille atténueraient sa capacité de refroidissement.

L'appareil conserve sa pleine puissance de refroidissement sur une plage de température allant de l'ambiante à + 38°C.

S'assurer que l'alimentation électrique soit celle requise à ±10%.

Les connections, d'un diamètre 0.5 pouce FPT, sont situées à l'arrière de l'appareil et sont référencées " SUPPLY " et " RETURN ".. Retirer les embouts plastiques. Connecter le tuyau enfiché sur " SUPPLY " vers l'entrée de l'équipement et celui sur " RETURN " vers la sortie.

Pour remplir le réservoir, ôter la tape à l'aide des deux vis.

MISE EN ROUTE
Vérifier les connections électriques, les tuyaux d'eau et le niveau de remplissage du liquide.

Mettre en route en appuyant sur " ON ". Un voyant s'allume qui indique que l'appareil est en fonctionnement. Pour l'éteindre, appuyer sur " OFF ".

Le voyant LED " Cool " allumé indique le mode de fonctionnement du système de réfrigération. Lorsque la température requise est atteinte, ce voyant s'éteint.

Après avoir éteint l'appareil, attendre environ cinq minutes avant de le rallumer, pour un bon équilibrage des pressions.Autrement, le cycle au niveau du compresseur serait trop bref et le refroidissement n'aurait pas lieu.

REGLAGE DU CONTROLEUR DE TEMPERATURE ANALOGIQUE
Tourner le potentiomètre situé à l'avant jusqu'à ce que la température désirée coïncide avec la graduation.

REGLAGE DU CONTROLEUR DE TEMPERATURE NUMERIQUE
Pour afficher la température souhaitée, maintenir appuyé l'interrupteur et tourner le bouton de réglage jusqu'à ce que la température souhaitée soit affichée. Relâcher ensuite l'interrupteur. L'affichage indique alors la température du fluide dans le réservoir.

MAINTENANCE PREVENTIVE
Vérifier régulièrement le niveau du réservoir,

Changer de temps à autre le liquide utilisé,

En cas de nettoyage, rincer avec un produit de lavage compatible,

Avant de changer de liquide, recirculer à une température plus élevée pour réchauffer le serpentin,

Nettoyer régulièrement selon les conditions de travail la grille d'aspiration. Nous recommandons d'effectuer la première inspection du condenseur un mois après l'installation,

Les modèles fonctionnant avec des pompes type PD sont équipés d'un filtre qui retient les impuretés. Il est recommandé de nettoyer ce filtre après la première semaine et, ensuite, une fois par mois. Ce nettoyage s'effectue après avoir débranché l'appareil et vidangé le réservoir

PROCEDIMIENTOS DE OPERACION DE REFERENCIA RAPIDA
PARA LA SERIE CFT

INSTALACION

La unidad tiene un sistema de refrigeración por aire. El aire es dirigido hacia el frontal de la unidad y se descarga por la parte trasera y lateral. Sitúe la unidad para no impedir la entrada y descarga. Una ventilación inadecuada causará una reducción en la capacidad de enfriamiento y, en casos extremos, un fallo en el compresor.

Deben evitarse las zonas excesivamente polvorientas y debe instituirse un calendario de limpiezas periódicas. Para un funcionamiento adecuado, la unidad necesita empujar una cantidad sustancial de aire a través de un condensador. Un cúmulo de polvo o residuos en las aletas del condensador ocasionaría una pérdida de capacidad de enfriamiento.

La unidad retendrá su capacidad completa en temperaturas ambiente de hasta aproximadamente 38°C.

Asegúrese de que el voltaje de la fuente de energía sea igual que el voltaje especificado, ±10%.

Las conexiones de tuberías están situadas en la parte trasera de la unidad y están marcadas como SUPPLY y RETURN. Estas conexiones son 1/2" FPT. Saque los protectores de plástico de ambas conexiones de tuberías. Conecte el adaptador SUPPLY en la entrada del instrumento que se quiere enfriar. Conecte el adaptador RETURN a la salida del instrumento que se quiere enfriar.

Para llenar el reservorio, saque el panel de acceso al reservorio desatornillando los tornillos. Localice el conector del reservorio (tuerca cuadrada). Saque el conector y llene el reservorio con fluido refrigerante limpio.

Se recomienda el agua corriente como fluido para operar desde +8 ºC hasta +30 ºC.

OPERACION

Antes de poner en marcha la unidad, compruebe todas las conexiones eléctricas y de tuberías. Asegúrese de que el sistema circulador se ha llenado con fluido refrigerante.

Para poner en marcha la unidad, ponga el interruptor de encendido en posición ON. El interruptor de encendido se iluminará para indicar que el sistema está funcionando. Para apagarlo, ponga el interruptor de encendido en posición OFF.

El LED Cool del panel frontal indica la situación del sistema de refrigeración. Se ilumina para indicar que el sistema de refrigeración está eliminando calor del fluido refrigerante. A medida que la temperatura de funcionamiento se aproxima al punto fijado, el LED se extinguirá.

Cuando se apaga la unidad, espere aproximadamente cinco minutos antes de volver a ponerla en marcha. Esto da tiempo para que las presiones de refrigeración se ecualicen. Si no se permite ecualizarse las presiones, el compresor se cortocicuitará y no enfriará.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR ANALOGICO

Para fijar el punto de ajuste de la temperatura, gire el dial ºC situado en el frontal de la unidad hasta la temperatura deseada.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR DIGITAL

Para que el punto de ajuste de temperatura aparezca en pantalla, mantenga presionado el interruptor DISPLAY. Para fijar el punto de ajuste de temperatura, mantenga presionado el interruptor DISPLAY y gire el botón ADJUST hasta que la pantalla digital indique el punto de ajuste de temperatura deseado. Una vez fijado el punto de ajuste, suelte el interruptor DISPLAY. La pantalla indicará la temperatura del fluido en el reservorio.

MANTENIMIENTO PERIODICO

Inspeccione periódicamente el fluido del reservorio. Si es necesaria una limpieza, rocíe el reservorio con un fluido de limpieza compatible con el sistema de circulación y el fluido refrigerante.

El fluido refrigerante debe sustituirse periódicamente.

Es necesario un vaciado periódico de las aletas del condensador. La frecuencia de limpieza depende del entorno en que funciona el aparato. Recomendamos una inspección visual mensual del condensador después de la instalación inicial. Después de varios meses, quedará establecida la frecuencia de limpieza.

Las unidades con bombas PD tienen un filtro. Si hay residuos en el sistema, el filtro prevendrá que el material entre en la bomba y dañe las paletas de la bomba.

Después de la instalación inicial, el filtro puede bloquearse. El filtro debe limpiarse después de la primera semana de la instalación. Después de esta primera limpieza, se recomienda una inspección visual mensual. Después de varios meses, se establecerá la frecuencia de limpieza.

Antes de limpiar el filtro, desenchufe el aparato y vacíe el reservorio.

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

CFT Series Quick Reference Operating Procedures

Installation

The unit has an air-cooled refrigeration system. Air is drawn in the front of the unit and discharged through rear and side. Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C.

Make sure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled either SUPPLY and RETURN or OUTLET and INLET. These connections are ½ inch FPT, ¾ inch FPT for CFT-150s with CP-55 pumps and CFT-300s. Remove the plastic protective plugs from both plumbing connections. Connect the OUTLET/SUPPLY fitting to the inlet of the instrument being cooled. Connect the INLET/RETURN fitting to the outlet of the instrument being cooled.

To fill the reservoir remove the reservoir access panel by unscrewing the thumbscrews. Locate the reservoir plug (square nut). Remove the plug and fill the reservoir with clean cooling fluid.

Filtered tap water is the recommended fluid for operation from +8°C to +30°C. Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Operation

Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

To start the unit, place the Power Switch to the on position. The Power Switch illuminates (except for the CFT-150) to indicate the system is operating. To turn the unit off, place the Power Switch to the off position.

The Cool LED indicates the status of the refrigeration system. It illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the setpoint, the LED will extinguish.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Temperature Adjustment

To display the temperature setpoint, press and hold the NEXT ENTER button on the controller . To adjust the temperature setpoint, press the YES or NO key until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, press the NEXT ENTER key twice. The display will now indicate the temperature of the fluid in the reservoir.

Periodic Maintenance

Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Before changing the cooling fluid, raise the unit's operating temperature to de-ice the cooling coils.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. Clean the strainer after the first week of installation. After this first cleaning, we recommend a monthly visual inspection. After several months, the cleaning frequency will be established. Before cleaning, disconnect the power cord from the power source and drain the reservoir.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 1000-4-2:1995
	IEC 1000-4-3:1994
	IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

If this product has been modified to operate at 0°C or lower, it has been tested with a non-freezing fluid. Although the system has been drained, some residual fluid may remain. This will not hinder your unit's performance.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the unit operation, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the labels on the rear of the unit to obtain the following information:

- unit BOM number _____

- unit serial number _____

- pump type _____

Section I Safety

Warnings

Warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle and text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, please contact our Sales Department (see After-sale Support).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Never connect the OUTLET/SUPPLY or INLET/RETURN fitting to your building water supply or any water pressure source.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer’s warranty.

Do not replace reservoir plug with a non-vented type or damage to the tank may occur.

For personal safety and equipment reliability, the following procedure should only be performed by a competent technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Additional Warnings

In addition to the specific warnings listed on the previous page the following general warnings apply to you unit:

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the reservoir.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified technician.

Section II General Information

Description

The CFT Recirculating Chiller is designed to provide a continuous supply of cooling fluid at a constant temperature and volume.

The unit consists of an air-cooled refrigeration system, a sealable reservoir, recirculating pump, and a temperature controller.

Throughout the manual, you will be asked to consult the unit's serial number label or the pump identification label for specific information. Both labels are located on the rear of the unit.

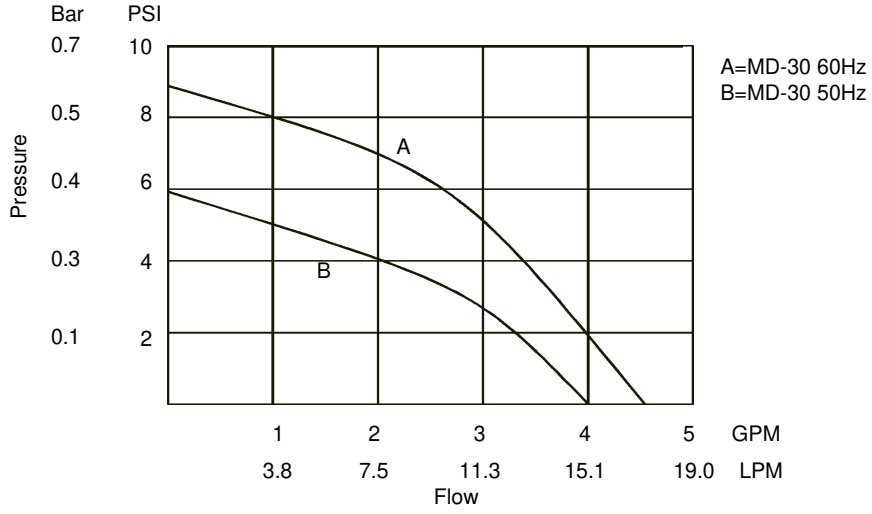
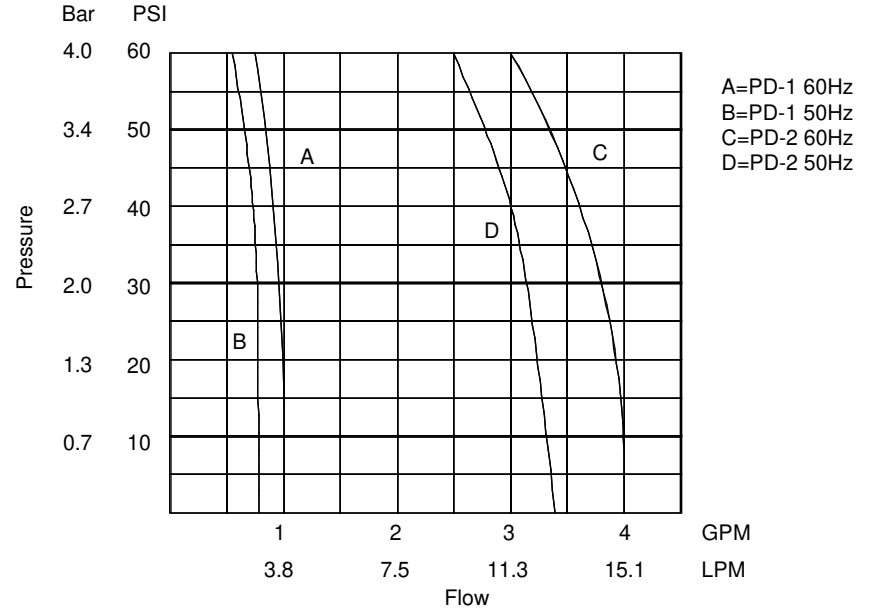
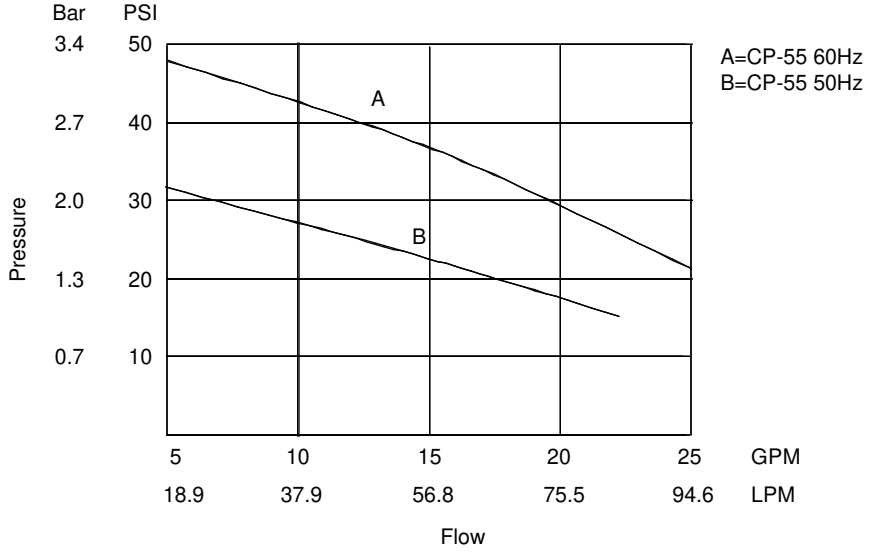
1. Dimension A is the height of the unit. The unit width and depth (dimensions B and C) are the case dimensions. Add approximately 2 inches to include the plumbing connections.
2. Dimension D is the distance from the floor to the bottom of the unit case (height of the castors).
3. Dimension E is the distance from the floor to the center of the DRAIN connection (CFT-300 only).
4. Dimension F is the distance from the floor of the center of the OUTLET connection.
5. Dimension G is the distance from the floor of the center of the INLET connection.
6. Dimension H is the distance from the unit's left side to the center of the INLET, OUTLET and DRAIN connections.
7. Weights are given in pounds
8. Air intake is given in cubic feet per minute.

Rev 01/30/97

Pump Capacity







Section III Installation

Site

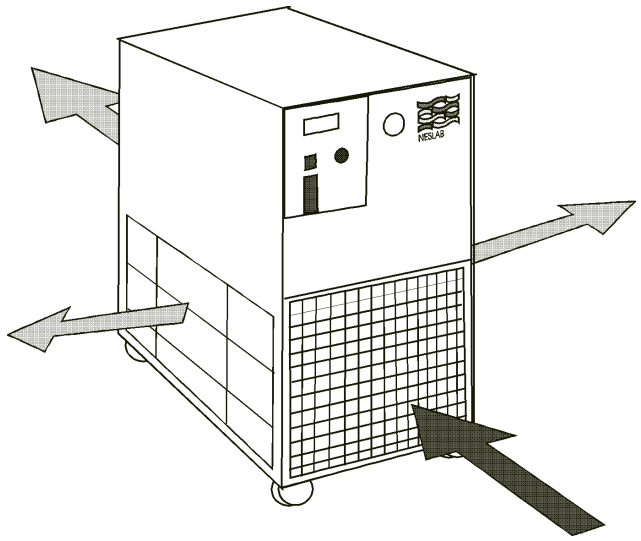
The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +13°C to +35°C.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. Air is drawn through the front of the unit and discharged through rear and side panels. The unit must be positioned so the intake and discharge are not impeded. A minimum clearance of 18 inches (45 centimeters) on all vented sides is necessary for adequate ventilation. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section V, Cleaning).

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C. Above +24°C, derate the cooling capacity 1% for every 0.5°C above +24°C, up to a maximum ambient temperature of +35°C.



Direction of Air Flow

Electrical Requirements

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Refer to Section II, Specifications, and to the serial number label on the rear of the unit for the specific electrical requirements of your unit.

The CFT-300 is supplied with a disconnect box. Wire the power connections in accordance to local, state and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

The CFT-300 is also equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

Plumbing Requirements

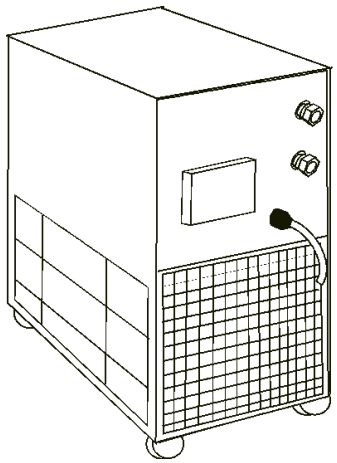
Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. The manufacturer of the instrument should be able to recommend a cleaning fluid for their equipment.

The plumbing connections are located on the rear of the unit and are labelled OUTLET/SUPPLY and INLET/RETURN. CFT-25 to CFT-150 connections are ½ inch FPT, CFT-150s with CP-55 pumps are ¾ inch and CFT-300 connections are ¾ inch FPT.

Remove the plastic protective plugs from both plumbing connections.

Connect the OUTLET/SUPPLY fitting to the inlet of the instrument being cooled. Connect the INLET/RETURN fitting to the outlet of the instrument being cooled.

Never connect the fittings to your building water supply or any water pressure source.



Plumbing Connections (Typical)

Two sets of plumbing adapters are included with CFT-25 to CFT-150 units. One set of adapters will accept 3/8 inch ID tubing. The other set will accept ½ inch ID tubing. If the unit is being plumbed using flexible tubing, install one set of adapters in the plumbing ports. To prevent leaking, be sure to wrap the threads of the adapters with Teflon® sealing tape before installing them in the plumbing ports.

Flexible tubing, if used, should be of heavy wall or reinforced construction. All tubing should be rated to withstand 80 psig at +30°C. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, they should be made at the inlet and outlet of the instrument being cooled, not at the CFT.

If substantial lengths of cooling lines are required, they should be pre-filled with cooling fluid before connecting them to the unit.

Fluids

The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Never use flammable or corrosive fluids with this unit. Highly distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to highly distilled or deionized water.

Filtered tap water is the recommended fluid for operation from +8°C to +30°C. See Water Quality Standards and Recommendations on the next page.

Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer's warranty.

Water Quality Standards and Recommendations

	Permissible (PPM)	Desirable (PPM)
Microbiologicals (algae, bacteria, fungi)	0	0
Inorganic Chemicals		
Calcium	<40	0.6
Chloride	250	<25
Copper	1.3	1.0
Iron	0.3	<0.1
Lead	0.015	0
Magnesium	<12	0.1
Manganese	0.05	<0.03
Nitrates\Nitrites	10 as N	0
Potassium	<20	0.3
Silicate	25	<1.0
Sodium	<20	0.3
Sulfate	250	<50
Hardness	17	<0.05
Total Dissolved Solids	50	10
Other Parameters		
pH	6.5-8.5	7-8
Resistivity	0.01*	0.05-0.1*
* Megohm-Cm (Compensated at 25°C)		

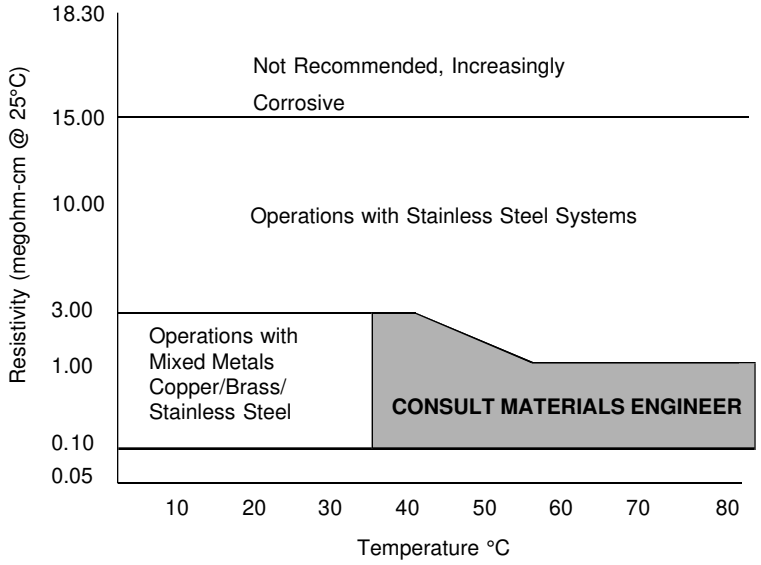
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (of NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (of NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated at 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated at 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated at 25°C).

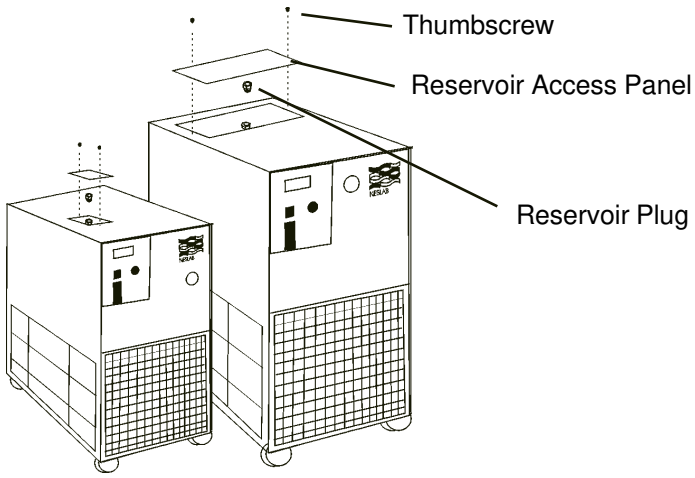
The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



Water Quality Considerations

Filling Requirements

Remove the reservoir access panel by unscrewing the thumbscrews. Locate the reservoir plug (square nut). Remove the plug and fill the reservoir with clean cooling fluid, following the special considerations outlined in the following paragraphs.



Reservoir filling locations (Typical)

NOTE: The CFT-300 has a FILL lamp which illuminates whenever the reservoir level is below normal operating level.

Circulating to a closed system (closed to the atmosphere)
Fill the reservoir to the bottom of the fill hole threads. Since the reservoir capacity is small compared to many instruments being cooled, have extra cooling fluid on hand to keep the system topped off when external circulation is started.

NOTE: The tank in your unit has a vent which relieves pressure built up from thermal expansion of water. The vent is located on the reservoir plug. It activates when tank pressure reaches 3 - 5 psi.

Do not replace reservoir plug with an non-vented type or damage to the tank may occur.

Circulating to an open system (open to the atmosphere)
Fill the reservoir so ¾ of the fill hole threads are covered. Wrap the tank plug with Teflon® sealing tape. Replace the tank plug and tighten securely to prevent air entry.

When circulating cooling fluid to an open vessel or tank, connect the OUTLET/SUPPLY and INLET/RETURN lines to the open tank. Secure the INLET/RETURN (suction) line below the fluid surface. The INLET/RETURN line should be submerged deep enough to avoid sucking air. Make sure the INLET/RETURN line is free of particles and debris that can block the flow of fluid. A baffle or screen may be required.

Section IV Operation

Start Up

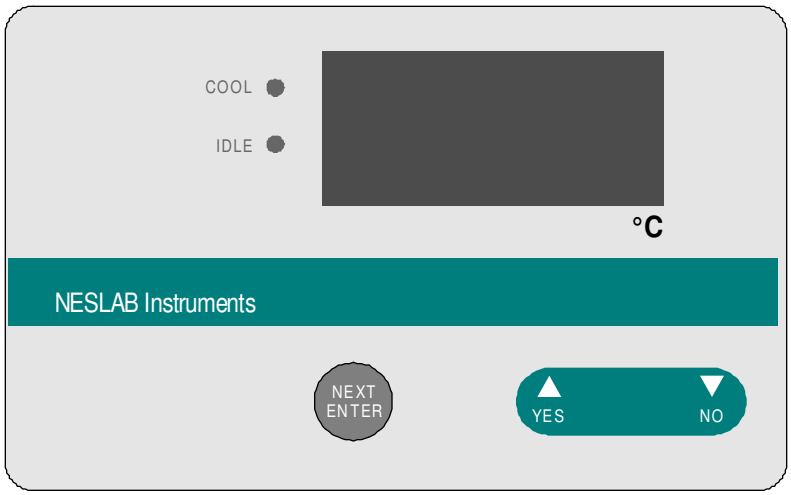
Before starting the unit, double check all electrical and plumbing connections and make sure the circulating system (the CFT, the instrument being cooled, and the tubing that connects them) has been properly filled with cooling fluid. To start the unit, place the POWER Switch to the on (**I**) position. The refrigeration system and the recirculation pump will start. The POWER Switch illuminates (except for the CFT-150) to indicate the system is operating. Units with PD pumps display the pump operating pressure on the RECIRCULATING PRESSURE gauge.

To turn the unit off, place the POWER Switch to the off (**0**) position.

The COOL LED indicates the status of the refrigeration system. It illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the temperature setpoint, the LED will extinguish.

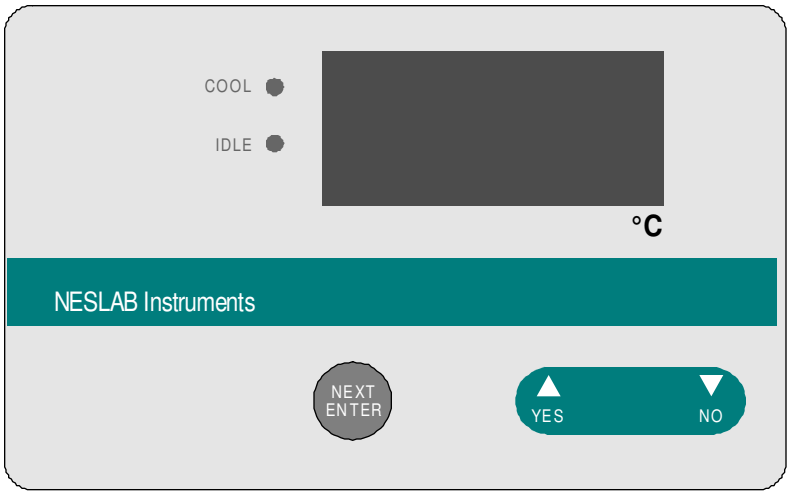
The IDLE LED indicates the unit is in a hot-gas-bypass mode of operation. As the operating temperature approaches the temperature setpoint, the COOL and IDLE LEDs cycle to indicate the approximate duty cycle of the unit.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.



Digital Temperature Controller

Digital Controller



Digital Temperature Controller

The digital controller controls temperature using a PID (Proportional-Integral-Derivative) algorithm. It is designed with self-diagnostic features and easy to use operator interface.

NEXT ENTER
Use this key to scroll forward through the menus and also to accept and save changes.

YES, ▲
This dual purpose key is used to answer Yes to Y/N questions or to increment numerical values upward for setting numeric values.

NO, ▼
This dual purpose key is used to answer No to Y/N questions or to decrement numerical values downward for setting numeric values.

The controller will not allow you to enter a value above the maximum or below the minimum value, or any illegal value. If you try to enter an illegal value the display will revert to its original value when the last digit was entered.

Changing a Value

The **YES** key increments the value. The **NO** key decrements the value.

The display will flash as soon as either key is depressed, and will continue to flash until the **NEXT ENTER** key is pressed twice to accept the new value.

The new value will not be used by the controller until the **NEXT ENTER** key is depressed twice and the display stops flashing.

NOTE: If the **ENTER** key is not depressed twice within three minutes, the controller will time out and the new value will not be accepted. The controller will revert to the previous value.

The controller will not allow you to enter a value above the unit's maximum temperature range or below the minimum temperature range. If you try to enter an illegal value outside the range, the display will revert to its original value.

Controller Displays

An alphanumeric display presents numeric readings of various operating conditions within the unit. Display function is selected by pressing the appropriate keys to move through a menu of available information.

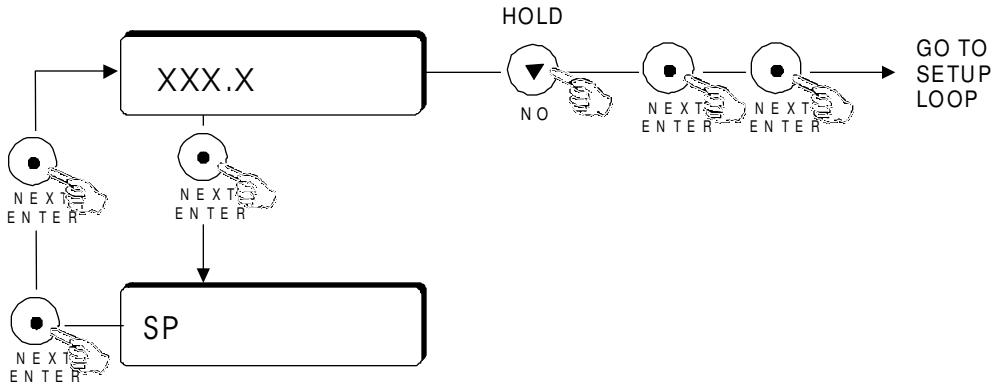
The controller has several loops. The Operator's Loop displays the reservoir temperature and is used to change the setpoint. The Setup Loop is used to adjust the controller's PID parameters. The Setup Loop can be accessed from the Operator's Loop by pressing and holding the key combinations shown in the figure below.

NOTE: If altering any settings in the Setup Loop, should you desire to return to the temperature display and abort any changes, keep pressing the **NEXT ENTER** until the display reads **Stor**, then press **NO.**

Operator's Loop

When the controller is first powered up it enters the Operator's Loop, displaying the reservoir fluid temperature. Press the NEXT ENTER key to view the setpoint.

SP displays the controller setpoint. The display will flash between SP and the actual setpoint number. Use the YES/NO keys to change the setpoint value. Once the desired setpoint is displayed, press the NEXT ENTER key twice.

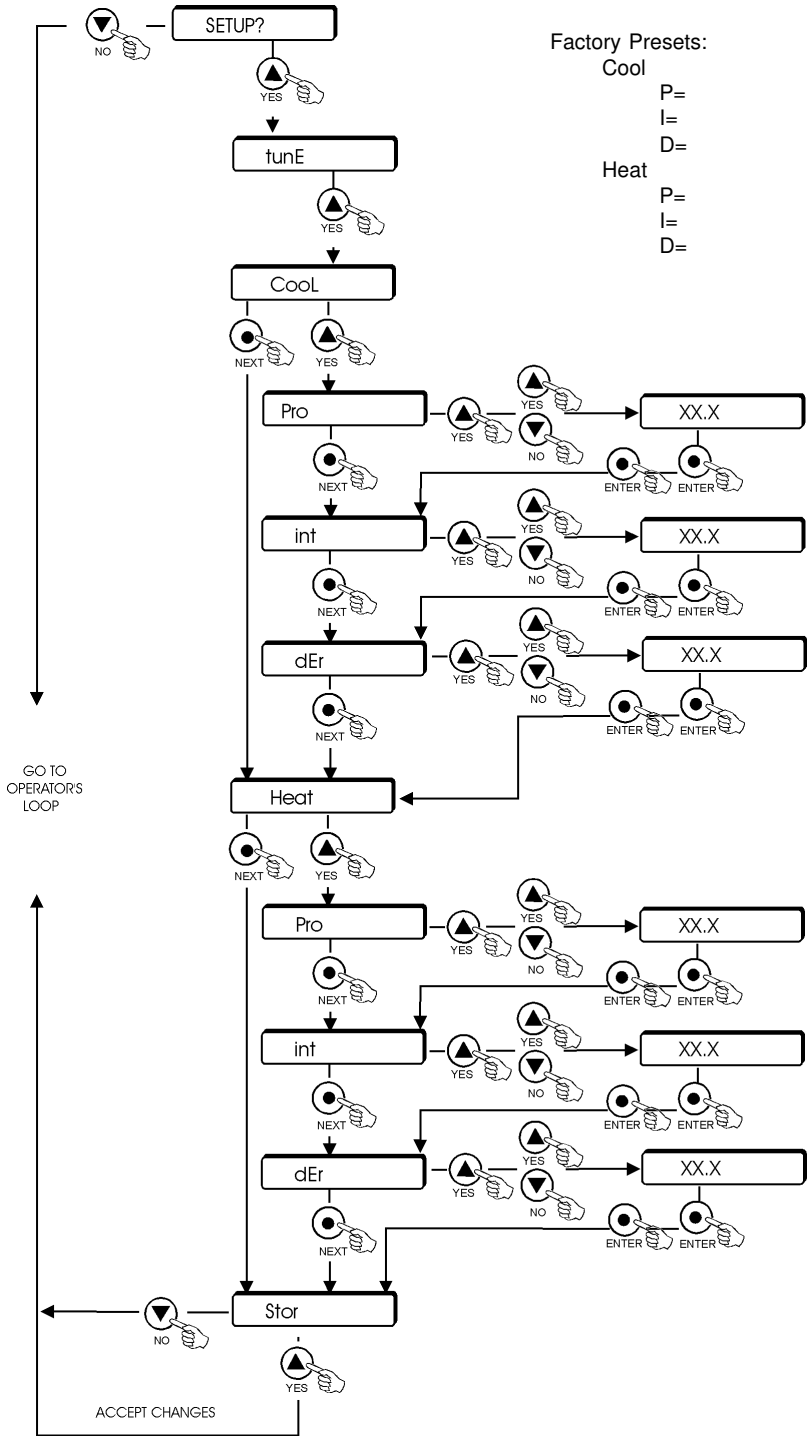


Operator's Loop

Setup Loop

The Setup Loop is used to adjust the controller's PID parameters (Pro = Proportional, int = Integral, dEr = Derivative).

Enter the Setup Loop from the Operator's Loop by pressing and holding the NO key while pressing the NEXT ENTER key twice. Use the YES/NO keys to adjust the values. Press the NEXT ENTER key twice to accept the new value.



Setup Loop

Pressure Relief Valve

Units with PD pumps have a pressure relief valve which establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The relief valve does not determine the actual operating pressure; the operating pressure is determined by the back pressure of the system.

If an adjustment is necessary, contact our Customer Service Department.

High Temperature Cutout (Optional)

The High Temperature Cutout (HTC) is designed to shut down the unit in the event the temperature of the fluid in the reservoir exceeds the HTC setting. The HTC is normally located on the rear of the unit.

NOTE: The HTC temperature scale is in °F.

CFT-300 High/Low Pressure Cutouts

CFT-300 units are equipped with high and low refrigeration pressure cutouts. Should either cutout activate the unit will shut down.

The High Pressure Cutout (HPC) activates if there is a blockage in the refrigeration lines or if the refrigerant temperature becomes too hot. The HPC is factory preset at 400psi.

The Low Pressure Cutout (LPC) activates if there is a leak in the refrigeration lines. THE LPC is factory preset at 4psi.

Both cutouts are located inside the case behind the rear panel. Once the cause of the shut down has been determined and corrected, manually depress the white button on the applicable cutout. If a "click" is not heard when depressing the button, the cutout was not activated and the unit shut down for another reason.

CFT-150 High Pressure Cutout

Some CFT-150 units are equipped with High Pressure Cutouts (HPC). Should the HPC activate the unit will shut down.

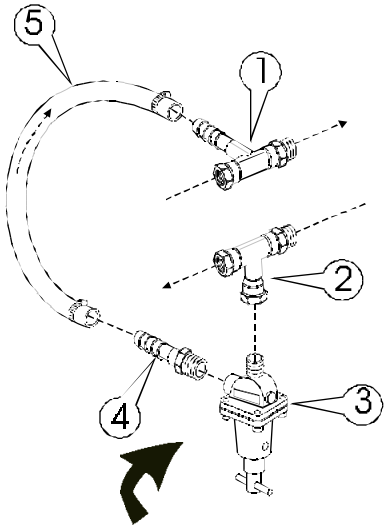
The HPC activates if there is a blockage in the refrigeration lines or if the refrigerant temperature becomes too hot. The HPC is factory preset at 400psi.

The cutout is located inside the case behind the rear panel. Once the cause of the shut down has been determined and corrected, manually depress the white button on the applicable cutout. If a "click" is not heard when depressing the button, the cutout was not activated and the unit shut down for another reason.

External Pressure Regulator (Optional)

For applications requiring a maximum pressure less than 55 PSI (380 kPa), an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 PSI (70 to 345 kPa). If the pressure of the fluid leaving the chiller exceeds the relief valve setting, the relief valve will bypass excess fluid back into the chiller to relieve the overpressure.

The pressure of the system is determined by the back pressure of the connected equipment and the flow rate of the recirculating fluid to your application. Connect the EPR as described.



NOTE: Install the fittings in the exact sequence shown.

NOTE: Use Teflon® tape on all threaded fittings.

Connect the Inlet Tee Assembly (1) to the chiller. Connect the Outlet Tee Assembly (2) to the chiller. Attach the relief valve (3) to the Outlet Tee Assembly (2). Attach the Hose Nipple (4) to the Relief Valve (3). Attach the Hose (5) between the Inlet Tee Assembly (1) and the Hose Nipple (4).

The EPR is now installed. Connect the inlet (to your application) to the remaining fitting of the Outlet Tee Assembly (2). Connect the outlet (from your application) to the remaining fitting of the Inlet Tee Assembly (1).

Tighten the hose clamps tight enough to prevent leakage. Do not overtighten or the clamps will bite into the flexible tubing and cause excessive wear. If a torque wrench is available, torque hose clamps to 50 in/lbs (280 cm/kg). Nylon-reinforced hose tends to cold-flow, so the clamps will need to be torqued again later. (The hose clamps do not actually loosen, but rather the hose outside diameter decreases.)

The "T" adjustment handle is equipped with a locknut. To adjust the relief pressure setting loosen the locknut and turn the "T" handle to the minimum pressure setting (direction of arrow).

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and the instrument being cooled. Monitor the operating pressure of the unit. Turn the "T" handle until the desired relief pressure is set. (The EPR valve cannot be set lower than the total back pressure of the instrument being cooled or the instrument will not receive any flow.)

Tighten the locknut to secure the position of the "T" handle. Open the hose between the EPR outlet tee assembly and the instrument being cooled.

Heater Package (Optional)

Heaters are controlled by a switch on the temperature controller. The heater itself is accessible through the small service panel on the rear of the unit.

These units also have a Low Level indicator. The indicator illuminates if the fluid level in the reservoir drops below proper operating level.

Illustration A shows the desired fluid level for normal operation.

Should the reservoir be filled as shown in illustration B, units designed to operate at high-end temperatures (near boiling) may cause air in the reservoir to become trapped. The air can be vented by slightly tilting the unit forward on its front castors.

Any fluid venting from the reservoir will drain through a hose which feeds to a small hole in the bottom of the unit.

Do not used silicon-based fluids with units designed to operate at high temperatures. These type fluids will damage the hoses and pump seal.

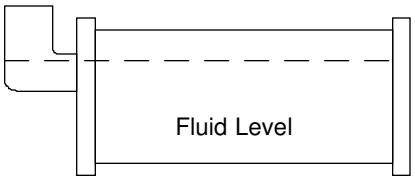


Illustration A

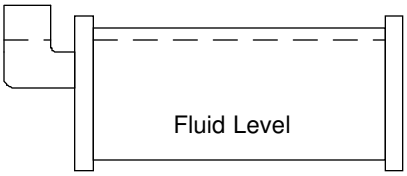

Illustration B

Section V Maintenance and Service

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Draining the Reservoir

The CFT-300 is equipped with a ½ inch FPT DRAIN fitting located on the rear of the unit.

To drain the CFT-25 to CFT-150 reservoirs we recommend the use of a wet/dry vacuum. Remove the reservoir plug and carefully insert the wet/dry vacuum so as not to damage the cooling coils. **NOTE:** Tilting the unit more than 45° may allow compressor oil to seep into the suction line.

Cleaning

Reservoir

Periodically inspect the fluid inside the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Before changing the cooling fluid, raise the operating temperature of the unit to de-ice the cooling coils. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Condenser

For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The lower front of the unit has a one-piece grille assembly. Gently pry the assembly off with a flathead screwdriver. Use care not to scratch the paint.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Algae

To restrict the growth of algae in the reservoir, it is recommended that the reservoir cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, 1 gram per 3.5 liters.

Pump Strainer

Units with PD pumps have a strainer. Refer to the pump label on the rear of the unit to identify the type of pump in your unit.

If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged with debris and scale. Therefore, the strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

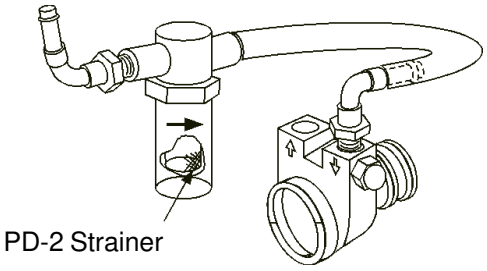
Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

PD-1 pumps have a wire mesh strainer located in the pump head. PD-2 pumps have the strainer located in the pump suction line.

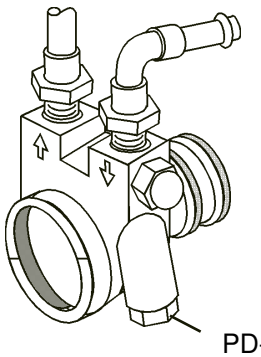
Remove the wrapper from the unit. Unscrew the larger of the two acorn nuts on the pump head and remove the screen.

Clean the screen by rinsing it with water.

When the screen is clean, replace it in the strainer, tighten the acorn nut and replace the wrapper. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.



PD-2 Strainer



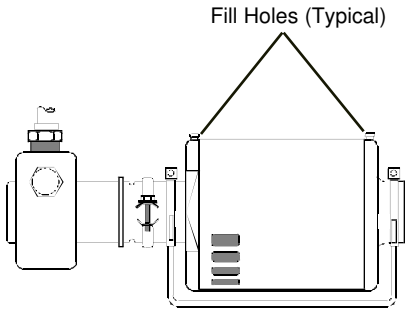
PD-1 Strainer

Pump Motor Lubrication

PD pump motors require periodic lubrication. Refer to the pump label on the rear of the unit to identify the type of pump in your unit.

PD pumps use sleeve type bearings with large reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil to each bearing on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



Hoses

The unit's internal and external hoses and clamps should be inspected and tightened on at least a semiannual basis.

Suction Discharge Pressure Speed Check

Unit	Pump	Refrigerant	Suction PSIG	Discharge PSIG	Speed °C/Min
CFT-25	PD-1	R134a	36 -38	160 - 170	4.8
CFT-25	MD-30	R134a	25 - 28	145 -160	4.0
CFT-33	PD1/2	R134a	42 - 45	180 - 200	3.0
CFT-75	PD1/2	R134a	37 - 41	170 -185	4.6
CFT-150	PD2	R22	70	270	2.8
CFT-300	PD2	R22	88 - 94	265 - 280	6.8
CFT-300	CP-55	R22	85 - 90	268 - 280	6.8

Standard temperature 60 Hertz units, derate 17% for 50 Hertz Units. +20°C fluid temperature, unit in the COOL mode, +20°C ambient. 100% water in the reservoir. Wrapper removed.

Section VI Troubleshooting

Checklist

Unit will not start

Check the line cord, make sure it is plugged in.

Check the voltage of the power source. Make sure it is within the rated voltage of the unit, ±10%.

Check that the Power Switch/Circuit Breaker has not tripped.

Check the setting on the optional High Temperature Cutout.

CFT-300 units are equipped with high and low pressure switches. If either switch activates the unit will shut down. Once the cause has been determined you have to manually reset the switch. The switches are located behind the rear panel, see Section IV, Operation.

Unit will not circulate fluid

Check the reservoir level. Fill, if necessary.

Make sure the pump has been purged.

Check the pressure gauge (units with PD pumps). If the reading is 60 psig, check the instrument being cooled for restrictions in the cooling line.

Check the pump strainer (units with PD pumps). A clogged strainer can starve the pump.

Inadequate temperature control

If the temperature continues to rise, make sure the heat load of the instrument being cooled does not exceed the rated specification, see Section II, Specifications.

Make sure the air intake and discharge are not impeded and the ambient temperature does not exceed +35°C.

Make sure the condenser is free of dust and debris, see Section VI, Cleaning.

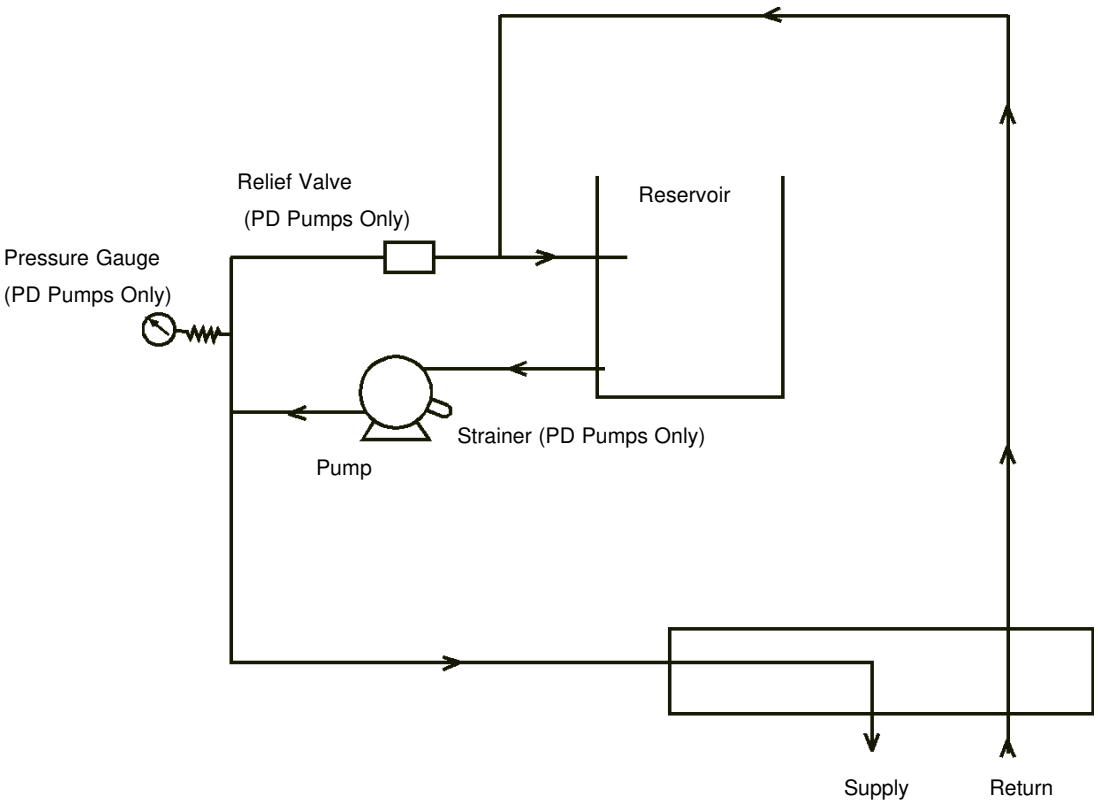
If the compressor short-cycles (a clicking sound), check the line voltage. It should be within the 10% of the specified voltage. Wait 5 minutes before restarting the unit.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please refer to the serial number label on the rear of the unit to obtain the following information:

- *unit BOM number*
- *unit serial number*
- *voltage of unit*
- *voltage of power source*

Pump Flow Diagram



WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

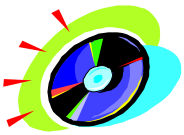
NESLAB ONLINE

NESLAB ONLINE is your source for online service data, including service bulletins, manuals, refrigerant charging information, calibration instructions, and more for all catalog units. You can browse the same library our Technical Support representatives use - and this is available 24 hours a day, 7 days a week. Obtain the access software, FirstClass Client, from sources on the next page or from us. Then use it to connect to (603) 427-2490 by modem.

→ ☐ FirstClass Client for Macintosh Mac OS

☐ FirstClass Client for Windows 3.x '95



NESLAB OFFLINE

NESLAB OFFLINE is a cd-rom which contains all the content of NESLAB ONLINE as of Jan. 1 1998. This is ideal if you have no modem capability. The cd-rom works on both Macintosh and Windows computers. It also includes FirstClass Client.

→ ☐ NESLAB OFFLINE cd-rom

The EVAPORATOR

The EVAPORATOR is our service newsletter. It contains service bulletins and information of interest to anyone who maintains NESLAB equipment.

→ ☐ subscription to The Evaporator

Section I: Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department (see After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Observe all warning labels. Never remove warning labels.
Never operate damaged or leaking equipment.
Never operate the unit without cooling fluid in the reservoir.
Always turn off the unit and disconnect the power source before performing any service or maintenance procedures, or before moving the unit.
Always empty the reservoir before moving the unit.
Never operate equipment with damaged line cords.
Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

The lightning flash with arrow symbol, within an equilateral triangle, is intended to alert the user to the presence of non-insulated "dangerous voltage" within the unit's enclosure. The voltage may be of significant magnitude to constitute a risk of electrical shock.

Section II: General information

After Sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or service contracts, contact our Service Department. Before calling, please obtain the following information from the unit's serial number label:
part number
serial number

Other resources

The Instruction and Operation Manual for the CFT series is PN U00362.

Pump systems are covered in a separate service manual.
For MD pumps, obtain service manual 000877.
For PD pumps, obtain service manual 000878.

Decoding part numbers

NESLAB identifies units using a 12-digit part number. To decode the part number, split up the digits as shown in the chart below. This will define what characteristics the unit has.

000	0	00	00	00	00
unit family	condenser	electrical	pump/head	controller	catalog
128 EX111 129 EX211 130 EX221 131 EX411 132 EX511 134 RTE111 135 RTE211 136 RTE221 137 EX111 138 EX211 139 EX221 140 EX411 141 EX511 157 RTE140 167 RTE111 168 RTE211 169 RTE221 171 RTE140,LT50 331 CFT25A 332 CFT33A 333 CFT75A 334 CFT25, R12 335 CFT33, R12 336 CFT75, R12 337 CFT150,FAC200 347 CFT25, R22 348 CFT33, R22 349 CFT75, R22 386 HX75, R22 387 HX100, R22 388 HX150, R22 389 HX200, R22 390 HX300, R22 391 HX500, R22 392 HX750, R22 393 CFT25, R134a 394 CFT33, R134a 395 CFT75, R134a 396 CFT300,FAC400 397 CFT500 398 CFT750 400 CFT100 607 CFT50 608 CFT75 612 RTE microprocessor 613 CFT200	0 Not applicable 1 Air cooled 2 Water cooled	00 None 01 100v / 50Hz / 1ø 02 100v 60Hz (no longer used) 03 115v / 60Hz / 1ø 04 208-230v / 60Hz / 1ø 05 208-230v / 60Hz / 3ø 06 220-240v / 50Hz / 1ø 07 220-240v / 50Hz / 3ø 08 Slave 09 440-480v / 60Hz / 3ø 10 380-415v / 50Hz / 3ø (4 wire) 11 100v / 50-60Hz 12 100-115v / 50-60Hz 13 200v / 50Hz / 1ø 15 200v / 50-60Hz 16 Dual rated: 200v / 50Hz / 1ø 200-230v / 60Hz / 1ø 17 208v / 60Hz / 3ø (5 wire) 20 415v / 50Hz / 3ø 21 380-415v / 50Hz / 3ø (5 wire) 22 200-240v / 50-60Hz /1ø 23 380-480v / 50-60Hz / 3ø (4 wire) 99 Special	00 No pump 01 CP25 02 CP55 03 PD1 04 PD2 05 CP75 06 TU1 07 TU5 08 TU6 09 TU7 10 TU8 11 SS PD1 12 SS PD2 15 MD30 16 CP20 17 G1 18 F Pump, 1 Stage 19 F Pump, 2 Stage 20 Z Pump 21 F Immersion head 22 R Immersion head 23 FV Immersion head 24 H Pump 25 Dual PD1 26 Dual PD2 28 was PD3, now unassigned 29 CP100 30 TU9 31 TU3 99 Special	01 Analog 02 Digital, non bath 03 Series II 04 Programmable 05 Basic 06 Cryotrol 07 Digital, bath 08 UL approved 09 UL approved plus interlocks 10 UL approved plus alarm pkg. 11 Microprocessor 12 Digital remote (HX1000, HX2000) 13 Fisher standard digital 14 Controller I (TC100) 15 Controller II (TC200) 16 Controller III (TC300) 17 Controller IV (TC400)	Once upon a time 00 indicated a standard catalog unit, and 01 and up indicated the presence of customizing options and/or accessories. That distinction is no longer used and these digits have no special significance any more.

Interface defined

This statement defines NESLAB's policy towards access and contents of various control loops for TC200, TC300, and TC400 controller applications. It is provided by the Measurement and Control group.

With an increasing number of controller applications it is important to maintain consistency in the way we code our operator interface. The goal is to minimize the effort to code, build, test, document, use, and service our products.

Unless the customer specification specifically requests a different approach, the operator interface will be programmed in the following manner. Private loops are those requiring a proprietary access code, as described in this manual.

Operator's loop (public): This is the default power-up loop. This loop is for basic display information and the location of the process setpoint adjustment, flow 1, flow 2, resistivity, etc.

Setup/tune loop (public): This loop contains any other adjustments the customer is expected to access. Consider this an advanced user's loop. If the customer is expected to change it, then it goes here. Example: Proportional-integral-derivative (PID) values, alarm setpoints, communication enable and parameters, remote sensor enable, selection of °F or °C display, etc.

Configuration loop (private): This loop is used by NESLAB production to enter any factory settings. These are not intended to be changed after the initial setting. Some designs may not have anything in the Configuration Loop. Example: injector setpoint and settings, high and low span, interlocks or cutouts, 50/60 Hz power selection, etc.

Calibration loop (private): This loop allows the operator to calibrate temperature and other variables to reference instruments.

Service loop (private): This is intended for service personnel to aid in field trouble-shooting. The service loop allows the controller inputs and outputs to be monitored and changed for testing of the electrical control system and components. Each application needs an unique one page service sheet that defines the controller inputs/outputs before the service loop can be used.

Documentation: The operators manual will only contain the operator's loop and setup/tune loop information. The appendix of the operators manual may also contain the calibration loop information. The service manual will contain all the different loops.

Displaying software version

The TC-200 controller has a function which will show the installed software version number on the unit's digital display.

For example, for a unit with software version **000550.45B**:

1. Unit is running normally and displaying temperature.

2. Press and hold the NO key for at least 10 seconds.
The display will show the digits to the left of the decimal (for example): **0550**
(note the two leading zeros are not shown).

3. Press the NEXT key.
The display will show the digits to the right of the decimal (for example): **45**

4. Press the NEXT key.
The display will show the revision letter, as its equivalent number, with A=1, B=2, etc. (for example): **2**

5. Press the NEXT key.
The digits shown may be disregarded.

6. Press the NEXT key.
The display returns to normal, displaying temperature.

Section III. Service

Troubleshooting

Unit will not start

Check the line cord, make sure it is plugged in.

Check the voltage of the power source. Make sure it is within the rated voltage of the unit, ±10%.

Check that the Power Switch/Circuit Breaker has not tripped.

Check the setting on the optional High Temperature Cutout.

CFT-300 units are equipped with high and low pressure switches. If either switch activates the unit will shut down. Once the cause has been determined you have to manually reset the switch. The switches are located behind the rear panel, see the operation manual.

Unit will not circulate fluid

Check the reservoir level. Fill, if necessary.

Make sure the pump has been purged.

Check the pressure gauge (units with PD pumps). If the reading is 60 psig, check the instrument being cooled for restrictions in the cooling line.

Check the pump strainer (units with PD pumps). A clogged strainer can starve the pump.

Inadequate temperature control

If the temperature continues to rise, make sure the heat load of the instrument being cooled does not exceed the rated specification, see the operating manual for specifications.

Make sure the air intake and discharge are not impeded and the ambient temperature does not exceed +35°C.

Make sure the condenser is free of dust and debris.

If the compressor short-cycles (a clicking sound), check the line voltage. It should be within the 10% of the specified voltage. Wait 5 minutes before restarting the unit.

Symptom	Possible cause	Repair
Compressor will not start - no hum	1. Line disconnect switch open 2. Line fuse (if any) removed or blown 3. Overload protector tripped 4. Wiring improper or loose	1. Close start or disconnect switch 2. Replace fuse 3. Allow compressor to cool 4. Check against wiring diagram
Compressor will not start - hums but trips on overload protector	1. Improperly wired 2. Low line voltage 3. Start capacitor defective 4. Relay failing to close 5. Compressor motor has winding open or shorted 6. Compressor mechanical failure 7. Liquid refrigerant in compressor	1. Check against wiring diagram 2. Determine reason and correct 3. Determine reason and replace 4. Determine reason and correct, replace if necessary 5. Replace compressor 6. Replace compressor 7. Add crankcase heater and/or accumulator
Compressor starts, but does not switch off start winding	1. Improperly wired 2. Low line voltage 3. Relay failing to open 4. Run capacitor defective 5. Excessive discharge pressure 6. Compressor motor has winding open or shorted 7. Compressor mechanical failure	1. Check against wiring diagram 2. Determine reason and correct 3. Determine reason and correct, replace if necessary 4. Determine reason and replace 5. Check discharge shut-off valve, possible overcharge, or insufficient cooling on condenser 6. Replace compressor 7. Replace compressor
Compressor starts and runs, but short cycles on overload protector	1. Additional current passing through overload protector 2. Low line voltage, or unbalanced if three-phase 3. Overload protector defective 4. Run capacitor defective 5. Excessive discharge pressure 6. Suction pressure too high 7. Compressor too hot, return gas hot 8. Compressor motor has a winding shorted	1. Check wiring diagram. Check for added fan motors, pumps, etc., connected to wrong side of protector 2. Determine reason and correct. 3. Check current, replace protector 4. Determine reason and replace 5. Check ventilation, restrictions in recirculating fluid path, restrictions in refrigeration system 6. Check for possibility of misapplication. Use stronger unit 7. Check refrigerant charge (fix leak), add if necessary 8. Replace compressor
Unit runs but continually stops and restarts	1. Overload protector 2. High temperature cutout, if so equipped 3. High pressure cutout due to: a. insufficient air or water supply b. overcharge c. air in system 4. Low pressure cutout due to: a. liquid line solenoid leaking b. compressor valve leak c. undercharge d. restriction in expansion device	1. See entire section above 2. Heat load too high, fluid flow too low 3a. Check air or water supply to condenser 3b. Reduce refrigerant charge 3c. Purge 4a. Replace 4b. Replace 4c. Fix leak, add refrigerant 4d. Replace device

Symptom	Possible cause	Repair
Unit operates long or continuously	1. Shortage of refrigerant 2. Control contacts stuck closed 3. Refrigerated fluid has excessive load or poor insulation 4. System inadequate to handle load 5. Evaporator coil iced 6. Restriction in refrigeration system 7. Dirty condenser 8. Air filter (if any) dirty	1. Fix leak, add charge 2. Clean contacts or replace 3. Determine fault and correct 4. Replace with larger system 5. Defrost 6. Determine location and remove 7. Clean condenser 8. Clean on replace
Start capacitor open, shorted, or blown	1. Relay contacts not operating properly 2. Prolonged operation on start cycle due to: a. low voltage to unit b. improper relay c. starting load too high 3. Excessive short cycling 4. Improper capacitor	1. Clean contacts, replace relay if needed 2a. Determine reason and correct 2b. Replace 2c. Correct 3. Determine reason and correct 4. Determine correct size and replace
Run capacitor open, shorted, or blown	1. Improper capacitor 2. Excessively high line voltage (110% of rated maximum)	1. Determine correct size and replace 2. Determine reason and correct
Relay defective or burned out	1. Incorrect relay 2. Incorrect mounting angle 3. Line voltage too high or too low 4. Excessive short cycling 5. Relay being influenced by loose vibrating mounting 6. Incorrect run capacitor	1. Check and replace 2. Remount relay in correct position 3. Determine reason and correct 4. Determine reason and correct 5. Remount rigidly 6. Replace with proper capacitor
Recirculating fluid temperature too high	1. Control setpoint too high 2. Expansion valve too small 3. Evaporator too small 4. Inadequate air circulation through condenser	1. Reset setpoint. 2. Use larger valve. 3. Add surface area or replace 4. Improve air movement
Suction line frosted or sweating	1. Expansion valve passing excess refrigerant or is oversized 2. Expansion valve stuck open 3. Overcharge of refrigerant	1. Readjust valve or replace with smaller valve 2. Clean valve of foreign particles, replace if necessary 3. Correct charge
Liquid line frosted or sweating	1. Restriction in drier or strainer 2. Liquid shut off (king valve) (if so equipped) partially closed	1. Replace part 2. Open valve fully
Unit noisy	1. Loose parts or mountings 2. Tubing rattle 3. Bent fan blade causing vibration 4. Fan motor bearings worn	1. Find and tighten 2. Reform to be free of contact 3. Replace blade 4. Replace motor

Microprocessor replacement

1. WARNING: Physically disconnect unit from line voltage.

2. Use proper Electro-Static Discharge (ESD) protection procedures. A wrist strap is mandatory, at a minimum. NESLAB is not responsible for replacement of integrated circuits damaged by ESD.

3. A Plastic Leaded Chip Carrier (PLCC) extraction tool is required.

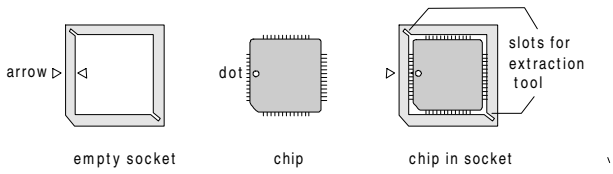
4. Remove wrapper of unit.

5. Remove the cover from the control box. On CFT-25, 33, and 75 there are four screws. On CFT-150 and larger, there are only two screws.

6. CFT-25, 33, and 75 only: The control box assembly must be pulled outside the case to allow access room. Remove the two nuts that hold the control box assembly to the case. Tip the control box assembly out of the hole in the case. Remove the secondary cover (the one with all the strain reliefs mounted to it).

Note: On CFT-150 and larger, there is adequate access room. The control box assembly may remain mounted to the case.

7. Observe the pin orientation of the old microprocessor chip. Remove it using the PLCC extraction tool. Install the new microprocessor chip, making sure the pin 1 designation on the microprocessor chip (a dimple in the middle of one side) and the socket (generally a triangle pointer on the socket or the circuit board) align. DO NOT USE THE ORIENTATION OF THE PAPER LABEL FOR ALIGNMENT. THE PAPER LABEL ORIENTATION IS ARBITRARY.



8. Reassemble the unit and all covers.

9. Plug unit in and turn it on. Error messages will appear. Press ENTER/NEXT after each error message until the temperature display appears.

10. The unit is now operational, but calibration has been lost. Calibrate unit per instructions in this manual.

Error codes

On power up:

These messages will be displayed on the controller. The controller will wait for someone to press the next/enter key. Once the “next/enter” key is pressed the controller will restore factory defaults and begin to run. For example if “Err1” is on the controller display at power up, this indicates the internal ram is messed up.

Er01 - Ram test failure
Er02 - Keypad failure, shorted keypad
Er03 - Critical checksum failure, will restore all factory defaults.
Er04- Non-Critical checksum failure, will restore 1/2 of factory values, keeps calibration, PID, restore setpoint

Unusual Hardware Conditions

These errors will flash on the display and cannot be cleared. These are internal controller problems.

Er04 thru Er15 - Interrupt errors during runtime

Functional/ Machine errors

These are the runtime/ logic errors these errors will clear themselves once the problem disappears.

Er16 - Bad calibration data - recalibrate controller
Er19 - Low temperature alarm
Er21 - High temperature alarm
Er22 - High tank temperature
Er23 - Shorted RTD2
Er24 - Open RTD2
Er25 - Shorted RTD1
Er26 - Open RTD1
Er31 - Low level fault
ADD - Low level alarm

Section IV. Adjustments

Factory defaults

Cool PID values:	Pro	20	Int	0.5	Der	0
Heat PID values:	Pro	5	Int	0.5	Der	0

Alarms

Hi temp	90
Lo temp	-20

Span

CFT25/33/75 standard temp	Lo limit 5	Hi limit 30
CFT25/33/75 high temp	Lo limit 5	Hi limit 85
CFT25/33/75 low temp	Lo limit -15	Hi limit 30
CFT150/300 standard temp	Lo limit 5	Hi limit 35
CFT150/300 high temp	Lo limit 5	Hi limit 85
CFT150/300 low temp	Lo limit -15	Hi limit 35

Cool cycle 15

Restoring factory defaults

This procedure will restore all controller values to the factory default settings (which vary by product).

1. Begin in the Operator's loop, displaying temperature as normal.

2. Hold NO, and while holding it, press YES, YES, YES. This should result in the Calibration Loop, with the display indicating "CaL".

3. Hold NO, and while holding it, press YES, YES, YES. This should result in the Configuration Loop, with the display indicating "ConF".

4. Hold NO, and then press and hold NEXT/ENTER for seven seconds minimum. This should result in the display indicating "reSt" (meaning RESTORE).

5. Press YES. The controller will restore the factory default settings and return to the Operator's Loop.

Field calibration

The unit is calibrated at the factory. Changing any values will nullify temperature indications. The calibration loop should only be used by qualified factory or service personnel. Improper calibration can affect product temperature measurements.

Requirements

Temperature calibration is performed at two different temperatures.
Calibration will be valid at and between those temperatures.
The unit must run at both of these temperatures in turn to be calibrated.

A reference thermometer is required.

Choosing calibration points

Decide what two temperatures you wish to use as calibration points. The temperatures chosen must be within the operating range of the unit (5° - 30°C), achievable, and measurable using a reference thermometer. Calibration will be most valid when the two points are as separated as possible, i.e. 5°C and 30°C. If the unit is only operated at one temperature (for example, 22°C), you may wish to optimize calibration at that point by choosing closer calibration points; such as 20° and 24°C.

Procedure - overview

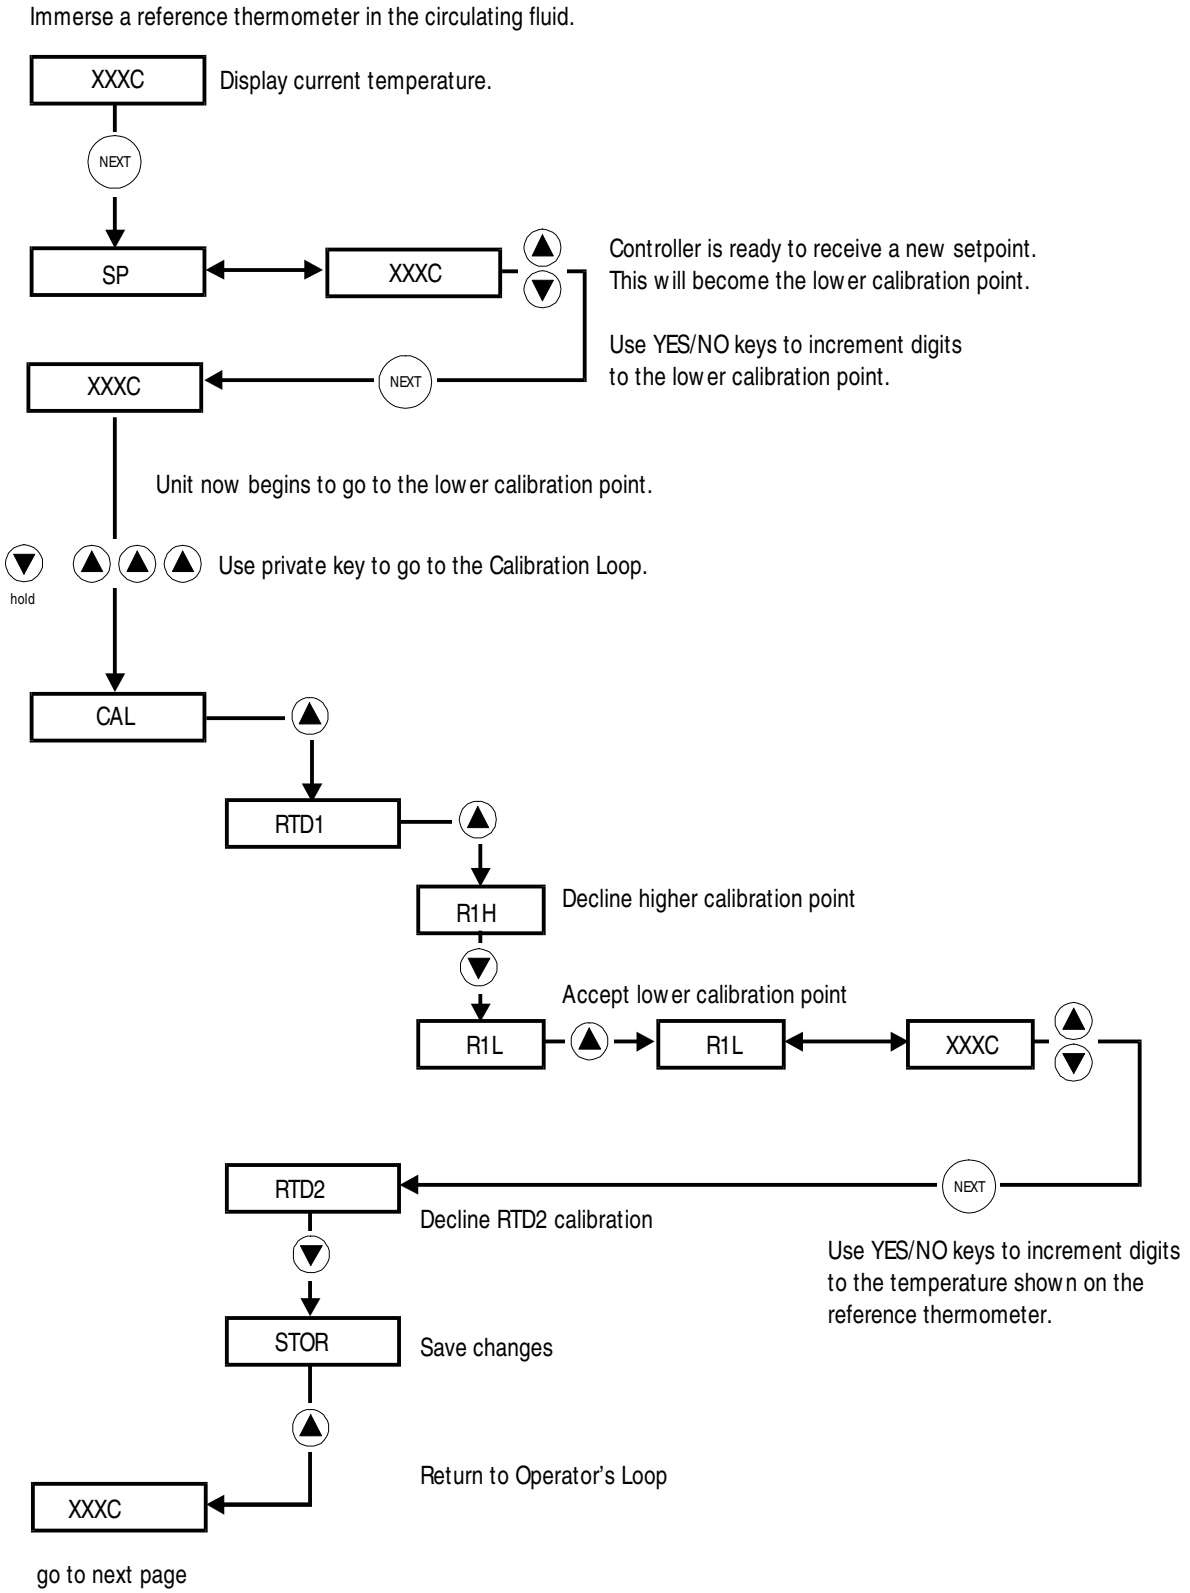
The general procedure consists of:

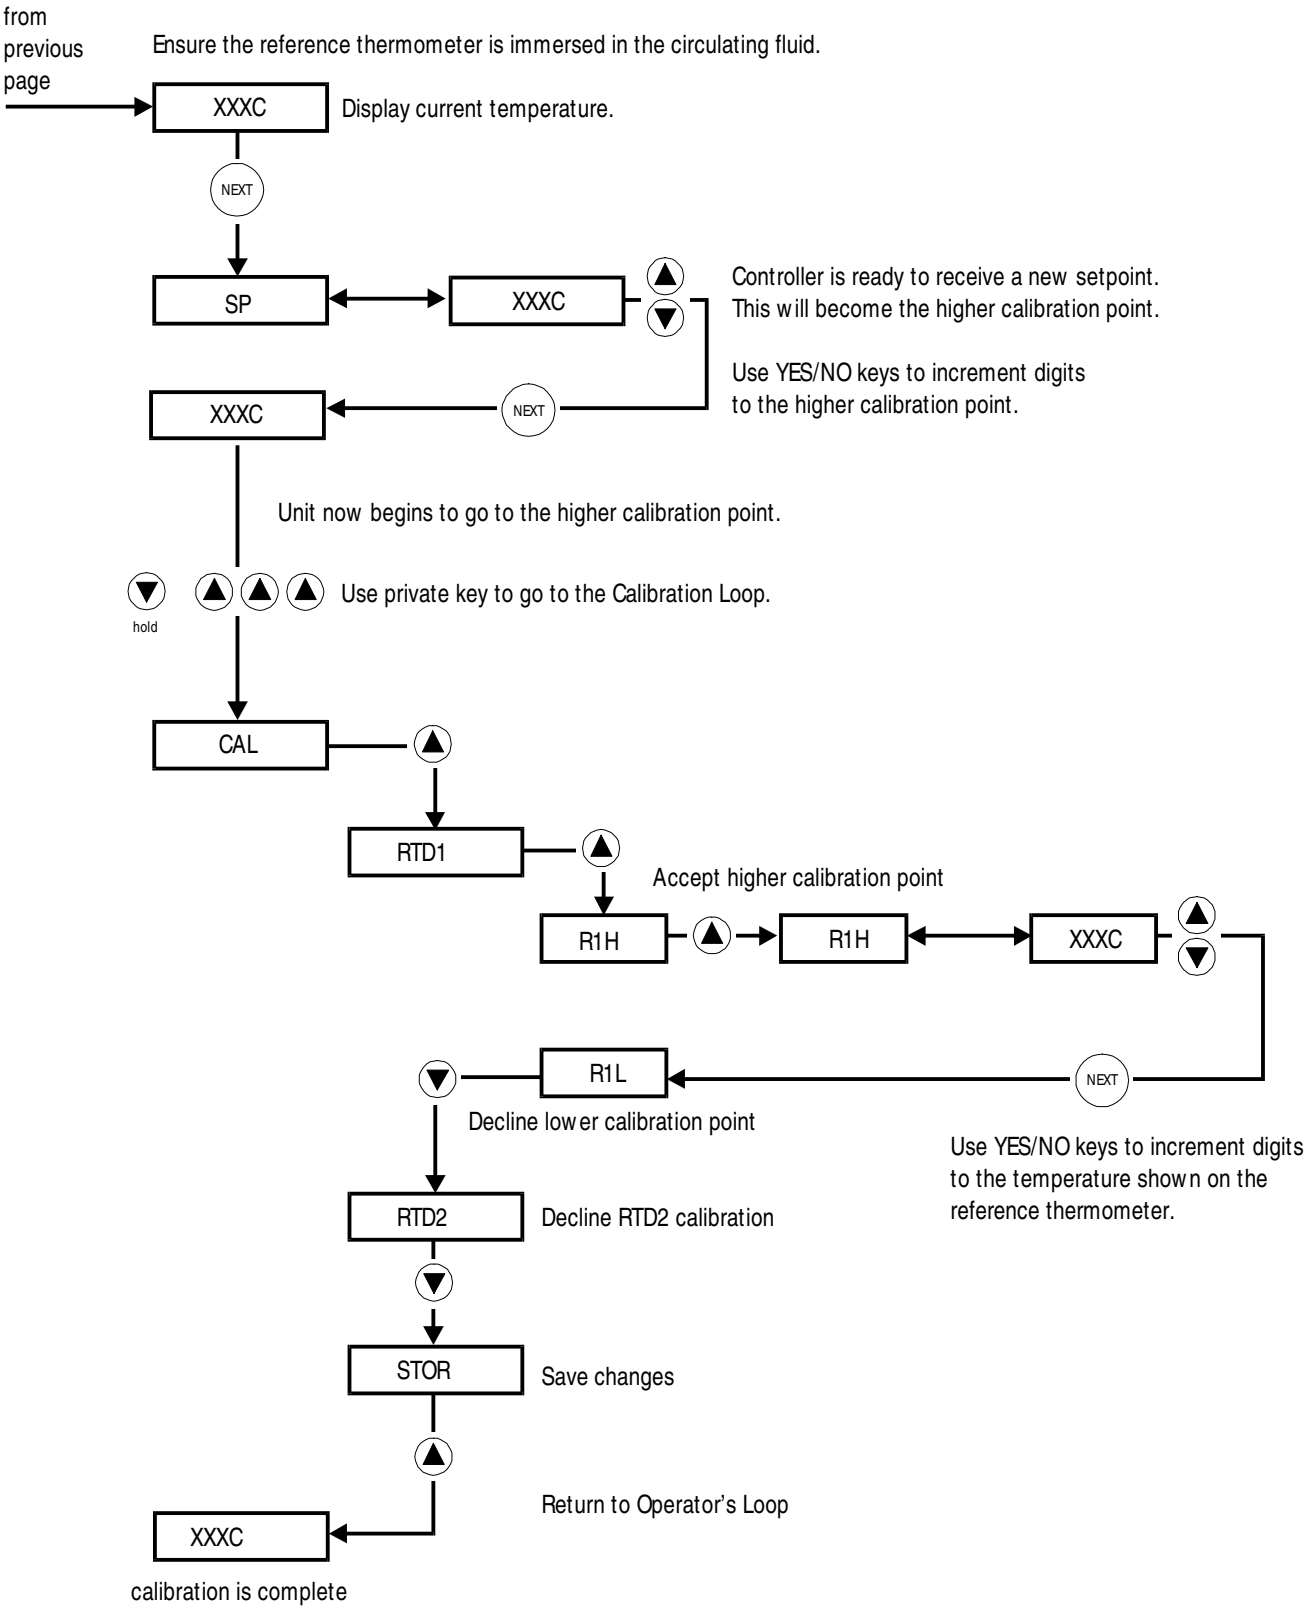
1. From operator’s loop, adjust setpoint to lower calibration point
2. Allow unit to achieve the lower calibration point.
3. Go to calibration loop, enter the reference thermometer value.
4. Go to operator’s loop, adjust setpoint to higher calibration point
5. Allow unit to achieve the higher calibration point.
6. Go to calibration loop, enter the reference thermometer value.

Note: The calibration points are independent.
The higher point may be set first if more convenient.

The step-by-step procedure follows.

Begin in the Operator's Loop





from previous page
Ensure the reference thermometer is immersed in the circulating fluid.
XXXC
Display current temperature.
NEXT
SP
XXXC
Controller is ready to receive a new setpoint.
This will become the higher calibration point.
Use YES/NO keys to increment digits to the higher calibration point.
XXXC
NEXT
Unit now begins to go to the higher calibration point.
hold
Use private key to go to the Calibration Loop.
CAL
RTD1
Accept higher calibration point
R1H
R1H
XXXC
R1L
NEXT
Decline lower calibration point
Use YES/NO keys to increment digits to the temperature shown on the reference thermometer.
RTD2
Decline RTD2 calibration
STOR
Save changes
Return to Operator's Loop
XXXC
calibration is complete

Hot gas valve

The hot gas valve is adjusted as follows.

WARNING: Disconnect unit from line voltage.

1. Attach refrigerant gauges and verify that the refrigerant charge is approximately correct.
2. Start unit and allow it to stabilize.
3. Turn unit setpoint up so unit remains in the heat/idle cycle.
4. Observe suction pressure gauge.
5. Compare reading of gauge to that in the refrigerant data table.
6. Adjust valve, if necessary, to comform to the table.
7. Turn unit off.

WARNING: Disconnect unit from line voltage.

8. Remove refrigerant gauges.

Section V. Preventive maintenance

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician. Contact our Service Department for assistance (see After-sale Support).

Service contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see After-sale Support).

Draining the reservoir

The CFT-300 is equipped with a ½ inch FPT DRAIN fitting located on the rear of the unit.

To drain the CFT-25 to CFT-150 reservoirs we recommend the use of a wet/dry vacuum. Remove the reservoir plug and carefully insert the wet/dry vacuum so as not to damage the cooling coils. **NOTE:** Tilting the unit more than 45° may allow compressor oil to seep into the suction line.

Cleaning

Reservoir

Periodically inspect the fluid inside the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Before changing the cooling fluid, raise the operating temperature of the unit to de-ice the cooling coils. Refer to the operating manual for instructions on replacing the cooling fluid.

Condenser

For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The lower front of the unit has a one-piece grille assembly. Gently pry the assembly off with a flathead screwdriver. Use care not to scratch the paint.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Algae

To restrict the growth of algae in the reservoir, it is recommended that the reservoir cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, 1 gram per 3.5 liters.

Pump strainer

Units with PD pumps have a strainer. Refer to the pump label on the rear of the unit to identify the type of pump in your unit.

If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged with debris and scale. Therefore, the strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

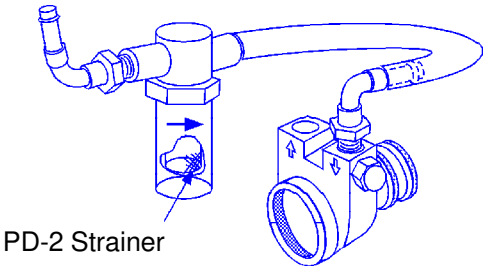
Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

PD-1 pumps have a wire mesh strainer located in the pump head. PD-2 pumps have the strainer located in the pump suction line.

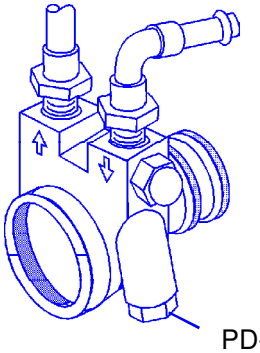
Remove the wrapper from the unit. Unscrew the larger of the two acorn nuts on the pump head and remove the screen.

Clean the screen by rinsing it with water.

When the screen is clean, replace it in the strainer, tighten the acorn nut and replace the wrapper. Refer to the operating manual for instructions on replacing the cooling fluid.



PD-2 Strainer



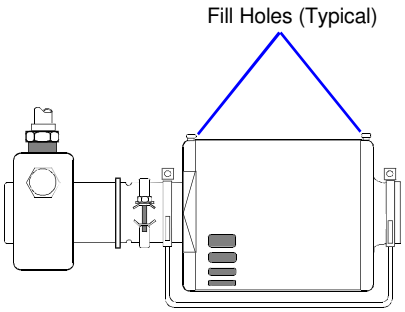
PD-1 Strainer

Pump motor lubrication

PD pump motors require periodic lubrication. Refer to the pump label on the rear of the unit to identify the type of pump in your unit.

PD pumps use sleeve type bearings with large reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil to each bearing on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



Torque

V-band clamp

The V-band clamp (which joins the pump to the motor) should be tightened to **15 - 30 inch-pounds** (85 - 170 cm/kg) of torque.

Hose clamps

The unit's internal and external hoses and clamps should be inspected and tightened on at least a semiannual basis. If the unit uses standard clear reinforced hose (with the reinforcement webbing visible in the wall of the hose), tighten hose clamps to **50 in/lbs** (280 cm/kg).

Note that this type hose will cold-flow, so the clamps will need to retorqued later after the hose conforms to the clamps. (Be aware the hose clamps do not actually loosen, but rather the hose O.D. decreases under them!)

It is best to give them a final torqueing just prior to leaving the job site. It is wise to explain to the customer that a further torqueing may be required the following day - and that a drip developing at the hose clamp is a result of this cold-flow and not poor workmanship.

material safety data sheet (MSDS)

A Material Safety Data Sheet (MSDS) is designed to provide both workers and emergency personnel with the proper procedures for handling or working with that substance. MSDS will include information such as physical data (melting point, boiling point, flash point etc.), toxicity, health effects, first aid, reactivity, storage, disposal, protective equipment, and spill/leak procedures. These are of particular use if a spill or other accident occurs. This Material Safety Data Sheets is provided as a public service. It was gathered from a variety of sources. **Neither NESLAB Instruments, Inc., nor any of its agents are liable for the accuracy, or inaccuracy, of the Material Safety Data Sheet**. You assume the liability for the use of any part of this Material Safety Data Sheet.

==========

Precautions for Safe Handling and Use

==========

Steps If Matl Released/Spill: REVIEW FIRE FIGHTING MEASURES BEFORE PROCEEDING W/CLEANUP.USE APPROPRIATE PPE DURING CLEANUP.VENTI AREAESPECIALLY LOW OR ENCLOSED PLACES WHERE HEAVY VAPORS COLLECT.REMOVE OPEN FLAMES.USE SCBA IF LG SPILL OR LEAK OCCURS.
Neutralizing Agent: NOT SPECIFIED BY MANUFACTURER.
Waste Disposal Method: CONTAMINATED HFC-134A CAN BE RECOVERED BY DISTILLATION OR REMOVED TO A PERMITTED WASTE DISPOSAL FACILITY. COMPLY WITH LOCAL, STATE AND FEDERAL REGULATIONS.
Precautions-Handling/Storing: STORE IN CLEAN, DRY AREA. DO NOT HEAT ABOVE 52C. USE W/SUFFICIENT VENTILATION TO KEEP EMPLOYEE EXPOSURE BELOW RECOMMENDED LIMITS.
Other Precautions: HFC-134A SHOULD NOT BE MIXED W/AIR FOR LEAK TESTING OR USEDS W/AIR FOR ANY OTHER PURPOSE ABOVE ATMOSPHERIC PRESSURE. SEE FIRE & EXPLOSION DATA & SUPPLEMENTAL SECS. CONTACT W/CHLORINE OR OTHER STRONG OXIDIZING AGENTS SHOULD ALSO BE AVOIDED.

==========

Control Measures

==========

Respiratory Protection: UNDER NORMAL MANUFACTURING CONDITIONS NO RESPIRATORY PROTECTION IS REQUIRED WHEN USING THIS PRODUCT. SELF-CONTAINED BREATHING APPARATUS (SCBA) IS REQUIRED IF A LARGE RELEASE OCCURS.
Ventilation: NORMAL VENTILATION FOR STANDARD MANUFACTURING PROCEDURES IS GENERALLY ADEQUATE.
Protective Gloves: IMPERVIOUS GLOVES.
Eye Protection: CHEM SPLASH GOGGLES.
Other Protective Equipment: NONE SPECIFIED BY MANUFACTURER.
Work Hygienic Practices: WASH CONTAMINATED CLOTHING/SHOE PRIOR TO REUSE.
Suppl. Safety & Health Data: MATL NOT FLAMM @ AMBIENT TEMP & ATM

PRESSURE.TESTS HAVE SHOWN COMBUSTIBLE @ PRESSURE AS LOW AS 5.5 PSIG @ 177C WHEN MIXED W/AIR @ CONCEN OF GENERALLY MORE THAN 60 VOLUME % AIR.AT LOWER TEMP,HIGHER PRESSURE ARE REQUIRED FOR COMBUSTIBILITY. DO NOT USE IN MED APPLICATINS INVOLVING PERMANENT IMPLANTATION IN THE HUMAN BODY.

Flash Point: NONE
Flash Point Method: TOC
Extinguishing Media: AS APPROPRIATE FOR COMBUSTIBLES IN AREA. EXTINGUISHANT FOR OTHER BURNING MATERIAL IN AREA IS SUFFICIENT TO STOP

BURNING.
Special Fire Fighting Proc: WEAR NIOSH/MSHA APPRVD PRESSURE DEMAND SCBA & FULL PROT EQUIP (FP N). USE WATER SPRAY/FOG TO COOL CONTAINERS.
Unusual Fire And Expl Hazrds: THERMAL DECOMP PRODS MAY INCLUDE CHLORIDES, FLUORIDES & PHOSGENE (FP N). OTHER BURNING MATLS MAY CAUSE HCFC 22 TO BURN WEAKLY. CHLORODIFLUOROMETHANE (SUP DAT)

==========

Reactivity Data

==========

Stability: YES
Cond To Avoid (Stability): AVOID OPEN FLAMES AND HIGH TEMPERATURES.
Materials To Avoid: ALKALI OR ALKALINE EARTH METALS (POWDERED AL, ZN, BE, ETC.).
Hazardous Decomp Products: HIGH TEMPS (OPEN FLAMES, GLOWING METAL SURFS, ETC.) FORMING HYDROCHLORIC & HYDROFLUORIC ACIDS, & POSS CARBONYL (SUP DAT)
Hazardous Poly Occur: NO
Conditions To Avoid (Poly): NOT RELEVANT.

==========

Health Hazard Data

==========

LD50-LC50 Mixture: NONE SPECIFIED BY MANUFACTURER.
Route Of Entry - Inhalation: YES
Route Of Entry - Skin: YES
Route Of Entry - Ingestion: NO
Health Haz Acute And Chronic: INHAL OF HIGH CONCS OF VAP IS HARMFUL & MAY CAUSE IRREGULARITIES, UNCONSCIOUSNESS/DEATH. INTENTIONAL MISUSE/DELIBERATE INHAL MAY CAUSE DEATH WITHOUT WARNING. VAP REDUCES OXYGEN AVAILABLE FOR BRTHG & IS HVR/AIR. LIQUID CONT CAN CAUSE FRSTBT. ANIMAL DATA: TOXICITY DESCRIBED IN ANIMALS EXPOSED BY INHAL TO CONCS (ING 9)
Carcinogenicity - NTP: NO
Carcinogenicity - IARC: NO
Carcinogenicity - OSHA: NO
Explanation Carcinogenicity: NOT RELEVANT.
Signs/Symptoms Of Overexp: OVEREXP TO VAPS BY INHAL MAY INCLUDE TEMPORARY NERVS SYS DEPRESS W/ANESTH EFTS SUCH AS DIZZ, HDCH, CONFUSN, INCOORD, & LOSS OF CONSCIOUSNESS. HIGHER EXPOS TO VAPS MAY CAUSE TEMPORARY ALTERATION OF HEART'S ELEC ACTIVITY W/IRREGULAR PULSE, PALPITATIONS/ INADEQUATE CIRCULATION. FATALITY MAY OCCUR FROM GROSS (ING 7)
Med Cond Aggravated By Exp: BECAUSE OF POSSIBLE DISTURBANCES OF CARDIAC RHYTHM, CATECHOLAMINE DRUGS, SUCH AS EPINEPHRINE, SHOULD ONLY BE CONSIDERED AS A LAST RESORT IN LIFE-THREATENING EMERGENCIES.
Emergency/First Aid Proc: INHAL: IF LGE CONCS ARE INHALED, IMMED REMOVE TO FRESH AIR. KEEP PERS CALM. IF NOT BRTHG, GIVE ARTF RESP. IF BRTHG IS DIFFICULT, GIVE OXYGEN. CALL MD. SKIN CONT: FLUSH W/WATER FOR 15 MIN. TREAT FOR FROSTBT IF NEC BY GENTLY WARMING AFFECTED AREA. IF IRRIT IS PRESENT, CALL MD. EYES: IMMED FLUSH W/PLENTY OF WATER FOR AT LEAST 15 MIN. CALL MD. INGEST: NOT CONSIDERED A POTENTIAL ROUTE OF EXPOSURE.

==========

Precautions for Safe Handling and Use

==========

Steps If Matl Released/Spill: NOTE: REVIEW FIRE & EXPLOS HAZ & SFTY PREC BEFORE PROCEEDING W/CLEAN UP. USE APPROP PERSONAL PROT EQUIP DURING CLEAN UP. VENT AREA, ESPECIALLY LOW/ENCLOSED PLACES WHERE HEAVY VAPS MIGHT COLLECT. REMOVE OPEN FLAMES. USE SCBA FOR LGE SPILLS/RELEASES.
Neutralizing Agent: NONE SPECIFIED BY MANUFACTURER.
Waste Disposal Method: COMPLY WITH FEDERAL, STATE, AND LOCAL REGULATIONS. RECLAIM BY DISTILLATION OR REMOVE TO A PERMITTED WASTE DISPOSAL.
Precautions-Handling/Storing: STORE IN CLEAN, DRY AREA. DO NOT HEAT ABOVE 52C (125F).
Other Precautions: NO SMKNG IN AREA OF USE. DO NOT USE IN GEN VICIN OF ARC WELDING, OPEN FLAMES/HOT SURFS. HEAT &/UV RADIA MAY CAUSE FORM OF CHLORIDES, FLUORIDES &/PHOSGENE (FP N). USE W/SUFFICIENT VENT TO KEEP EMPLOYEE EXPOS BELOW RECOMMENDED LIMITS. (ING 4)

==========

Control Measures

==========

Respiratory Protection: UNDER NORMAL MANUFACTURING CONDITIONS, NO RESPIRATORY PROTECTION IS REQUIRED WHEN USING THIS PRODUCT. USE NIOSH/MSHA APPROVED SCBA WHEN A LARGE RELEASE OCCURS.
Ventilation: NORM VENT FOR STANDARD MFG PROC IS GEN ADEQ. LOC EXHAUST SHOULD BE USED WHEN LARGE AMOUNTS ARE RELEASED. MECH (ING 3)
Protective Gloves: IMPERVIOUS GLOVES (FP N).
Eye Protection: ANSI APPRVD CHEM WORKERS GOGGS(FP N).
Other Protective Equipment: EMERGENCY EYEWASH & DELUGE SHOWER MEETING ANSI DESIGN CRITERIA (FP N).
Work Hygienic Practices: NONE SPECIFIED BY MANUFACTURER.
Suppl. Safety & Health Data: HAZ DECOMP PROD: HALIDES, PHOSGENE (FP N). EXPLO HAZ: IS NOT FLAM AT AMBIENT TEMPS & ATMOSPHERIC PRESS. HOWEVER IT HAS BEEN SHOWN IN TESTS TO BE COMBUST AT PRESS AS LOW AS 60 PSIG AT AMBIENT TEMP WHEN MIXED W/AIR AT CONCS OF 65 VOL & AIR. EXPTL DATA HAVE ALSO BEEN REPORTED WHICH INDICATE COMBUST OF “FREON” 22 (ING 2)

CFT75: solenoid valve change

1. What units are affected?

model:	**CFT 75 R134A ONLY (not R22 or R12)**
part numbers:	**395xxxxxxxxx**
serial numbers:	**this change occurs at serial number 198223000**
date of manufacture:	**this change occurs August 11, 1998**

2. What is the problem/symptom?
The unit may runaway cold, even though the controller is calling for heating.

3. What is the cause?
The installed liquid line solenoid valve (PN 009475 - type XUP) is not optimum for this application.

4. What is the fix?
The solenoid valve is replaced by a different one (PN 009741 - type XWG).

5. Should we fix any existing units (rework or recall units in the field)?
It is not necessary to service any units that operate correctly. If a unit exhibits this symptom, the valve should be replaced with the new one. The coil is the same and may be reused.

6. How do I get replacement parts or more information?
Consult NESLAB Technical Service.

7. Need more information?
Current service information is available 24 hours a day on NESLAB ONLINE. Service information is available on the NESLAB OFFLINE 1998 cd-rom.

Service manual **000877** is available for CFT75 units using traditional (“Banks”) controllers with a controller code of 01 or 02 (the controller code is the ninth and tenth digits of the 12-digit unit part number). This manual is available on paper, on cd-rom, and online. Service manual **U00320** is available for CFT75 units using the newer TC200 controllers with a controller code of 15 (the controller code is the ninth and tenth digits of the 12-digit unit part number). This manual is available on paper, or online.

Refer to PCO (Product Change Order) **12173.**

Test sheets are available on microfiche at all NESLAB offices.

Service bulletin
U00349
18 May 1999

1. What units are affected?

model: **CFT-33**

part numbers: **394106031501 394106031502 394106031503 394106031504 394106041501 394106041502 394106041503 394106041504 394106041505 394106041506 394106121501 394106991501 394106991502**

serial numbers (approximate range): **196270001 to 199130001**

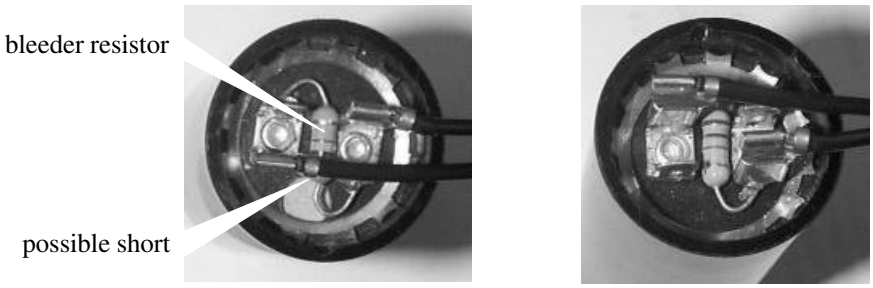
date of manufacture: **from late 1996 to May 1999**

2. What is the problem/symptom?

When main power is applied the compressor will not start and the compressor motor overload quickly trips. The start capacitor will appear to be shorted when checked with an ohmmeter.

3. What is the cause?

Wires may have been incorrectly attached to the start capacitor by the condensing unit manufacturer so that the capacitor is shorted. Actual short is between the wire terminal and the end cap of the bleeder resistor. A shorted capacitor can not participate in the compressor start cycle and as a result the compressor motor may not start.



wrong right

4. What is the fix?

If capacitor is wired incorrectly, disconnect from line voltage and rewire start capacitor as indicated. Replace bleeder resistor if the enamel is damaged. Unit should now start normally.

5. Should we fix any existing units (rework or recall units in the field)?

All units returned for servicing should be checked for correct capacitor wiring. Units found to be incorrectly wired should be reworked as shown.

6. Who can I call for help?

Our Technical service group is ready to help you sort out issues involving product performance.

Year 2000 statement

NESLAB Instruments, Inc.
P.O. Box 1178 Portsmouth, NH 03802-1178 800/258-0830 FAX (603 436-8411)
Revised 18 May 1999
Subject: Y2K Year 2000 Policy Statement

NESLAB Instruments Inc. and the Year 2000. NESLAB Instruments Inc. recognizes the importance of providing our customers with products that will continue to function correctly during the Year 2000 and beyond. NESLAB is also committed to communicating to its customers its status with respect to Year 2000 compliance.

Definition. NESLAB Instruments has adopted the following definition of Year 2000 compliance as set forth by the British Standards Institution in DISC PD2000-1 A Definition of Year 2000 Conformity Requirements (available on the Internet at http://www.bsi.org.uk/disc/year2000.html), with the qualification that the upper limit for compliance is the year 2035:

Year 2000 conformity shall mean that neither performance nor functionality is affected by dates prior to, during, and after the year 2000. In particular:

Rule 1: No value for current date will cause any interruption in operation.
Rule 2: Date-based functionality must behave consistently for dates prior to, during, and after year 2000.
Rule 3: In all interfaces and data storage, the century in any date must be specified either explicitly or by unambiguous algorithms or inferencing rules.
Rule 4: Year 2000 must be recognized as a leap year.

Our Products. It is our goal that our customers can continue to use our Products during and after the Year 2000. NESLAB Instruments has carried out a review of its products with respect to Year 2000 compliance.

There are no current NESLAB products which incorporate clock or calendar functions. Therefore, we believe all of our current products to be Year 2000 compliant.

Additional information about NESLAB Instruments' products can be found at our website (http://www.neslabinc.com).

Internal Business Systems. NESLAB has carried out a review of its products and its internal systems with respect to Year 2000 compliance.

NESLAB houses an IBM AS/400 system that runs MAPICS XA R3 MRP software. This software package is fully Year 2000 compliant. NESLAB also utilizes Windows 95 and other Microsoft products on the desktop; all of these software products are also Year 2000 compliant. In addition, NESLAB will be performing internal testing to further ensure Year 2000 compliance of these systems.

In addition, NESLAB Instruments is contacting its key vendors/suppliers to assess their Year 2000 readiness.

Summary

In summary, NESLAB Instruments, Inc. believes that its products and its internal business systems are currently Year 2000 compliant.

Customer Commitment. NESLAB Instruments recognizes the importance of this issue to our customers. If you have additional questions, please contact Mr. Mike Pratt of our technical support group.

Nothing in this statement is intended to modify rights and obligations under any agreement or to create any new rights or obligations between NESLAB Instruments and our customers.

Sincerely,

James R. Allen
Vice President Finance, Systems & Administration

CFT Series Quick Reference Operating Procedures

Installation
The unit has an air-cooled refrigeration system. Air is drawn in the front of the unit and discharged through rear and side. Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C.

Make sure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled either SUPPLY and RETURN or OUTLET and INLET. These connections are ½ inch FPT, ¾ inch FPT for CFT-300s. Remove the plastic protective plugs from both plumbing connections. Connect the OUTLET/SUPPLY fitting to the inlet of the instrument being cooled. Connect the INLET/RETURN fitting to the outlet of the instrument being cooled.

To fill the reservoir remove the reservoir access panel by unscrewing the thumbscrews. Locate the reservoir plug (square nut). Remove the plug and fill the reservoir with clean cooling fluid.

Tap water is the recommended fluid for operation from +8°C to +30°C. Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Operation
Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

To start the unit, place the Power Switch to the on position. The Power Switch illuminates (except for the CFT-150) to indicate the system is operating. To turn the unit off, place the Power Switch to the off position.

The Cool LED indicates the status of the refrigeration system. It illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the setpoint, the LED will extinguish.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressuresare not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Analog Controller Temperature Adjustment
To adjust the temperature setpoint, turn the °C dial on the front of the unit to the desired temperature.

Digital Controller Temperature Adjustment
To display the temperature setpoint, press and hold the DISPLAY switch. To adjust the temperature setpoint, press and hold the DISPLAY switch and turn the ADJUST knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the DISPLAY switch. The display will now indicate the temperature of the fluid in the reservoir.

Periodic Maintenance
Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Before changing the cooling fluid, raise the unit's operating temperature to de-ice the cooling coils.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established. Before cleaning, disconnect the power cord from the power source and drain the reservoir.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 1000-4-2:1995
	IEC 1000-4-3:1994
	IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

If this product has been modified to operate at 0°C or lower, it has been tested with a non-freezing fluid. Although the system has been drained, some residual fluid may remain. This will not hinder your unit's performance.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the unit operation, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the labels on the rear of the unit to obtain the following information:

- unit BOM number _____

- unit serial number _____

- pump type _____

Section I Safety

Warnings

Warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle and text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, please contact our Sales Department (see After-sale Support).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Never connect the OUTLET/SUPPLY or INLET/RETURN fitting to your building water supply or any water pressure source.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer’s warranty.

Do not replace reservoir plug with a non-vented type or damage to the tank may occur.

For personal safety and equipment reliability, the following procedure should only be performed by a competent technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Additional Warnings

In addition to the specific warnings listed on the previous page the following general warnings apply to you unit:

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the reservoir.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified technician.

Section II General Information

Description

The CFT Recirculating Chiller is designed to provide a continuous supply of cooling fluid at a constant temperature and volume.

The unit consists of an air-cooled refrigeration system, a sealable reservoir, recirculating pump, and a temperature controller.

Throughout the manual, you will be asked to consult the unit's serial number label or the pump identification label for specific information. Both labels are located on the rear of the unit.

Specifications

	CFT-25	CFT-33	CFT-75	CFT-150	CFT-300
Cooling Capacity[1]					
60Hz	580 Watts	950 Watts	2100 Watts	4500Watts	10650 Watts
50Hz	475 Watts	1000 Watts	1900 Watts	3735 Watts	9000 Watts
Temperature Range	+5°C to +30°C			+5°C to +35°C	
Temperature Stability[2,3]					
Analog Temperature Controller	±1.0°C				
Digital Temperature Controller	±0.5°				±1.0°
Reservoir Volume					
Gallons	0.5	1.1	1.8	5.6	
Liters	1.9	4.1	6.8	21.3	
Refrigerant	R134a			R22	

1. Circulating water at 20°C, at 20°C ambient. Cooling capacity will vary depending on fluid temperature, ambient temperature, and cooling fluid. A PD-1 pump was used in the CFT-25, a PD-2 in the other units.
2. Stability determined for CFT-150 analog unit with 75% heat load @ 20°C circulating temperature.
3. CFT-300 stabliity determined with 86% heat load.

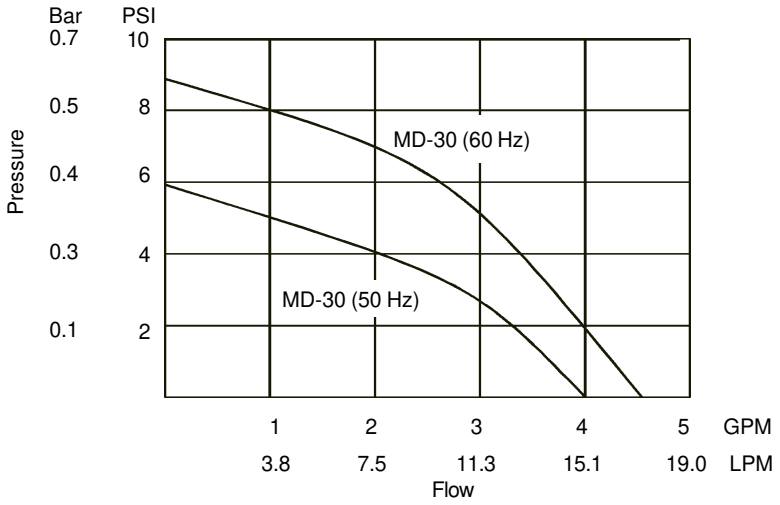
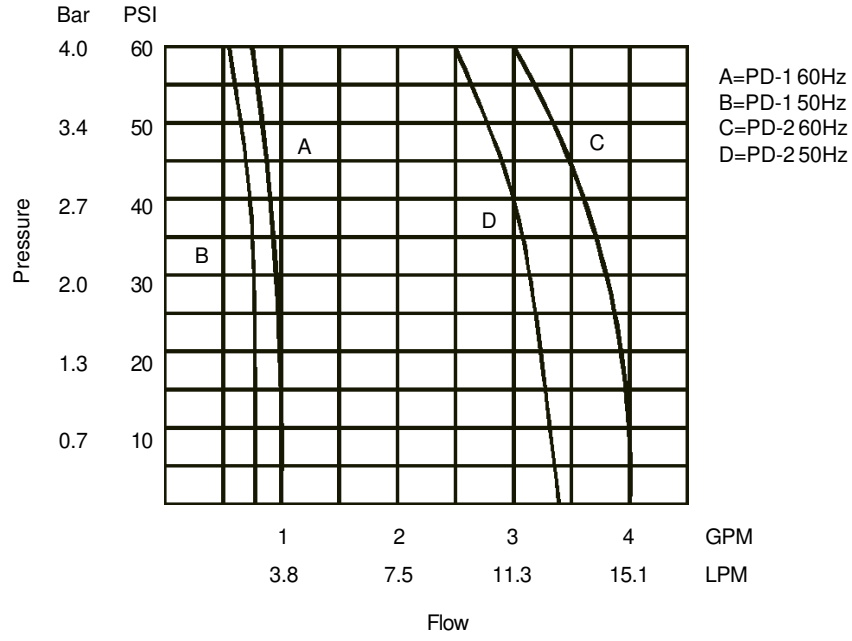
1. Dimension A is the height of the unit. The unit width and depth (dimensions B and C) are the case dimensions. Add approximately 2 inches to include the plumbing connections.
2. Dimension D is the distance from the floor to the bottom of the unit case (height of the castors).
3. Dimension E is the distance from the floor to the center of the DRAIN connection (CFT-300 only).
4. Dimension F is the distance from the floor of the center of the OUTLET connection.
5. Dimension G is the distance from the floor of the center of the INLET connection.
6. Dimension H is the distance from the unit's left side to the center of the INLET, OUTLET and DRAIN connections.
7. Weights are given in pounds
8. Air intake is given in cubic feet per minute.

Rev 01/30/97

Pump Capacity[1]





1. To determine which pump is installed, refer to the label on the rear of your unit.

Section III Installation

Site

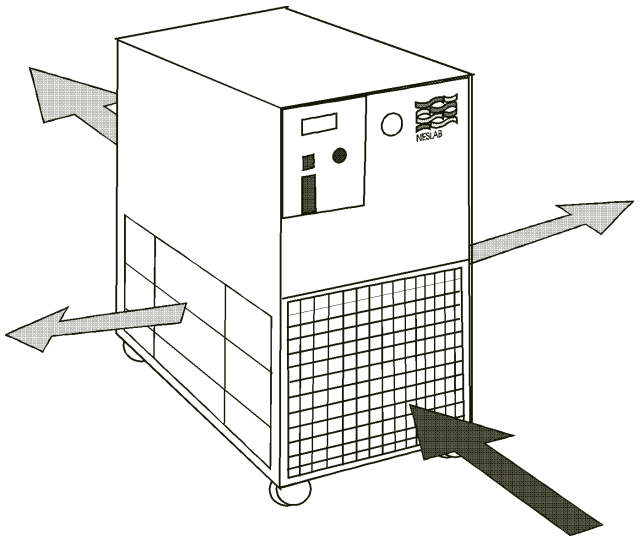
The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +13°C to +35°C.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. Air is drawn through the front of the unit and discharged through rear and side panels. The unit must be positioned so the intake and discharge are not impeded. A minimum clearance of 18 inches (45 centimeters) on all vented sides is necessary for adequate ventilation. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section V, Cleaning).

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C. Above +24°C, derate the cooling capacity 1% for every 0.5°C above +24°C, up to a maximum ambient temperature of +35°C.



Direction of Air Flow

Electrical Requirements

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Refer to Section II, Specifications, and to the serial number label on the rear of the unit for the specific electrical requirements of your unit.

The CFT-300 is supplied with a disconnect box. Wire the power connections in accordance to local, state and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

The CFT-300 is also equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

Plumbing Requirements

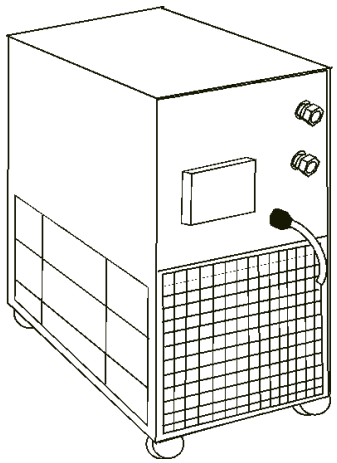
Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. The manufacturer of the instrument should be able to recommend a cleaning fluid for their equipment.

The plumbing connections are located on the rear of the unit and are labelled OUTLET/SUPPLY and INLET/RETURN. CFT-25 to CFT-150 connections are ½ inch FPT, CFT-150s with CP-55 pumps are ¾ inch and CFT-300 connections are ¾ inch FPT.

Remove the plastic protective plugs from both plumbing connections.

Connect the OUTLET/SUPPLY fitting to the inlet of the instrument being cooled. Connect the INLET/RETURN fitting to the outlet of the instrument being cooled.

Never connect the fittings to your building water supply or any water pressure source.



Plumbing Connections (Typical)

Two sets of plumbing adapters are included with CFT-25 to CFT-150 units. One set of adapters will accept 3/8 inch ID tubing. The other set will accept ½ inch ID tubing. If the unit is being plumbed using flexible tubing, install one set of adapters in the plumbing ports. To prevent leaking, be sure to wrap the threads of the adapters with Teflon® sealing tape before installing them in the plumbing ports.

Flexible tubing, if used, should be of heavy wall or reinforced construction. All tubing should be rated to withstand 80 psig at +30°C. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, they should be made at the inlet and outlet of the instrument being cooled, not at the CFT.

If substantial lengths of cooling lines are required, they should be pre-filled with cooling fluid before connecting them to the unit.

Fluids

The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Tap water is the recommended fluid for operation from +8°C to +30°C. See Water Quality Standards and Recommendations on the next page.

Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer's warranty.

Water Quality Standards and Recommendations

	Permissible(PPM)	Desirable(PPM)
Microbiologicals (algae,bacteria,fungi)	0	0
Inorganic Chemicals		
Calcium	<40	0.6
Chloride	250	<25
Copper	1.3	1.0
Iron	0.3	<0.1
Lead	0.015	0
Magnesium	<12	0.1
Manganese	0.05	<0.03
Nitrates\Nitrites	10 as N	0
Potassium	<20	0.3
Silicate	25	<1.0
Sodium	<20	0.3
Sulfate	250	<50
Hardness	17	<0.05
Total Dissolved Solids	50	10
Other Parameters		
pH	6.5-8.5	7-8
Resistivity	0.01*	0.05-0.1*
* Megohm-Cm (Compensated at 25C)		

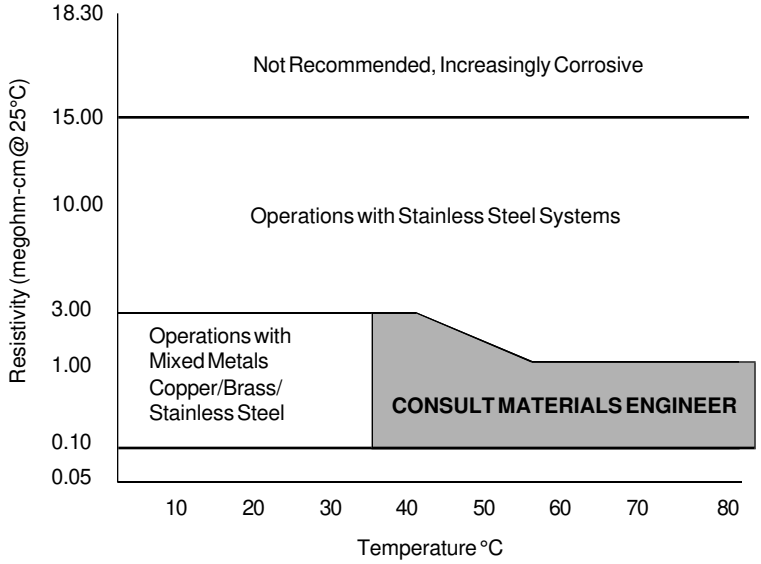
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (as NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (as NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated at 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated at 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated at 25°C).

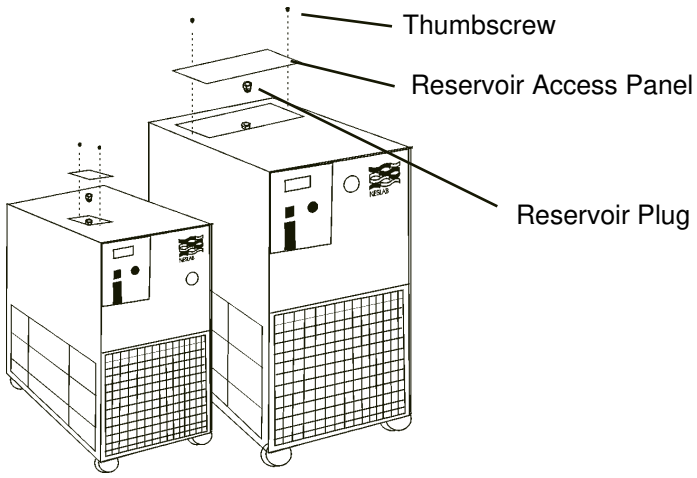
The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



Water Quality Considerations

Filling Requirements

Remove the reservoir access panel by unscrewing the thumbscrews. Locate the reservoir plug (square nut). Remove the plug and fill the reservoir with clean cooling fluid, following the special considerations outlined in the following paragraphs.



Reservoir filling locations (Typical)

NOTE: The CFT-300 has a FILL lamp which illuminates whenever the reservoir level is below normal operating level.

Circulating to a closed system (closed to the atmosphere)
Fill the reservoir to the bottom of the fill hole threads. Since the reservoir capacity is small compared to many instruments being cooled, have extra cooling fluid on hand to keep the system topped off when external circulation is started.

NOTE: The tank in your unit has a vent which relieves pressure built up from thermal expansion of water. The vent is located on the reservoir plug. It activates when tank pressure reaches 3 - 5 psi.

Do not replace reservoir plug with an non-vented type or damage to the tank may occur.

Circulating to an open system (open to the atmosphere)
Fill the reservoir so ¾ of the fill hole threads are covered. Wrap the tank plug with Teflon® sealing tape. Replace the tank plug and tighten securely to prevent air entry.

When circulating cooling fluid to an open vessel or tank, connect the OUTLET/SUPPLY and INLET/RETURN lines to the open tank. Secure the INLET/RETURN (suction) line below the fluid surface. The INLET/RETURN line should be submerged deep enough to avoid sucking air. Make sure the INLET/RETURN line is free of particles and debris that can block the flow of fluid. A baffle or screen may be required.

Section IV Operation

Start Up

Before starting the unit, double check all electrical and plumbing connections and make sure the circulating system (the CFT, the instrument being cooled, and the tubing that connects them) has been properly filled with cooling fluid. To start the unit, place the POWER Switch to the on (**I**) position. The refrigeration system and the recirculation pump will start. The POWER Switch illuminates (except for the CFT-150) to indicate the system is operating. Units with PD pumps display the pump operating pressure on the RECIRCULATING PRESSURE gauge.

To turn the unit off, place the POWER Switch to the off (**0**) position.

The Cool LED on the front panel indicate the status of the refrigeration system. It illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the temperature setpoint, the LED will extinguish.

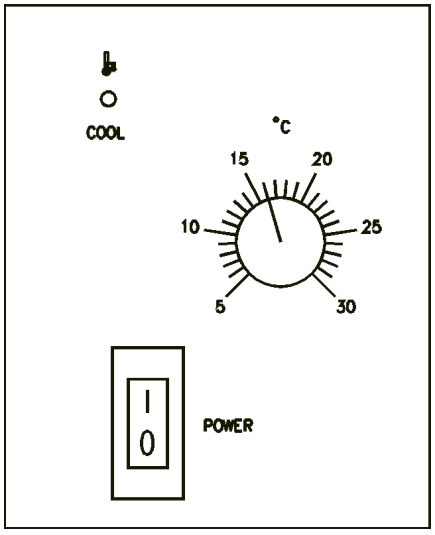
The Idle LED on the front panel of CFT-150 units indicates the unit is in a hot-gas-bypass mode of operation. As the operating temperature approaches the temperature setpoint, the Cool and Idle LEDs cycle to indicate the approximate duty cycle of the unit.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Analog Temperature Controller

Temperature Adjustment

To adjust the temperature setpoint, turn the calibrated °C dial on the front of the unit to the desired temperature.



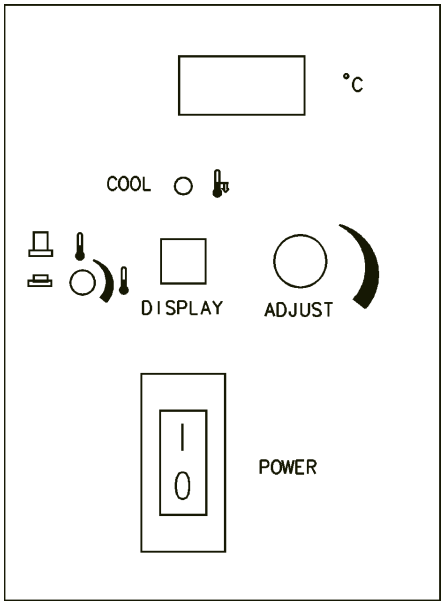
Analog Temperature Controller (Typical)

Digital Temperature Controller

Temperature Adjustment

To display the temperature setpoint, press and hold the DISPLAY switch. To adjust the temperature setpoint, press and hold the DISPLAY switch and turn the ADJUST knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the DISPLAY switch. The display will now indicate the temperature of the fluid in the reservoir.

NOTE: Inadvertent movement of the ADJUST knob, regardless of the position of the DISPLAY switch, will result in a change in the setpoint. This change will not be immediately reflected on the digital display, unless the DISPLAY switch is pressed. The digital display will eventually change as the unit reacts to the new setpoint.



Digital Temperature Controller (Typical)

Pressure Relief Valve

Units with PD pumps have a pressure relief valve which establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The relief valve does not determine the actual operating pressure; the operating pressure is determined by the back pressure of the system.

If an adjustment is necessary, contact our Customer Service Department.

High Temperature Cutout (Optional)

The High Temperature Cutout (HTC) is designed to shut down the unit in the event the temperature of the fluid in the reservoir exceeds the HTC setting. The HTC is normally located on the rear of the unit.

NOTE: The HTC temperature scale is in °F.

CFT-300 High/Low Pressure Cutout

CFT-300 units are equipped with high and low refrigeration pressure cutouts. Should either cutout activate the unit will shut down.

The High Pressure Cutout (HPC) activates if there is a blockage in the refrigeration lines or if the refrigerant temperature becomes too hot. The HPC is factory preset at 400psi.

The Low Pressure Cutout (LPC) activates if there is a leak in the refrigeration lines. THE LPC is factory preset at 4psi.

Both cutouts are located inside the case behind the rear panel. Once the cause of the shut down has been determined and corrected, manually depress the white button on the applicable cutout. If a "click" is not heard when depressing the button, the cutout was not activated and the unit shut down for another reason.

CFT-150 High Pressure Cutout

Some CFT-150 units are equipped with High Pressure Cutouts (HPC). Should the HPC activate the unit will shut down.

The HPC activates if there is a blockage in the refrigeration lines or if the refrigerant temperature becomes too hot. The HPC is factory preset at 400psi.

The cutout is located inside the case behind the rear panel. Once the cause of the shut down has been determined and corrected, manually depress the white button on the applicable cutout. If a "click" is not heard when depressing the button, the cutout was not activated and the unit shut down for another reason.

Heater Package (Optional)

Heaters are controlled by a switch on the temperature controller. The heater itself is accessible through the small service panel on the rear of the unit.

These units also have a Low Level indicator. The indicator illuminates if the fluid level in the reservoir drops below proper operating level.

Illustration A shows the desired fluid level for normal operation.

Should the reservoir be filled as shown in illustration B, units designed to operate at high-end temperatures (near boiling) may cause air in the reservoir to become trapped. The air can be vented by slightly tilting the unit forward on its front castors.

Any fluid venting from the reservoir will drain through a hose which feeds to a small hole in the bottom of the unit.

Do not used silicon-based fluids with units designed to operate at high temperatures. These type fluids will damage the hoses and pump seal.

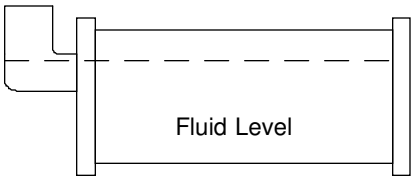


Illustration A

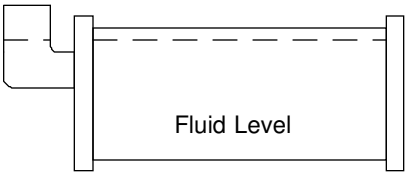

Illustration B

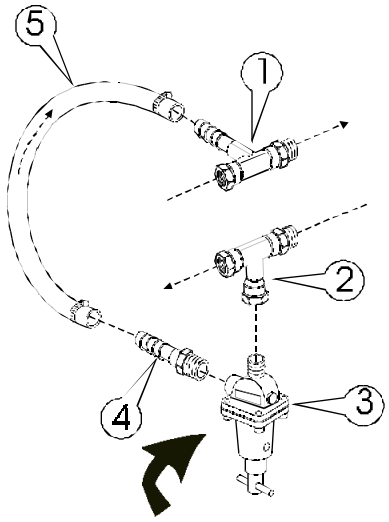
External Pressure Regulator (Optional)

For applications requiring a maximum pressure less than 55 PSI (380 kPa), an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 PSI (70 to 345 kPa). If the pressure of the fluid leaving the chiller exceeds the relief valve setting, the relief valve will bypass excess fluid back into the chiller to relieve the overpressure.

The pressure of the system is determined by the back pressure of the connected equipment and the flow rate of the recirculating fluid to your application. Connect the EPR as described.

NOTE: Install the fittings in the exact sequence shown.

NOTE: Use Teflon® tape on all threaded fittings.



Connect the Inlet Tee Assembly (1) to the chiller. Connect the Outlet Tee Assembly (2) to the chiller. Attach the relief valve (3) to the Outlet Tee Assembly (2). Attach the Hose Nipple (4) to the Relief Valve (3). Attach the Hose (5) between the Inlet Tee Assembly (1) and the Hose Nipple (4).

The EPR is now installed. Connect the inlet (to your application) to the remaining fitting of the Outlet Tee Assembly (2). Connect the outlet (from your application) to the remaining fitting of the Inlet Tee Assembly (1).

Tighten the hose clamps tight enough to prevent leakage. Do not overtighten or the clamps will bite into the flexible tubing and cause excessive wear. If a torque wrench is available, torque hose clamps to 50 in/lbs (280 cm/kg). Nylon-reinforced hose tends to cold-flow, so the clamps will need to retorqued later. (The hose clamps do not actually loosen, but rather the hose outside diameter decreases!).

The "T" adjustment handle is equipped with a locknut. To adjust the relief pressure setting loosen the locknut and turn the "T" handle to the minimum pressure setting (direction of arrow).

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and the instrument being cooled. Monitor the operating pressure of the unit. Turn the "T" handle until the desired relief pressure is set. (The EPR valve cannot be set lower than the total back pressure of the instrument being cooled or the instrument will not receive any flow.)

Tighten the locknut to secure the position of the "T" handle. Open the hose between the EPR outlet tee assembly and the instrument being cooled.

Section V Maintenance and Service

For personal safety and equipment reliability, the following procedure should only be performed by a competent technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Draining the Reservoir

The CFT-300 is equipped with a ½ inch FPT DRAIN fitting located on the rear of the unit.

To drain the CFT-25 to CFT-150 reservoirs we recommend the use of a wet/dry vacuum. Remove the reservoir plug and carefully insert the wet/dry vacuum so as not to damage the cooling coils. **NOTE:** Tilting the unit more than 45° may allow compressor oil to seep into the suction line.

Cleaning

Reservoir

Periodically inspect the fluid inside the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Before changing the cooling fluid, raise the operating temperature of the unit to de-ice the cooling coils. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Condenser

For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The lower front of the unit has a one-piece grille assembly. Gently pry the assembly off with a flathead screwdriver. Use care not to scratch the paint.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Algae

To restrict the growth of algae in the reservoir, it is recommended that the reservoir cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, one gram per gallon.

Pump Strainer

Units with PD pumps have a strainer. Refer to the pump label on the rear of the unit to identify the type of pump in your unit.

If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged with debris and scale. Therefore, the strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

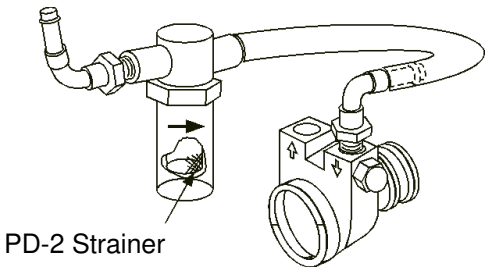
Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

PD-1 pumps have a wire mesh strainer located in the pump head. PD-2 pumps have the strainer located in the pump suction line.

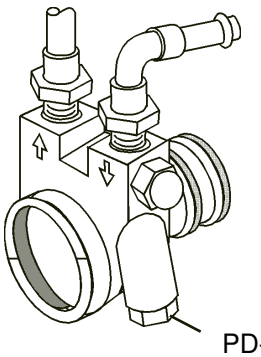
Remove the wrapper from the unit. Unscrew the larger of the two acorn nuts on the pump head and remove the screen.

Clean the screen by rinsing it with water.

When the screen is clean, replace it in the strainer, tighten the acorn nut and replace the wrapper. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.



PD-2 Strainer



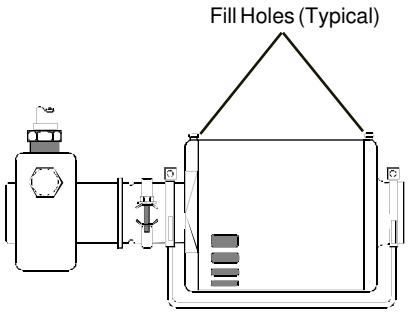
PD-1 Strainer

Pump Motor Lubrication

PD pump motors require periodic lubrication. Refer to the pump label on the rear of the unit to identify the type of pump in your unit.

PD pumps use sleeve type bearings with large reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil to each bearing on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



Hoses

The unit's internal and external hoses and clamps should be inspected and tightened on at least a semiannual basis.

Suction Discharge Pressure Speed Check

Unit	Pump	Refrigerant	Suction PSIG	Discharge PSIG	Speed °C/Min
CFT-25	PD-1	R134a	36 -38	160 - 170	4.8
CFT-25	MD-30	R134a	25 - 28	145 -160	4.0
CFT-33	PD1/2	R134a	42 - 45	180 - 200	3.0
CFT-75	PD1/2	R134a	37 - 41	170 -185	4.6
CFT-150	PD2	R22	70	270	2.8
CFT-300	PD2	R22	88 - 94	265 - 280	6.8
CFT-300	CP-55	R22	85 - 90	268 - 280	6.8

Standard temperature 60 Hertz units, derate 17% for 50 Hertz Units. +20°C fluid temperature, unit in the COOL mode, +20°C ambient. 100% water in the reservoir. Wrapper removed.

Section VI Troubleshooting

Checklist

Unit will not start

Check the line cord, make sure it is plugged in.

Check the voltage of the power source. Make sure it is within the rated voltage of the unit, ±10%.

Check that the Power Switch/Circuit Breaker has not tripped.

Check the setting on the optional High Temperature Cutout.

CFT-300 units are equipped with high and low pressure switches. If either switch activates the unit will shut down. Once the cause has been determined you have to manually reset the switch. The switches are located behind the rear panel. (See Section IV, Operation on page 17.)

Unit will not circulate fluid

Check the reservoir level. Fill, if necessary.

Make sure the pump has been purged.

Check the pressure gauge (units with PD pumps). If the reading is 60 psig, check the instrument being cooled for restrictions in the cooling line.

Check the pump strainer (units with PD pumps). A clogged strainer can starve the pump.

Inadequate temperature control

If the temperature continues to rise, make sure the heat load of the instrument being cooled does not exceed the rated specification. (See Section II, Specifications on page 6.)

Make sure the air intake and discharge are not impeded and the ambient temperature does not exceed +35°C.

Make sure the condenser is free of dust and debris. (See Section VI, Cleaning on page 20.)

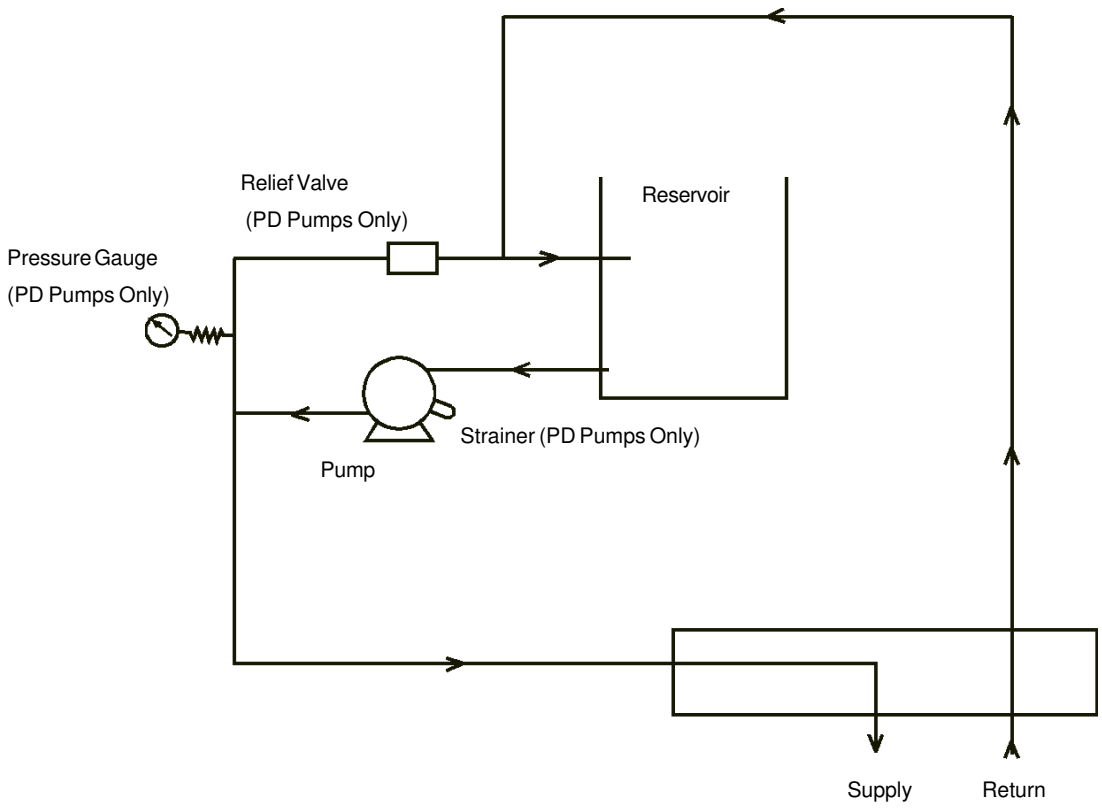
If the compressor short-cycles (a clicking sound), check the line voltage. It should be within the 10% of the specified voltage. Wait 5 minutes before restarting the unit.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please refer to the serial number label on the rear of the unit to obtain the following information:

- *unit BOM number*
- *unit serial number*
- *voltage of unit*
- *voltage of power source*

Pump Flow Diagram



WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

Section I: Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department (see After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Observe all warning labels. Never remove warning labels.
Never operate damaged or leaking equipment.
Never operate the unit without cooling fluid in the reservoir.
Always turn off the unit and disconnect the power source before performing any service or maintenance procedures, or before moving the unit.
Always empty the reservoir before moving the unit.
Never operate equipment with damaged line cords.
Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

The lightning flash with arrow symbol, within an equilateral triangle, is intended to alert the user to the presence of non-insulated "dangerous voltage" within the unit's enclosure. The voltage may be of significant magnitude to constitute a risk of electrical shock.

Section II: General information

After Sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or service contracts, contact our Service Department. Before calling, please obtain the following information from the unit's serial number label:
part number
serial number

Other resources

The Instruction and Operation Manual for the CFT series is PN U00362.

Pump systems are covered in a separate service manual.
For MD pumps, obtain service manual 000877.
For PD pumps, obtain service manual 000878.

Decoding part numbers

NESLAB identifies units using a 12-digit part number. To decode the part number, split up the digits as shown in the chart below. This will define what characteristics the unit has.

000	0	00	00	00	00
unit family	condenser	electrical	pump/head	controller	catalog
128 EX111 129 EX211 130 EX221 131 EX411 132 EX511 134 RTE111 135 RTE211 136 RTE221 137 EX111 138 EX211 139 EX221 140 EX411 141 EX511 157 RTE140 167 RTE111 168 RTE211 169 RTE221 171 RTE140,LT50 331 CFT25A 332 CFT33A 333 CFT75A 334 CFT25, R12 335 CFT33, R12 336 CFT75, R12 337 CFT150,FAC200 347 CFT25, R22 348 CFT33, R22 349 CFT75, R22 386 HX75, R22 387 HX100, R22 388 HX150, R22 389 HX200, R22 390 HX300, R22 391 HX500, R22 392 HX750, R22 393 CFT25, R134a 394 CFT33, R134a 395 CFT75, R134a 396 CFT300,FAC400 397 CFT500 398 CFT750 400 CFT100 607 CFT50 608 CFT75 612 RTE microprocessor 613 CFT200	0 Not applicable 1 Air cooled 2 Water cooled	00 None 01 100v / 50Hz / 1ø 02 100v 60Hz (no longer used) 03 115v / 60Hz / 1ø 04 208-230v / 60Hz / 1ø 05 208-230v / 60Hz / 3ø 06 220-240v / 50Hz / 1ø 07 220-240v / 50Hz / 3ø 08 Slave 09 440-480v / 60Hz / 3ø 10 380-415v / 50Hz / 3ø (4 wire) 11 100v / 50-60Hz 12 100-115v / 50-60Hz 13 200v / 50Hz / 1ø 15 200v / 50-60Hz 16 Dual rated: 200v / 50Hz / 1ø 200-230v / 60Hz / 1ø 17 208v / 60Hz / 3ø (5 wire) 20 415v / 50Hz / 3ø 21 380-415v / 50Hz / 3ø (5 wire) 22 200-240v / 50-60Hz /1ø 23 380-480v / 50-60Hz / 3ø (4 wire) 99 Special	00 No pump 01 CP25 02 CP55 03 PD1 04 PD2 05 CP75 06 TU1 07 TU5 08 TU6 09 TU7 10 TU8 11 SS PD1 12 SS PD2 15 MD30 16 CP20 17 G1 18 F Pump, 1 Stage 19 F Pump, 2 Stage 20 Z Pump 21 F Immersion head 22 R Immersion head 23 FV Immersion head 24 H Pump 25 Dual PD1 26 Dual PD2 28 was PD3, now unassigned 29 CP100 30 TU9 31 TU3 99 Special	01 Analog 02 Digital, non bath 03 Series II 04 Programmable 05 Basic 06 Cryotrol 07 Digital, bath 08 UL approved 09 UL approved plus interlocks 10 UL approved plus alarm pkg. 11 Microprocessor 12 Digital remote (HX1000, HX2000) 13 Fisher standard digital 14 Controller I (TC100) 15 Controller II (TC200) 16 Controller III (TC300) 17 Controller IV (TC400)	Once upon a time 00 indicated a standard catalog unit, and 01 and up indicated the presence of customizing options and/or accessories. That distinction is no longer used and these digits have no special significance any more.

Interface defined

This statement defines NESLAB's policy towards access and contents of various control loops for TC200, TC300, and TC400 controller applications. It is provided by the Measurement and Control group.

With an increasing number of controller applications it is important to maintain consistency in the way we code our operator interface. The goal is to minimize the effort to code, build, test, document, use, and service our products.

Unless the customer specification specifically requests a different approach, the operator interface will be programmed in the following manner. Private loops are those requiring a proprietary access code, as described in this manual.

Operator's loop (public): This is the default power-up loop. This loop is for basic display information and the location of the process setpoint adjustment, flow 1, flow 2, resistivity, etc.

Setup/tune loop (public): This loop contains any other adjustments the customer is expected to access. Consider this an advanced user's loop. If the customer is expected to change it, then it goes here. Example: Proportional-integral-derivative (PID) values, alarm setpoints, communication enable and parameters, remote sensor enable, selection of °F or °C display, etc.

Configuration loop (private): This loop is used by NESLAB production to enter any factory settings. These are not intended to be changed after the initial setting. Some designs may not have anything in the Configuration Loop. Example: injector setpoint and settings, high and low span, interlocks or cutouts, 50/60 Hz power selection, etc.

Calibration loop (private): This loop allows the operator to calibrate temperature and other variables to reference instruments.

Service loop (private): This is intended for service personnel to aid in field trouble-shooting. The service loop allows the controller inputs and outputs to be monitored and changed for testing of the electrical control system and components. Each application needs an unique one page service sheet that defines the controller inputs/outputs before the service loop can be used.

Documentation: The operators manual will only contain the operator's loop and setup/tune loop information. The appendix of the operators manual may also contain the calibration loop information. The service manual will contain all the different loops.

Displaying software version

The TC-200 controller has a function which will show the installed software version number on the unit's digital display.

For example, for a unit with software version **000550.45B**:

1. Unit is running normally and displaying temperature.

2. Press and hold the NO key for at least 10 seconds.
The display will show the digits to the left of the decimal (for example): **0550**
(note the two leading zeros are not shown).

3. Press the NEXT key.
The display will show the digits to the right of the decimal (for example): **45**

4. Press the NEXT key.
The display will show the revision letter, as its equivalent number, with A=1, B=2, etc. (for example): **2**

5. Press the NEXT key.
The digits shown may be disregarded.

6. Press the NEXT key.
The display returns to normal, displaying temperature.

Section III. Service

Troubleshooting

Unit will not start

Check the line cord, make sure it is plugged in.

Check the voltage of the power source. Make sure it is within the rated voltage of the unit, ±10%.

Check that the Power Switch/Circuit Breaker has not tripped.

Check the setting on the optional High Temperature Cutout.

CFT-300 units are equipped with high and low pressure switches. If either switch activates the unit will shut down. Once the cause has been determined you have to manually reset the switch. The switches are located behind the rear panel, see the operation manual.

Unit will not circulate fluid

Check the reservoir level. Fill, if necessary.

Make sure the pump has been purged.

Check the pressure gauge (units with PD pumps). If the reading is 60 psig, check the instrument being cooled for restrictions in the cooling line.

Check the pump strainer (units with PD pumps). A clogged strainer can starve the pump.

Inadequate temperature control

If the temperature continues to rise, make sure the heat load of the instrument being cooled does not exceed the rated specification, see the operating manual for specifications.

Make sure the air intake and discharge are not impeded and the ambient temperature does not exceed +35°C.

Make sure the condenser is free of dust and debris.

If the compressor short-cycles (a clicking sound), check the line voltage. It should be within the 10% of the specified voltage. Wait 5 minutes before restarting the unit.

Symptom	Possible cause	Repair
Compressor will not start - no hum	1. Line disconnect switch open 2. Line fuse (if any) removed or blown 3. Overload protector tripped 4. Wiring improper or loose	1. Close start or disconnect switch 2. Replace fuse 3. Allow compressor to cool 4. Check against wiring diagram
Compressor will not start - hums but trips on overload protector	1. Improperly wired 2. Low line voltage 3. Start capacitor defective 4. Relay failing to close 5. Compressor motor has winding open or shorted 6. Compressor mechanical failure 7. Liquid refrigerant in compressor	1. Check against wiring diagram 2. Determine reason and correct 3. Determine reason and replace 4. Determine reason and correct, replace if necessary 5. Replace compressor 6. Replace compressor 7. Add crankcase heater and/or accumulator
Compressor starts, but does not switch off start winding	1. Improperly wired 2. Low line voltage 3. Relay failing to open 4. Run capacitor defective 5. Excessive discharge pressure 6. Compressor motor has winding open or shorted 7. Compressor mechanical failure	1. Check against wiring diagram 2. Determine reason and correct 3. Determine reason and correct, replace if necessary 4. Determine reason and replace 5. Check discharge shut-off valve, possible overcharge, or insufficient cooling on condenser 6. Replace compressor 7. Replace compressor
Compressor starts and runs, but short cycles on overload protector	1. Additional current passing through overload protector 2. Low line voltage, or unbalanced if three-phase 3. Overload protector defective 4. Run capacitor defective 5. Excessive discharge pressure 6. Suction pressure too high 7. Compressor too hot, return gas hot 8. Compressor motor has a winding shorted	1. Check wiring diagram. Check for added fan motors, pumps, etc., connected to wrong side of protector 2. Determine reason and correct. 3. Check current, replace protector 4. Determine reason and replace 5. Check ventilation, restrictions in recirculating fluid path, restrictions in refrigeration system 6. Check for possibility of misapplication. Use stronger unit 7. Check refrigerant charge (fix leak), add if necessary 8. Replace compressor
Unit runs but continually stops and restarts	1. Overload protector 2. High temperature cutout, if so equipped 3. High pressure cutout due to: a. insufficient air or water supply b. overcharge c. air in system 4. Low pressure cutout due to: a. liquid line solenoid leaking b. compressor valve leak c. undercharge d. restriction in expansion device	1. See entire section above 2. Heat load too high, fluid flow too low 3a. Check air or water supply to condenser 3b. Reduce refrigerant charge 3c. Purge 4a. Replace 4b. Replace 4c. Fix leak, add refrigerant 4d. Replace device

Symptom	Possible cause	Repair
Unit operates long or continuously	1. Shortage of refrigerant 2. Control contacts stuck closed 3. Refrigerated fluid has excessive load or poor insulation 4. System inadequate to handle load 5. Evaporator coil iced 6. Restriction in refrigeration system 7. Dirty condenser 8. Air filter (if any) dirty	1. Fix leak, add charge 2. Clean contacts or replace 3. Determine fault and correct 4. Replace with larger system 5. Defrost 6. Determine location and remove 7. Clean condenser 8. Clean on replace
Start capacitor open, shorted, or blown	1. Relay contacts not operating properly 2. Prolonged operation on start cycle due to: a. low voltage to unit b. improper relay c. starting load too high 3. Excessive short cycling 4. Improper capacitor	1. Clean contacts, replace relay if needed 2a. Determine reason and correct 2b. Replace 2c. Correct 3. Determine reason and correct 4. Determine correct size and replace
Run capacitor open, shorted, or blown	1. Improper capacitor 2. Excessively high line voltage (110% of rated maximum)	1. Determine correct size and replace 2. Determine reason and correct
Relay defective or burned out	1. Incorrect relay 2. Incorrect mounting angle 3. Line voltage too high or too low 4. Excessive short cycling 5. Relay being influenced by loose vibrating mounting 6. Incorrect run capacitor	1. Check and replace 2. Remount relay in correct position 3. Determine reason and correct 4. Determine reason and correct 5. Remount rigidly 6. Replace with proper capacitor
Recirculating fluid temperature too high	1. Control setpoint too high 2. Expansion valve too small 3. Evaporator too small 4. Inadequate air circulation through condenser	1. Reset setpoint. 2. Use larger valve. 3. Add surface area or replace 4. Improve air movement
Suction line frosted or sweating	1. Expansion valve passing excess refrigerant or is oversized 2. Expansion valve stuck open 3. Overcharge of refrigerant	1. Readjust valve or replace with smaller valve 2. Clean valve of foreign particles, replace if necessary 3. Correct charge
Liquid line frosted or sweating	1. Restriction in drier or strainer 2. Liquid shut off (king valve) (if so equipped) partially closed	1. Replace part 2. Open valve fully
Unit noisy	1. Loose parts or mountings 2. Tubing rattle 3. Bent fan blade causing vibration 4. Fan motor bearings worn	1. Find and tighten 2. Reform to be free of contact 3. Replace blade 4. Replace motor

Microprocessor replacement

1. WARNING: Physically disconnect unit from line voltage.

2. Use proper Electro-Static Discharge (ESD) protection procedures. A wrist strap is mandatory, at a minimum. NESLAB is not responsible for replacement of integrated circuits damaged by ESD.

3. A Plastic Leaded Chip Carrier (PLCC) extraction tool is required.

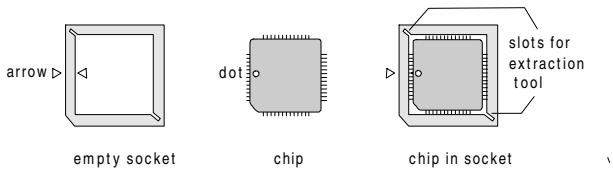
4. Remove wrapper of unit.

5. Remove the cover from the control box. On CFT-25, 33, and 75 there are four screws. On CFT-150 and larger, there are only two screws.

6. CFT-25, 33, and 75 only: The control box assembly must be pulled outside the case to allow access room. Remove the two nuts that hold the control box assembly to the case. Tip the control box assembly out of the hole in the case. Remove the secondary cover (the one with all the strain reliefs mounted to it).

Note: On CFT-150 and larger, there is adequate access room. The control box assembly may remain mounted to the case.

7. Observe the pin orientation of the old microprocessor chip. Remove it using the PLCC extraction tool. Install the new microprocessor chip, making sure the pin 1 designation on the microprocessor chip (a dimple in the middle of one side) and the socket (generally a triangle pointer on the socket or the circuit board) align. DO NOT USE THE ORIENTATION OF THE PAPER LABEL FOR ALIGNMENT. THE PAPER LABEL ORIENTATION IS ARBITRARY.



8. Reassemble the unit and all covers.

9. Plug unit in and turn it on. Error messages will appear. Press ENTER/NEXT after each error message until the temperature display appears.

10. The unit is now operational, but calibration has been lost. Calibrate unit per instructions in this manual.

Error codes

On power up:

These messages will be displayed on the controller. The controller will wait for someone to press the next/enter key. Once the “next/enter” key is pressed the controller will restore factory defaults and begin to run. For example if “Err1” is on the controller display at power up, this indicates the internal ram is messed up.

Er01 - Ram test failure
Er02 - Keypad failure, shorted keypad
Er03 - Critical checksum failure, will restore all factory defaults.
Er04- Non-Critical checksum failure, will restore 1/2 of factory values, keeps calibration, PID, restore setpoint

Unusual Hardware Conditions

These errors will flash on the display and cannot be cleared. These are internal controller problems.

Er04 thru Er15 - Interrupt errors during runtime

Functional/ Machine errors

These are the runtime/ logic errors these errors will clear themselves once the problem disappears.

Er16 - Bad calibration data - recalibrate controller
Er19 - Low temperature alarm
Er21 - High temperature alarm
Er22 - High tank temperature
Er23 - Shorted RTD2
Er24 - Open RTD2
Er25 - Shorted RTD1
Er26 - Open RTD1
Er31 - Low level fault
ADD - Low level alarm

Section IV. Adjustments

Factory defaults

Cool PID values:	Pro	20	Int	0.5	Der	0
Heat PID values:	Pro	5	Int	0.5	Der	0

Alarms

Hi temp	90
Lo temp	-20

Span

CFT25/33/75 standard temp	Lo limit 5	Hi limit 30
CFT25/33/75 high temp	Lo limit 5	Hi limit 85
CFT25/33/75 low temp	Lo limit -15	Hi limit 30
CFT150/300 standard temp	Lo limit 5	Hi limit 35
CFT150/300 high temp	Lo limit 5	Hi limit 85
CFT150/300 low temp	Lo limit -15	Hi limit 35

Cool cycle 15

Restoring factory defaults

This procedure will restore all controller values to the factory default settings (which vary by product).

1. Begin in the Operator's loop, displaying temperature as normal.

2. Hold NO, and while holding it, press YES, YES, YES. This should result in the Calibration Loop, with the display indicating "CaL".

3. Hold NO, and while holding it, press YES, YES, YES. This should result in the Configuration Loop, with the display indicating "ConF".

4. Hold NO, and then press and hold NEXT/ENTER for seven seconds minimum. This should result in the display indicating "reSt" (meaning RESTORE).

5. Press YES. The controller will restore the factory default settings and return to the Operator's Loop.

Field calibration

The unit is calibrated at the factory. Changing any values will nullify temperature indications. The calibration loop should only be used by qualified factory or service personnel. Improper calibration can affect product temperature measurements.

Requirements

Temperature calibration is performed at two different temperatures.
Calibration will be valid at and between those temperatures.
The unit must run at both of these temperatures in turn to be calibrated.

A reference thermometer is required.

Choosing calibration points

Decide what two temperatures you wish to use as calibration points. The temperatures chosen must be within the operating range of the unit (5° - 30°C), achievable, and measurable using a reference thermometer. Calibration will be most valid when the two points are as separated as possible, i.e. 5°C and 30°C. If the unit is only operated at one temperature (for example, 22°C), you may wish to optimize calibration at that point by choosing closer calibration points; such as 20° and 24°C.

Procedure - overview

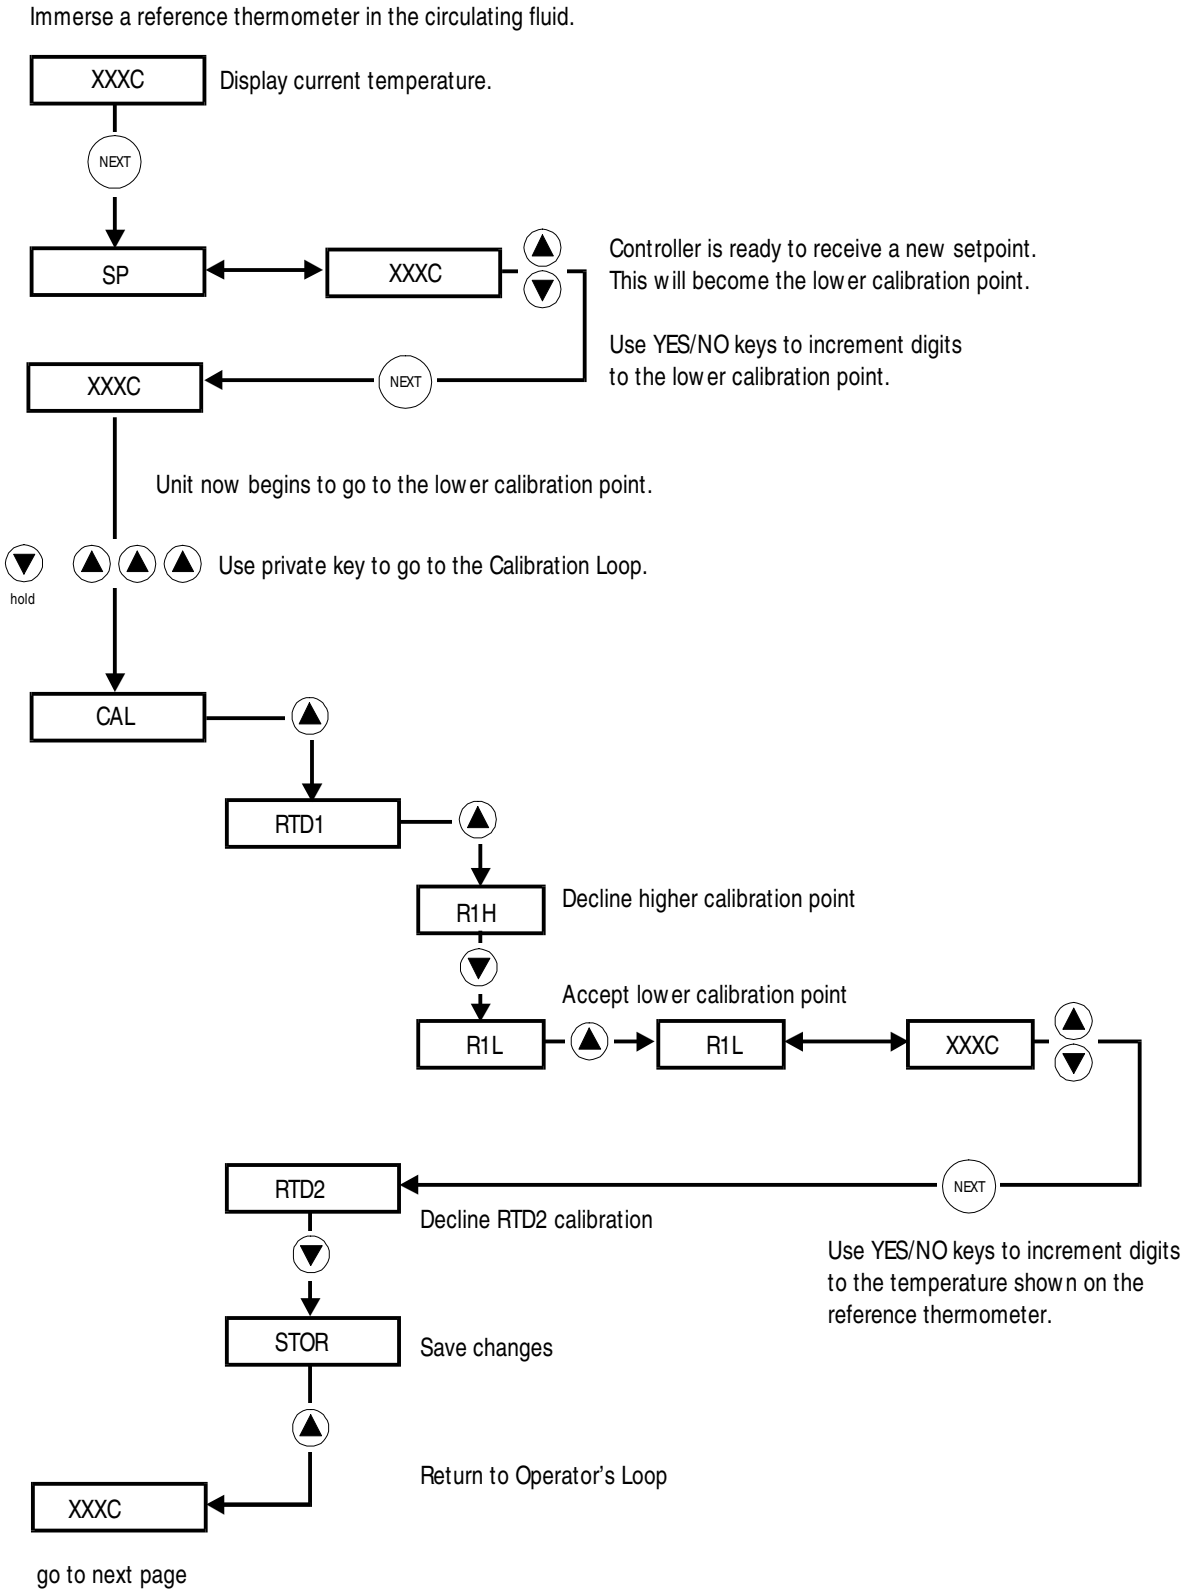
The general procedure consists of:

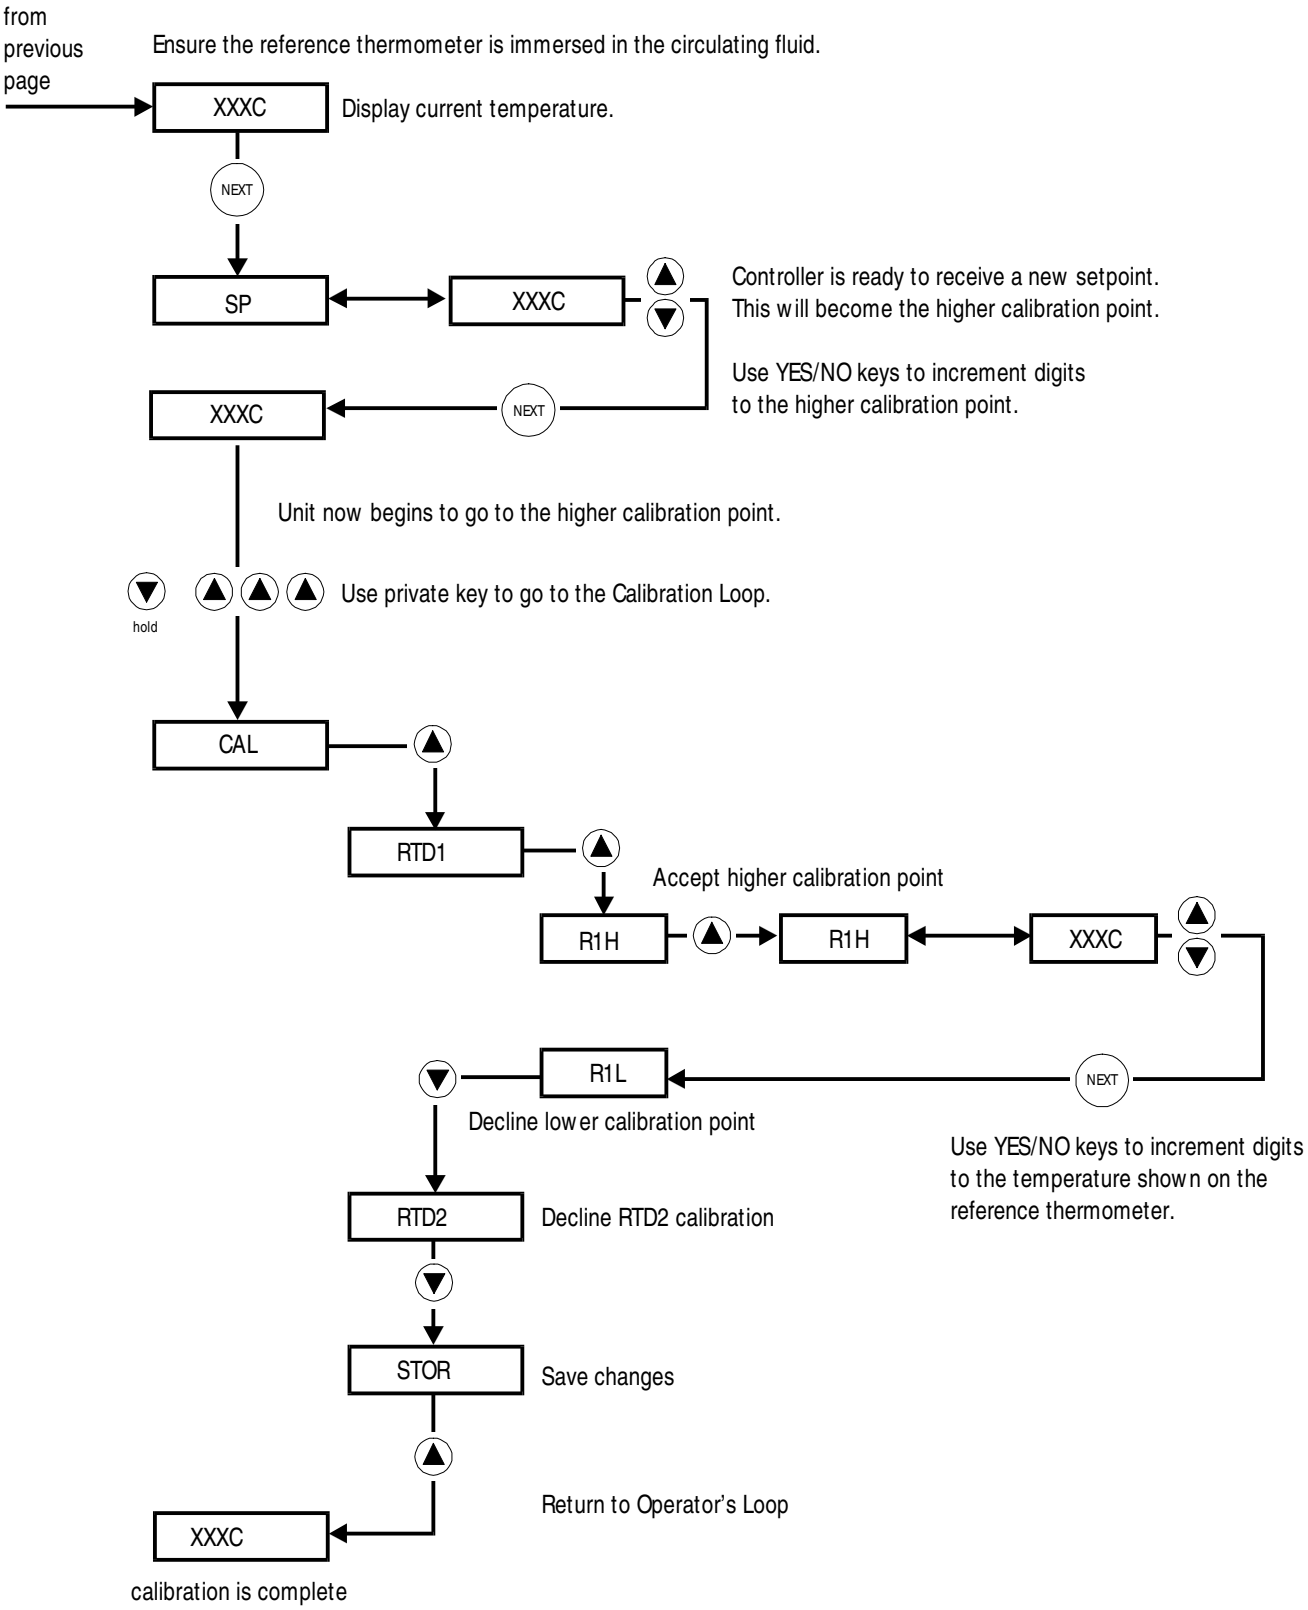
1. From operator’s loop, adjust setpoint to lower calibration point
2. Allow unit to achieve the lower calibration point.
3. Go to calibration loop, enter the reference thermometer value.
4. Go to operator’s loop, adjust setpoint to higher calibration point
5. Allow unit to achieve the higher calibration point.
6. Go to calibration loop, enter the reference thermometer value.

Note: The calibration points are independent.
The higher point may be set first if more convenient.

The step-by-step procedure follows.

Begin in the Operator's Loop





from previous page
Ensure the reference thermometer is immersed in the circulating fluid.
XXXC
Display current temperature.
NEXT
SP
XXXC
Controller is ready to receive a new setpoint.
This will become the higher calibration point.
Use YES/NO keys to increment digits to the higher calibration point.
XXXC
NEXT
Unit now begins to go to the higher calibration point.
hold
Use private key to go to the Calibration Loop.
CAL
RTD1
Accept higher calibration point
R1H
R1H
XXXC
R1L
NEXT
Decline lower calibration point
Use YES/NO keys to increment digits to the temperature shown on the reference thermometer.
RTD2
Decline RTD2 calibration
STOR
Save changes
Return to Operator's Loop
XXXC
calibration is complete

Hot gas valve

The hot gas valve is adjusted as follows.

WARNING: Disconnect unit from line voltage.

1. Attach refrigerant gauges and verify that the refrigerant charge is approximately correct.
2. Start unit and allow it to stabilize.
3. Turn unit setpoint up so unit remains in the heat/idle cycle.
4. Observe suction pressure gauge.
5. Compare reading of gauge to that in the refrigerant data table.
6. Adjust valve, if necessary, to comform to the table.
7. Turn unit off.

WARNING: Disconnect unit from line voltage.

8. Remove refrigerant gauges.

Section V. Preventive maintenance

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician. Contact our Service Department for assistance (see After-sale Support).

Service contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see After-sale Support).

Draining the reservoir

The CFT-300 is equipped with a ½ inch FPT DRAIN fitting located on the rear of the unit.

To drain the CFT-25 to CFT-150 reservoirs we recommend the use of a wet/dry vacuum. Remove the reservoir plug and carefully insert the wet/dry vacuum so as not to damage the cooling coils. **NOTE:** Tilting the unit more than 45° may allow compressor oil to seep into the suction line.

Cleaning

Reservoir

Periodically inspect the fluid inside the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Before changing the cooling fluid, raise the operating temperature of the unit to de-ice the cooling coils. Refer to the operating manual for instructions on replacing the cooling fluid.

Condenser

For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The lower front of the unit has a one-piece grille assembly. Gently pry the assembly off with a flathead screwdriver. Use care not to scratch the paint.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Algae

To restrict the growth of algae in the reservoir, it is recommended that the reservoir cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, 1 gram per 3.5 liters.

Pump strainer

Units with PD pumps have a strainer. Refer to the pump label on the rear of the unit to identify the type of pump in your unit.

If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged with debris and scale. Therefore, the strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

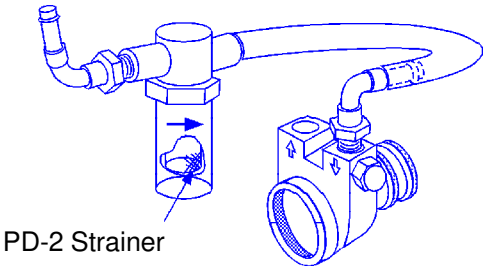
Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

PD-1 pumps have a wire mesh strainer located in the pump head. PD-2 pumps have the strainer located in the pump suction line.

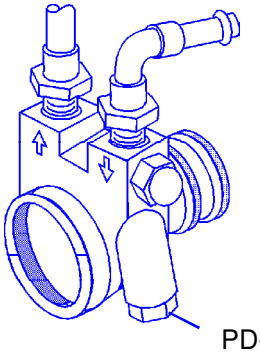
Remove the wrapper from the unit. Unscrew the larger of the two acorn nuts on the pump head and remove the screen.

Clean the screen by rinsing it with water.

When the screen is clean, replace it in the strainer, tighten the acorn nut and replace the wrapper. Refer to the operating manual for instructions on replacing the cooling fluid.



PD-2 Strainer



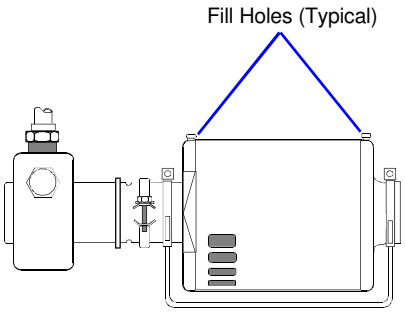
PD-1 Strainer

Pump motor lubrication

PD pump motors require periodic lubrication. Refer to the pump label on the rear of the unit to identify the type of pump in your unit.

PD pumps use sleeve type bearings with large reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil to each bearing on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



Torque

V-band clamp

The V-band clamp (which joins the pump to the motor) should be tightened to **15 - 30 inch-pounds** (85 - 170 cm/kg) of torque.

Hose clamps

The unit's internal and external hoses and clamps should be inspected and tightened on at least a semiannual basis. If the unit uses standard clear reinforced hose (with the reinforcement webbing visible in the wall of the hose), tighten hose clamps to **50 in/lbs** (280 cm/kg).

Note that this type hose will cold-flow, so the clamps will need to retorqued later after the hose conforms to the clamps. (Be aware the hose clamps do not actually loosen, but rather the hose O.D. decreases under them!)

It is best to give them a final torqueing just prior to leaving the job site. It is wise to explain to the customer that a further torqueing may be required the following day - and that a drip developing at the hose clamp is a result of this cold-flow and not poor workmanship.

Section VI. Reference

material safety data sheet (MSDS)

A Material Safety Data Sheet (MSDS) is designed to provide both workers and emergency personnel with the proper procedures for handling or working with that substance. MSDS will include information such as physical data (melting point, boiling point, flash point etc.), toxicity, health effects, first aid, reactivity, storage, disposal, protective equipment, and spill/leak procedures. These are of particular use if a spill or other accident occurs. This Material Safety Data Sheets is provided as a public service. It was gathered from a variety of sources. **Neither NESLAB Instruments, Inc., nor any of its agents are liable for the accuracy, or inaccuracy, of the Material Safety Data Sheet**. You assume the liability for the use of any part of this Material Safety Data Sheet.

R-134a refrigerant

DUPONT E I — SUVA COLD-MP, SUVA 134A
MATERIAL SAFETY DATA SHEET
FSC: 6830
NIIN: 00D003276
Manufacturer's CAGE: 02348
Part No. Indicator: A

pH: N/A
==========
Fire and Explosion Hazard Data
==========
Flash Point: WILL NOT BURN

Lower Explosive Limit: N/A
Upper Explosive Limit: N/A
Extinguishing Media: AS APPROPRIATE FOR COMBUSTIBLES IN AREA.
Special Fire Fighting Proc: COOL CYLINDERS W/WATER SPRAY. SELF-CONTAINED BREATHING APPARATUS MAY BE REQUIRED IF CYLINDERS RUPTURE OR RELEASE UNDER FIRE CONDITIONS.
Unusual Fire And Expl Hazrds: CYLINDERS MAY RUPTURE UNDER FIRE CONDITONS. DECOMPO MAY OCCUR.EXPERIMENTAL DATA HAVE REPORTED COMBUST OF MATL IN PRESENCE OF CERTAIN CONCEN OF CHLORINE.SEE SUPPL

==========

Reactivity Data

==========

Stability: YES
Cond To Avoid (Stability): AVOID OPEN FLAMES AND HIGH TEMPERATURE. ALSO GLOWING METAL SURFACES.
Materials To Avoid: ALKALI OR ALKALINE EARTH METALS-POWDERED ALUMINUM, ZINC, BERYLIUM, ETC. CERTAIN CONCENTRATIONS OF CHLORINE.
Hazardous Decomp Products: DECOMPOSES @ HI TEMP FORMING HYDROFLUORIC ACID AND POSSIBLY CARBONYL FLUORIDE.
Hazardous Poly Occur: NO
Conditions To Avoid (Poly): NOT RELEVANT.

==========

Health Hazard Data

==========

LD50-LC50 Mixture: DUPONT'S 1000PPM, 8 & 12 HR TWA.
Route Of Entry - Inhalation: YES
Route Of Entry - Skin: YES
Route Of Entry - Ingestion: NO
Health Haz Acute And Chronic: INHAL OF HI CONCEN OF VAPOR IS HARMFUL & MAY CAUSE HEART IRREGULARITIES, UNCONSCIOUSNESS OR DEATH. VAPOR REDUCES OXYGEN AVAILABLE FOR BREATHING & IS HEAVIER THAN AIR. LIQ CONTACT CAN CAUSE FROSTBITE.
Carcinogenicity - NTP: NO
Carcinogenicity - IARC: NO
Carcinogenicity - OSHA: NO
Explanation Carcinogenicity: PER MSDS:NONE OF COMPONENTS PRESENT IN MATL @ CONCEN = OR < 0.1% ARE LISTED BY IARC,NTP, OSHA OR ACGIH AS A CARCINOGEN.
Signs/Symptoms Of Overexp: OVEREXOSURE BY INHAL TO VERY HI CONCEN MAY CAUSE TEMP ALTERATION OF THE HEART'S ELECTRICAL ACTIVITY WITH IRREGULAR PULSE, PALPITATIONS, OR INADEQUATE CIRCULATION. SKIN CONTACT WITH THE LIQUID MAY CAUSE FROSTBITE.
Med Cond Aggravated By Exp: INDIVIDUALS WITH PRE-EXISTING DISEASES OF THE CENTRAL NERVOUS OR CARDIOVASCULAR SYSTEM MAY HAVE INCREASED SUSCEPTIBILITY TO THE TOXICITY OF EXCESSIVE EXPOSURES.
Emergency/First Aid Proc: INHAL:IMMED REMOVE TO FRESH AIR.KEEP PERSON CALM.NOT BREATH GIVE ARTIF RESP.BREATH DIFFI GIVE OXY.CALL DR. SKIN:IMMED FLUSH W/LOTS OF H2O FOR @ LEAST 15MINS.REMOVE CONTAM CLOTH/SHOE.CALL DR. TREAT FOR FROSTBITE IF NECESSARY BY GENTLY WARMING AFFECTED AREA.EYE:IMMED FLUSH W/LOTS OF H2O FOR @ LEAST 15MINS.CALL DR. DR:BECAUSE POSSIBLE DISTRUBANCES OF CARDIAC RHYTHM USE CATECHOLAMINE DRUGS CAUTIOUSLY.

==========

Precautions for Safe Handling and Use

==========

Steps If Matl Released/Spill: REVIEW FIRE FIGHTING MEASURES BEFORE PROCEEDING W/CLEANUP.USE APPROPRIATE PPE DURING CLEANUP.VENTI AREAESPECIALLY LOW OR ENCLOSED PLACES WHERE HEAVY VAPORS COLLECT.REMOVE OPEN FLAMES.USE SCBA IF LG SPILL OR LEAK OCCURS.
Neutralizing Agent: NOT SPECIFIED BY MANUFACTURER.
Waste Disposal Method: CONTAMINATED HFC-134A CAN BE RECOVERED BY DISTILLATION OR REMOVED TO A PERMITTED WASTE DISPOSAL FACILITY. COMPLY WITH LOCAL, STATE AND FEDERAL REGULATIONS.
Precautions-Handling/Storing: STORE IN CLEAN, DRY AREA. DO NOT HEAT ABOVE 52C. USE W/SUFFICIENT VENTILATION TO KEEP EMPLOYEE EXPOSURE BELOW RECOMMENDED LIMITS.
Other Precautions: HFC-134A SHOULD NOT BE MIXED W/AIR FOR LEAK TESTING OR USEDS W/AIR FOR ANY OTHER PURPOSE ABOVE ATMOSPHERIC PRESSURE. SEE FIRE & EXPLOSION DATA & SUPPLEMENTAL SECS. CONTACT W/CHLORINE OR OTHER STRONG OXIDIZING AGENTS SHOULD ALSO BE AVOIDED.

==========

Control Measures

==========

Respiratory Protection: UNDER NORMAL MANUFACTURING CONDITIONS NO RESPIRATORY PROTECTION IS REQUIRED WHEN USING THIS PRODUCT. SELF-CONTAINED BREATHING APPARATUS (SCBA) IS REQUIRED IF A LARGE RELEASE OCCURS.
Ventilation: NORMAL VENTILATION FOR STANDARD MANUFACTURING PROCEDURES IS GENERALLY ADEQUATE.
Protective Gloves: IMPERVIOUS GLOVES.
Eye Protection: CHEM SPLASH GOGGLES.
Other Protective Equipment: NONE SPECIFIED BY MANUFACTURER.
Work Hygienic Practices: WASH CONTAMINATED CLOTHING/SHOE PRIOR TO REUSE.
Suppl. Safety & Health Data: MATL NOT FLAMM @ AMBIENT TEMP & ATM

PRESSURE.TESTS HAVE SHOWN COMBUSTIBLE @ PRESSURE AS LOW AS 5.5 PSIG @ 177C WHEN MIXED W/AIR @ CONCEN OF GENERALLY MORE THAN 60 VOLUME % AIR.AT LOWER TEMP,HIGHER PRESSURE ARE REQUIRED FOR COMBUSTIBILITY. DO NOT USE IN MED APPLICATINS INVOLVING PERMANENT IMPLANTATION IN THE HUMAN BODY.

Flash Point Method: TOC
Extinguishing Media: AS APPROPRIATE FOR COMBUSTIBLES IN AREA. EXTINGUISHANT FOR OTHER BURNING MATERIAL IN AREA IS SUFFICIENT TO STOP

BURNING.
Special Fire Fighting Proc: WEAR NIOSH/MSHA APPRVD PRESSURE DEMAND SCBA & FULL PROT EQUIP (FP N). USE WATER SPRAY/FOG TO COOL CONTAINERS.
Unusual Fire And Expl Hazrds: THERMAL DECOMP PRODS MAY INCLUDE CHLORIDES, FLUORIDES & PHOSGENE (FP N). OTHER BURNING MATLS MAY CAUSE HCFC 22 TO BURN WEAKLY. CHLORODIFLUOROMETHANE (SUP DAT)

==========

Reactivity Data

==========

Stability: YES
Cond To Avoid (Stability): AVOID OPEN FLAMES AND HIGH TEMPERATURES.
Materials To Avoid: ALKALI OR ALKALINE EARTH METALS (POWDERED AL, ZN, BE, ETC.).
Hazardous Decomp Products: HIGH TEMPS (OPEN FLAMES, GLOWING METAL SURFS, ETC.) FORMING HYDROCHLORIC & HYDROFLUORIC ACIDS, & POSS CARBONYL (SUP DAT)
Hazardous Poly Occur: NO
Conditions To Avoid (Poly): NOT RELEVANT.

==========

Health Hazard Data

==========

LD50-LC50 Mixture: NONE SPECIFIED BY MANUFACTURER.
Route Of Entry - Inhalation: YES
Route Of Entry - Skin: YES
Route Of Entry - Ingestion: NO
Health Haz Acute And Chronic: INHAL OF HIGH CONCS OF VAP IS HARMFUL & MAY CAUSE IRREGULARITIES, UNCONSCIOUSNESS/DEATH. INTENTIONAL MISUSE/DELIBERATE INHAL MAY CAUSE DEATH WITHOUT WARNING. VAP REDUCES OXYGEN AVAILABLE FOR BRTHG & IS HVR/AIR. LIQUID CONT CAN CAUSE FRSTBT. ANIMAL DATA: TOXICITY DESCRIBED IN ANIMALS EXPOSED BY INHAL TO CONCS (ING 9)
Carcinogenicity - NTP: NO
Carcinogenicity - IARC: NO
Carcinogenicity - OSHA: NO
Explanation Carcinogenicity: NOT RELEVANT.
Signs/Symptoms Of Overexp: OVEREXP TO VAPS BY INHAL MAY INCLUDE TEMPORARY NERVS SYS DEPRESS W/ANESTH EFTS SUCH AS DIZZ, HDCH, CONFUSN, INCOORD, & LOSS OF CONSCIOUSNESS. HIGHER EXPOS TO VAPS MAY CAUSE TEMPORARY ALTERATION OF HEART'S ELEC ACTIVITY W/IRREGULAR PULSE, PALPITATIONS/ INADEQUATE CIRCULATION. FATALITY MAY OCCUR FROM GROSS (ING 7)
Med Cond Aggravated By Exp: BECAUSE OF POSSIBLE DISTURBANCES OF CARDIAC RHYTHM, CATECHOLAMINE DRUGS, SUCH AS EPINEPHRINE, SHOULD ONLY BE CONSIDERED AS A LAST RESORT IN LIFE-THREATENING EMERGENCIES.
Emergency/First Aid Proc: INHAL: IF LGE CONCS ARE INHALED, IMMED REMOVE TO FRESH AIR. KEEP PERS CALM. IF NOT BRTHG, GIVE ARTF RESP. IF BRTHG IS DIFFICULT, GIVE OXYGEN. CALL MD. SKIN CONT: FLUSH W/WATER FOR 15 MIN. TREAT FOR FROSTBT IF NEC BY GENTLY WARMING AFFECTED AREA. IF IRRIT IS PRESENT, CALL MD. EYES: IMMED FLUSH W/PLENTY OF WATER FOR AT LEAST 15 MIN. CALL MD. INGEST: NOT CONSIDERED A POTENTIAL ROUTE OF EXPOSURE.

==========

Precautions for Safe Handling and Use

==========

Steps If Matl Released/Spill: NOTE: REVIEW FIRE & EXPLOS HAZ & SFTY PREC BEFORE PROCEEDING W/CLEAN UP. USE APPROP PERSONAL PROT EQUIP DURING CLEAN UP. VENT AREA, ESPECIALLY LOW/ENCLOSED PLACES WHERE HEAVY VAPS MIGHT COLLECT. REMOVE OPEN FLAMES. USE SCBA FOR LGE SPILLS/RELEASES.
Neutralizing Agent: NONE SPECIFIED BY MANUFACTURER.
Waste Disposal Method: COMPLY WITH FEDERAL, STATE, AND LOCAL REGULATIONS. RECLAIM BY DISTILLATION OR REMOVE TO A PERMITTED WASTE DISPOSAL.
Precautions-Handling/Storing: STORE IN CLEAN, DRY AREA. DO NOT HEAT ABOVE 52C (125F).
Other Precautions: NO SMKNG IN AREA OF USE. DO NOT USE IN GEN VICIN OF ARC WELDING, OPEN FLAMES/HOT SURFS. HEAT &/UV RADIA MAY CAUSE FORM OF CHLORIDES, FLUORIDES &/PHOSGENE (FP N). USE W/SUFFICIENT VENT TO KEEP EMPLOYEE EXPOS BELOW RECOMMENDED LIMITS. (ING 4)

==========

Control Measures

==========

Respiratory Protection: UNDER NORMAL MANUFACTURING CONDITIONS, NO RESPIRATORY PROTECTION IS REQUIRED WHEN USING THIS PRODUCT. USE NIOSH/MSHA APPROVED SCBA WHEN A LARGE RELEASE OCCURS.
Ventilation: NORM VENT FOR STANDARD MFG PROC IS GEN ADEQ. LOC EXHAUST SHOULD BE USED WHEN LARGE AMOUNTS ARE RELEASED. MECH (ING 3)
Protective Gloves: IMPERVIOUS GLOVES (FP N).
Eye Protection: ANSI APPRVD CHEM WORKERS GOGGS(FP N).
Other Protective Equipment: EMERGENCY EYEWASH & DELUGE SHOWER MEETING ANSI DESIGN CRITERIA (FP N).
Work Hygienic Practices: NONE SPECIFIED BY MANUFACTURER.
Suppl. Safety & Health Data: HAZ DECOMP PROD: HALIDES, PHOSGENE (FP N). EXPLO HAZ: IS NOT FLAM AT AMBIENT TEMPS & ATMOSPHERIC PRESS. HOWEVER IT HAS BEEN SHOWN IN TESTS TO BE COMBUST AT PRESS AS LOW AS 60 PSIG AT AMBIENT TEMP WHEN MIXED W/AIR AT CONCS OF 65 VOL & AIR. EXPTL DATA HAVE ALSO BEEN REPORTED WHICH INDICATE COMBUST OF “FREON” 22 (ING 2)

CFT75: solenoid valve change

1. What units are affected?

model:	**CFT 75 R134A ONLY (not R22 or R12)**
part numbers:	**395xxxxxxxxx**
serial numbers:	**this change occurs at serial number 198223000**
date of manufacture:	**this change occurs August 11, 1998**

2. What is the problem/symptom?
The unit may runaway cold, even though the controller is calling for heating.

3. What is the cause?
The installed liquid line solenoid valve (PN 009475 - type XUP) is not optimum for this application.

4. What is the fix?
The solenoid valve is replaced by a different one (PN 009741 - type XWG).

5. Should we fix any existing units (rework or recall units in the field)?
It is not necessary to service any units that operate correctly. If a unit exhibits this symptom, the valve should be replaced with the new one. The coil is the same and may be reused.

6. How do I get replacement parts or more information?
Consult NESLAB Technical Service.

7. Need more information?
Current service information is available 24 hours a day on NESLAB ONLINE. Service information is available on the NESLAB OFFLINE 1998 cd-rom.

Service manual **000877** is available for CFT75 units using traditional (“Banks”) controllers with a controller code of 01 or 02 (the controller code is the ninth and tenth digits of the 12-digit unit part number). This manual is available on paper, on cd-rom, and online. Service manual **U00320** is available for CFT75 units using the newer TC200 controllers with a controller code of 15 (the controller code is the ninth and tenth digits of the 12-digit unit part number). This manual is available on paper, or online.

Refer to PCO (Product Change Order) **12173.**

Test sheets are available on microfiche at all NESLAB offices.

Service bulletin
U00349
18 May 1999

1. What units are affected?

model: **CFT-33**

part numbers: **394106031501 394106031502 394106031503 394106031504 394106041501 394106041502 394106041503 394106041504 394106041505 394106041506 394106121501 394106991501 394106991502**

serial numbers (approximate range): **196270001 to 199130001**

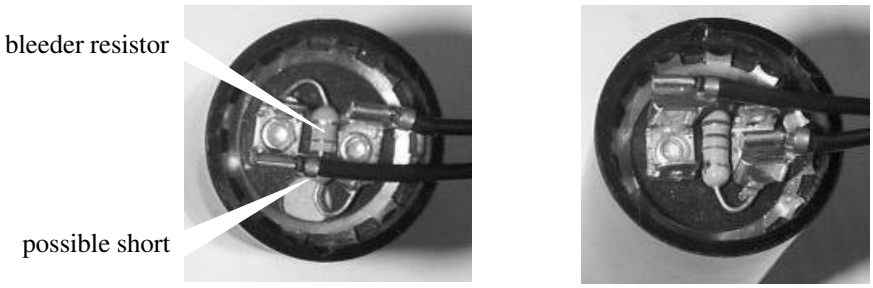
date of manufacture: **from late 1996 to May 1999**

2. What is the problem/symptom?

When main power is applied the compressor will not start and the compressor motor overload quickly trips. The start capacitor will appear to be shorted when checked with an ohmmeter.

3. What is the cause?

Wires may have been incorrectly attached to the start capacitor by the condensing unit manufacturer so that the capacitor is shorted. Actual short is between the wire terminal and the end cap of the bleeder resistor. A shorted capacitor can not participate in the compressor start cycle and as a result the compressor motor may not start.



wrong right

4. What is the fix?

If capacitor is wired incorrectly, disconnect from line voltage and rewire start capacitor as indicated. Replace bleeder resistor if the enamel is damaged. Unit should now start normally.

5. Should we fix any existing units (rework or recall units in the field)?

All units returned for servicing should be checked for correct capacitor wiring. Units found to be incorrectly wired should be reworked as shown.

6. Who can I call for help?

Our Technical service group is ready to help you sort out issues involving product performance.

Year 2000 statement

NESLAB Instruments, Inc.

Subject: Y2K Year 2000 Policy Statement

NESLAB Instruments Inc. and the Year 2000. NESLAB Instruments Inc. recognizes the importance of providing our customers with products that will continue to function correctly during the Year 2000 and beyond. NESLAB is also committed to communicating to its customers its status with respect to Year 2000 compliance.

Definition. NESLAB Instruments has adopted the following definition of Year 2000 compliance as set forth by the British Standards Institution in DISC PD2000-1 A Definition of Year 2000 Conformity Requirements (available on the Internet at http://www.bsi.org.uk/disc/year2000.html), with the qualification that the upper limit for compliance is the year 2035:

Year 2000 conformity shall mean that neither performance nor functionality is affected by dates prior to, during, and after the year 2000. In particular:

Rule 1: No value for current date will cause any interruption in operation.
Rule 2: Date-based functionality must behave consistently for dates prior to, during, and after year 2000.
Rule 3: In all interfaces and data storage, the century in any date must be specified either explicitly or by unambiguous algorithms or inferencing rules.
Rule 4: Year 2000 must be recognized as a leap year.

Our Products. It is our goal that our customers can continue to use our Products during and after the Year 2000. NESLAB Instruments has carried out a review of its products with respect to Year 2000 compliance.

There are no current NESLAB products which incorporate clock or calendar functions. Therefore, we believe all of our current products to be Year 2000 compliant.

Additional information about NESLAB Instruments' products can be found at our website (http://www.neslabinc.com).

Internal Business Systems. NESLAB has carried out a review of its products and its internal systems with respect to Year 2000 compliance.

NESLAB houses an IBM AS/400 system that runs MAPICS XA R3 MRP software. This software package is fully Year 2000 compliant. NESLAB also utilizes Windows 95 and other Microsoft products on the desktop; all of these software products are also Year 2000 compliant. In addition, NESLAB will be performing internal testing to further ensure Year 2000 compliance of these systems.

In addition, NESLAB Instruments is contacting its key vendors/suppliers to assess their Year 2000 readiness.

Summary

In summary, NESLAB Instruments, Inc. believes that its products and its internal business systems are currently Year 2000 compliant.

Customer Commitment. NESLAB Instruments recognizes the importance of this issue to our customers. If you have additional questions, please contact Mr. Mike Pratt of our technical support group.

Nothing in this statement is intended to modify rights and obligations under any agreement or to create any new rights or obligations between NESLAB Instruments and our customers.

Sincerely,

James R. Allen
Vice President Finance, Systems & Administration

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. This label indicates testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 1000-4-2:1995
	IEC 1000-4-3:1994
	IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units are warranted against defective parts and workmanship for one full year from date of shipment. See back page for more details.

After-sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Customer Service Department. Before calling, please obtain the following information from the unit's serial number label:

*BOM Number*_____

*Serial Number*_____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department (see After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturers warranty.

Observe all warning labels.

Never remove warning labels.

Never operate damaged equipment.

Refer service and repairs to a qualified technician.

Sales Centers

North American and European Thermo NESLAB Sales and Service Centers are open 8:00 am to 5:00 pm (in their respective time zones), Monday through Friday.

Section II General Information

Description

The Cryotrol Temperature Controller is an analog temperature controller designed to control the temperature of a CryoCool Immersion Cooler, a PBC Portable Bath Cooler, or a Cryobath Low Temperature Bath. The Cryotrol provides the host unit with temperature stability of ±0.5°C.

The unit consists of solid state, zero crossover relay and a temperature sensor.

Specifications

Temperature Range	-100°C to +20°C
Sensor	Stainless Steel 4' (1.2M) lead
Sensor Dimensions	
(Diameter x Length) In.	3/16 x 10
Cm.	0.5 x 25.4
Power Requirements	115 V, 60 Hz, 0.6 Amps
50 Hz Models	220-240 V, 50 Hz, 0.3 Amps
Shipping Weight	
Pounds	6
Kilkograms	2.7

Section III Installation

Site

The unit should be located on a sturdy table or bench top.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

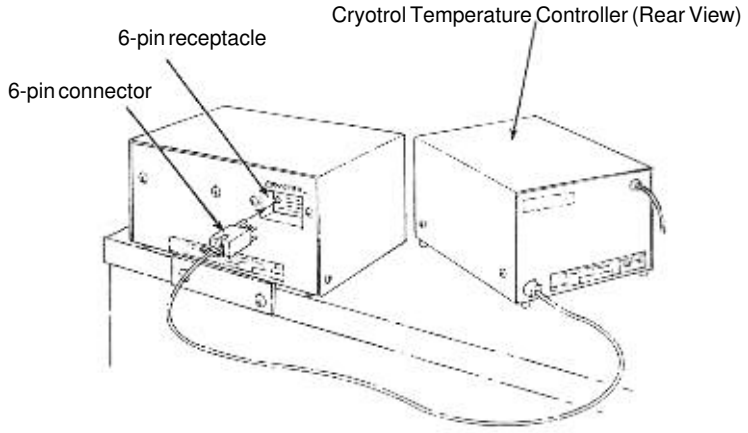
Electrical Requirements

The Cryotrol receives its power from the host unit. Plug the 6 pin connector from the Cryotrol into the 6 pin receptacle on the host unit. When properly connected, the Power lamp on the front of the Cryotrol will light when the host unit is turned on.

Older CryoCool, Cryobath, and PBC units are equipped with a round 8 pin receptacle. If you wish to connect your Cryotrol to one of these older host units, an adapter cable is available from Thermo NESLAB. Contact our Customer Service Department for more information (see Preface, After-sale Support).

Sensor

Insert the Cryotrol temperature sensor into the fluid work area.



Cryotrol Installation (Typical)

Section IV Operation

Start Up

Before starting the unit, double check the electrical connections, make sure the temperature sensor is inserted in the work area, and make sure the calibrated temperature dial is adjusted for a temperature lower than the fluid in the bath.

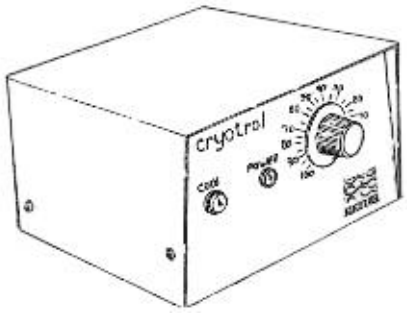
When the host unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Temperature Adjustment

To adjust the temperature of the fluid in the work area, turn the calibrated dial and position the reference line as close as possible to the desired temperature. The Cool lamp on the front of the controller indicates the status of the refrigeration system in the host unit.

Do not operate CryoCool or Cryobath units above -25°C.

For best results, stirring or agitation in the work area is recommended. With no stirring the work area will show temperature layering, and the coldest, most dense fluid will be at the bottom.



Cryotrol Temperature Controller (Front)

Section V Maintenance

Service Contracts

Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Customer Service Department (see Preface, After-sale Support).

Cleaning

Periodically clean the unit using a soft, non-abrasive cloth.

Calibration

The Cryotrol must be periodically calibrated. The frequency of calibration depends on the amount and type of use. Thermo NESLAB recommends checking the Cryotrol against a calibrated reference thermometer once a month after initial installation. After several months, the frequency of calibration will be established.

Equipment required:

The Cryotrol's host unit.

Calibrated reference thermometer, accurate to ±1°C. A Thermo NESLAB DR-2 digital thermometer is recommended.

If calibrating the Cryotrol with a CryoCool immersion cooler or PBC portable bath cooler, an insulated container, filled with non-freezing fluid is required. A Thermo NESLAB U-tainer, or Agitainer insulated container is recommended.

Calibration:

Calibrating the Cryotrol with a Cryobath: insert the Cryotrol sensor and the reference thermometer sensor in the host unit's bath.

Calibrating the Cryotrol with a CryoCool or PBC: insert the Cryotrol sensor, the reference thermometer sensor and the host unit's probe in the insulated container.

Adjust the Cryotrol's temperature dial for -40°C (-20°C on PBC units). Align the dial's reference line as close as possible with -40°C (-20°C).

Remove the temperature dial.

Turn the Cryotrol on. Allow time for the fluid temperature in the bath or insulated container to stabilize.

Replace the temperature dial, aligning the reference line as close as possible to the temperature indicated on the reference thermometer.

Section VI Troubleshooting

Checklist

Power lamp is not lit.

Check electrical connection between Cryotrol and host unit (see Section III, Electrical Requirements).

Host unit is not on.

Power lamp may have failed.

No temperature control.

Check electrical connection between Cryotrol and host unit (see Section III, Electrical Requirements).

Make sure the temperature sensor is in the fluid work area.

Stirring or agitation in the work area is necessary (see Section IV, Temperature Adjustment).

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Customer Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

BOM number

Serial number

Voltage of unit

Voltage of power source

Technical Support

Our Customer Service Department can provide you with a wiring diagram and a complete list of spare parts for your unit (see Preface, After-sale Support). Before calling, please obtain the following information:

BOM number

Serial number

Section VII Warranty

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. Thermo NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Thermo NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

WARRANTY

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. This label indicates testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. The unit control box for microprocessor units is packed in a separate carton. Be sure to locate this separate carton; do not dispose of it by mistake.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Customer Service Department. Before calling, please obtain the following information from the unit's serial number label:

- *BOM number* _____

- *Serial number* _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department.

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without bath fluid in the bath.

Never use pure ethylene glycol as a bath fluid. A minimum 80/20 mixture of Ethylene Glycol and tap water is allowed.

For 220 - 240 volt units supplied without a line cord, use a harmonized (HAR) grounded 3-conductor cord, type H 0 5 V V - F , with conductors listed below. A suitable cord end is required for connecting to the equipment (see unit socket) and must terminate with an IEC approved plug for proper connection to power supply.

NON-BOOST HEATER UNITS	**Nominal 1.0 mm^2 cross section rated 10 Amps**
	Unit Socket: IEC - 320 C13
BOOST HEATER UNITS	**Nominal 1.5 mm^2 cross section rated 16 Amps**
	Unit Socket: IEC - 320 C19

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the bath before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, personal injury or death.

Section II General Information

Description

The EX Series Bath Circulators are designed to provide temperature control for applications requiring a fluid work area or pumping to an external system.

The units consist of a circulation pump, stainless steel bath, a work area cover, and a temperature controller.

Specifications

	EX-111	EX-211
Temperature Range[1]	Ambient to +150°C	
Temperature Stability[2]	±0.01°C	
Pumping Capacity	15 lpm at 0' (0 M) 0 lpm at 16' (4.9 M)	
Heater *Watts* *50 Hz Models*	800 1000	
Bath Work Area (H x W x D) *Inches* *Centimeters*	4 3/4 x 8 x 6 12.1 x 20.3 x 15.2	9 1/4 x 10 x 6 23.5 x 25.4 x 15.2

3. Power Board Transformer Fuse- T 2.0A 250V (Qty 1) [T=Time Delay].

Section III Installation

Site

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

Lift the unit by grasping under the case near the rubber feet. Locate the unit on a sturdy table or bench top. Ambient temperatures should be inside the range of +50°F to +80°F (+10°C to +27°C).

Electrical Requirements

Line voltage may be easily accessible inside the pump/control box. Always unplug the unit prior to removing pump/control box cover.

Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

For 220 - 240 volt units supplied without a line cord, use a harmonized (HAR) grounded 3-conductor cord, type H 0 5 V V - F , with conductors listed below. A suitable cord end is required for connecting to the equipment (see unit socket) and must terminate with an IEC approved plug for proper connection to power supply.

BOOST HEATER UNITS	**Nominal 1.5 mm² cross section rated 16 Amps**
	Unit Socket: IEC - 320 C19
NON-BOOST HEATER UNITS	**Nominal 1.0 mm² cross section rated 10 Amps**
	Unit Socket: IEC - 320 C13

Plumbing Requirements

Ensure the unit is off before connecting tubing to the unit.

Hose Connections

The pump connections are located at the rear of the pump box and are labelled PUMP INLET and PUMP OUTLET. These connections are bent upward so the recirculating fluid will drain back into the reservoir when the hoses are disconnected. Both connections are capped with stainless steel serrated plugs.

The pump lines have ¼ inch male pipe threads for mating with standard plumbing fittings. For your convenience stainless steel adapters, ¼ inch female pipe thread to ⅜ inch O.D. serrated fitting, are provided. (To assure proper fit, they should be installed using Teflon® tape around the threads.)

Flexible tubing, if used, should be of heavy wall or reinforced construction. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the external system as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, make them at the inlet and outlet of the external system, not at the unit.

If substantial lengths of cooling lines are required, they should be pre-filled with bath fluid before connecting them to the unit. This will ensure that an adequate amount of fluid will be in the bath once it is in operation.

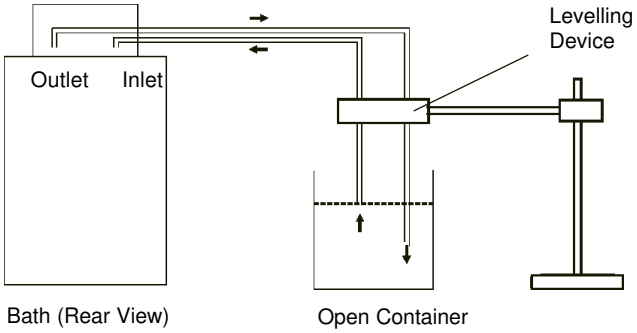
Pumping

The pump is designed to deliver a flow of 15 liters/minute (4 gallons minute) at 0 feet head. To prevent external circulation, the PUMP INLET and PUMP OUTLET lines on the rear of the unit are capped. The caps must be removed when external circulation is required.

To properly secure external hose connections to the unit, wrap teflon tape around the pipe line threads before installation. Once the hose connections are made, the hoses must be properly plumbed to an external system. *It is important the bath is not in operation until all plumbing is complete.*

If the bath is not used for external circulation, make sure the stainless steel caps are in place prior to operating the bath.

Circulating to an open container



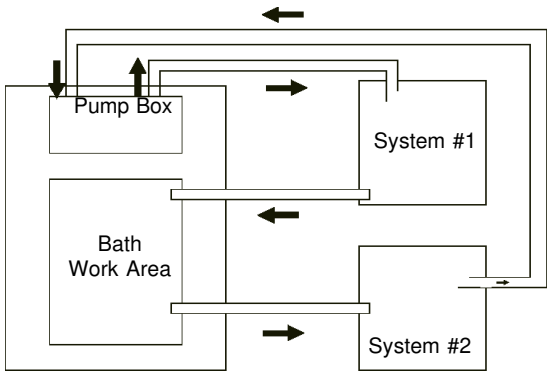
A stainless steel leveling device is available to aid circulation to an open vessel. Contact our Sales Department for more information (see Preface, After-sale Support).

Support the leveling device over the open container with a ringstand. Stagger the tubes in the leveling device so one tube is submerged in the vessel fluid, and the other tube is level with the fluid surface. Connect the deeper tube to the PUMP OUTLET and the shorter tube to the PUMP INLET.

Adjust the flow rate using the accessory flow control valve connected to the PUMP OUTLET, or by partially restricting the outlet tubing. When properly adjusted, the pump inlet will draw an occasional air bubble to prevent over flow, and the pump outlet will force fluid through the submerged tube to prevent aeration of the vessel.

To avoid siphoning the bath work area when the unit is shut off, lift the leveling device out of the vessel and above the level of the unit.

Circulating through two closed loops



Bath (Top View)

The pump can be used to circulate through two closed loop systems. Connect the shortest practical length of flexible tubing from the PUMP OUTLET to the inlet of external system #1. Connect the outlet of system #1 directly into the bath work area. Connect tubing from the bath work area to the inlet of system #2. Connect the outlet of system #2 to the PUMP INLET.

Tap Water Cooling Coils

The unit is equipped with a cooling coil located behind the stainless steel baffle in the bath. The bath can be cooled and temperature stability improved by circulating cold fluid through the coil. For best results, the fluid should be a least 5°C below the temperature setpoint. The required fluid flow rate depends on the type of fluid, the setpoint, and the desired stability.

The plumbing connections for the cooling coil are 3/8 inch OD stainless steel tubes located on the rear of the unit. These connections will accept 3/8 inch or 5/16 inch ID tubing. Tubing is available from NESLAB.

Connect the COOLING COIL IN tube to the cold fluid source. Connect the COOLING COIL OUT tube to the cold fluid return (or drain if tap water is being used).

Drain

Ensure the temperature of the bath fluid is safe before draining the unit.

The unit is equipped with a drain located at the back of the unit at the base of the bath. The drain has ¼ inch male pipe threads and is capped with a stainless steel plug. To drain the reservoir simply remove the cap.

To assure proper fit when replacing the cap, be sure to line the threads with Teflon® tape.

Fluids

Never use flammable or corrosive fluids with this unit.

Tap water is the recommended fluid for operation from +8°C to +80°C.

Above +80°C, the user is responsible for fluids used.

Never use pure ethylene glycol as a bath fluid. A minimum 80/20 mixture of Ethylene Glycol and tap water is allowed.

Filling Requirements

The bath work area has a high and low level marker to guide filling. The markers are 1 inch horizontal slits located in the center of the stainless steel baffle separating the work area and the pump assembly. The correct fluid level falls between these two markers. The heating coils will be exposed and may become damaged if the correct fluid level is not provided.

When pumping to an external system, keep extra fluid on hand to maintain the proper level in both the circulating lines and the external system.

Never run the unit when the work area is empty.

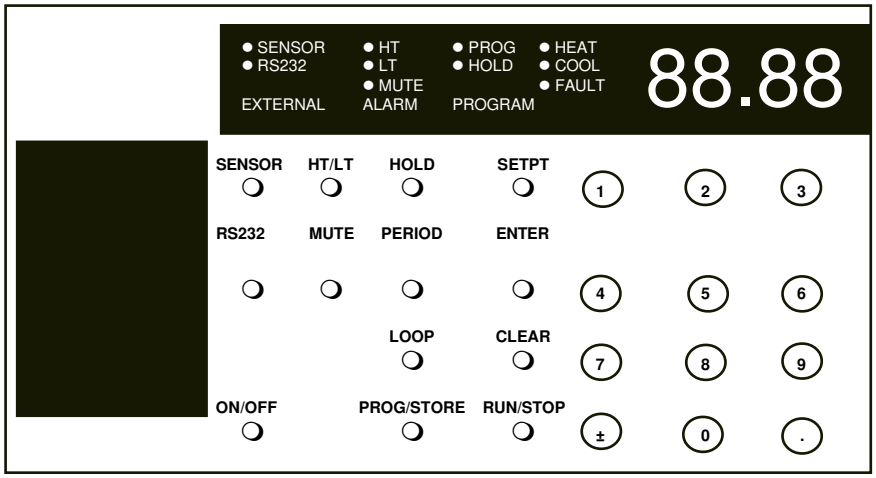
Section IV Microprocessor Controllers

Microprocessor Controller

Description

The microprocessor controller is designed as a separate component from the unit. The controller can be mounted directly on the pump box, or remotely from the bath. The controller provides proportional with integral and derivative (PID) control.

The controller has two sections. The upper section contains the LED indicators and the Main display which provide feedback to you about the controller and bath. The ten individual LED indicators provide output on selected parameters while the Main display will provide information on various unit conditions.[1] The lower section contains the keypad you use to input data to the controller.



Microprocessor Temperature Controller (Front View)

Controller Mounting

The controller can be removed from the bath and placed in a remote location. Extension cables are available from NESLAB. Contact our Sales Department for more information.

Controller Connection

Microprocessor controllers are supplied with a cable needed to connect the controller to the pump box. Connect the cable to the 25-pin male connector on the control box and the female connector on the pump box. Once the connection is made, the unit is ready for operation.

NOTE: The MAIN POWER should be OFF before connecting/disconnecting cables from the control box.

1. The COOL LED is applicable only to refrigerated uits.

LED Indicators

The following table explains the controller LED indicators. The LEDs can be on, off or flashing.

LED	STATUS	INDICATION
SENSOR	OFF	All controller functions are operating from the unit's internal probe.
	ON	All controller functions are operating from remote sensor input.
	FLASHING	The Main display indicates the remote sensor temperature. The controller, however, still uses the internal probe to control the bath temperature.
RS232	OFF	Communication port disabled.
	ON	Communication port enabled.
	FLASHING	Awaiting next key press
LT	OFF	No alarm.
	ON	Main display indicates low limit setpoint.
	FLASHING	Low limit alarm condition.
HT	OFF	No alarm.
	ON	Main display indicates high limit setpoint.
	FLASHING	High limit alarm condition.
HOLD	OFF	Programming hold feature disabled.
	ON	Programming hold feature enabled.
PROG	OFF	No program running.
	ON	The program is suspended[1].
	FLASHING	The program is running.
COOL[2]	OFF	Refrigeration is off.
	ON	Refrigeration is on.
HEAT	OFF	The heater is off.
	ON	The heater is on.
	FLASHING	The heater duty cycle.
MUTE	OFF	The alarm is enabled.
	ON	The alarm horn is disabled.
	FLASHING	The alarm horn has been disabled for any current condition. The alarm horn will automatically reset when the condition is cleared.
FAULT	OFF	No fault condition.
	ON	The high temperature/low level safety has activated.

1.The bath fluid will maintain he setpoint achieved at the time the program is suspended. No operator inputs are available to the controller while in a suspended condition.

2.The COOL LED is applicable only to refrigerated units.

Start Up

Before starting the unit, check all electrical and plumbing connections and make sure the work area has been properly filled with bath fluid.

NOTE: The fluid level should be between the two lateral slots at the rear of the reservoir.

To power the controller on 115V units, place the MAIN POWER switch on the side of the unit to the ON position. This only supplies power to the controller. *The unit itself is not operating.* The Main display on the controller will display OFF.

220V units have a circuit breaker instead of a switch. The circuit breaker is labeled **I** (power on) and **O** (power off). Ensure the circuit breaker is in the **I** position.

Press the keypad ON/OFF button on the controller. The pump will start and the Main display will indicate the temperature of the fluid in the bath. The controller will respond to the current setpoint.

Pressing the keypad ON/OFF button again will disable control of the bath and shut down the pump. The Main display will indicate OFF. (When the controller is in the RS232 mode of operation, see page 13, the ON/OFF button is deactivated. Control of the bath can only be disabled via an RS232 input.)

Temperature Adjustment

To display the temperature setpoint, press SETPT. The Main display will flash the current setpoint. Press ENTER to return the display to the bath's fluid temperature. To adjust the setpoint press SETPT and then press CLEAR, the display will go blank. Use the keypad to input the desired value. If the value is correct press ENTER. If the value is incorrect press CLEAR, the display will go blank. Use the keypad to correct the value and press ENTER.

Low and High Temperature Limits

To display the temperature limits, press HT/LT. Either the HT or LT LED will illuminate and the Main display will flash the corresponding temperature limit. Press ENTER and then press HT/LT again to observe the other temperature limit. The corresponding LED on the controller will illuminate. Should either limit be exceeded an alarm will sound (if not muted) and the corresponding LED will flash.

To adjust either limit, press HT/LT and then press CLEAR, the display will go blank. Use the keypad to input the desired value. If the value is correct press ENTER. If the value is incorrect press CLEAR, the display will go blank. Use the keypad to correct the value and press ENTER. Use the LT or HT LED indicators to verify which temperature limit you are changing.

Alarm/External Functions

Mute Alarm

The alarm audio may be permanently silenced by pressing MUTE, and then immediately (within one second) pressing HOLD. The MUTE LED will now stay lit. To restore the audio, press MUTE and then immediately (within one second) press CLEAR. The MUTE LED will extinguish.

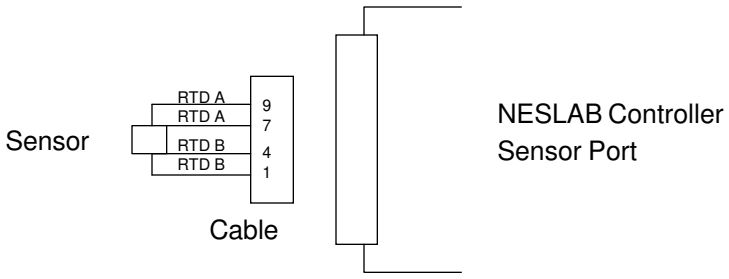
If desired, you may mute the audible portion of an alarm for an existing condition. Press MUTE on the temperature controller. The MUTE LED flashes to indicate a muted alarm horn. The MUTE button acts as a toggle switch to activate/deactivate the alarm horn. The appropriate HT or LT LED will continue to flash during the alarm condition. If the alarm is muted for an existing condition it will automatically reset once the temperature limit problem is corrected. The alarm will resound if a limit is exceeded another time unless MUTE is pressed again.

Sensor

The controller has the capability to enable and/or monitor a remote bath's temperature sensor. (Remote sensor probes of various sizes are available from NESLAB. Contact our Sales Department for more information.) Pressing SENSOR, when a remote sensor is properly connected to the controller's 9-pin SENSOR connector, will display the remote sensor's temperature on the Main display. The SENSOR LED will flash. *The controller and alarm, however, will continue to respond to the signals from the unit's internal probe.*

To completely transfer all display, control and alarm functions to the remote sensor, press SENSOR and then press ENTER. The SENSOR LED will stay lit. The controller will not respond to the signal from the unit's internal probe.

To disable the remote sensor press SENSOR and then press CLEAR. The SENSOR LED will extinguish. All display and alarm functions will again respond to the signal from the unit's internal probe.



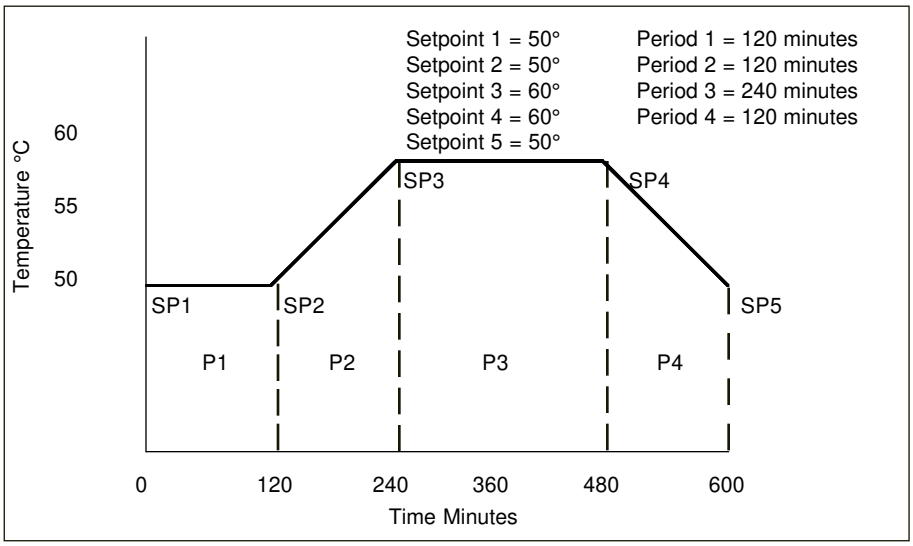
RS232

The unit can be controlled through your computer's serial port by using a standard 9-pin RS232 connection on ther rear of the temperature controller. For complete information see Appendix A.

Program Functions

Programming

The microprocessor controller can store up to 8 temperature programs, each one having up to 15 program steps (16 setpoints). You can select, enter or run one program at a time. The procedure for selecting a program is discusssed in Program Control on page 15. The programs can cover the unit's full temperature operating range in 0.01°C increments. Step times can vary from 0 to 6,500 minutes in 0.1 minute increments. Each program can be set up to run as many as 9999 repetitions (LOOPS).



Typical Program

The controller can store all programs in its nonvolatile memory, see Program Control on page 16.

The programming process begins with program definition. Define your program as a series of setpoints with a known period of time interval between each of them. Each interval is one step of the program. Give careful attention to the first part of your program. What conditions must exist at the beginning of your process? For example, you may wish to program an initial period of constant temperature to allow for thermal stabilization.

When a program is started, it begins immediately at the initial program setpoint.

Consider the unit’s limitations when designing programs. Temperature or time parameters which exceed the performance capabilities of the bath will result in unsatisfactory operation. It is possible to create a program calling for very rapid changes in temperature. Although the equipment may not be capable of producing such changes, it may be practical to program such steps as a way to cause the fastest *possible* temperature change.

Loops

This option allows for automatic repetition(s) of a program. For example, set the number of loops to three. Once the program reaches the last setpoint, it will loop back to the first setpoint and run the program again. In this instance the program will loop back three times. The entire program will run a total of four times. The maximum number of loops is 9999.

Hold

This option determines what will happen at the end of a program. In the hold mode of operation the setpoint will remain at the final temperature when the program is completed. Without hold the setpoint will return to the starting setpoint when the program is completed. The setpoint may change abruptly, but the fluid temperature will respond as quickly as the system's heating and cooling capacity allows.

The procedures for placing the controller in the hold mode is discussed in Program Control on page 16.

Current Values

While a program is running, the program selected, current period, current setpoint, time remaining for the current step, or the current loop, may be viewed on the Main display. Momentarily depress the appropriate key listed below to view the desired parameter. After several seconds, the Main display will again indicate the temperature of the bath fluid.

SETPT	View Current Setpoint
LOOP	View Current Loop
PERIOD	Time Remaining in Current Period
PERIOD PERIOD	Current Period Number
+/- followed immediately by **PROG/STORE**	Selected Program Number

Assured Soak

This option is used when you need to ensure the bath temperature will reach the next setpoint (regardless of time) before moving onto the next period.

This option is controlled by a DIP switch on the rear of the controller. Turn DIP switch number seven (7) to the ON position to enable this feature.

Period Adjust

This option is used to skip the current period of a running program. See Table 13 on page 18 for the appropriate procedure. **NOTE:** If Assured Soak is activated, the bath *must* reach that setpoint before the program will continue.

Program Control

The following tables show how to use the keypad and Main display to program the controller.

Use Table 1 to select one of the eight programs to be the current program for either entering or running.

TABLE 1

Keypad input	Main Display	Comments
+/-	Current bath temperature	
-PROG/STORE[1]	**Pro** followed by the program number	Enter desired program number.
-ENTER	Current bath temperature	

1. PROG/STORE must be depressed immediately (within one second) after +/-.

Once Table 1 is complete, use Table 2 for entering and storing a two-setpoint program. You would follow this procedure for programming any number of setpoints (up to the 16 setpoint maximum).

TABLE 2

Keypad input	Main Display	Comments
-PROG/STORE	**- - - - - -**	If YES appears you should clear the current program (see Table 10).
-SETPT	**SP-1**	Input setpoint.
-ENTER	Desired setpoint	
-PERIOD	**P-1**	Input time in minutes.
-ENTER	Desired time	
-SETPT	**SP-2**	Input setpoint.
-ENTER	Desired setpoint	
-LOOPS	**LOOPS**	Input number of loops
-ENTER	Desired number of loops	
-PROG/STORE	**FILE?**	
-ENTER	Current bath temperature	

Use Table 3 to abort programming at any time.

TABLE 3

Keypad input	Main Display	Comments
-ENTER	**- - - - -**	
-PROG/STORE	**FILE?**	
-CLEAR	Current bath temperature	

Use Table 4 to scroll through a two-setpoint stored program. You would use this procedure for scrolling any number of setpoints (up to the 16 setpoint maximum).

TABLE 4

Keypad input	Main Display	Comments
-PROG/STORE	**YES**	
-ENTER	**SP-1** followed by actual value	
-ENTER	**SP-2** followed by actual value	
-ENTER	**P-1** followed by actual value	
-ENTER	**LOOPS** followed by actual value	
-ENTER	Current bath temperature	

Use Table 5 to abort scrolling through a program at any time.

TABLE 5

Keypad input	Main Display	Comments
-PROG/STORE	**FILE?**	
-ENTER	Current bath temperature	

Once Tables 1 and 2 are complete, use Table 6 to run a stored program.

TABLE 6

Keypad input	Main Display	Comments
-RUN/STOP	Current bath temperature	**PROG LED** will flash.

Use Table 7 to stop a running program.

TABLE 7

Keypad input	Main Display	Comments
-RUN/STOP	Current bath temperature	**PROG LED** will stay on steady.
-CLEAR	Current bath temperature	**PROG LED** extinguishes.

Use Table 8 to temporarily suspend a running program.

TABLE 8

Keypad input	Main Display	Comments
-RUN/STOP	Current bath temperature	**PROG LED** stays on steady.

Use Table 9 to resume a suspended program.

TABLE 9

Keypad input	Main Display	Comments
-RUN/STOP	Current bath temperature	**PROG LED** flashes.

Use Table 10 to clear a stored program.

TABLE 10

Keypad input	Main Display	Comments
-PROG/STORE	**YES**	
-PROG/STORE	**FILE?**	
-CLEAR	Current bath temperature	

Use Table 11 to add HOLD operation. (Hold must be established before running a program. The hold function is not part of the stored program.)

TABLE 11

Keypad input	Main Display	Comments
-PROG/STORE	**YES**	
-HOLD	**YES**	**HOLD** LED stays on steady.
-PROG/STORE	**FILE?**	
-ENTER	Current bath temperature	

Use Table 12 to clear hold operation.

TABLE 12

Keypad input	Main Display	Comments
-PROG/STORE	**YES**	
-HOLD	**YES**	**HOLD** LED extinguishes.
-PROG/STORE	**FILE?**	
-ENTER	Current bath temperature	

Use Table 13 to force a running program to skip ahead to the next period.

TABLE 13

Keypad input	Main Display	Comments
+/-	Current bath temperature	
-PERIOD[1]	**P-Adj**	(Period adjust)

1. PERIOD must be depressed immediately (within one second) after +/-.

Error Messages

The Main LED will indicate an error message for eight different conditions.

Error1 - Program incomplete or illogical. Re-enter the program.

Error2 - Period entered exceeds 6,500 minutes. Reenter a period.

Error3 - Entered value exceeds allowable limits. Reenter proper value.

Error4 - Loops entered greater than 9,999. Reenter loops

Error5 - Attempted to run a program without a program in memory. Build a program.

Error6 - No period entered for a program. Enter a period.

Error7 - With alarm - SENSOR depressed without a sensor properly connected to controller. Properly connect a sensor. (If sensor is properly connected the sensor may have failed.) Without alarm - Internal probe failure, unit will shut off.

Error8 - Internal nonvolatile memory has failed. Press ENTER for the controller to reinitialize nonvolatile memory to factory preset parameters. **NOTE:** This will erase any program and setpoints in nonvolatile memory. The unit will have to be recalibrated.

Miscellaneous

Additional Parameters

Two parameters can also be set while the controller is deactivated (Main display shows OFF). You can adjust the light intensity of the Main display and set the controller pushbuttons to "beep" or not when depressed.

To adjust the Main display intensity first press the "±" key on the controller keyboard. Repeatedly depress the "1" key to decrease intensity or the "3" key to increase. Each press changes the intensity an incremental amount. Once the desired intensity is displayed press ENTER.

To silence the "beep" first press the "." key. Press "0" to turn the beep off or press "1" to turn it on. Next, press ENTER.

DIP Switches

Three DIP switches on the rear of the controller are operational. Switch #1 controls the temperature scale. OFF (up position) displays the temperature in °C, ON (down position) displays the temperature in °F.

Switch #6 sets the display update rate the controller uses to display temperature. This will determine how sensitive the display will be to temperature fluctuations. OFF (up position) sets a fast rate, ON (down position) sets a slow rate. (OFF causes more fluctuations than ON.)

Switch #7 controls the assured soak option for programs. ON enables assured soak.

PID Control

PID controllers are best suited for systems that may experience changing heat loads. Proportional control is combined with Integral and Derivative adjustments which allow the controller to automatically compensate for any changes from the setpoint. You may have to experiment with the PID settings to find out which are most suitable to your application.

To change or view any of the PID settings the controller must be operating.

To change or view the proportional band, press "1" and immediately, within one second, press ENTER. The "percent of span" value will flash on the Main display. Press ENTER to accept the value. To change the value press CLEAR and then enter the desired value. Press ENTER to exit this mode.

To change or view the Integral, press "2" and and immediately, within one second, press ENTER. The "repeats per minute" value will flash on the Main display. Press ENTER to accept the value. To change the value press CLEAR and then enter the desired value. Press ENTER to exit this mode.

To change or view the Derivative, press "3" and and immediately, within one second, press ENTER. The "minutes" value will flash on the screen. Press ENTER to accept the value. To change the value press CLEAR and then enter the desired value. Press ENTER to exit this mode.

Restoring Factory Preset Values

To restore the factory preset values hold the "0" button on the keypad and turn the Main Power switch on the side of the unit to the ON position. Release the "0" button and the Main display will indicate OFF. The following preset values will be installed:

P =0.6%
I =0.25 repeats per minute
D =0.05 minutes

In addition, the following values will be preset

BAUD Rate	=9600
Stop bits	=1
Data Bits	=8
Parity	=none

Calibration

The microprocessor controller has three different modes of calibration: Self-Cal, Two-point, and One-point. The controller is shipped from the factory with a Two-point calibration so no additional controller calibration may be required. Both the internal probe and the remote sensor input must be independently calibrated. Different calibration modes for each probe can be used if desired. The remote sensor input has been Self-Calibrated at the factory.

Self-Cal is used to initialize the analog-to-digital (A/D) converter input channel before performing the other types of calibrations. This mode removes all previous calibrations and brings the measurement error to less than 2°C. If this is the required accuracy, then no additional calibration is needed.

Two-point calibration is used to negate A/D and probe errors over the full span of the controller. This type of calibration is performed when high accuracy is desired.

One-point calibration (offset) is used to make the controller very accurate at one specific operating temperature.

One-point Calibration can be performed after a Two-point calibration as many times as desired. Each One-point calibration adds a different offset to the original Two-point calibration data (if one was already performed).

Calibration Procedures

Note: The controller should be powered at least 15 minutes before calibration to assure the electronic circuits are at operating temperature. To perform One and Two-point calibrations on the remote sensor input the unit must be in the remote sensor mode. Messages will end with CAL 1 for internal probe calibrations and CAL 2 for remote sensor calibrations.

Self-Cal: The controller must be deactivated (displaying OFF) to access this mode. Press SETPT followed by ENTER to Self-Cal the internal probe input. The message “S-CAL 1” will be followed by “done”. To Self-CAL the sensor input press SENSOR followed by ENTER. The message “S-CAL 2” followed by “done” will be displayed.

Two-point: For high accuracy measurements the controller input can be calibrated at two points. These two points (one high, one low) should be as far apart as practical for good performance.

Do not pick points that are outside the safe operating limits of the fluid in your application. For example with a water bath, 5°C and 90°C would be typical calibration points.

Before a Two-point cal, Self-cal must be performed on the desired sensor input.

With the controller on and measuring from the internal or remote probe, depending on which sensor is being calibrated, set the controller setpoint to the desired high cal temperature. When the bath reaches the setpoint and stabilizes, measure the actual bath temperature with an external calibrated thermometer. Press in quick succession “2” “.” “ENTER”. The message H-CAL # will appear followed by the flashing setpoint. Now enter in the actual bath temperature as measured by the calibrated thermometer and press ENTER. The Main display will indicate the temperature of the bath fluid (the calibrated temperature will not appear until the next step is complete).

Next set the controller setpoint to the desired low cal temperature. When the bath reaches this setpoint and stabilizes, measure the actual bath temperature with an external calibrated thermometer. Press in quick succession “2” “.” “ENTER”. The message L-CAL # will appear followed by the flashing setpoint. Now enter in the actual bath temperature as measured by the calibrated thermometer and press ENTER. The Main display will now indicate the calibrated temperature of the fluid in the bath.

One-point: Before a One-point cal, Self-cal or Two-point cal must be performed on the desired sensor.

With the controller on, and measuring from the internal or remote probe, depending on which sensor is being calibrated, set the controller setpoint to the desired temperature. When the bath reaches this setpoint and stabilizes, measure the actual bath temperature with an external calibrated thermometer. Press in quick succession “1” “.” “ENTER”. The message 1-CAL # will appear followed by the flashing setpoint. Now enter in the actual bath temperature as measured by the calibrated thermometer and press ENTER. The display will now show the calibrated temperature and all temperatures will have this offset added to them.

Calibration clear: At any point the calibration data from a One or Two-point cal can be erased by quickly pressing “2” “.” “CLEAR”. This procedure clears the calibration data only for the selected probe.

High Temperature/ Low Liquid Level Safety

To protect your application, the adjustable High Temperature/Low Liquid Level Safety (HIGH TEMP/LOW LEVEL) ensures the heater will not exceed temperatures which can cause serious damage to your unit. A single temperature sensor, located on the heater coils in the bath, monitors both conditions. A High Temperature/Low Liquid Level fault occurs when the temperature of the sensor exceeds the set temperature limit.

In the event of a fault, the unit will shut down. The cause of the fault must be identified and corrected before the unit can be restarted.

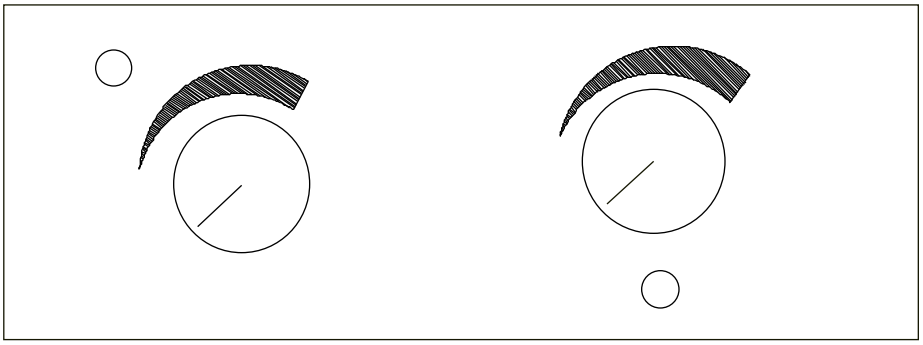
The safety on single heater systems is not preset and must be adjusted during initial installation.

Units with a boost heater have an additional nonadjustable safety located behind the main safety. It has a red reset button but no adjustment knob.

To set the safety, locate the HIGH TEMP/LOW LEVEL SAFETY adjustment dial on the right side of the pump box. Turn the dial fully clockwise and press the red RESET switch. The RESET switch is located NEXT TO the adjustment dial. **NOTE:** For units without a reset switch turn the power switch off and then back on.

Start the unit. Adjust the setpoint for a few degrees higher than the highest desired fluid temperature and allow the bath to stabilize at the temperature setpoint. Turn the HIGH TEMP/LOW LEVEL SAFETY dial counter-clockwise until you hear a click and the unit shuts down. The red FAULT LED on the temperature controller will light to indicate a fault has occurred.

NOTE: The minimum high temperature safety setting is 50°C. For units without a reset switch the temperature range is 0°C to 180°C.



High Temperature/Low Liquid Level Safety
(Some units do not have a rese switrch.)

Section V Maintenance

To avoid electrical shock, disconnect the mains cord prior to removing any access panels or covers.

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide . extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Reservoir Cleaning

Routine cleaning can be achieved by simply sponging down the seamless stainless steel tank with tap water. (Dish washing detergent may be used but the tank must be thoroughly rinsed.)

To gain access to the entire reservoir the pump box and reservoir cover should be removed.

Remove the line cord from the rear of the unit.

Remove the four screws securing the reservoir's cover.

Carefully raise the controller and cover assembly to remove it from unit.

Place the cover on its side.

Algae

To restrict the growth of algae in the bath, we recommend the bath cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light required for the growth of most common algae.

NESLAB recommends rthe use ofChloramine-T, one gram per gallon.

Section VI Troubleshooting

Checklist

Unit will not start

Make sure the voltage of the power source meets the specified voltage, ±10%. Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Check the High Temperature/Low Liquid Level Safety. If the FAULT light is on, make sure the fluid level in the bath is between the marks in the baffle and the HIGH TEMP/LOW LEVEL SAFETY setting is greater than the fluid temperature. Push the RESET switch(es), or, for units without a reset switch, turn the power switch off and then back on and attempt to restart.

No external circulation

Make sure the stainless steel plugs on the PUMP INLET and PUMP OUTLET have been removed.

Check for obstructions, kinks, or leaks in the circulation tubing.

Circulation will cease when the pump head has been exceeded.

No communication between bath's microprocessor and your computer

Ensure the bath's microprocessor parameters (baud rate, parity etc.) match your computer requirements.

Ensure the RS-232 light is on steady. See page 13 for details. **NOTE:** You cannot input data from the keypad when the RS-232 mode is enabled.

Check the cable. The microprocessor reads data on pin 2 and transmit data on pin 3. Ensure the cable is correctly connected. Computer 25-pin and 9-pin communication ports usually have different conventions.

Ensure the only pins connected to the microprocessor are 2, 3 and 5. All other pins must *not* be connected.

Continued on next page.

No communication between bath's microprocessor and your computer
Ensure the bath's microprocessor parameters (baud rate, parity etc.) match your computer requirements.

Ensure the RS-232 light is on steady. See page 13 for details. **NOTE:** You cannot input data from the keypad when the RS-232 mode is enabled.

Check the cable. The microprocessor reads data on pin 2 and transmit data on pin 3. Ensure the cable is correctly connected. Computer 25-pin and 9-pin communication ports usually have different conventions.

Ensure the only pins connected to the microprocessor are 2, 3 and 5. All other pins must *not* be connected.

Keypad locked up
If necessary, remove computer cable. Turn off the bath using the main power switch on the side of the unit. While holding the "0" button on the keypad, turn the unit back on. The Main Display will read OFF.

This will also restore the factory preset PID values and also reset the communication parameters and buffer. See Restoring Factory Preset Values on page 20.

Service Assistance and Technical Support

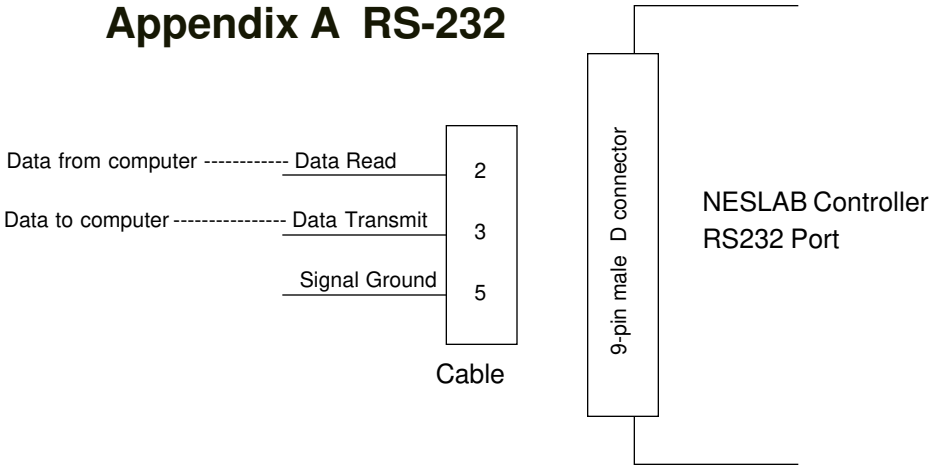
If, after following these troubleshooting steps, your unit fails to operate properly, contact our Customer Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

Part number
Serial number
Voltage of unit
Voltage of power source

In addition to arranging warranty service, our Service Department can provide you with a wiring diagram and a complete list of spare parts for your unit. Before calling, please obtain the following information:

Part number
Serial number

Appendix A RS-232



The unit can be controlled through your computer's serial port by using a standard 9-pin RS232 connection on the rear of the temperature controller. Data transmit of the serial port connects to data read (pin 2) of the bath. Data read of the serial port connects to the data transmit (pin 3) of the bath.

NOTE: Do not use a cable that connects to the unused pins on the bath communications port. This may cause a communication fault. Communication cables are available from NESLAB. Contact our sales department for additional information.

With a cable properly connected to the controller press RS232, the RS232 LED will start to flash. Press ENTER while the LED is flashing and the RS232 LED will come on steady indicating your computer's serial port can control the unit's operation.

In this mode of operation you cannot manually input data with the keypad. You can, however, observe the setpoint and/or alarm temperature limits by pressing the appropriate button on the controller. Your computer can be used to operate all modes of operation.

Communication Commands

All commands must be entered in the exact format shown in the following four tables. Do not send a [LF] (line feed) after the [CR]. Ensure the specified letter case is used. The tables on the next few pages show all commands available, their format and responses. Controller responses are either the requested data, an exclamation point (!) if the command was properly executed, or a question mark (?) if the controller could not execute the command. A question mark response indicates either an improper command format or an attempt to enter settings that are outside the allowable range. The controller response *must* be received before sending the next command.

NOTE: All responses from the bath are terminated with a single [CR] only. Wait for your computer to respond before sending the next command.

If you are using the NESLAB DeltaTemp communication software you must set up the bath controller for: 300 baud, 8 data bits, 2 stop bits and no parity. The bath controller will only support the programming features of DeltaTemp and will ignore the various output controls.

TABLE 1 GENERAL COMMANDS

Command Echo Echo: i = 1, No echo: i = 0 (control returns commands)	SEi[CR]
Set Setpoint -30.00 to +150.00°C or -22.00 to +300.00°F	SSxxx.xx[CR]
Read Setpoint	RS[CR]
Read Main Probe Temperature	RT[CR]
Read Remote Probe Temperature	RR[CR]
Turn Control On or Off On: i = 1, Off: i = 0	SOi[CR]
Set Power Status Flag Set: i = 1, Reset i = 0 (reset when controller power is lost)	SWi[CR]
Read Power Status Flag	RW[CR]
Read F or C Units	RU[CR]

TABLE 2 ALARM COMMANDS

Set High Alarm Limit Same range as setpoint	SHxxx.xx[CR]
Read High Alarm Limit	RH[CR]
Set Low Alarm Limit Same range as setpoint	SLxxx.xx[CR]
Read Low Alarm Limit	RL[CR]
Read Alarm Status Returns: 0 = no alarm, 1 = alarm	RF[CR]

TABLE 3 CONTROL COMMANDS

Set Proportional Bandwidth 0.10 to 10.00 % of full scale	SPxx.xx[CR]
Read Proportional Bandwidth	RP[CR]
Set Integral Compensation 0.00 to 10.00 repeats/minute	SIxx.xx[CR]
Read Integral Compensation	RI[CR]
Set Derivative Compensation 0.00 to 1.00 minutes	SDx.xx[CR]
Read Derivative Compensation	Rd[CR]
Main/Remote Probe Selection Main: i = 0, Remote: i = 1	Sri[CR]
Boost Heater Inhibit Inhibit: i = 0, Enable: i = 1	SBi[CR]

TABLE 4 PROGRAMMING COMMANDS

Set Step Setpoint n = step number	SYn,xxx.xx<[CR]
Read Step Setpoint	RYn[CR]
Set Step Period n = step number	SXn,xxx.xx[CR]
Read Step Period	RXn[CR]
Read Number of Steps	Rs[CR]
Set Number of Loops 0 to 9999 additional loops after first program execution	SKxxxx[CR]
Read Number of Loops	RK[CR]
Set Hold Status Hold: i = 1, No hold: i = 0	SZi[CR]
Pause/Resume Program Resume: i = 1, Pause: i = 0	SGi[CR]
End Program	SR[CR]
Read Elapsed Step Time	RE[CR]
Select Program Number	SVx[CR]
Read Selected Program Number	RV[CR]
Read Current Period	RC[CR]
Skip Ahead One Period	SJ[CR]

To set the communications data format the controller must be deactivated (Main display indicates OFF). Press the RS232 button. The word "Baud" will momentarily appear followed by the current baud rate (9600, 4800, 1200, 600 or 300). Use the keypad to enter the desired change, if any. Press ENTER and "db" will momentarily appear followed by the current number of data bits setting. Again, use the keypad to enter any desired change (7 or 8) and then press ENTER. "Sb" will momentarily appear followed by the current number of stop bits (1 or 2). Change, if needed, and press ENTER and "PAr" will momentarily appear followed by the current parity control setting (0 = none, 1 = odd, 2 = even). Change, if needed, and press ENTER.

To manually exit this mode of operation press RS232. The RS232 LED will start to flash. Press the CLEAR button and the RS232 LED will extinguish.

Communication Command Protocol

The following table lists the communication command protocol for programming the controller via a computer.Use the Ctrl - C key combination to clear the controller receiving buffer if an erroneous character is detected.

FUNCTION	SYNTAX[1]	RETURN MESSAGE[2]
SET SETPOINT	SSxxx.xx[CR]	![CR]
SET LOW LIMIT	SLxxx.xx[CR]	![CR]
SET HIGH LIMIT	SHxxx.xx[CR]	![CR]
SET PROPORTIONAL BAND[3]	SPxx.xx[CR]	![CR]
SET INTEGRAL[4]	SIxx.xx[CR]	![CR]
SET DERIVATIVE[5]	SDx.xx or Sdx.xx[CR]	![CR]
BOOST HEATER INHIBIT	SBi[CR]	![CR]
SET POWER STATUS FLAG	SWi[CR]	![CR]
SET ON/OFF	SOi[CR]	![CR]
SELECT PROGRAM NUMBER	SVx[CR]	![CR]
SET STEP SETPOINT	SYn,xxx.xx[CR]	![CR]
SET STEP PERIOD	SXn,xxx.x[CR]	![CR]
SET NUMBER OF PERIODS	Ssn[CR]	![CR]
SET NUMBER OF LOOPS	SKxxxx[CR]	![CR]
SET HOLD STATUS	SZi[CR]	![CR]
END PROGRAM	SR[CR]	![CR]
ECHO CONTROL[6]	SEi[CR]	![CR]
REMOTE SENSOR CONTROL	Sri[CR]	![CR]
SUSPEND/RESUME PROGRAM	SGi[CR]	![CR]
SKIP AHEAD ONE PERIOD	SJ[CR]	![CR]
READ SETPOINT	RS[CR]	xxx.xx[CR]
READ TEMPERATURE	RT[CR]	xxx.xx[CR]
READ ALARM STATUS	RF[CR]	![CR]
READ REMOTE TEMPERATURE	RR[CR]	xxx.xx[CR]
READ UNITS	RU[CR]	C[CR] or F[CR]
READ CURRENT PERIOD	RC[CR]	xx[CR]
READ ELAPSED TIME	RE[CR]	xxx.x[CR]
READ LOW LIMIT	RL[CR]	xxx.xx[CR]
READ HIGH LIMIT	RH[CR]	xxx.xx[CR]
READ PROPORTIONAL BAND	RP[CR]	xx.xx[CR]
READ INTEGRAL	RI[CR]	xx.xx[CR]
READ DERIVATIVE	Rd[CR]	x.xx[CR]
READ PROGRAM NUMBER	RV[CR]	x[CR]
READ STEP SETPOINT	RYn[CR]	xxx.xx[CR]
READ STEP PERIOD	RXn[CR]	xxx.x[CR]
READ NUMBER OF STEPS	Rs[CR]	x[CR]
READ NUMBER OF LOOPS	RK[CR]	xxxx[CR]
READ POWER STATUS	RW[CR]	x[CR]

1. x = ASCI digit, i = 0 (OFF or STOP) i = 1 (ON or GO), n = step number.
2. Ensure the return message is correct. If not, resend or troubleshoot communication lines.
3. Factory preset at 0.6%.
4. Factory preset at 0.25 repeats per minute.
5. Factory preset at 0.05 minutes.
6. Allows computer to compare send signal to receive signal.

Remote Programming

The bath can be programmed and controlled by a remote computer. Enter step setpoints using the SYn command, time periods using the SXn command, number of loops using the SKxxxx command and number of periods in the program using the Ssn command. Start the program using SG1 and suspend the program using SG0. When the program is finished it will stop automatically. If needed, SR will end the program at any time. Here is a four setpoint, two loop example:

SV1[CR]	Select program number one
SY1,25.00[CR]	First setpoint = 25.00 degrees
SX1,20.0[CR]	First period = 20.0 minutes
SY2,40.00[CR]	Second setpoint = 40.00 degrees
SX2,60.0[CR]	Second period = 60.0 minutes
SY3,40.00[CR]	Third setpoint = 40.00 degrees
SX3,45.0[CR]	Third period = 45.0 minutes
SY4,25.00[CR]	Fourth setpoint = 25.00 degrees
Ss3[CR]	Program has three periods
SK2[CR]	Execute the program three times total
SG1[CR]	Begin executing program
SG0[CR]	Temporarily suspend the program
SR[CR]	Stop the program before it is finished

Blank page.

Appendix B

International Quick Reference Guides

EX mikroprozessorgesteuert Kurzbedienungsanleitung

Installation
Stellen Sie das Gerät auf einen stabilen Tisch oder Labortisch. Die Umgebungstemperatur sollte zwischen +10 °C und +27 °C liegen.

Vergewissern Sie sich, daß die Spannung Ihrer Stromanschlüsse mit der für das Gerät vorgesehenen Spannung übereinstimmt (± 10%).

Die Schlauchanschlüsse (1/4 Zoll MPT) des Gerätes befinden sich an der Rückseite und sind mit PUMP INLET und PUMP OUTLET bezeichnet. Entfernen Sie die Kappen, falls externe Zirkulation gewünscht wird. Schließen Sie den PUMP OUTLET-Anschluß an den Eingang Ihres Instruments und den PUMP INLET-Anschluß an den Ausgang Ihres Instruments an.

Füllen Sie das Reservoir bis zu einem Stand, der zwischen den horizontalen Markierungen liegt, die auf dem Blech markiert sind, das den Arbeitsbereich von der Pumpeneinheit trennt.

Verwenden Sie niemals entflammbare oder Korrosion verursachende Flüssigkeiten. Für den Betrieb im Arbeits-Temperaturbereich bis +80°C empfiehlt NESLAB Leitungswasser. Oberhalb +80 °C ist der Anwender selbst für die verwendeten Flüssigkeiten verantwortlich. Über +115 °C dürfen Sie niemals pures Ethylenglykol als Badflüssigkeit verwenden.

Wenn sie zu einem externen System zirkulieren, sollten Sie zusätzliche Kühlflüssigkeit zur Hand haben, um den Kühlflüssigkeitsstand in den Zirkulationsleitungen und dem externen System beibehalten zu können.

Betreiben Sie das Gerät niemals mit leerem Arbeitsbereich!

Inbetriebnahme
Vor Inbetriebnahme des Gerätes vergewissern Sie sich bitte, daß die elektrischen Anschlüsse und die Rohr- u. Schlauchanschlüsse sachgemäß installiert sind und daß das gesamte System mit Kühlflüssigkeit gefüllt ist.

Geräte, die bei 220 Volt betrieben werden, verfügen über einen Stromkreisunterbrecher auf der Rückseite des Gerätes. Vergewissern Sie sich, daß dieser auf ON gestellt ist. Um das Gerät einzuschalten, müssen Sie den I/O-Schalter auf „I“ stellen. Die Power-Lampe leuchtet auf, wenn das Gerät in Betrieb ist. Um das Gerät abzuschalten, muß der I/O-Schalter auf „O“ gestellt werden.

Die HEAT-LED-Anzeige zeigt den Status des Heizelements an. Sie leuchtet auf, wenn das Heizelement arbeitet. Wenn die Arbeitstemperatur den gewünschten Setpoint erreicht, blinkt die LED-Anzeige, um den ungefähren Arbeitsrhythmus des Heizelements anzuzeigen.

Mikroprozessor-Temperatursteuerung
Bitte schlagen Sie Sektion IV der Betriebsanleitung auf, um die kompletten Bedienungsanweisungen für die Mikroprozessorsteuerung nachzulesen.

Wartung
Überprüfen Sie das Reservoir regelmäßig. Sollte eine Säuberung notwendig sein, spülen Sie das Reservoir mit einer speziellen Reinigungsflüssigkeit, die mit dem Umlaufsystem und der Zirkulationsflüssigkeit kompatibel ist.

Für umfassende Informationen einschließlich Fehlerbeseitigungsmöglichkeiten schlagen Sie bitte in der Betriebsanleitung nach oder wenden Sie sich an unsere Service-Abteilung: 069/50 91 90 32.

EX Kvik Referance

Installation:
Operationstemperatur ved 100% udnyttelse er fra stuetemperatur til+75^0 C under forudsætning af, at netspændingen er den nominelle 240V +/- 10%.

Tilslutning af slanger er på bagsiden mærket „PUMP INLET“ (ind) and „PUMP OUTLET“ (ud). Tilslutningerne er $^1/_4$" MPT-gevind.

Fyld resovoiret til mærket placeret på bafflen mellem arbejdsområdet og pumpeenheden.

Anvend aldrig brandbare væsker, rent ionbyttet eller dobbeltdestilleret vand kan anvendes op til +80^{0}C, over denne temperatur anbefales specialvæsker.

Sørg altid for at den rette mængde væske er til stede i termostatkarret, og husk at kompensere for den væske, der medgår til ekstern cirkulation.

Betjening:
Før opstart checkes elektriske forbindelser, slangeforbindelser og kølevæske stand.

Check hovedkontakten på bagsiden af badet, og sørg for at den er tændt. Når badet skal startes trykkes I/O kontakten på siden i I position, og strømindikatoren tænder. Skal badet slukkes, trykkes I/O kontakten i O stilling, og indikatoren slukker.

Dioden på frontpanelet angiver status på badet, der lyser ved opvarmning og slukker, når den indstillede temperatur er nået.

Microprocessorkontrol:
Se venligst Section IV i manualen.inde, skal temperaturen ændres drejes herefter på „Adjust“ knappen. Slip „Display“ knappen og aktuel temperatur vises

Periodisk vedligeholdelse:
Check standen af kølevæske periodisk. Før skift af væske indstilles temperaturen på „de-ice“. Check med mellemrum vakuummet på pumpesiden, rens systemet og check for aflejringer, vækst, utætheder og evt. filtre. Husk åben aldrig instrumentet uden strømmen er afbrudt, og strømkablet er taget ud!

EX met Microprocessor, Handleiding voor snelle installatieprocedures

Installatie
Plaats het apparaat op een tafel of werkbank. Omgevingstemperaturen moeten liggen tussen de +10°C en +27°C.

Let erop dat de netspanning gelijk is aan het aangegeven voltage, +/- 10%.

De slangaansluitingen zijn bevestigd aan de achterkant van het apparaat en zijn voorzien van de labels PUMP INLET en PUMP OUTLET. Deze aansluitingen zijn 1/4 inch MPT. Verwijder de pluggen indien externe circulatie gewenst is. Bevestig de PUMP OUTLET aan de ingang van uw applicatie. Bevestig de PUMP INLET aan de uitgang van uw applicatie.

Vul nu het reservoir tot het niveau tussen de horizontale strepen op de roestvrij stalen scheidingsplaat, die de werkruimte van het pompgedeelte scheidt.

Gebruik nooit brandbare of andere koelvloeistoffen, die het toestel kunnen aantasten. Kraanwater wordt in het algemeen aanbevolen wanneer u bij temperaturen werkt van +8°C tot +80°C. Boven de + 80C. zal de gebruiker verantwoordelijk zijn voor de benodigde vloeistoffen. Indien men boven de 115°C. werkt, gelieve nooit puur ethylene glycol als badvloeistof te gebruiken.

Wanneer u wilt pompen naar een extern systeem, dient u altijd extra vloeistof achter de hand te houden om met juiste vloeistofniveau's zowel in het interne als het externe gedeelte van het systeem, te handhaven.

Gebruik het apparaat nooit wanneer het reservoir leeg is.

Operationeel gebruik
Alvorens het apparaat in gebruik te nemen, dient u eerst alle elektrische- en slangaansluitingen te controleren. Tevens dient u te controleren of het systeem gevuld is met vloeistof.

220 Volt apparaten hebben een z.g. "circuit breaker" aan de achterkant van het apparaat. Controleer of deze in werking is gesteld. Om het apparaat te starten, gelieve de I/O knop aan de zijkant van het apparaat te draaien naar de I positie. Het lampje zal oplichten als indicatie dat het systeem in werking is gesteld. Om het apparaat uit te zetten, gelieve de I/O knop naar de O positie te draaien.

Het "HEAT LED" duidt de actuele status van het verwarmings-element aan. Het zal oplichten indien het verwarmingselement in werking is gesteld. Als de ingestelde temperatuur de set-point heeft bereikt, zal de LED aan en uit gaan om het proces van de heater aan te duiden.

Microprocessor Controller
Voor verdere (complete) instructies betreffende de bediening van de microprocessor regelaar, zie hoofstuk IV van deze handleiding.

Periodiek Onderhoud
Het reservoir dient regelmatig gecontroleerd te worden. Indien reiniging noodzakelijk is, zal het reservoir schoongespoeld moeten worden met een vloeistof, welke verenigbaar is met het systeem en de koelvloeistof.

Indien u meer informatie wenst, inclusief procedures in geval van problemen, kunt u de handleiding raadplegen of contact opnemen met de NESLAB service-afdeling: (+31) - 40 - 300066.

Kortfattad Bruksanvisning för EX Mikroprocessor

Installation
Ställ maskinen på ett stadigt bord eller en bänk. Temperaturen i rummet bör vara mellan +50°F (10°C) och +80°F (27°C).

Försäkra att spänningen är den samma som den som är given i instruktionerna ± 10%.

Röranslutning finns på baksidan av maskinen och har följande beskrivning: SUPPLY och RETURN. Anslutningarna är 1/4 inch MPT. Ta bort de skyddande plast bitarna från röranslutningarna. Anslut SUPPLY kopplingen till intaget av din anordning och RETURN kopplingen till uttaget.

För att fylla tanken, lösgör skruvarna och ta bort luckan. Ta bort tank locket och fyll tanken med ren kylnings vätska.

Använd aldrig eldfarliga eller frätande vätskor. Kran vatten rekommenderas upp till +80°C. Över +80°C är användaren ansvarig för vilken vätska som används. Använd aldrig ren etylen glykol som vätska över 115°C.

Ha extra vätska redo om din anordning kräver det så att den rätta nivån behålls i cirkulations sytemet.

Användning
Innan maskinen startas, kontrollera alla elektriska och alla rör anslutningar. Se till att cirkulations systemen har fyllts med vätska.

220V maskiner har en ström brytare på baksidan av maskinen. För att starta maskinen, sätt I/O knappen på sidan av maskinen på I. Lampan lyser för att visa att maskinen är på. Sätt knappen på O för att stänga av den.

Mikroprocessor Kontroll.
Se del IV av den här bruksanvisningen för en utförlig beskrivning av Mikroprocessor kontrollen.

Periodiskt Underhåll
Inspektera vätskan i tanken periodvis. Om det är nödvändigt med rengöring, spola tanken med en vätska som är förenlig med cirkulations sytemet och med kylvätskan.

PROCEDIMIENTOS DE OPERACION DE REFERENCIA RAPIDA
PARA EL EX CON MICROPROCESADOR

INSTALACION

Sitúe la unidad sobre una mesa resistente o sobre un banco de trabajo. Las temperaturas ambientes deben estar dentro del rango de + 50 ºF a + 80 ºF.

Asegúrese de que el voltaje de la fuente de energía sea igual que el voltaje especificado, +/- 10%.

Las conexiones de tuberías están situadas en la parte trasera de la unidad y están marcadas como PUMP INLET y PUMP OUTLET. Estas conexiones son 1/4" MPT. Saque las tapas cuando requiera circulación externa. Conecte el adaptador PUMP OUTLET a la entrada de su aplicación. Conecte el adaptador PUMP INLET a la salida de su aplicación.

Llene el reservorio a un nivel entre los marcadores horizontales situados en la puerta de acero inoxidable que separa la zona de trabajo de la bomba.

No utilice nunca fluidos inflamables o corrosivos. Se recomienda utilizar agua corriente para operar a +80 ºC. Por encima de +80 ºC, el usuario es responsable de los fluidos que utilice. Por encima de 115 ºC no utilice nunca etileno glicol puro como fluido de baño.

Cuando bombee a un sistema externo, tenga fluido extra a mano para mantener el nivel apropiado tanto en las lineas circulantes como en el sistema externo.

Nunca haga funcionar el instrumento con el área de trabajo vacía.

OPERACION

Antes de poner en marcha la unidad, compruebe todas las conexiones eléctricas y de tuberías. Asegúrese de que el sistema circulador se ha llenado con fluido.

Las unidades de 220 V. tienen un cortador de circuito en la parte trasera de la unidad. Asegúrese de que está en posición ON. Para poner en marcha la unidad, ponga el interruptor I/O situado en el lateral de la unidad en posición I. La lámpara Power se iluminará para indicar que el sistema está funcionando. Para apagarlo, ponga el interruptor de encendido en posición O.

El LED HEAT indica la situación del sistema del calentador. Se ilumina para indicar que el calentador está funcionando. A medida que la temperatura de funcionamiento se aproxima al punto fijado, el LED ciclará para indicar el ciclo de trabajo del calentador.

CONTROLADOR POR MICROPROCESADOR

Ver Sección IV de este manual para instrucciones completas para utilizar el controlador por microprocesador.

MANTENIMIENTO PERIODICO

Inspeccione periódicamente el fluido del reservorio. Si es necesaria una limpieza, rocíe el reservorio con un fluido de limpieza compatible con el sistema de circulación y el fluido recirculante.

Para una información completa, incluyendo solución de problemas, refiérase al manual de instrucciones o contacte con el Departamento de Servicio al Cliente en el teléfono 1-800-258-0830.

Blank page.

Appendix C Programming Software

NEScom Software

The NESLAB Communications Software is a user friendly software that allows you to automate your temperature control process. The software includes a 3½" disk, Comprehensive Operator's Manual and a toll-free number to a trained technical staff.

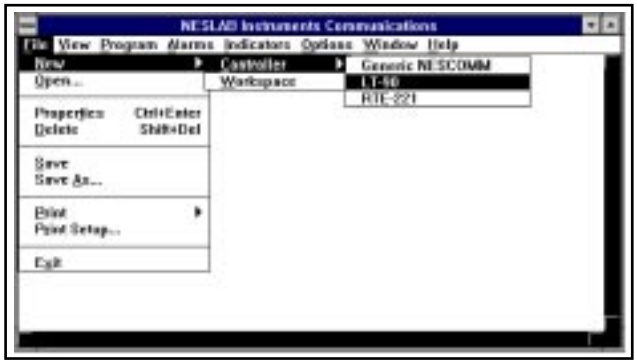
NEScom Software allows you to write custom temperature programs for our Digital or Microprocessor based temperature control apparatus. Choose upper or lower temperature limits and monitor system status with an alarm. NEScom can also record your results on a user selectable graph. NesCom must be used with an IBM or 100% compatible computer.

Select from easy to use product icons.

Create graphs and charts.

Easily configure ramping functions which set the setpoint over time.

View pop-up alarm windows which display if an alarm condition occurred.



Select software functions from the easy to use pulldown menus.

View a virtual controller screen which allows remote monitoring and operation of product control panel.

DeltaTemp

DeltaTemp programming software is now available for free download from NESLAB ONLINE BBS (Bulletin Board System) at 603-427-2490.

DeltaTemp software allows you to write custom temperature programs for NESLAB digital units (any unit with a digital temperature readout AND a 10-15 pin INTERFACE port). The menu-driven program provides a table format for entering temperature parameters and a visual graph confirmation of the program you have designed. Program time can range from 0 to 999 minutes with unlimited looping. Choose upper and lower temperature limits and monitor system status with an audible alarm. DeltaTemp can also record your results on a printed graph or file. DeltaTemp is a DOS program, and requires an IBM or 100% compatible computer.

DeltaTemp may require use of a computer interface device, depending on which NESLAB unit is being used. Refer to the setup diagram in the DeltaTemp folder for full details.

To download the software, go to: CONFERENCES / SOFTWARE / DeltaTemp.

The folder also contains the operating manual, setup diagrams, application notes, and directions on making your own interface cable.

NESLAB ONLINE is a FirstClass® system accessible by general terminal software (Windows Terminal accessory, ClarisWorks Communications, Z-Term, Pro-Comm, or similar).

To use the full graphics and features of the BBS we recommend using FirstClass® Client software. FirstClass® Client is available for Macintosh or Windows platforms. It is available from many sources:

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

International Quick Reference Guides

WARRANTY

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Customer Service Depart-ment. Before calling, please obtain the following information from the unit's serial number label:

- *BOM number*_____
- *Serial number* _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department.

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without bath fluid in the bath.

Never use pure ethylene glycol as a bath fluid. A minimum 80/20 mixture of Ethylene Glycol and tap water is allowed.

For 220 - 240 volt units supplied without a line cord, use a harmonized (HAR) grounded 3-conductor cord, type H05VV-F, with conductors listed below. A suitable cord end is required for connecting to the equipment (see unit socket) and must terminate with an IEC approved plug for proper connection to power supply.

NON-BOOST HEATER UNITS	**Nominal 1.0 mm² cross section rated 10 Amps** **Unit Socket: IEC - 320 C13**
BOOST HEATER UNITS	**Nominal 1.5 mm² cross section rated 16 Amps** **Unit Socket: IEC - 320 C19**

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the bath before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, personal injury or death.

Section II General Information

Description

The EX Series Bath Circulators are designed to provide temperature control for applications requiring a fluid work area or pumping to an external system.

The units consist of a circulation pump, stainless steel bath, a work area cover, and a temperature controller.

Specifications

	EX-111	EX-211
Temperature Range[1] *Analog controller* *Digital controller*	Ambient +3°C to +100°C Ambient +3°C to +150°C	
Temperature Stability[2] *Analog controller* *Digital controller*	±0.1°C ±0.01°C

Section III Installation

Site

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

Lift the unit by grasping it under the case, near the rubber feet.

Locate the unit on a sturdy table or bench top. Ambient temperatures should be inside the range of +50°F to +80°F (+10°C to +27°C).

Electrical Requirements

Line voltage may be easily accessible inside the pump/control box. Always unplug the unit prior to removing pump/control box cover.

Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

For 220 - 240 volt units supplied without a line cord, use a harmonized (HAR) grounded 3-conductor cord, type H 0 5 V V - F , with conductors listed below. A suitable cord end is required for connecting to the equipment (see unit socket) and must terminate with an IEC approved plug for proper connection to power supply.

NON-BOOST HEATER UNITS	**Nominal 1.0 mm² cross section rated 10 Amps** **Unit Socket: IEC - 320 C13**
BOOST HEATER UNITS	**Nominal 1.5 mm² cross section rated 16 Amps** **Unit Socket: IEC - 320 C19**

Plumbing Requirements

Ensure the unit is off before connecting tubing to the unit.

Hose Connections

The pump connections are located at the rear of the pump box and are labelled PUMP INLET and PUMP OUTLET. These connections are bent upward so the recirculating fluid will drain back into the reservoir when the hoses are disconnected. The connections are capped with stainless steel serrated plugs.

The pump lines have ¼" MPT for mating with standard plumbing fittings. For your convenience two stainless steel adapters, ¼" FPT to ⅜" O.D. serrated fitting, are provided. (To assure proper fit, they should be installed using 1½ turns of Teflon® tape around the threads.)

Flexible tubing, if used, should be of heavy wall or reinforced construction. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the external system as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, make them at the inlet and outlet of the external system, not at the unit.

If substantial lengths of cooling lines are required, they should be pre-filled with bath fluid before connecting them to the unit. This will ensure that a adequate amount of fluid will be in the bath once it is in operation.

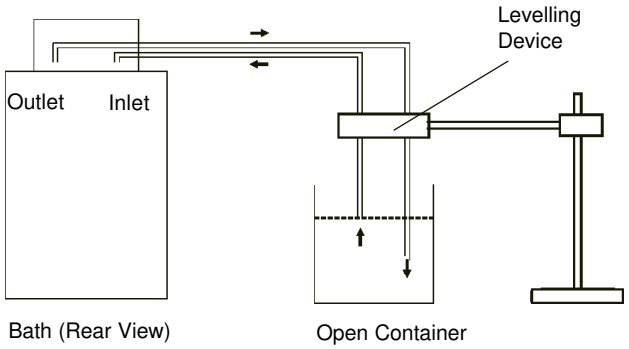
Pumping

The pump is designed to deliver a flow of 15 liters/minute (4 gallons per minute) at 0 feet head. To prevent external circulation, the PUMP INLET and PUMP OUTLET lines are capped. The caps must be removed when external circulation is required.

To properly secure the external hose connections to the unit, wrap teflon tape around the pipe line threads before installation. Once the hose connections are made, the pump must be properly plumbed to an external system. *It is important the bath is not in operation until all plumbing is complete.*

If the bath is not used for external circulation, make sure the stainless steel caps are in place prior to operating the bath.

Circulating to an open container



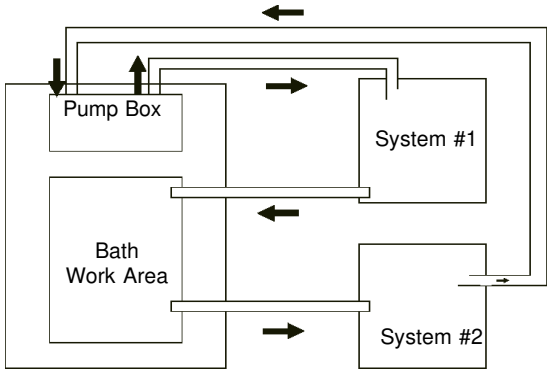
A stainless steel leveling device is available to aid circulation to an open vessel. Contact our Sales Department for more information (see Preface, After-sale Support).

Support the leveling device over the open container with a ringstand. Stagger the tubes in the leveling device so one tube is submerged in the vessel fluid, and the other tube is level with the fluid surface. Connect the deeper tube to the PUMP OUTLET and the shorter tube to the PUMP INLET.

Adjust the flow rate using the accessory flow control valve connected to the PUMP OUTLET, or by partially restricting the outlet tubing. When properly adjusted, the pump inlet will draw an occasional air bubble to prevent over flow, and the pump outlet will force fluid through the submerged tube to prevent aeration of the vessel.

To avoid siphoning the bath work area when the unit is shut off, lift the leveling device out of the vessel and above the level of the unit.

Circulating through two closed loops



Bath (Top View)

The pump can be used to circulate through two closed loop systems. Connect the shortest practical length of flexible tubing from the PUMP OUTLET to the inlet of external system #1. Connect the outlet of system #1 directly into the bath work area. Connect tubing from the bath work area to the inlet of system #2. Connect the outlet of system #2 to the PUMP INLET.

Drain

Ensure the temperature of the bath fluid is safe before draining the unit.

The unit is equipped with a drain located at the back of the unit at the base of the bath. The drain has ¼ inch male pipe threads and is capped with a stainless steel plug. To drain the reservoir simply remove the cap.

To assure proper fit when replacing the cap, be sure to line the threads with Teflon tape.

Fluids

Never use flammable or corrosive fluids with this unit.

Tap water is the recommended fluid for operation to +80°C.

Above +80°C, the user is responsible for fluids used.

Never use pure ethylene glycol as a bath fluid. A minimum 80/20 mixture of Ethylene Glycol and tap water is allowed.

Filling Requirements

The bath work area has a high and low level marker to guide filling. The markers are 1 inch horizontal slits located in the center of the stainless steel baffle separating the work area and the pump assembly. The correct fluid level falls between these two markers. The heating coils will be exposed and may become damaged if the correct fluid level is not provided.

When pumping to an external system, keep extra fluid on hand to maintain the proper level in both the circulating lines and external system.

Never run the unit when the work area is empty.

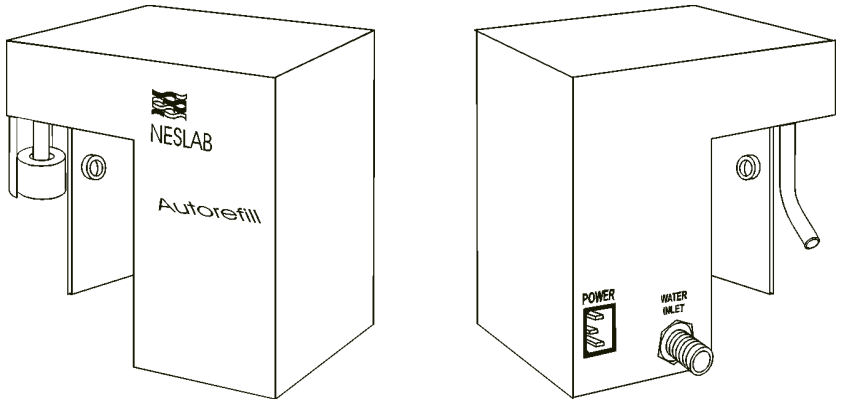
Autorefill (Optional)

An optional autorefill device is designed to maintain the correct level of fluid in the reservoir. The device consists of a float switch and a solenoid valve. If the fluid level falls, the float switch will open the solenoid valve and allow makeup fluid to fill the reservoir. Once the fluid reaches the proper level, the float switch will rise and the solenoid valve will close.

The plumbing connection for the autorefill device, labeled WATER INLET, is located on the rear of the autorefill assembly. The connection is 3/8 inch OD stainless steel. Remove the nut and install the tubing from your makeup fluid source. Reinstall the nut and tubing on to the connection.

Tubing is available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

The autorefill device requires its own source of electrical power. The connector for the line cord (provided with the assembly) is also located on the rear of the autorefill device. The connector is labelled POWER.



Autorefill Device

Section IV Controllers

Controllers

Two standard temperature controllers are available with the unit: Analog and Digital. This section explains the installation and operation of the controllers.

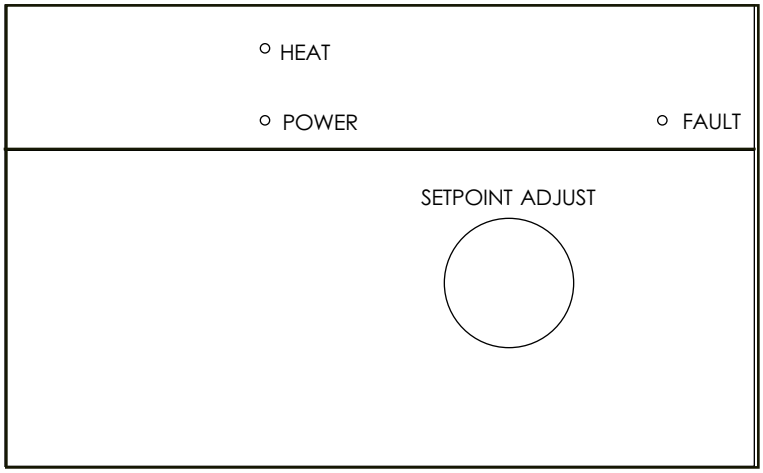
Analog

Start Up

Before starting the unit, check all electrical and plumbing connections and make sure the work area has been properly filled with bath fluid.

To start 115V units press the I/O switch on the side of the controller to the **I** (power on) position. The pump will start and the POWER LED will light.

220V units have a circuit breaker instead of a switch. The circuit breaker is labeled **I** (power on) and **O** (power off). Ensure the circuit breaker is in the **I** position.



Analog Controller

The HEAT LED indicates the status of the heater. As the temperature of the fluid in the bath approaches the temperature setpoint, the lamp will cycle on and off to indicate the approximate duty cycle of the heater.

Temperature Adjustment

Units with Analog temperature controller are equipped with a glass tube thermometer. Insert the thermometer in the grommet located on the left side of the work area.

To adjust the bath temperature, turn the dial to the desired setpoint. Use the bath thermometer to make fine adjustments to the bath temperature.

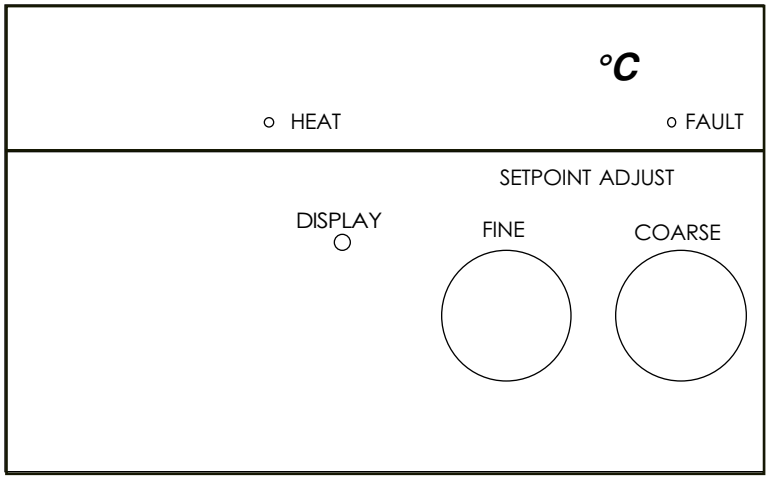
Digital

Start Up

Before starting the unit, check all electrical and plumbing connections and make sure the work area has been properly filled with bath fluid.

To start 115V units press the I/O switch on the side of the controller to the **I** (power on) position. The pump will start and the POWER LED will light.

220V units have a circuit breaker instead of a switch. The circuit breaker is labeled **I** (power on) and **O** (power off). Ensure the circuit breaker is in the **I** position.



Digital Controller

The HEAT LED indicates the status of the heater. As the temperature of the fluid in the bath approaches the temperature setpoint, the lamp will cycle on and off to indicate the approximate duty cycle of the heater.

Temperature Adjustment

To display the temperature setpoint, press the DISPLAY switch. To adjust the setpoint, press and hold the DISPLAY switch and turn the COARSE and FINE dials until the temperature setpoint is indicated on the LED display.

NOTE: Inadvertent movement of the COARSE and FINE dials, regardless of the position of the DISPLAY switch, will result in a change of the setpoint. The change will not be immediately reflected on the LED display unless the DISPLAY switch is pressed. The display will eventually change as the unitre-sponds to the new setpoint.

Tap Water Cooling Coils

The unit is equipped with a cooling coil located behind the stainless steel baffle in the bath. The bath can be cooled and temperature stability improved by circulating cold fluid through the coil. For best results, the fluid should be at least 5°C below the temperature setpoint. The required fluid flow rate depends on the type of fluid, the setpoint, and the desired stability.

The plumbing connections for the cooling coil are $^{3}/_{8}$ inch OD stainless steel tubes located on the rear of the unit. These connections will accept $^{3}/_{8}$ inch or $^{5}/_{16}$ inch ID tubing. Tubing is available from NESLAB.

Connect the COOLING COIL IN tube to the cold fluid source. Connect the COOLING COIL OUT tube to the cold fluid return (or drain if tap water is being used).

Boost Heater

EX-221 and EX-511 units are equipped with a boost heater. The boost heater is designed to provide additional heat to the unit.

To start the heater press the BOOST HEAT switch, located on the front of the temperature controller, to the ON position. Even though the switch automatically returns to the OFF position, the boost heater will start to function. (You can verify this by observing the fluid temperature rising.) The boost heater automatically ceases operation when the setpoint is reached.

High Temperature/ Low Liquid Level Safety

To protect your application, the adjustable High Temperature/Low Liquid Level Safety (HIGH TEMP/LOW LEVEL) ensures the heater will not exceed temperatures which can cause serious damage to your unit. A single temperature sensor, located on the heater coils in the bath, monitors both conditions. A High Temperature/Low Liquid Level fault occurs when the temperature of the sensor exceeds the set temperature limit.

In the event of a fault, the unit will shut down. The cause of the fault must be identified and corrected before the unit can be restarted.

The safety on single heater systems is not preset and must be adjusted during initial installation.

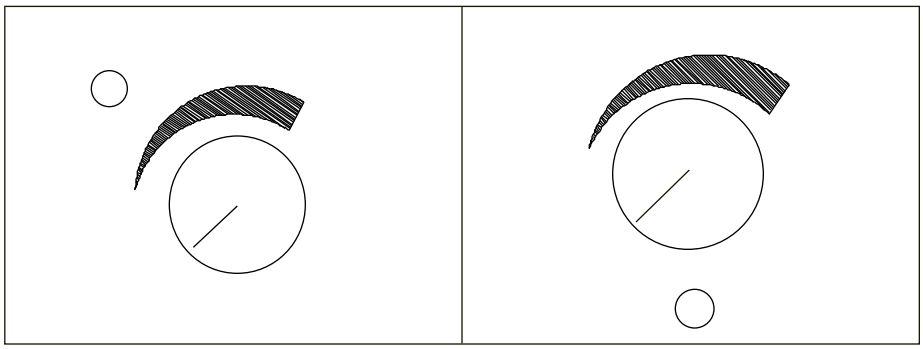
Units with a boost heater have an additional nonadjustable safety located behind the main safety. It has a red reset button but no adjustment knob.

To set the safety, locate the HIGH TEMP/LOW LEVEL SAFETY adjustment dial on the right side of the pump box. Turn the dial fully clockwise and press the red RESET switch. The RESET switch is located next to the adjustment dial. NOTE: For units without a reset switch turn the I/O switch off then back on.

Start the unit. Adjust the setpoint for a few degrees higher than the highest desired fluid temperature and allow the bath to stabilize at the temperature setpoint. Turn the HIGH TEMP/LOW LEVEL SAFETY dial counterclockwise until you hear a click and the unit shuts down. The red FAULT LED on the temperature controller will light to indicate a fault has occurred.

Cool the bath and then, without moving the adjustment dial, press the red RESET switch or turn the I/O switch off then back on.

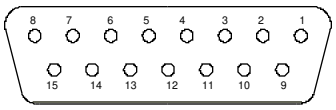
NOTE: For units with a reset switch, the minimum high temperature safety setting is 50°C. For units without a reset switch the safety has a temperature range of 0°C to 180°C.



High Temperature/Low Liquid Level Safety (Typical)
(Some units do not have a reset switch.)

15-Pin Accessory Connector (Optional)

Digital units are equipped with a 15 pin D-subminiature female receptacle on the right side of the power box. An ENABLE/DISABLE switch is located just below the receptacle. Place the switch to the ENABLE position to control the bath via the receptacle connection. (The sensor temperature and setpoint, pin 7 and 8, can be read with the switch in either position.) The pin-out information is listed below.



15 pin D-subminiature female receptacle

Pin #	Function
1	Chassis ground.
2	No connection.
3	Span +. Indicates the maximum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +350mV = +35.0°C).
4	Span -. Indicates the minimum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +50mV = +5.0°C).
5	No connection.
6	Analog ground. The analog ground is physically separated from the power ground throughout the unit. To prevent offsets that result from ground currents, the analog and power grounds are only connected at the unit's power supply. Analog ground should only be used as a reference pin.
7	Sensor temperature (current limited through 2.7K OHM resistor). The fluid temperature, as measured by the controller's sensor located in the reservoir, can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
8	Setpoint out. The present temperature setpoint can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
9	Power Ground.
10	No connection.
11	No connection.
12	Digital display (input only). An external voltage can be displayed on the operator panel digital display by applying the voltage to this pin. The display has a low input resistance and a full scale rating of ±1.99VDC. Input is referenced to analog ground, pin 6. The maximum voltage applied to the display should be limited to ±2VDC.
13	- 5V. Power supply of -5VDC (15mA maximum).
14	+5V. Power supply of +5VDC (50mA maximum).
15	Setpoint in. The temperature setpoint can be controlled by applying a known voltage to this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +230mV = +23.0°C).

NOTE: With the switch in the ENABLE position and no input to pin 15, the bath will slowly go to the setpoint value set on the digital controller.

Section V Maintenance

To avoid electrical shock, disconnect the mains cord prior to removing any access panels or covers.

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Reservoir Cleaning

Routine cleaning can be achieved by simply sponging down the seamless stainless steel tank with tap water. (Dish washing detergent may be used but the tank must be thoroughly rinsed.)

To gain access to the entire reservoir the pump box and reservoir cover should be removed.

Remove the line cord from the rear of the unit.

Remove the four screws securing the reservoir's cover.

Carefully raise the controller and cover assembly to remove it from unit.

Place the cover on its side.

Algae

To restrict the growth of algae in the bath, we recommend the bath cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light required for the growth of most common algae.

NESLAB also recommends the use of Chloramine-T, one gram per gallon.

Section VI Troubleshooting

Checklist

Unit will not start

Make sure the voltage of the power source meets the specified voltage, ±10%. Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Check the High Temperature/Low Liquid Level Safety. If the FAULT light is on, make sure the fluid level in the bath is between the marks in the baffle and the HIGH TEMP/LOW LEVEL SAFETY setting is greater than the fluid temperature. Push the RESET switch(es) or, for units without a reset switch, turn the I/O switch off then back on and attempt to restart.

No external circulation

Make sure the stainless steel plugs on the PUMP INLET and PUMP OUTLET have been removed.

Check for obstructions, kinks, or leaks in the circulation tubing.

Circulation will cease when the pump head has been exceeded.

Service Assistance and Technical Support

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Customer Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

Part number
Serial number
Voltage of unit
Voltage of power source

Our Service Department can provide you with a wiring diagram and a complete list of spare parts for your unit. Before calling, please obtain the following information:

Part number
Serial number

Section VII Programming Software

NEScom Software

The NESLAB Communications Software is a user friendly software that allows you to automate your temperature control process. The software includes a 3½" disk, Comprehensive Operator's Manual and a toll-free number to a trained technical staff.

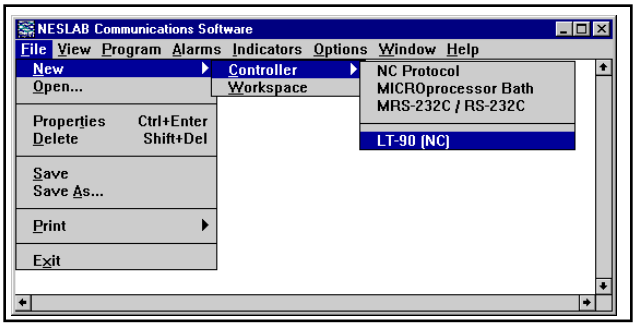
NEScom Software allows you to write custom temperature programs for our Digital or Microprocessor based temperature control apparatus. Choose upper or lower temperature limits and monitor system status with an alarm. NEScom can also record your results on a user selectable graph. NesCom must be used with an IBM or 100% compatible computer.

Select from easy to use product icons.

Create graphs and charts.

Easily configure ramping functions which set the setpoint over time.

View pop-up alarm windows which display if an alarm condition occurred.



Select software functions from the easy to use pulldown menus.

View a virtual controller screen which allows remote monitoring and operation of product control panel.

DeltaTemp

DeltaTemp programming software is now available for free download from NESLAB ONLINE BBS (Bulletin Board System) at 603-427-2490.

DeltaTemp software allows you to write custom temperature programs for NESLAB digital units (any unit with a digital temperature readout AND a 10-15 pin INTERFACE port). The menu-driven program provides a table format for entering temperature parameters and a visual graph confirmation of the program you have designed. Program time can range from 0 to 999 minutes with unlimited looping. Choose upper and lower temperature limits and monitor system status with an audible alarm. DeltaTemp can also record your results on a printed graph or file. DeltaTemp is a DOS program, and requires an IBM or 100% compatible computer.

DeltaTemp may require use of a computer interface device, depending on which NESLAB unit is being used. Refer to the setup diagram in the DeltaTemp folder for full details.

To download the software, go to: CONFERENCES / SOFTWARE / DeltaTemp.

The folder also contains the operating manual, setup diagrams, application notes, and directions on making your own interface cable.

NESLAB ONLINE is a FirstClass® system accessible by general terminal software (Windows Terminal accessory, ClarisWorks Communications, Z-Term, Pro-Comm, or similar).

To use the full graphics and features of the BBS we recommend using FirstClass® Client software. FirstClass® Client is available for Macintosh or Windows platforms. It is available from many sources:

NESLAB ONLINE
Mac: Conferences/Software/Macintosh
Windows: Conferences/Software/Windows

AMERICA ONLINE
Mac: Computing/software center/mac communications forum/industry connection/softarc
Windows: Computing/software center/communications programs

Appendix

International Quick Reference Guides

EX - Serie Kurzbedienungsanleitung

Installation
Stellen Sie das Gerät auf einen stabilen Tisch oder Labortisch. Die Umgebungstemperatur sollte zwischen +10 °C und +27 °C liegen.

Vergewissern Sie sich, daß die Spannung Ihrer Stromanschlüsse mit der für das Gerät vorgesehenen Spannung übereinstimmt (± 10%).

Die Schlauchanschlüsse (1/4 Zoll MPT) des Gerätes befinden sich an der Rückseite und sind mit PUMP INLET und PUMP OUTLET bezeichnet. Entfernen Sie die Kappen, falls externe Zirkulation gewünscht wird. Schließen Sie den PUMP OUTLET-Anschluß an den Eingang Ihres Instruments und den PUMP INLET-Anschluß an den Ausgang Ihres Instruments an.

Füllen Sie das Reservoir bis zu einem Stand, der zwischen den horizontalen Markierungen liegt, die auf dem Blech markiert sind, das den Arbeitsbereich von der Pumpeneinheit trennt.

Verwenden Sie niemals entflammbare oder Korrosion verursachende Flüssigkeiten. Für den Betrieb im Arbeits-Temperaturbereich bis +80°C empfiehlt NESLAB Leitungswasser. Oberhalb +80 °C ist der Anwender selbst für die verwendeten Flüssigkeiten verantwortlich. Über +115 °C dürfen Sie niemals pures Ethylenglykol als Badflüssigkeit verwenden.

Wenn sie zu einem externen System zirkulieren, sollten Sie zusätzliche Kühlflüssigkeit zur Hand haben, um den Kühlflüssigkeitsstand in den Zirkulationsleitungen und dem externen System beibehalten zu können.

Betreiben Sie das Gerät niemals mit leerem Arbeitsbereich!

Inbetriebnahme
Vor Inbetriebnahme des Gerätes vergewissern Sie sich bitte, daß die elektrischen Anschlüsse und die Rohr- u. Schlauchanschlüsse sachgemäß installiert sind und daß das gesamte System mit Kühlflüssigkeit gefüllt ist.

Geräte, die bei 220 Volt betrieben werden, verfügen über einen Stromkreisunterbrecher auf der Rückseite des Gerätes. Vergewissern Sie sich, daß dieser auf ON gestellt ist. Um das Gerät einzuschalten, müssen Sie den I/O-Schalter auf „I“ stellen. Die Power-Lampe leuchtet auf, wenn das Gerät in Betrieb ist. Um das Gerät abzuschalten, muß der I/O-Schalter auf „O“ gestellt werden.

Die HEAT-LED-Anzeige zeigt den Status des Heizelements an. Sie leuchtet auf, wenn das Heizelement arbeitet. Wenn die Arbeitstemperatur den gewünschten Setpoint erreicht, blinkt die LED-Anzeige, um den ungefähren Arbeitsrhythmus des Heizelements anzuzeigen.

Einstellung der Analog-Temperatursteuerung
Um die Temperatur einzustellen (setpoint), drehen Sie den SETPOINT ADJUST-Schalter an der Vorderseite des Gerätes auf die gewünschte Temperatur.

Einstellung der Digital-Temperatursteuerung
Um sich den Temperatur-Setpoint anzeigen zu lassen, drücken Sie den DISPLAY-Schalter und halten Sie ihn gedrückt. Um den Temperatur-Setpoint einzustellen, drücken Sie den Display-Schalter, halten diesen, und drehen gleichzeitig den SETPOINT ADJUST-Schalter so lange, bis die gewünschte Temperatur in der Digitalanzeige angezeigt wird. Wenn die Temperatur eingestellt ist, lassen Sie den Display-Schalter los. Die Digitalanzeige zeigt dann die Temperatur der Kühlflüssigkeit im Reservoir an.

Wartung
Überprüfen Sie das Reservoir regelmäßig. Sollte eine Säuberung notwendig sein, spülen Sie das Reservoir mit einer speziellen Reinigungsflüssigkeit, die mit dem Umlaufsystem und der Zirkulationsflüssigkeit kompatibel ist.

Für umfassende Informationen einschließlich Fehlerbeseitigungsmöglichkeiten schlagen Sie bitte in der Betriebsanleitung nach oder wenden Sie sich an unsere Service-Abteilung: 069/50 91 90 32.

EX Serie Kvik Referance

Installation:
Operationstemperatur ved 100% udnyttelse er fra stuetemperatur til+75^0 C under forudsætning af, at netspændingen er den nominelle 240V +/- 10%.

Tilslutning af slanger er på bagsiden mærket „PUMP INLET“ (ind) and „PUMP OUTLET“ (ud). Tilslutningerne er $^1/_4$" MPT-gevind.

Fyld resovoiret til mærket placeret på bafflen mellem arbejdsområdet og pumpeenheden.

Anvend aldrig brandbare væsker, rent ionbyttet eller dobbeltdestilleret vand kan anvendes op til +80^0 C, over denne temperatur anbefales specialvæsker.

Sørg altid for at den rette mængde væske er til stede i termostatkarret, og husk at kompensere for den væske, der medgår til ekstern cirkulation.

Betjening:
Før opstart checkes elektriske forbindelser, slangeforbindelser og kølevæske stand.
Check hovedkontakten på bagsiden af badet, og sørg for at den er tændt. Når badet skal startes trykkes I/O kontakten på siden i I position, og strømindikatoren tænder. Skal
badet slukkes, trykkes I/O kontakten i O stilling, og indikatoren slukker.

Dioden på frontpanelet angiver status på badet, der lyser ved opvarmning og
slukker, når den indstillede temperatur er nået.

Analog temperatur kontrol:
Drej ^{0}C tasten til den ønskede temperatur og lad systemet stabiliserer sig.

Digital temperatur kontrol:
Tryk på „DISPLAY“ tasten for at se den indstillede temperatur. Indstilling af ny temperatur, tryk på „DISPLAY“ og drej på „ADJUST“ indtil den rigtige temperatur vises, slip derefter „DISPLAY“ tasten. Skærmen vil nu vise den aktuelle temperatur i badet.

Periodisk vedligeholdelse:
Check standen af kølevæske periodisk. Før skift af væske indstilles temperaturen på „de-ice“. Check med mellemrum vakuummet på pumpesiden, rens systemet og check for aflejringer, vækst, utætheder og evt. filtre. Husk åben aldrig instrumentet uden strømmen er afbrudt, og strømkablet er taget ud!

EX Series, Handleiding voor snelle installatieprocedures

Installatie
Plaats het apparaat op een tafel of werkbank. Omgevingstemperaturen moeten liggen tussen de +10°C en +27°C.

Let erop dat de netspanning gelijk is aan het aangegeven voltage, +/- 10%.

De slangaansluitingen zijn bevestigd aan de achterkant van het apparaat en zijn voorzien van de labels PUMP INLET en PUMP OUTLET. Deze aansluitingen zijn 1/4 inch MPT. Verwijder de pluggen indien externe circulatie gewenst is. Bevestig de PUMP OUTLET aan de ingang van uw applicatie. Bevestig de PUMP INLET aan de uitgang van uw applicatie.

Vul nu het reservoir tot het niveau tussen de horizontale strepen op de roestvrij stalen scheidingsplaat, die de werkruimte van het pompgedeelte scheidt.

Gebruik nooit brandbare of andere koelvloeistoffen, die het toestel kunnen aantasten. Kraanwater wordt in het algemeen aanbevolen wanneer u bij temperaturen werkt van +8°C tot +80°C. Boven de + 80C. zal de gebruiker verantwoordelijk zijn voor de benodigde vloeistoffen. Indien men boven de 115°C. werkt, gelieve nooit puur ethylene glycol als badvloeistof te gebruiken.

Wanneer u wilt pompen naar een extern systeem, dient u altijd extra vloeistof achter de hand te houden om met juiste vloeistofniveau's zowel in het interne als het externe gedeelte van het systeem, te handhaven.

Gebruik het apparaat nooit wanneer het reservoir leeg is.

Operationeel gebruik
Alvorens het apparaat in gebruik te nemen, dient u eerst alle elektrische- en slangaansluitingen te controleren. Tevens dient u te controleren of het systeem gevuld is met vloeistof.

220 Volt apparaten hebben een z.g. "circuit breaker" aan de achterkant van het apparaat. Controleer of deze in werking is gesteld. Om het apparaat te starten, gelieve de I/O knop aan de zijkant van het apparaat te draaien naar de I positie. Het lampje zal oplichten als indicatie dat het systeem in werking is gesteld. Om het apparaat uit te zetten, gelieve de I/O knop naar de O positie te draaien.

Het "HEAT LED" duidt de actuele status van het verwarmings-element aan. Het zal oplichten indien het verwarmingselement in werking is gesteld. Als de ingestelde temperatuur de set-point heeft bereikt, zal de LED aan en uit gaan om het proces van de heater aan te duiden.

Analog Controller Temperature Adjustment
Om de temperatuur set-point aan te passen, draai de SETPOINT ADJUST knop aan de voorkant van het apparaat naar de gewenste temperatuur.

Digital Controller Temperature Adjustment
Om de temperatuur set-point af te kunnen lezen, houdt u de DISPLAY knop ingedrukt. Om de temperatuur set-point aan te passen, houdt u de DISPLAY knop ingedrukt en draait u de set-point set point knop, totdat de gewenste temperatuur set-point af te lezen is van de display. Als de set-point is aangepast, kunt u de DISPLAY knop weer loslaten. De display zal nu de temperatuur weergeven van de vloeistof in het reservoir.

Periodiek Onderhoud
Het reservoir dient regelmatig gecontroleerd te worden. Indien reiniging noodzakelijk is, zal het reservoir schoongespoeld moeten worden met een vloeistof, welke verenigbaar is met het systeem en de koelvloeistof.

Indien u meer informatie wenst, inclusief procedures in geval van problemen, kunt u de handleiding raadplegen of contact opnemen met de NESLAB service-afdeling: (+31) - 40 - 300066.

Kortfattad Bruksanvisning för EX Serie

Installation
Ställ maskinen på ett stadigt bord eller en bänk. Temperaturen i rummet bör vara mellan +50°F (10°C) och +80°F (27°C).

Försäkra att spänningen är den samma som den som är given i instruktionerna ± 10%.

Röranslutning finns på baksidan av maskinen och har följande beskrivning: SUPPLY och RETURN. Anslutningarna är 1/4 inch MPT. Ta bort de skyddande plast bitarna från röranslutningarna. Anslut SUPPLY kopplingen till intaget av din anordning och RETURN kopplingen till uttaget.

Lösgör skruvarna och ta bort luckan för att fylla tanken. Ta bort tank locket och fyll tanken med ren kylnings vätska.

Använd aldrig eldfarliga eller frätande vätskor. Kran vatten rekommenderas upp till +80°C. Över +80°C är användaren ansvarig för vilken vätska som används. Använd aldrig ren etylen glykol som vätska över 115°C.

Ha extra vätska redo om din anordning kräver det så att den rätta nivån behålls i cirkulations sytemet.

Användning
Kontrollera alla elektriska och alla rör anslutningar innan maskinen startas. Se till att cirkulations systemen har fyllts med vätska.

220V maskiner har en ström brytare på baksidan av maskinen. För att starta maskinen, sätt I/O knappen på sidan av maskinen på I. Lampan lyser för att visa att maskinen är på. Sätt knappen på O för att stänga av den.

Analog Kontroll, Temperatur Ändring

För att ändra den önskade förbestämda temperaturen, vrid °C knappen på framsidan av maskinen tills den önskade temperaturen är nådd.

Digital Kontroll, Temperatur Ändring
Håll Display knappen intryckt för att visa den önskade temperaturen. Håll Display knappen intryckt och vrid Adjust knappen för att ändra den önskade temperaturen. Släpp Display knappen efter att den önskade temperaturen visas på kontroll panelen. Temperaturen på vätskan i tanken visas nu på kontroll panelen.

Periodiskt Underhåll
Inspektera vätskan i tanken periodvis. Om det är nödvändigt med rengöring, spola tanken med en vätska som är förenlig med cirkulations sytemet och med kylvätskan.

NOTICE D'UTILISATION

BAINS EX

INSTALLATION
Placer l'appareil sur une table ou une paillasse suffisamment robuste. La température de la pièce doit être comprise entre 10 et 25°C.

S'assurer que l'alimentation électrique soit celle requise à ±10%.

Les connections sont situées à l'arrière de l'appareil et sont étiquetées " PUMP INLET " et " PUMP OUTLET ". Ces connections sont en inox d'un diamètre 3/8eme de pouce. Retirer les embouts en inox si vous souhaitez recirculer. Enficher le connecteur " PUMP OUTLET " à l'entrée de votre équipement et le connecteur " PUMP INLET " à la sortie.

Remplir le réservoir à un niveau compris entre les deux graduations " maxi " et " mini ".

Ne pas utiliser de liquide inflammable, corrosif, ou dont la viscosité serait inférieure à 50 centistokes aux températures les plus basses. Pour un fonctionnement jusqu'à 80°C, l'eau du robinet est la plus indiquée. En phase d'amorçage (au début de la recirculation), rajouter rapidement du liquide. Ne jamais l'utiliser sans liquide ou en dessous du niveau minimum.

Ces bains sont équipés d'un robinet de vidange situé à l'arrière.

MISE EN ROUTE
Vérifier les connections électriques, les tuyaux d'eau ainsi que le niveau de remplissage.

Les modèles en 220V ont un interrupteur général à l'arrière. Vérifier qu'il est sur " on ", placer l'interrupteur sur la position 1. La pompe, ainsi que le système de réfrigération se mettent en route. Le controleur de température numérique indique la température dans le bain. Pour éteindre, mettre l'interrupteur sur la position 0.

Le témoin lumineux " heat " indique que le bain fonctionne en mode " chauffage ". Quand la température approche de celle souhaitée, la diode s'éteint et s'allume.

REGLAGE DU CONTROLEUR DE TEMPERATURE ANALOGIQUE
Tourner le potentiomètre situé à l'avant jusqu'à ce que la température désirée coïncide avec la graduation.

REGLAGE DU CONTROLEUR DE TEMPERATURE NUMERIQUE
Pour afficher la température souhaitée, maintenir appuyé l'interrupteur et tourner le bouton de réglage jusqu'à ce que la température souhaitée soit affichée. Relâcher ensuite l'interrupteur. L'affichage indique alors la température du fluide dans le réservoir.

MAINTENANCE PREVENTIVE
Vérifier régulièrement le fluide dans le réservoir,

Changer de temps à autre le liquide utilisé,

En cas de nettoyage, rincer avec un produit de lavage compatible,

PROCEDIMIENTOS DE OPERACION DE REFERENCIA RAPIDA

PARA LA SERIE EX

INSTALACION

Sitúe la unidad sobre una mesa resistente o sobre un banco de trabajo. Las temperaturas ambientes deben estar dentro del rango de + 50 ºF a + 80 ºF.

Asegúrese de que el voltaje de la fuente de energía sea igual que el voltaje especificado, +/- 10%.

Las conexiones de tuberías están situadas en la parte trasera de la unidad y están marcadas como PUMP INLET y PUMP OUTLET. Estas conexiones son 1/4" MPT. Saque las tapas cuando requiera circulación externa. Conecte el adaptador PUMP OUTLET a la entrada de su aplicación. Conecte el adaptador PUMP INLET a la salida de su aplicación.

Llene el reservorio a un nivel entre los marcadores horizontales situados en la puerta de acero inoxidable que separa la zona de trabajo de la bomba.

No utilice nunca fluidos inflamables o corrosivos. Se recomienda utilizar agua corriente para operar a +80 ºC. Por encima de +80 ºC, el usuario es responsable de los fluidos que utilice. Por encima de 115 ºC no utilice nunca etileno glicol puro como fluido de baño.

Cuando bombee a un sistema externo, tenga fluido extra a mano para mantener el nivel apropiado tanto en las lineas circulantes como en el sistema externo.

Nunca haga funcionar el instrumento con el área de trabajo vacía.

OPERACION

Antes de poner en marcha la unidad, compruebe todas las conexiones eléctricas y de tuberías. Asegúrese de que el sistema circulador se ha llenado con fluido.

Las unidades de 220 V. tienen un cortador de circuito en la parte trasera de la unidad. Asegúrese de que está en posición ON. Para poner en marcha la unidad, ponga el interruptor I/O situado en el lateral de la unidad en posición I. La lámpara Power se iluminará para indicar que el sistema está funcionando. Para apagarlo, ponga el interruptor de encendido en posición O.

El LED HEAT indica la situación del sistema del calentador. Se ilumina para indicar que el calentador está funcionando. A medida que la temperatura de funcionamiento se aproxima al punto fijado, el LED ciclará para indicar el ciclo de trabajo del calentador.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR ANALOGICO

Para fijar el punto de ajuste de la temperatura, gire el dial SETPOINT ADJUST situado en el frontal de la unidad hasta la temperatura deseada.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR DIGITAL

Para que el punto de ajuste de temperatura aparezca en pantalla, mantenga presionado el interruptor DISPLAY. Para fijar el punto de ajuste de temperatura, mantenga presionado el interruptor DISPLAY y gire los botones SETPOINT ADJUST hasta que la pantalla digital indique el punto de ajuste de temperatura deseado. Una vez fijado el punto de ajuste, suelte el interruptor DISPLAY. La pantalla indicará la temperatura del fluido en el reservorio.

MANTENIMIENTO PERIODICO

Inspeccione periódicamente el fluido del reservorio. Si es necesaria una limpieza, rocíe el reservorio con un fluido de limpieza compatible con el sistema de circulación y el fluido recirculante.

Para una información completa, incluyendo solución de problemas, refiérase al manual de instrucciones o contacte con el Departamento de Servicio al Cliente en el teléfono 1-800-258-0830.

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact NESLAB for more information.

After-sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Customer Service Department. Before calling, please obtain the following information from the unit's serial number label:

- *BOM number* _____
- *Serial number* _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department.

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without bath fluid in the bath.

Never use pure ethylene glycol as a bath fluid. A minimum 80/20 mixture of Ethylene Glycol and tap water is allowed.

For 220 - 240 volt units supplied without a line cord, use a harmonized (HAR) grounded 3-conductor cord, type H05VV-F, with conductors listed below. A suitable cord end is required for connecting to the equipment (see unit socket) and must terminate with an IEC approved plug for proper connection to power supply.

NON-BOOST HEATER UNITS	**Nominal 1.0 mm² cross section rated 10 Amps** **Unit Socket: IEC - 320 C13**
BOOST HEATER UNITS	**Nominal 1.5 mm² cross section rated 16 Amps** **Unit Socket: IEC - 320 C19**

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the bath before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, personal injury or death.

Section II General Information

Description

The EX Series Bath Circulators are designed to provide temperature control for applications requiring a fluid work area or pumping to an external system.

The units consist of a circulation pump, stainless steel bath, a work area cover, and a temperature controller.

Specifications

	EX-111	EX-211
Temperature Range[1] *Analog controller* *Digital controller*	Ambient +3°C to +100°C Ambient +3°C to +150°C	
Temperature Stability[2] *Analog controller* *Digital controller*	±0.1°C ±0.01°C	
Pumping Capacity	15 lpm at 0' (0 M) 0 lpm at 16' (4.9 M)	
Heater *Watts* *50 Hz Models*	800 1000	
Bath Work Area (H x W x D) *Inches* *Centimeters*	4 3/4 x 8 x 6 12.1 x 20.3 x 15.2	9 1/4 x 10 x 6 23.5 x 25.4 x 15.2
Bath Volume *Liters*	7.0	12.25
Case Dimensions *(L x W x D)* *Inches* *Centimeters*	17 x 10 5/16 x 15 7/8 43.2 x 26.2 x 40.3	17 x 12 3/8 x 18 3/8 43.2 x 31.4 x 46.7
Power Requirements[3]	115 V, 60 Hz, 9 Amps 220/240 V, 50 Hz, 5.5 Amps	

1. Low-end temperature with tap water cooling. The controller may be set to -30°C, however to achieve temperatures below the specified range requires accessory cooling. Contact Thermo Neslab for more details.
2. Stability is a function of the bath fluid temperature. The use of a work area cover and tap water cooling may optimize bath stability for your work. For some applications, agitation and stability above ambient temperatures may be may be improved by connecting a small length of hose between the PUMP INLET and PUMP OUTLET connections on the rear of the unit.
3. Power Board Transformer Fuse–Analog T 0.5A 250V (Qty 1), Digital T 0.8A 250V (Qty 2) [T=Time Delay]

2. Stability is a function of the bath fluid temperature. The use of a work area cover and tap water cooling may optimize bath stability for your work. For some applications, agitation and stability above ambient temperatures may be may be improved by connecting a small length of hose between the PUMP INLET and PUMP OUTLET connections on the rear of the unit.
3. Power Board Transformer Fuse–Analog T 0.5A 250V (Qty 1), Digital T 0.8A 250V (Qty 2) [T=Time Delay]

Section III Installation

Site

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

Lift the unit by grasping it under the case, near the rubber feet.

Locate the unit on a sturdy table or bench top. Ambient temperatures should be inside the range of +50°F to +80°F (+10°C to +27°C).

Electrical Requirements

Line voltage may be easily accessible inside the pump/control box. Always unplug the unit prior to removing pump/control box cover.

Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

For 220 - 240 volt units supplied without a line cord, use a harmonized (HAR) grounded 3-conductor cord, type H 0 5 V V - F , with conductors listed below. A suitable cord end is required for connecting to the equipment (see unit socket) and must terminate with an IEC approved plug for proper connection to power supply.

NON-BOOST HEATER UNITS	**Nominal 1.0 mm² cross section rated 10 Amps** **Unit Socket: IEC - 320 C13**
BOOST HEATER UNITS	**Nominal 1.5 mm² cross section rated 16 Amps** **Unit Socket: IEC - 320 C19**

Plumbing Requirements

Ensure the unit is off before connecting tubing to the unit.

To prevent damage to the plumbing lines, always support the ¾" fittings while installing/removing the pumping caps and lines.

Hose Connections

The pump connections are located at the rear of the pump box and are labelled PUMP INLET and PUMP OUTLET. These connections are bent upward so the recirculating fluid will drain back into the reservoir when the hoses are disconnected. The connections are capped with stainless steel serrated plugs.

The pump lines have ¼" MPT for mating with standard plumbing fittings. For your convenience two stainless steel adapters, ¼" FPT to ⅜" O.D. serrated fitting, are provided. (To assure proper fit, they should be installed using 1½ turns of Teflon® tape around the threads.)

Flexible tubing, if used, should be of heavy wall or reinforced construction. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from Thermo NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the external system as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, make them at the inlet and outlet of the external system, not at the unit.

If substantial lengths of cooling lines are required, they should be pre-filled with bath fluid before connecting them to the unit. This will ensure that a adequate amount of fluid will be in the bath once it is in operation.

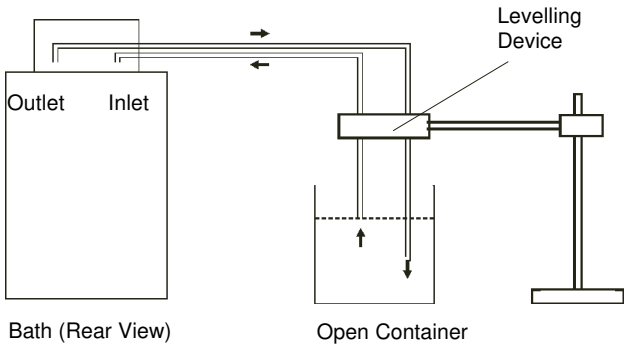
Pumping

The pump is designed to deliver a flow of 15 liters/minute (4 gallons per minute) at 0 feet head. To prevent external circulation, the PUMP INLET and PUMP OUTLET lines are capped. The caps must be removed when external circulation is required.

To properly secure the external hose connections to the unit, wrap teflon tape around the pipe line threads before installation. Once the hose connections are made, the pump must be properly plumbed to an external system. *It is important the bath is not in operation until all plumbing is complete.*

If the bath is not used for external circulation, make sure the stainless steel caps are in place prior to operating the bath.

Circulating to an open container



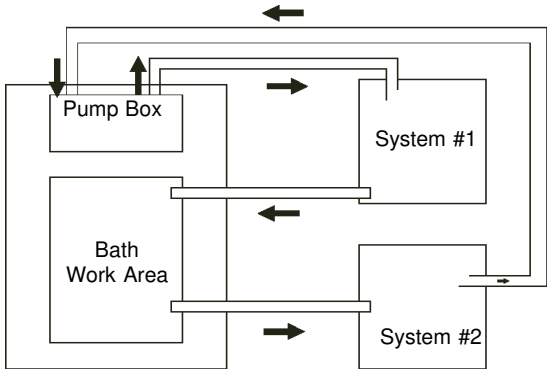
A stainless steel leveling device is available to aid circulation to an open vessel. Contact our Sales Department for more information (see Preface, After-sale Support).

Support the leveling device over the open container with a ringstand. Stagger the tubes in the leveling device so one tube is submerged in the vessel fluid, and the other tube is level with the fluid surface. Connect the deeper tube to the PUMP OUTLET and the shorter tube to the PUMP INLET.

Adjust the flow rate using the accessory flow control valve connected to the PUMP OUTLET, or by partially restricting the outlet tubing. When properly adjusted, the pump inlet will draw an occasional air bubble to prevent over flow, and the pump outlet will force fluid through the submerged tube to prevent aeration of the vessel.

To avoid siphoning the bath work area when the unit is shut off, lift the leveling device out of the vessel and above the level of the unit.

Circulating through two closed loops



Bath (Top View)

The pump can be used to circulate through two closed loop systems. Connect the shortest practical length of flexible tubing from the PUMP OUTLET to the inlet of external system #1. Connect the outlet of system #1 directly into the bath work area. Connect tubing from the bath work area to the inlet of system #2. Connect the outlet of system #2 to the PUMP INLET.

Drain

Ensure the temperature of the bath fluid is safe before draining the unit.

The unit is equipped with a drain located at the back of the unit at the base of the bath. The drain has ¼ inch male pipe threads and is capped with a stainless steel plug. To drain the reservoir simply remove the cap.

To assure proper fit when replacing the cap, be sure to line the threads with Teflon tape.

Fluids

Never use flammable or corrosive fluids with this unit.

Tap water is the recommended fluid for operation to +80°C.

Above +80°C, the user is responsible for fluids used.

Never use pure ethylene glycol as a bath fluid. A minimum 80/20 mixture of Ethylene Glycol and tap water is allowed.

Filling Requirements

The bath work area has a high and low level marker to guide filling. The markers are 1 inch horizontal slits located in the center of the stainless steel baffle separating the work area and the pump assembly. The correct fluid level falls between these two markers. The heating coils will be exposed and may become damaged if the correct fluid level is not provided.

When pumping to an external system, keep extra fluid on hand to maintain the proper level in both the circulating lines and external system.

Never run the unit when the work area is empty. Avoid overfilling. Overfilling the bath may damage the insulation and affects stability.

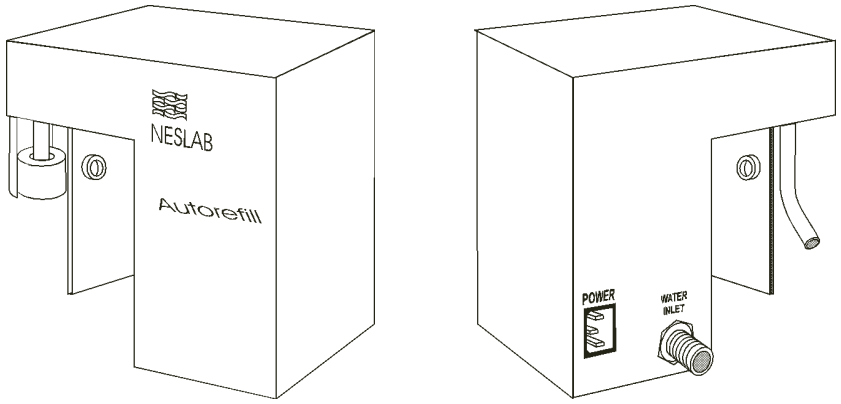
Autorefill (Optional)

An optional autorefill device is designed to maintain the correct level of fluid in the reservoir. The device consists of a float switch and a solenoid valve. If the fluid level falls, the float switch will open the solenoid valve and allow makeup fluid to fill the reservoir. Once the fluid reaches the proper level, the float switch will rise and the solenoid valve will close.

The plumbing connection for the autorefill device, labeled WATER INLET, is located on the rear of the autorefill assembly. The connection is 3/8 inch OD stainless steel. Remove the nut and install the tubing from your makeup fluid source. Reinstall the nut and tubing on to the connection.

Tubing is available from Thermo NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

The autorefill device requires its own source of electrical power. The connector for the line cord (provided with the assembly) is also located on the rear of the autorefill device. The connector is labelled POWER.



Autorefill Device

Section IV Controllers

Controllers

Two standard temperature controllers are available with the unit: Analog and Digital. This section explains the installation and operation of the controllers.

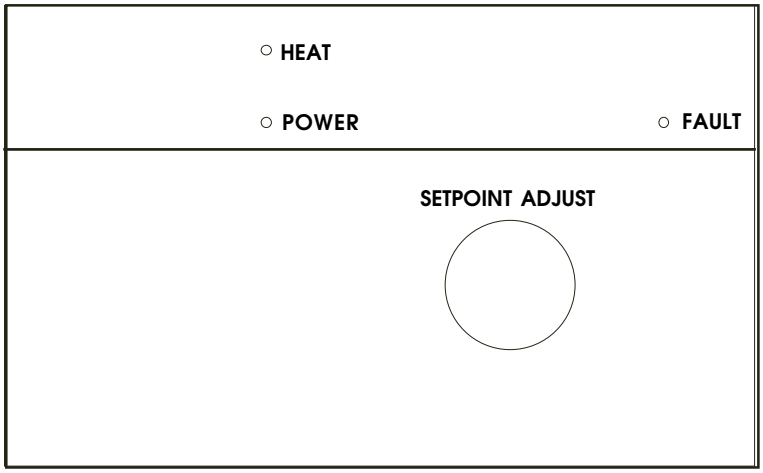
Analog

Start Up

Before starting the unit, check all electrical and plumbing connections and make sure the work area has been properly filled with bath fluid.

To start 115V units press the I/O switch on the side of the controller to the **I** (power on) position. The pump will start and the POWER LED will light.

220V units have a circuit breaker instead of a switch. The circuit breaker is labeled **I** (power on) and **O** (power off). Ensure the circuit breaker is in the **I** position.



Analog Controller

The HEAT LED indicates the status of the heater. As the temperature of the fluid in the bath approaches the temperature setpoint, the lamp will cycle on and off to indicate the approximate duty cycle of the heater.

Temperature Adjustment

Units with Analog temperature controller are equipped with a glass tube thermometer. Insert the thermometer in the grommet located on the left side of the work area.

To adjust the bath temperature, turn the dial to the desired setpoint. Use the bath thermometer to make fine adjustments to the bath temperature.

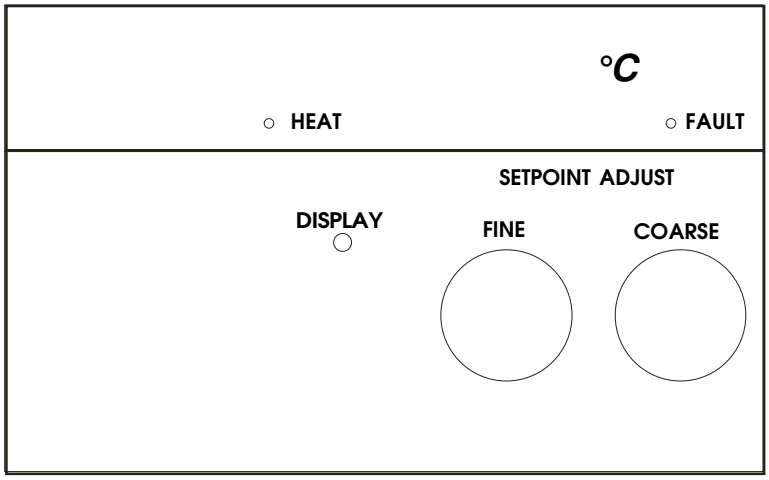
Digital

Start Up

Before starting the unit, check all electrical and plumbing connections and make sure the work area has been properly filled with bath fluid.

To start 115V units press the I/O switch on the side of the controller to the **I** (power on) position. The pump will start and the POWER LED will light.

220V units have a circuit breaker instead of a switch. The circuit breaker is labeled **I** (power on) and **O** (power off). Ensure the circuit breaker is in the **I** position.



Digital Controller

The HEAT LED indicates the status of the heater. As the temperature of the fluid in the bath approaches the temperature setpoint, the lamp will cycle on and off to indicate the approximate duty cycle of the heater.

Temperature Adjustment

To display the temperature setpoint, press the DISPLAY switch. To adjust the setpoint, press and hold the DISPLAY switch and turn the COARSE and FINE dials until the temperature setpoint is indicated on the LED display.

NOTE: Inadvertent movement of the COARSE and FINE dials, regardless of the position of the DISPLAY switch, will result in a change of the setpoint. The change will not be immediately reflected on the LED display unless the DISPLAY switch is pressed. The display will eventually change as the unit responds to the new setpoint.

Tap Water Cooling Coils

The unit is equipped with a cooling coil located behind the stainless steel baffle in the bath. The bath can be cooled and temperature stability improved by circulating cold fluid through the coil. For best results, the fluid should be at least 5°C below the temperature setpoint. The required fluid flow rate depends on the type of fluid, the setpoint, and the desired stability.

The plumbing connections for the cooling coil are $^{3}/_{8}$ inch OD stainless steel tubes located on the rear of the unit. These connections will accept $^{3}/_{8}$ inch or $^{5}/_{16}$ inch ID tubing. Tubing is available from Thermo NESLAB.

Connect the COOLING COIL IN tube to the cold fluid source. Connect the COOLING COIL OUT tube to the cold fluid return (or drain if tap water is being used).

Boost Heater

EX-221 and EX-511 units are equipped with a boost heater. The boost heater is designed to provide additional heat to the unit.

To start the heater press the BOOST HEAT switch, located on the front of the temperature controller, to the ON position. Even though the switch automatically returns to the OFF position, the boost heater will start to function. (You can verify this by observing the fluid temperature rising.) The boost heater automatically ceases operation when the setpoint is reached.

High Temperature/ Low Liquid Level Safety

To protect your application, the adjustable High Temperature/Low Liquid Level Safety (HIGH TEMP/LOW LEVEL) ensures the heater will not exceed temperatures which can cause serious damage to your unit. A single temperature sensor, located on the heater coils in the bath, monitors both conditions. A High Temperature/Low Liquid Level fault occurs when the temperature of the sensor exceeds the set temperature limit.

In the event of a fault, the unit will shut down. The cause of the fault must be identified and corrected before the unit can be restarted.

The safety on single heater systems is not preset and must be adjusted during initial installation.

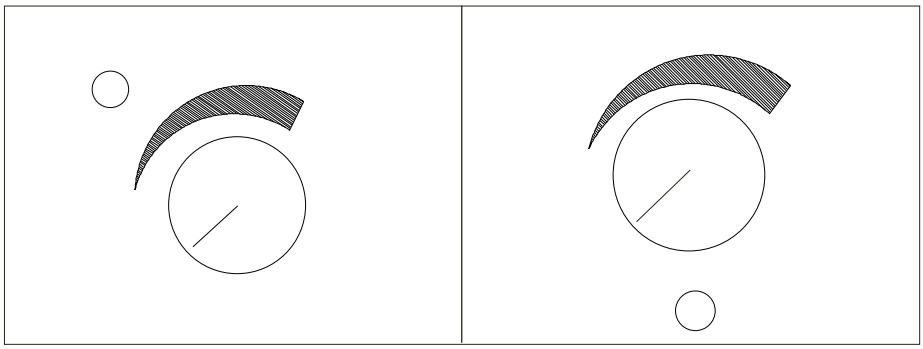
Units with a boost heater have an additional nonadjustable safety located behind the main safety. It has a red reset button but no adjustment knob.

To set the safety, locate the HIGH TEMP/LOW LEVEL SAFETY adjustment dial on the right side of the pump box. Turn the dial fully clockwise and press the red RESET switch. The RESET switch is located next to the adjustment dial. NOTE: For units without a reset switch turn the I/O switch off then back on.

Start the unit. Adjust the setpoint for a few degrees higher than the highest desired fluid temperature and allow the bath to stabilize at the temperature setpoint. Turn the HIGH TEMP/LOW LEVEL SAFETY dial counterclockwise until you hear a click and the unit shuts down. The red FAULT LED on the temperature controller will light to indicate a fault has occurred.

Cool the bath and then, without moving the adjustment dial, press the red RESET switch or turn the I/O switch off then back on.

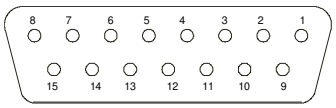
NOTE: For units with a reset switch, the minimum high temperature safety setting is 50°C. For units without a reset switch the safety has a temperature range of 0°C to 180°C.



High Temperature/Low Liquid Level Safety (Typical)
(Some units do not have a reset switch.)

15-Pin Accessory Connector (Optional)

Digital units are equipped with a 15 pin D-subminiature female receptacle on the right side of the power box. An ENABLE/DISABLE switch is located just below the receptacle. Place the switch to the ENABLE position to control the bath via the receptacle connection. (The sensor temperature and setpoint, pin 7 and 8, can be read with the switch in either position.) The pin-out information is listed below.



15 pin D-subminiature female receptacle

Pin #	Function
1	Chassis ground.
2	No connection.
3	Span +. Indicates the maximum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +350mV = +35.0°C).
4	Span -. Indicates the minimum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +50mV = +5.0°C).
5	No connection.
6	Analog ground. The analog ground is physically separated from the power ground throughout the unit. To prevent offsets that result from ground currents, the analog and power grounds are only connected at the unit's power supply. Analog ground should only be used as a reference pin.
7	Sensor temperature (current limited through 2.7K OHM resistor). The fluid temperature, as measured by the controller's sensor located in the reservoir, can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
8	Setpoint out. The present temperature setpoint can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
9	Power Ground.
10	No connection.
11	No connection.
12	Digital display (input only). An external voltage can be displayed on the operator panel digital display by applying the voltage to this pin. The display has a low input resistance and a full scale rating of ±1.99VDC. Input is referenced to analog ground, pin 6. The maximum voltage applied to the display should be limited to ±2VDC.
13	- 5V. Power supply of -5VDC (15mA maximum).
14	+5V. Power supply of +5VDC (50mA maximum).
15	Setpoint in. The temperature setpoint can be controlled by applying a known voltage to this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +230mV = +23.0°C).

NOTE: With the switch in the ENABLE position and no input to pin 15, the bath will slowly go to the setpoint value set on the digital controller.

Section V Maintenance

To avoid electrical shock, disconnect the mains cord prior to removing any access panels or covers.

Service Contracts

Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Reservoir Cleaning

Routine cleaning can be achieved by simply sponging down the seamless stainless steel tank with tap water. (Dish washing detergent may be used but the tank must be thoroughly rinsed.)

To gain access to the entire reservoir the pump box and reservoir cover should be removed.

Remove the line cord from the rear of the unit.

Remove the four screws securing the reservoir's cover.

Carefully raise the controller and cover assembly to remove it from unit.

Place the cover on its side.

Algae

To restrict the growth of algae in the bath, we recommend the bath cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light required for the growth of most common algae.

Thermo NESLAB also recommends the use of Chloramine-T, 1 gram per 3.8 liters.

Section VI Troubleshooting

Checklist

Unit will not start

Make sure the voltage of the power source meets the specified voltage, ±10%. Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Check the High Temperature/Low Liquid Level Safety. If the FAULT light is on, make sure the fluid level in the bath is between the marks in the baffle and the HIGH TEMP/LOW LEVEL SAFETY setting is greater than the fluid temperature. Push the RESET switch(es) or, for units without a reset switch, turn the I/O switch off then back on and attempt to restart.

No external circulation

Make sure the stainless steel plugs on the PUMP INLET and PUMP OUTLET have been removed.

Check for obstructions, kinks, or leaks in the circulation tubing.

Circulation will cease when the pump head has been exceeded.

Service Assistance and Technical Support

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Customer Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

Part number
Serial number
Voltage of unit
Voltage of power source

Our Service Department can provide you with a wiring diagram and a complete list of spare parts for your unit. Before calling, please obtain the following information:

Part number
Serial number

Section VII Programming Software

NEScom Software

The Thermo NESLAB Communications Software is a user friendly software that allows you to automate your temperature control process. The software includes a 3½" disk, Comprehensive Operator's Manual and a toll-free number to a trained technical staff.

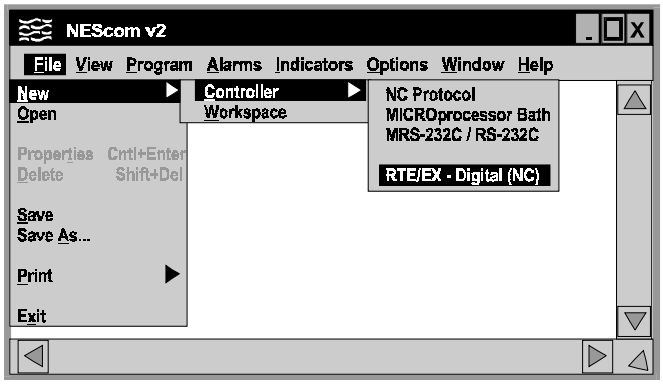
NEScom Software allows you to write custom temperature programs for our Digital or Microprocessor based temperature control apparatus. Choose upper or lower temperature limits and monitor system status with an alarm. NEScom can also record your results on a user selectable graph. NesCom must be used with an IBM or 100% compatible computer.

Select from easy to use product icons.

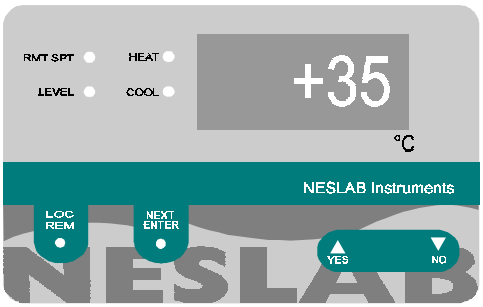
Create graphs and charts.

Easily configure ramping functions which set the setpoint over time.

View pop-up alarm windows which display if an alarm condition occurred.



Select software functions from the easy to use pulldown menus.



View a virtual controller screen which allows remote monitoring and operation of product control panel.

Appendix

International Quick Reference Guides

EX - Serie Kurzbedienungsanleitung

Installation
Stellen Sie das Gerät auf einen stabilen Tisch oder Labortisch. Die Umgebungstemperatur sollte zwischen +10 °C und +27 °C liegen.

Vergewissern Sie sich, daß die Spannung Ihrer Stromanschlüsse mit der für das Gerät vorgesehenen Spannung übereinstimmt (± 10%).

Die Schlauchanschlüsse (1/4 Zoll MPT) des Gerätes befinden sich an der Rückseite und sind mit PUMP INLET und PUMP OUTLET bezeichnet. Entfernen Sie die Kappen, falls externe Zirkulation gewünscht wird. Schließen Sie den PUMP OUTLET-Anschluß an den Eingang Ihres Instruments und den PUMP INLET-Anschluß an den Ausgang Ihres Instruments an.

Füllen Sie das Reservoir bis zu einem Stand, der zwischen den horizontalen Markierungen liegt, die auf dem Blech markiert sind, das den Arbeitsbereich von der Pumpeneinheit trennt.

Verwenden Sie niemals entflammbare oder Korrosion verursachende Flüssigkeiten. Für den Betrieb im Arbeits-Temperaturbereich bis +80°C empfiehlt Thermo NESLAB Leitungswasser. Oberhalb +80 °C ist der Anwender selbst für die verwendeten Flüssigkeiten verantwortlich. Über +115 °C dürfen Sie niemals pures Ethylenglykol als Badflüssigkeit verwenden.

Wenn sie zu einem externen System zirkulieren, sollten Sie zusätzliche Kühlflüssigkeit zur Hand haben, um den Kühlflüssigkeitsstand in den Zirkulationsleitungen und dem externen System beibehalten zu können.

Betreiben Sie das Gerät niemals mit leerem Arbeitsbereich!

Inbetriebnahme
Vor Inbetriebnahme des Gerätes vergewissern Sie sich bitte, daß die elektrischen Anschlüsse und die Rohr- u. Schlauchanschlüsse sachgemäß installiert sind und daß das gesamte System mit Kühlflüssigkeit gefüllt ist.

Geräte, die bei 220 Volt betrieben werden, verfügen über einen Stromkreisunterbrecher auf der Rückseite des Gerätes. Vergewissern Sie sich, daß dieser auf ON gestellt ist. Um das Gerät einzuschalten, müssen Sie den I/O-Schalter auf „I“ stellen. Die Power-Lampe leuchtet auf, wenn das Gerät in Betrieb ist. Um das Gerät abzuschalten, muß der I/O-Schalter auf „O“ gestellt werden.

Die HEAT-LED-Anzeige zeigt den Status des Heizelements an. Sie leuchtet auf, wenn das Heizelement arbeitet. Wenn die Arbeitstemperatur den gewünschten Setpoint erreicht, blinkt die LED-Anzeige, um den ungefähren Arbeitsrhythmus des Heizelements anzuzeigen.

Einstellung der Analog-Temperatursteuerung
Um die Temperatur einzustellen (setpoint), drehen Sie den SETPOINT ADJUST-Schalter an der Vorderseite des Gerätes auf die gewünschte Temperatur.

Einstellung der Digital-Temperatursteuerung
Um sich den Temperatur-Setpoint anzeigen zu lassen, drücken Sie den DISPLAY-Schalter und halten Sie ihn gedrückt. Um den Temperatur-Setpoint einzustellen, drücken Sie den Display-Schalter, halten diesen, und drehen gleichzeitig den SETPOINT ADJUST-Schalter so lange, bis die gewünschte Temperatur in der Digitalanzeige angezeigt wird. Wenn die Temperatur eingestellt ist, lassen Sie den Display-Schalter los. Die Digitalanzeige zeigt dann die Temperatur der Kühlflüssigkeit im Reservoir an.

Wartung
Überprüfen Sie das Reservoir regelmäßig. Sollte eine Säuberung notwendig sein, spülen Sie das Reservoir mit einer speziellen Reinigungsflüssigkeit, die mit dem Umlaufsystem und der Zirkulationsflüssigkeit kompatibel ist.

Für umfassende Informationen einschließlich Fehlerbeseitigungsmöglichkeiten schlagen Sie bitte in der Betriebsanleitung nach oder wenden Sie sich an unsere Service-Abteilung: 069/50 91 90 32.

EX Serie Kvik Referance

Installation:
Operationstemperatur ved 100% udnyttelse er fra stuetemperatur til+75^0 C under forudsætning af, at netspændingen er den nominelle 240V +/- 10%.

Tilslutning af slanger er på bagsiden mærket „PUMP INLET“ (ind) and „PUMP OUTLET“ (ud). Tilslutningerne er $^1/_4$" MPT-gevind.

Fyld resovoiret til mærket placeret på bafflen mellem arbejdsområdet og pumpeenheden.

Anvend aldrig brandbare væsker, rent ionbyttet eller dobbeltdestilleret vand kan anvendes op til +80^0 C, over denne temperatur anbefales specialvæsker.

Sørg altid for at den rette mængde væske er til stede i termostatkarret, og husk at kompensere for den væske, der medgår til ekstern cirkulation.

Betjening:
Før opstart checkes elektriske forbindelser, slangeforbindelser og kølevæske stand.
Check hovedkontakten på bagsiden af badet, og sørg for at den er tændt. Når badet skal startes trykkes I/O kontakten på siden i I position, og strømindikatoren tænder. Skal
badet slukkes, trykkes I/O kontakten i O stilling, og indikatoren slukker.

Dioden på frontpanelet angiver status på badet, der lyser ved opvarmning og
slukker, når den indstillede temperatur er nået.

Analog temperatur kontrol:
Drej ^{0}C tasten til den ønskede temperatur og lad systemet stabiliserer sig.

Digital temperatur kontrol:
Tryk på „DISPLAY“ tasten for at se den indstillede temperatur. Indstilling af ny temperatur, tryk på „DISPLAY“ og drej på „ADJUST“ indtil den rigtige temperatur vises, slip derefter „DISPLAY“ tasten. Skærmen vil nu vise den aktuelle temperatur i badet.

Periodisk vedligeholdelse:
Check standen af kølevæske periodisk. Før skift af væske indstilles temperaturen på „de-ice“. Check med mellemrum vakuummet på pumpesiden, rens systemet og check for aflejringer, vækst, utætheder og evt. filtre. Husk åben aldrig instrumentet uden strømmen er afbrudt, og strømkablet er taget ud!

EX Series, Handleiding voor snelle installatieprocedures

Installatie
Plaats het apparaat op een tafel of werkbank. Omgevingstemperaturen moeten liggen tussen de +10°C en +27°C.

Let erop dat de netspanning gelijk is aan het aangegeven voltage, +/- 10%.

De slangaansluitingen zijn bevestigd aan de achterkant van het apparaat en zijn voorzien van de labels PUMP INLET en PUMP OUTLET. Deze aansluitingen zijn 1/4 inch MPT. Verwijder de pluggen indien externe circulatie gewenst is. Bevestig de PUMP OUTLET aan de ingang van uw applicatie. Bevestig de PUMP INLET aan de uitgang van uw applicatie.

Vul nu het reservoir tot het niveau tussen de horizontale strepen op de roestvrij stalen scheidingsplaat, die de werkruimte van het pompgedeelte scheidt.

Gebruik nooit brandbare of andere koelvloeistoffen, die het toestel kunnen aantasten. Kraanwater wordt in het algemeen aanbevolen wanneer u bij temperaturen werkt van +8°C tot +80°C. Boven de + 80C. zal de gebruiker verantwoordelijk zijn voor de benodigde vloeistoffen. Indien men boven de 115°C. werkt, gelieve nooit puur ethylene glycol als badvloeistof te gebruiken.

Wanneer u wilt pompen naar een extern systeem, dient u altijd extra vloeistof achter de hand te houden om met juiste vloeistofniveau's zowel in het interne als het externe gedeelte van het systeem, te handhaven.

Gebruik het apparaat nooit wanneer het reservoir leeg is.

Operationeel gebruik
Alvorens het apparaat in gebruik te nemen, dient u eerst alle elektrische- en slangaansluitingen te controleren. Tevens dient u te controleren of het systeem gevuld is met vloeistof.

220 Volt apparaten hebben een z.g. "circuit breaker" aan de achterkant van het apparaat. Controleer of deze in werking is gesteld. Om het apparaat te starten, gelieve de I/O knop aan de zijkant van het apparaat te draaien naar de I positie. Het lampje zal oplichten als indicatie dat het systeem in werking is gesteld. Om het apparaat uit te zetten, gelieve de I/O knop naar de O positie te draaien.

Het "HEAT LED" duidt de actuele status van het verwarmings-element aan. Het zal oplichten indien het verwarmingselement in werking is gesteld. Als de ingestelde temperatuur de set-point heeft bereikt, zal de LED aan en uit gaan om het proces van de heater aan te duiden.

Analog Controller Temperature Adjustment
Om de temperatuur set-point aan te passen, draai de SETPOINT ADJUST knop aan de voorkant van het apparaat naar de gewenste temperatuur.

Digital Controller Temperature Adjustment
Om de temperatuur set-point af te kunnen lezen, houdt u de DISPLAY knop ingedrukt. Om de temperatuur set-point aan te passen, houdt u de DISPLAY knop ingedrukt en draait u de set-point set point knop, totdat de gewenste temperatuur set-point af te lezen is van de display. Als de set-point is aangepast, kunt u de DISPLAY knop weer loslaten. De display zal nu de temperatuur weergeven van de vloeistof in het reservoir.

Periodiek Onderhoud
Het reservoir dient regelmatig gecontroleerd te worden. Indien reiniging noodzakelijk is, zal het reservoir schoongespoeld moeten worden met een vloeistof, welke verenigbaar is met het systeem en de koelvloeistof.

Indien u meer informatie wenst, inclusief procedures in geval van problemen, kunt u de handleiding raadplegen of contact opnemen met de Thermo NESLAB service-afdeling: (+31) - 40 - 300066.

Kortfattad Bruksanvisning för EX Serie

Installation
Ställ maskinen på ett stadigt bord eller en bänk. Temperaturen i rummet bör vara mellan +50°F (10°C) och +80°F (27°C).

Försäkra att spänningen är den samma som den som är given i instruktionerna ± 10%.

Röranslutning finns på baksidan av maskinen och har följande beskrivning: SUPPLY och RETURN. Anslutningarna är 1/4 inch MPT. Ta bort de skyddande plast bitarna från röranslutningarna. Anslut SUPPLY kopplingen till intaget av din anordning och RETURN kopplingen till uttaget.

Lösgör skruvarna och ta bort luckan för att fylla tanken. Ta bort tank locket och fyll tanken med ren kylnings vätska.

Använd aldrig eldfarliga eller frätande vätskor. Kran vatten rekommenderas upp till +80°C. Över +80°C är användaren ansvarig för vilken vätska som används. Använd aldrig ren etylen glykol som vätska över 115°C.

Ha extra vätska redo om din anordning kräver det så att den rätta nivån behålls i cirkulations sytemet.

Användning
Kontrollera alla elektriska och alla rör anslutningar innan maskinen startas. Se till att cirkulations systemen har fyllts med vätska.

220V maskiner har en ström brytare på baksidan av maskinen. För att starta maskinen, sätt I/O knappen på sidan av maskinen på I. Lampan lyser för att visa att maskinen är på. Sätt knappen på O för att stänga av den.

Analog Kontroll, Temperatur Ändring

För att ändra den önskade förbestämda temperaturen, vrid °C knappen på framsidan av maskinen tills den önskade temperaturen är nådd.

Digital Kontroll, Temperatur Ändring
Håll Display knappen intryckt för att visa den önskade temperaturen. Håll Display knappen intryckt och vrid Adjust knappen för att ändra den önskade temperaturen. Släpp Display knappen efter att den önskade temperaturen visas på kontroll panelen. Temperaturen på vätskan i tanken visas nu på kontroll panelen.

Periodiskt Underhåll
Inspektera vätskan i tanken periodvis. Om det är nödvändigt med rengöring, spola tanken med en vätska som är förenlig med cirkulations sytemet och med kylvätskan.

NOTICE D'UTILISATION

BAINS EX

INSTALLATION
Placer l'appareil sur une table ou une paillasse suffisamment robuste. La température de la pièce doit être comprise entre 10 et 25°C.

S'assurer que l'alimentation électrique soit celle requise à ±10%.

Les connections sont situées à l'arrière de l'appareil et sont étiquetées " PUMP INLET " et " PUMP OUTLET ". Ces connections sont en inox d'un diamètre 3/8eme de pouce. Retirer les embouts en inox si vous souhaitez recirculer. Enficher le connecteur " PUMP OUTLET " à l'entrée de votre équipement et le connecteur " PUMP INLET " à la sortie.

Remplir le réservoir à un niveau compris entre les deux graduations " maxi " et " mini ".

Ne pas utiliser de liquide inflammable, corrosif, ou dont la viscosité serait inférieure à 50 centistokes aux températures les plus basses. Pour un fonctionnement jusqu'à 80°C, l'eau du robinet est la plus indiquée. En phase d'amorçage (au début de la recirculation), rajouter rapidement du liquide. Ne jamais l'utiliser sans liquide ou en dessous du niveau minimum.

Ces bains sont équipés d'un robinet de vidange situé à l'arrière.

MISE EN ROUTE
Vérifier les connections électriques, les tuyaux d'eau ainsi que le niveau de remplissage.

Les modèles en 220V ont un interrupteur général à l'arrière. Vérifier qu'il est sur " on ", placer l'interrupteur sur la position 1. La pompe, ainsi que le système de réfrigération se mettent en route. Le controleur de température numérique indique la température dans le bain. Pour éteindre, mettre l'interrupteur sur la position 0.

Le témoin lumineux " heat " indique que le bain fonctionne en mode " chauffage ". Quand la température approche de celle souhaitée, la diode s'éteint et s'allume.

REGLAGE DU CONTROLEUR DE TEMPERATURE ANALOGIQUE
Tourner le potentiomètre situé à l'avant jusqu'à ce que la température désirée coïncide avec la graduation.

REGLAGE DU CONTROLEUR DE TEMPERATURE NUMERIQUE
Pour afficher la température souhaitée, maintenir appuyé l'interrupteur et tourner le bouton de réglage jusqu'à ce que la température souhaitée soit affichée. Relâcher ensuite l'interrupteur. L'affichage indique alors la température du fluide dans le réservoir.

MAINTENANCE PREVENTIVE
Vérifier régulièrement le fluide dans le réservoir,

Changer de temps à autre le liquide utilisé,

En cas de nettoyage, rincer avec un produit de lavage compatible,

PROCEDIMIENTOS DE OPERACION DE REFERENCIA RAPIDA

PARA LA SERIE EX

INSTALACION

Sitúe la unidad sobre una mesa resistente o sobre un banco de trabajo. Las temperaturas ambientes deben estar dentro del rango de + 50 ºF a + 80 ºF.

Asegúrese de que el voltaje de la fuente de energía sea igual que el voltaje especificado, +/- 10%.

Las conexiones de tuberías están situadas en la parte trasera de la unidad y están marcadas como PUMP INLET y PUMP OUTLET. Estas conexiones son 1/4" MPT. Saque las tapas cuando requiera circulación externa. Conecte el adaptador PUMP OUTLET a la entrada de su aplicación. Conecte el adaptador PUMP INLET a la salida de su aplicación.

Llene el reservorio a un nivel entre los marcadores horizontales situados en la puerta de acero inoxidable que separa la zona de trabajo de la bomba.

No utilice nunca fluidos inflamables o corrosivos. Se recomienda utilizar agua corriente para operar a +80 ºC. Por encima de +80 ºC, el usuario es responsable de los fluidos que utilice. Por encima de 115 ºC no utilice nunca etileno glicol puro como fluido de baño.

Cuando bombee a un sistema externo, tenga fluido extra a mano para mantener el nivel apropiado tanto en las lineas circulantes como en el sistema externo.

Nunca haga funcionar el instrumento con el área de trabajo vacía.

OPERACION

Antes de poner en marcha la unidad, compruebe todas las conexiones eléctricas y de tuberías. Asegúrese de que el sistema circulador se ha llenado con fluido.

Las unidades de 220 V. tienen un cortador de circuito en la parte trasera de la unidad. Asegúrese de que está en posición ON. Para poner en marcha la unidad, ponga el interruptor I/O situado en el lateral de la unidad en posición I. La lámpara Power se iluminará para indicar que el sistema está funcionando. Para apagarlo, ponga el interruptor de encendido en posición O.

El LED HEAT indica la situación del sistema del calentador. Se ilumina para indicar que el calentador está funcionando. A medida que la temperatura de funcionamiento se aproxima al punto fijado, el LED ciclará para indicar el ciclo de trabajo del calentador.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR ANALOGICO

Para fijar el punto de ajuste de la temperatura, gire el dial SETPOINT ADJUST situado en el frontal de la unidad hasta la temperatura deseada.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR DIGITAL

Para que el punto de ajuste de temperatura aparezca en pantalla, mantenga presionado el interruptor DISPLAY. Para fijar el punto de ajuste de temperatura, mantenga presionado el interruptor DISPLAY y gire los botones SETPOINT ADJUST hasta que la pantalla digital indique el punto de ajuste de temperatura deseado. Una vez fijado el punto de ajuste, suelte el interruptor DISPLAY. La pantalla indicará la temperatura del fluido en el reservorio.

MANTENIMIENTO PERIODICO

Inspeccione periódicamente el fluido del reservorio. Si es necesaria una limpieza, rocíe el reservorio con un fluido de limpieza compatible con el sistema de circulación y el fluido recirculante.

Para una información completa, incluyendo solución de problemas, refiérase al manual de instrucciones o contacte con el Departamento de Servicio al Cliente en el teléfono 1-800-258-0830.

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. Thermo NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Thermo NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

WARRANTY

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact Thermo NESLAB for more information.

After-sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label to obtain the following information:

- BOM number _____

- Serial number _____

- Software version (see page 22) _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department.

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without bath fluid in the bath.

Never use pure ethylene glycol as a bath fluid. Above 80°C the user is responsible for the fluid used.

For 220 - 240 volt units supplied without a line cord, use a harmonized (HAR) grounded 3-conductor cord, type H05VV-F, with conductors listed below. A suitable cord end is required for connecting to the equipment (see unit socket) and must terminate with an IEC approved plug for proper connection to power supply.

EX-111, EX-211, EX411	**Nominal 1.0 mm² cross section rated 10 Amps** **Unit Socket: IEC - 320 C13**
EX-221, EX-511	**Nominal 1.5 mm² cross section rated 16 Amps** **Unit Socket: IEC - 320 C19**

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the bath before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, personal injury or death.

Section II General Information

Description

The EX Series Bath Circulators are designed to provide temperature control for applications requiring a fluid work area or pumping to an external system.

The units consist of a circulation pump, stainless steel bath, a work area cover, and a digital temperature controller.

Specifications

	EX-111	EX-211
Temperature Range[1]	Ambient +15°C to +150°C	
Temperature Stability[2,3]	±0.01°C	
Pumping Capacity[2]	15 lpm at 0' (0 M) 0 lpm at 16' (4.9 M)	
Heater *Watts* *50 Hz Models*	800 1000	
Bath Work Area (H x W x D) *Inches* *Centimeters*	4 3/4 x 8 x 6 12.1 x 20.3 x 15.2	9 1/4 x 10 x 6 23.5 x 25.4 x 15.2
Bath Volume *Gallons/Liters*	1.9/7.2	3.2/12.1
Case Dimensions[4] *(L x W x D)* *Inches* *Centimeters*	17 x 10 5/16 x 15 7/8 43.2 x 26.2 x 40.3	17 x 12 3/8 x 18 3/8 43.2 x 31.4 x 46.7
Power Requirements[5]	115 V, 60 Hz 220 V, 50 Hz	

1. Low-end temperature with tap water cooling. The controller may be set to -30°C, however to achieve temperatures below the specified range requires accessory cooling. Contact Thermo Neslab for more details.
2. Stability and pump specifications using water, other specifications determined using fluid with specific heat of 0.35, ambient 20°C.
3. Stability is a function of the bath fluid temperature. The use of a work area cover and tap water cooling may optimize bath stability for your work. For some applications, agitation and stability above ambient temperatures may be improved by connecting a small length of hose between the PUMP INLET and PUMP OUTLET connections on the rear of the unit.
4. Add 1½ inches (3.8 centimeters) to depth for plumbing connections.
5. Control transformer fusing - 115VAC units = [T=Time Delay] 500mA 250V 5 x 20mm (Qty 1), 220VAC units = [T=Time Delay] 250mA 250V 5 x 20mm (Qty 2).
   Bussman fusing part numbers: 500mA fuse = Bussman S504-500mA
   250mA fuse = Bussman S504-250mA

   250mA fuse = Bussman S504-250mA

Section III Installation

Site

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

Lift the unit by grasping it under the case, near the rubber feet.

Locate the unit on a sturdy table or bench top. Ambient temperatures should be inside the range of +50°F to +80°F (+10°C to +27°C).

Electrical Requirements

Line voltage may be easily accessible inside the pump/control box. Always unplug the unit prior to removing pump/control box cover.

Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

For 220 - 240 volt units supplied without a line cord, use a harmonized (HAR) grounded 3-conductor cord, type H 0 5 V V - F , with conductors listed below. A suitable cord end is required for connecting to the equipment (see unit socket) and must terminate with an IEC approved plug for proper connection to power supply.

EX-111, EX-211, EX-411	**Nominal 1.0 mm² cross section rated 10 Amps** **Unit Socket: IEC - 320 C13**
EX-221, EX-511	**Nominal 1.5 mm² cross section rated 16 Amps** **Unit Socket: IEC - 320 C19**

Plumbing Requirements

Ensure the unit is off before connecting tubing to the unit.

To prevent damage to the plumbing lines, always support the ¾" fittings while installing/removing the pumping caps and lines.

Hose Connections

The pump connections are located at the rear of the pump box and are labelled PUMP INLET and PUMP OUTLET. These connections are bent upward so the recirculating fluid will drain back into the reservoir when the hoses are disconnected. The connections are capped with stainless steel serrated plugs.

The pump lines have ¼" MPT for mating with standard plumbing fittings. For your convenience two stainless steel adapters, ¼" FPT to ⅜" O.D. serrated fitting, are provided. (To assure proper fit, they should be installed using 1½ turns of Teflon® tape around the threads.)

Flexible tubing, if used, should be of heavy wall or reinforced construction. Make sure all tubing connections are securely clamped. Tubing and insulation are available from Thermo NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the external system as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, make them at the inlet and outlet of the external system, not at the unit.

If substantial line lengths are required, they should be pre-filled with bath fluid before connecting them to the unit. This will ensure that a adequate amount of fluid will be in the bath once it is in operation.

Pumping

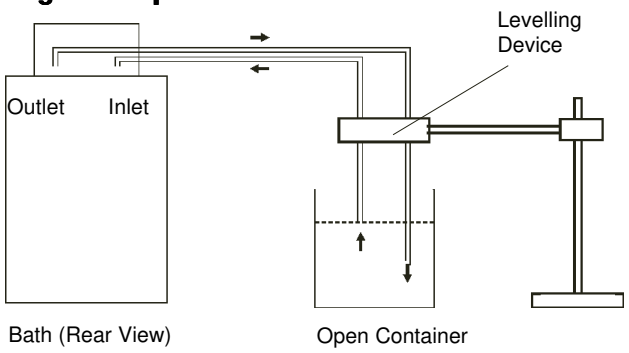
The pump is designed to deliver a flow of 15 liters/minute (4 gallons per minute) at 0 feet head. To prevent external circulation, the PUMP INLET and PUMP OUTLET lines are capped. The caps must be removed when external circulation is required.

To properly secure the external hose connections to the unit, wrap Teflon® tape around the pipe line threads before installation. Once the hose connections are made, the pump must be properly plumbed to an external system. *It is important the bath is not in operation until all plumbing is complete.*

If the bath is not used for external circulation, ensure the stainless steel caps are in place prior to operating it.

NOTE: To increase agitation in the bath when not circulating externally, connect a short loop of hose between the inlet and outlet lines.

Circulating to an open container



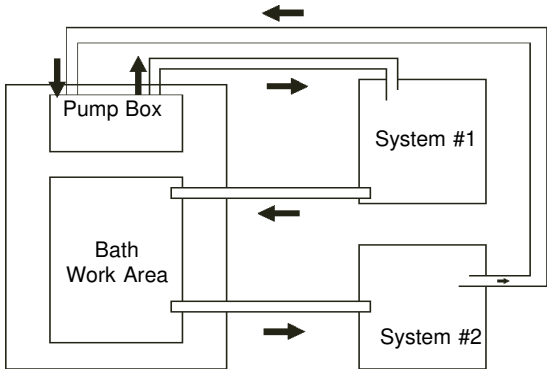
A stainless steel leveling device is available to aid circulation to an open vessel. Contact our Sales Department for more information (see Preface, After-sale Support).

Support the leveling device over the open container with a ringstand. Stagger the tubes in the leveling device so one tube is submerged in the vessel fluid, and the other tube is level with the fluid surface. Connect the deeper tube to the PUMP OUTLET and the shorter tube to the PUMP INLET.

Adjust the flow rate using the accessory flow control valve connected to the PUMP OUTLET, or by partially restricting the outlet tubing. When properly adjusted, the pump inlet will draw an occasional air bubble to prevent over flow, and the pump outlet will force fluid through the submerged tube to prevent aeration of the vessel.

To avoid siphoning the bath work area when the unit is shut off, lift the leveling device out of the vessel and above the level of the unit.

Circulating through two closed-loops



Bath (Top View)

The pump can be used to circulate through two closed-loop systems. Connect the shortest practical length of flexible tubing from the PUMP OUTLET to the inlet of external system #1. Connect the outlet of system #1 directly into the bath work area. Connect tubing from the bath work area to the inlet of system #2. Connect the outlet of system #2 to the PUMP INLET.

Drain

Ensure the temperature of the bath fluid is safe before draining the unit.

The unit is equipped with a drain located at the back of the unit at the base of the bath. The drain has ¼ inch male pipe threads and is capped with a stainless steel plug. To drain the reservoir simply remove the cap.

To assure proper fit when replacing the cap, be sure to line the threads with Teflon® tape.

Fluids

Never use flammable or corrosive fluids with this unit.

Filtered tap water is the recommended fluid for operation to +80°C. See Water Quality Standards and Recommendations on the next page.

Never use pure ethylene glycol as a bath fluid. Above 80°C the user is responsible for the fluid used.

Filling Requirements

The bath work area has a high and low level marker to guide filling. The markers are 1 inch horizontal slits located in the center of the stainless steel baffle separating the work area and the pump assembly. The correct fluid level falls between these two markers. The heating coils will be exposed and may become damaged if the correct fluid level is not provided.

When pumping to an external system, keep extra fluid on hand to maintain the proper level in both the circulating lines and external system.

Never run the unit when the work area is empty. Avoid overfilling. Overfilling the bath may damage the insulation and affects stability.

Water Quality Standards and Recommendations

	Permissible (PPM)	Desirable (PPM)
Microbiologicals		
(algae, bacteria, fungi)	0	0
Inorganic Chemicals		
Calcium	<40	0.6
Chloride	250	<25
Copper	1.3	1.0
Iron	0.3	<0.1
Lead	0.015	0
Magnesium	<12	0.1
Manganese	0.05	<0.03
Nitrates\Nitrites	10 as N	0
Potassium	<20	0.3
Silicate	25	<1.0
Sodium	<20	0.3
Sulfate	250	<50
Hardness	17	<0.05
Total Dissolved Solids	50	10
Other Parameters		
pH	6.5-8.5	7-8
Resistivity	0.01*	0.05-0.1*

* Megohm-Cm (Compensated to 25°C)

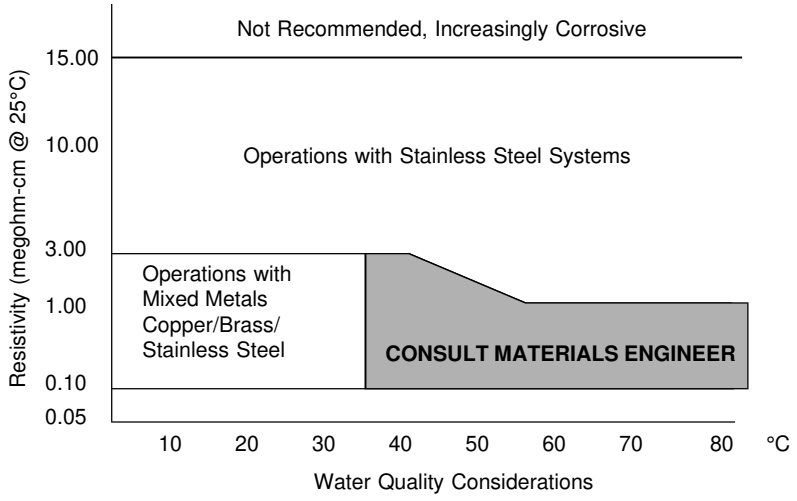
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

For example, raw water in the U.S. averages 171 ppm (of NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (of NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water; as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated to 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated to 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated to 25°C).

The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



Section IV Digital Temperature Controller

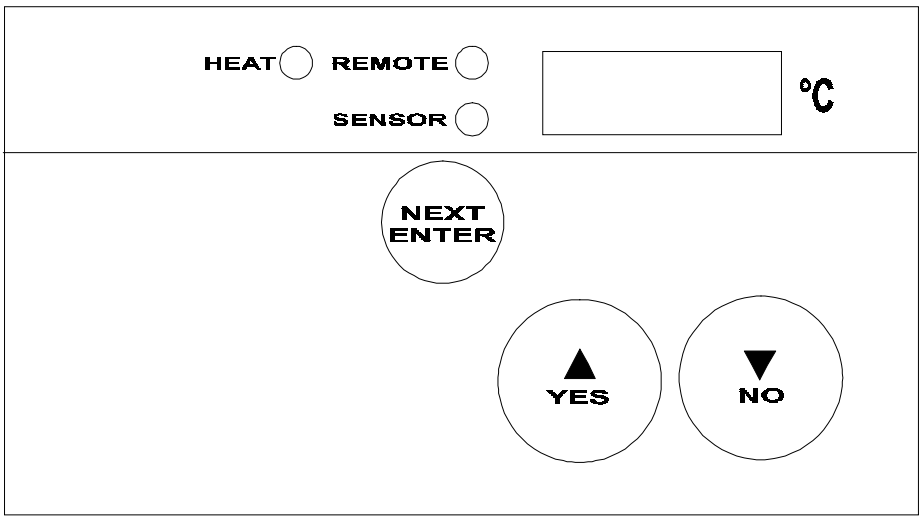
Start Up

Before starting the unit, check all electrical and plumbing connections and make sure the work area has been properly filled with bath fluid.

To start the bath place the I/O circuit breaker on the side of the control box to the **I** (power on) position. The pump will start and the controller will display the temperature of the fluid in the reservoir

The digital controller controls temperature using a PID (Proportional-Integral-Derivative) algorithm. It is designed with self-diagnostic features and easy to use operator interface.

Controller Keypad & Display



The HEAT indicator is lit when the heater is on. The heat indicator flashes when the heater is pulsating.

The REMOTE indicator illuminates whenever the unit is configured to accept a remote setpoint. The controller's SENSOR indicator illuminates whenever the remote sensor is selected. See Controller Displays on the next page for information on the °C display.

NEXT ENTER
Use this key to scroll forward through the menus and also to accept and save changes.

YES, ▲
This dual purpose key is used to answer Yes to Y/N questions or to increment numerical values upward for setting numeric values.

NO, ▼
This dual purpose key is used to answer No to Y/N questions or to decrement numerical values downward for setting numeric values.

Changing a Value

The **YES** key increments the value. The **NO** key decrements the value.

The display will flash as soon as either key is depressed, and will continue to flash until the **NEXT ENTER** key is pressed twice to accept the new value.

The new value will not be used by the controller until the **NEXT ENTER** key is depressed twice and the display stops flashing.

NOTE: If the **NEXT ENTER** key is not depressed twice within ten seconds, the controller will time out and the new value will not be accepted. The controller will revert to the previous setpoint value.

The controller will not allow you to enter a value above the maximum (+150°C) or below the minimum (+15°C).

Controller Displays

An alphanumeric display presents numeric readings of various operating conditions within the bath. Display function is selected by pressing the appropriate keys to move through a menu of available information.

When the controller is first powered up it performs a quick self-test then enters the Operator's Loop. The Operator's Loop displays the bath temperature and is used to change the setpoint, see page 13. The Setup Loop can be accessed from the Operator's Loop by pressing and holding the key combinations shown on Figure 1 on the next page. The Setup Loop is used to adjust the controller's PID parameters, select either the internal or optional external sensor, and set the high/low temperature limits. It is also used to select RS232 parameters and display the unit's identification number. See pages 14-15.

Operator's Loop

When the controller is first powered up it enters the Operator's Loop, displaying reservoir fluid temperature. Press the NEXT ENTER key to view the setpoint.

SP displays the controller setpoint. The display will flash between SP and the actual setpoint number. Use the YES/NO keys to change the setpoint value. Once the desired setpoint is displayed, press the NEXT ENTER key twice.

NOTE: If the bath is controlled via RS232 communications, the setpoint can not be changed from the keypad.

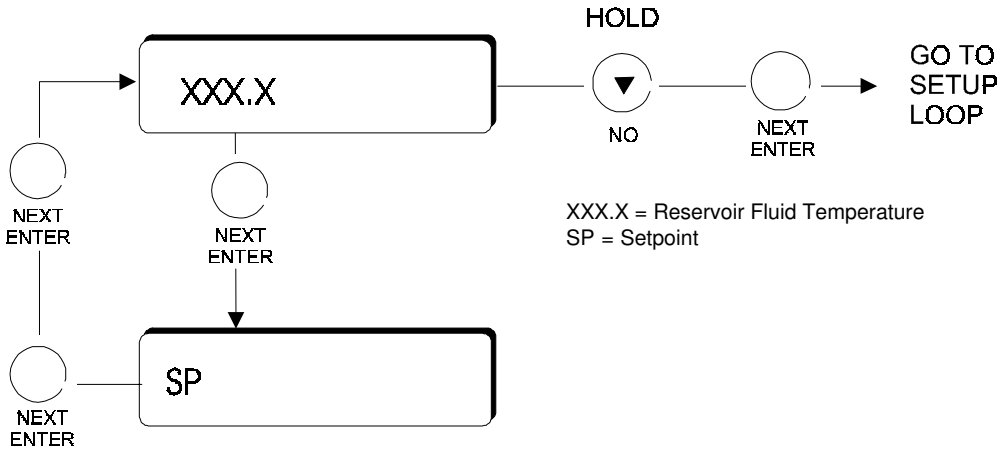


Figure 1 Operator's Loop

Setup Loop

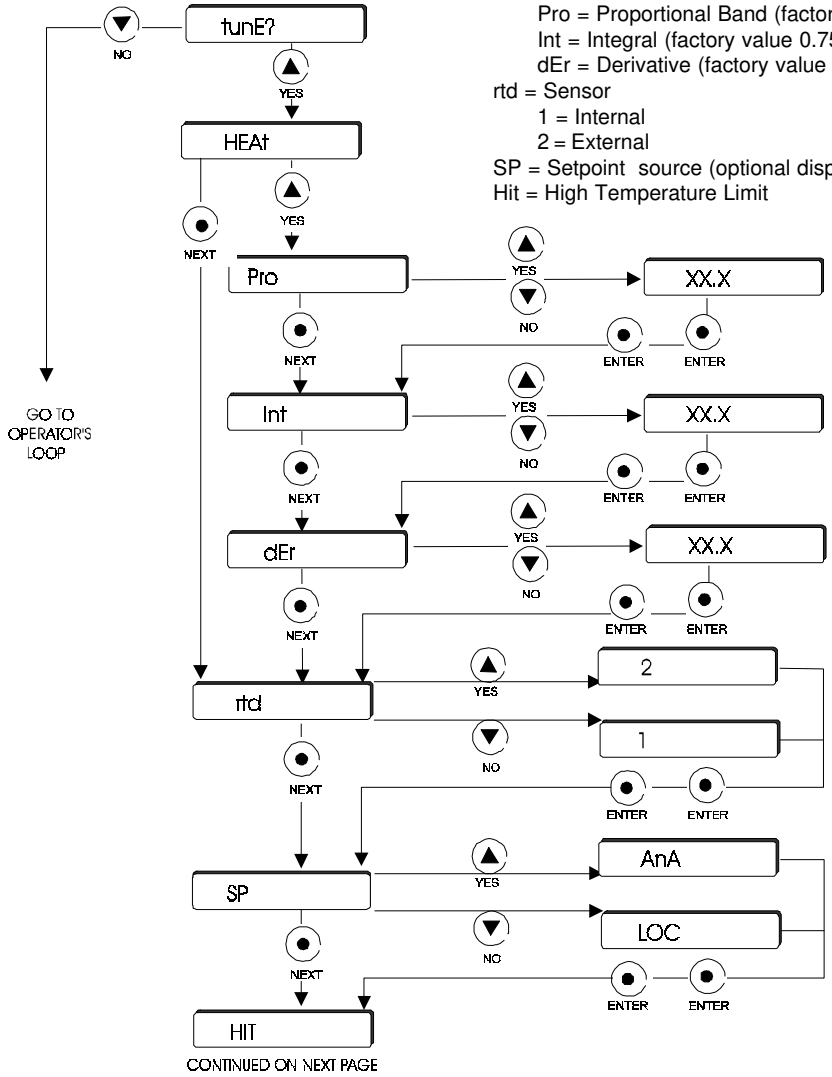
The Setup Loop is used to adjust the controller's PID parameters; select either the internal(1) or optional extenal(2) sensor; set the high/low temperature limits; select RS232 parameters; and to display the unit's ID number.

Enter the Setup Loop from the Operator's Loop by pressing and holding the NO key then press the NEXT ENTER key. Use the YES/NO keys to adjust the values. Press the NEXT ENTER key twice to accept the new value.

While in the Setup Loop, if any key is not pressed during a one minute time span, the controller will automatically return to the Operator's Loop temperature display.

NOTE: If the unit exceeds either temperature limit, the appropriate error message will flash, see page 16. The unit will not shut down (unless the temperature exceeds the high temperature safety setting, see page 18). You will also receive an error code if the optional external sensor is selected but it is not installed.

tUnE = Tune
HEAt = Heat PID Parameters
Pro = Proportional Band (factory value 1.5%)
Int = Integral (factory value 0.75 repeats per minute)
dEr = Derivative (factory value 0.05 minutes)
rtd = Sensor
1 = Internal
2 = External
SP = Setpoint source (optional display see page 20)
Hit = High Temperature Limit



Optional. Selecting Analog Input (AnA) as the mode of temperature control overrides both manual input from the keypad, and any serial communication input.

Figure 2 Setup Loop (1 of 2)

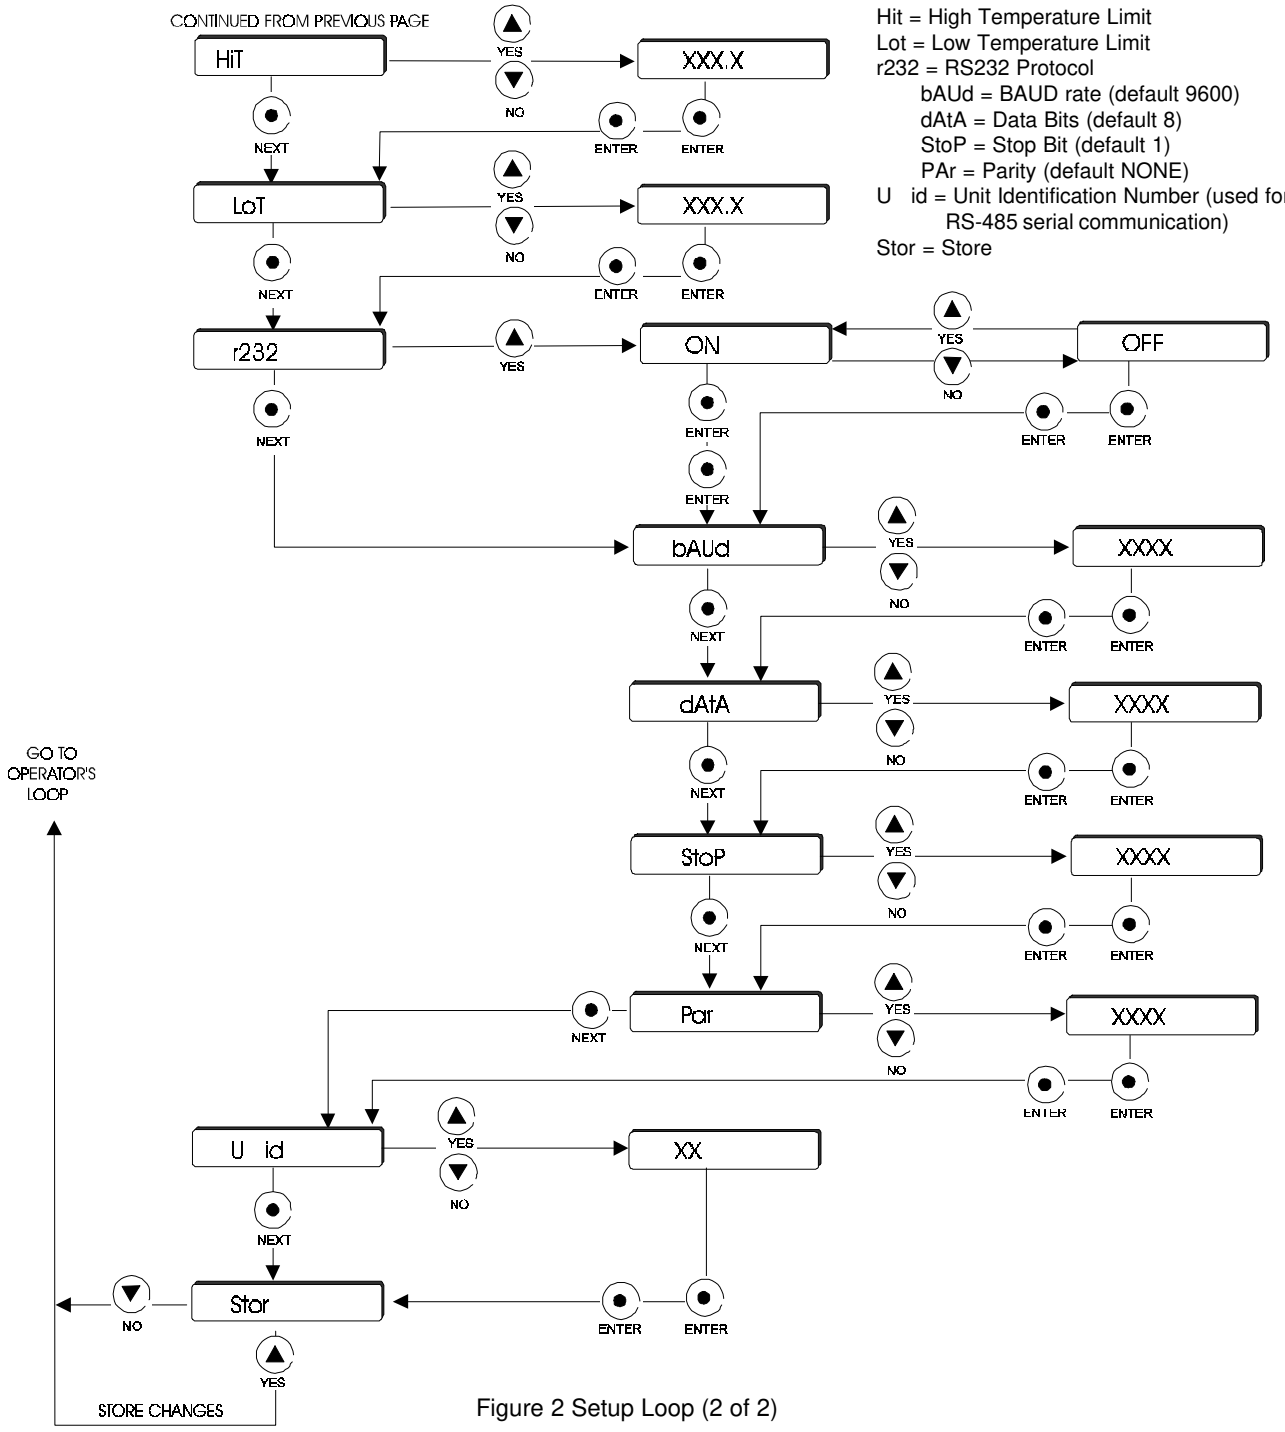


Figure 2 Setup Loop (2 of 2)

NOTE: To save *all* changes, when the display reads **Stor** press **YES**. Should you desire to return to the temperature display and abort *all* changes, when the display reads **Stor** press **NO.**

Error Messages

Error	Action
Er00:	ROM Checksum
Er01:	RAM Test Failed
Er02:	Keypad Test Failed
Er04-13:	Interrupt Error
Er14:	Synchronous Error
Er15:	Asychronous Error
Er16:	Bad Calibration
LoT:	Low Temp Limit
HiT:	High Temp Limit
Er23:	RTD2 Shorted
Er24:	RTD2 Open/Not Installed
Er25:	RTD1 Shorted
Er26:	RTD1 Open
HTC:	High Temperature Cutout
PrES:	Pressure Cutout

NOTE: HTC and PrES are optional displays available only on specially modified units. Errors 00 through 15 will lockup the controller keypad. Errors 00 through 03 may be cleared by depressing the NEXT ENTER key.

Tap Water Cooling Coils

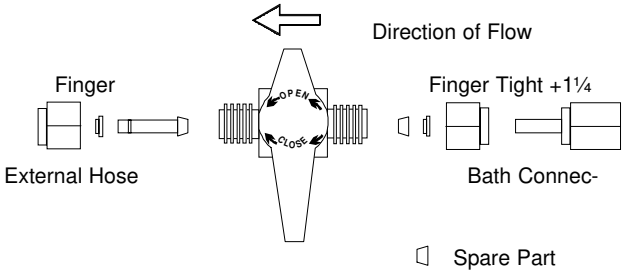
The unit is equipped with a cooling coil located behind the stainless steel baffle in the bath. The bath can be cooled and temperature stability improved by circulating cold fluid through the coil. For best results, the fluid should be at least 5°C below the temperature setpoint. The required fluid flow rate depends on the type of fluid, the setpoint, and the desired stability.

The plumbing connections for the cooling coil are $^{3}/_{8}$ inch OD stainless steel tubes located on the rear of the unit. These connections will accept $^{3}/_{8}$ inch or $^{5}/_{16}$ inch ID tubing. Tubing is available from Thermo NESLAB.

Connect the COOLING COIL IN tube to the cold fluid source. Connect the COOLING COIL OUT tube to the cold fluid return (or drain if tap water is being used).

Flow Control Valve (Optional)

An optional flow control valve is available to control external circulation. The valve assembly consists of the nine pieces shown below. Once assembled and installed on the unit, clamp a hose to the end of the assembly. Turn the unit on and check for leaks with the valve opened as well as closed.



Autorefill (Optional)

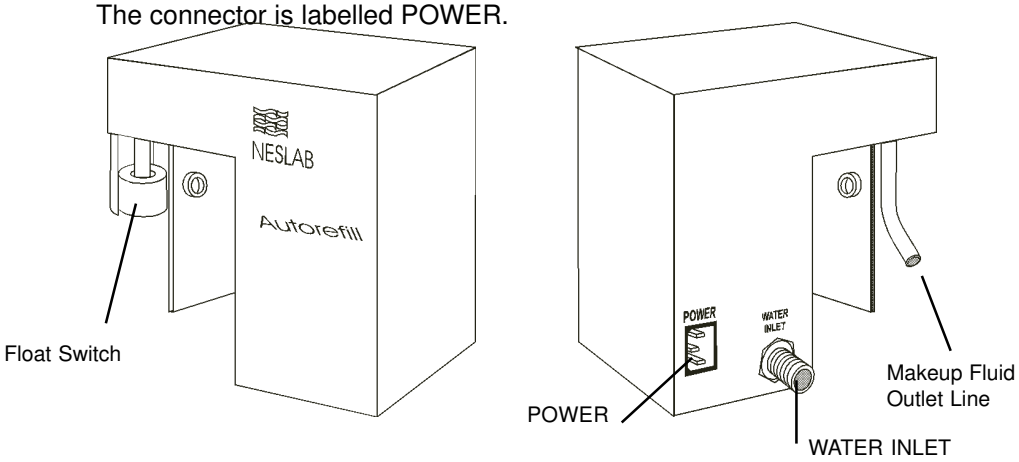
The autorefill device is designed to maintain the correct level of fluid in the reservoir. The device consists of a float switch and a solenoid valve. If the fluid level falls, the float switch opens the solenoid valve allowing makeup fluid to fill the reservoir. Once the fluid reaches the proper level, the float switch rises and the solenoid valve closes.

The plumbing connection for the autorefill device, labeled WATER INLET, is located on the rear of the autorefill assembly. The connection is 3/8" OD stainless steel. To prevent damage to your hosing and to prevent the hose from slipping of the connection, install the supplied hose barb into your tubing. Tubing is also available from Thermo NESLAB. Contact our Sales Department.

Remove the nut on the WATER INLET connection and install the tubing from your makeup fluid source. Reinstall the nut and tubing on the connection.

Install the device on the unit. To secure the device to the unit, tighten the screw located between the float switch and the makeup fluid outlet line. If desired, place the supplied cover on the unit.

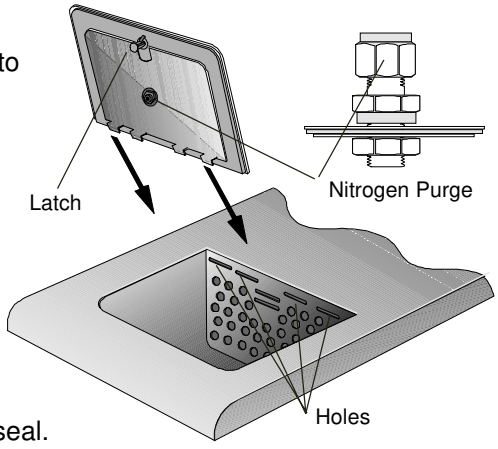
The autorefill device requires its own source of electrical power. A connector for the supplied line cord is also located on the rear of the autorefill device. The connector is labelled POWER.



Sealable Bath Lid (Optional)

Depending on your application requirements and/or working environment, a bath lid is available to make EX-111 reservoirs sealable (not pressurized).

The top of the pump grate in the unit's reservoir has four holes cut into the sheet metal. Align the protrusions on the lid with these holes as shown. A locking adjustable grip latch tightens the lid to the tank top allowing an EDPM gasket to create a seal.



The lid also has a nitrogen purge port. The purge port is a ¼" male Swageloc connector with an o-ring seal.

High Temperature/ Low Liquid Level Safety

To protect your application, the adjustable High Temperature/Low Liquid Level Safety (HIGH TEMP/LOW LEVEL) ensures the heater will not exceed temperatures that can cause serious damage to your unit. A single temperature sensor, located on the heater coils in the bath, monitors both conditions. A High Temperature/Low Liquid Level fault occurs when the temperature of the sensor exceeds the set temperature limit. The safety switch has a temperature range of 7°C to 180°C.

In the event of a fault, the red LED near the adjustment dial will light, the display will go blank, and the unit will shut down. The cause of the fault must be identified and corrected before the unit can be restarted.

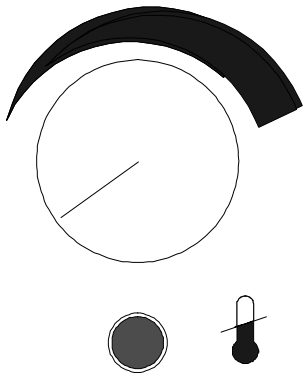
The safety is not preset and must be adjusted during initial installation.

To set the safety, locate the HIGH TEMP/LOW LEVEL SAFETY adjustment dial on the right side of the pump box. Turn the dial fully clockwise and turn the I/O switch off then back on.

Start the unit. Adjust the setpoint for a few degrees higher than the highest desired fluid temperature and allow the bath to stabilize at the temperature setpoint. Turn the HIGH TEMP/LOW LEVEL SAFETY dial counterclockwise until you hear a click and the unit shuts down. The red LED near the adjustment dial will light to indicate a fault has occurred.

Cool the bath and then, without moving the adjustment dial, turn the I/O switch off then back on.

NOTE: Thermo NESLAB recommends rechecking operation if the unit is moved.



High Temperature/Low Liquid Level Safety

9-Pin Accessory Connector

The unit is equipped with two 9-pin D-connectors located on the rear of the control box. The female COMM is used for RS232 communication (see the Appendix); the male is used with an optional external sensor.

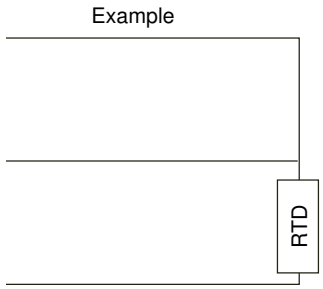
COMM Pin Connections

Pin #	Function
1	No connection.
2	TX = Transmitted data from controller
3	RX = Received data to controller
4	No connection
5	GND = Signal ground
6	No connection.
7	No connection
8	No connection
9	No connection

Hardware	Internal Connector	Mating Connector
	AMP Part# 745491-2	AMP Part# 745492-2

External Sensor Connections

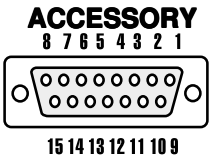
Pin #	Function
1	3-wire RTD connection A
2	No connection
3	No connection
4	3-wire RTD connection A
5	No connection
6	No connection.
7	3-wire RTD connection B
8	No connection
9	No connection



Hardware	Internal Connector	Mating Connector
	AMP Part# 745492-2	AMP Part# 745491-2

Analog Interface (Optional)

An optional 15-pin D subminiature female receptacle for analog interface is located on the rear of the control/pump box.



Pin #	Function
1	Chassis ground.
2	No connection.
3 - 5	No connection.
6	Analog Ground. The analog ground is physically separated from the power ground throughout the unit. To prevent offsets that result from ground currents, the analog and power grounds are only connected at the unit's power supply. Analog ground should only be used as a reference pin.
7	Temperature Out. The fluid temperature, as measured by the sensor slected in theSetup Loop (see page 14) , can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
8	No connection.
9	Power Ground (5V RTN).
10 - 13	No connection.
14	+5V. Power supply of +5VDC (15mA maximum).
15	Setpoint In. The temperature setpoint can be controlled by applying a known voltage to this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +230mV = +23.0°C). **Note**: The setpoint is updated only when the voltage represents a temperature within the setpoint limits.

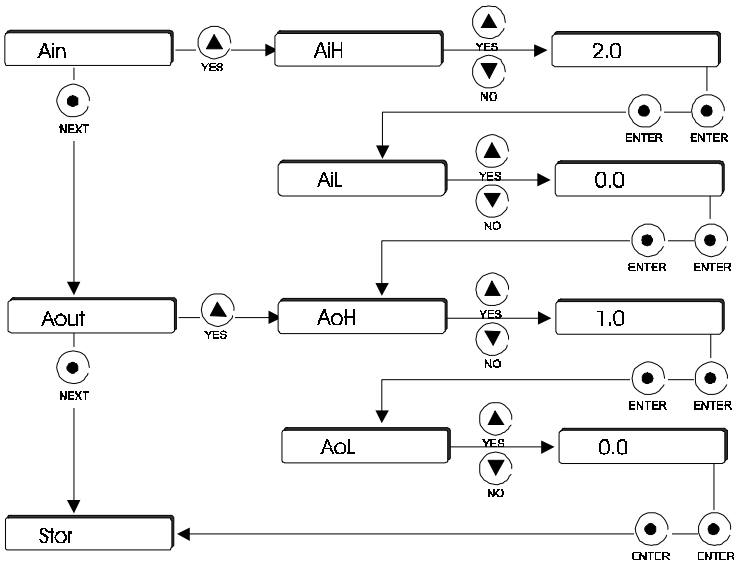
The analog setpoint signal (Setpoint In) is enabled using the unit's software. Using the Setup Loop discussed on page 14, keep depressing the NEXT ENTER key until SP is displayed. Use the YES or NO key to display the desired mode, AnA for analog or LoC for local, then press NEXT ENTER to continue with the loop. **NOTE:** The last value entered is maintained when SP is changed from AnA to LOC or LOC to AnA until a valid voltage is applied.

Store the change.

NOTE: Selecting Analog Input (AnA) as the mode of temperature control overrides both manual input from the keypad, and any serial communication input.

The Analog In and Analog Out discussed in the Calibration Loop on pages 23 and 24 is applicable to this unit. Analog In calibration is done by applying a 2Vdc signal for AiH, and a 0Vdc signal for AiL. Reference the appropriate pins on the ACCESSORY connector.

Analog Out calibration is done by measuring the appropriate pins on the ACCESSORY connector. Adjust the AoH to 1.000Vdc using the YES and NO keys then press ENTER twice. Adjust the AoL to 0.000Vdc using the YES and NO keys then press ENTER twice.



Section V Maintenance

To avoid electrical shock, disconnect the mains cord prior to removing any access panels or covers.

Service Contracts

Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Reservoir Cleaning

Routine cleaning can be achieved by simply sponging down the seamless stainless steel tank with tap water. (Dish washing detergent may be used but the tank must be thoroughly rinsed.)

To gain access to the entire reservoir the pump box and reservoir cover should be removed.

Remove the line cord from the rear of the unit.

Remove the four screws securing the reservoir's cover.

Carefully raise the controller and cover assembly to remove it from unit.

Place the cover on its side.

Algae

To restrict the growth of algae in the bath, we recommend the bath cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light required for the growth of most common algae.

Thermo NESLAB recommends the use of Chloramine-T, 1 gram per 3.5 liters.

Additional Loops

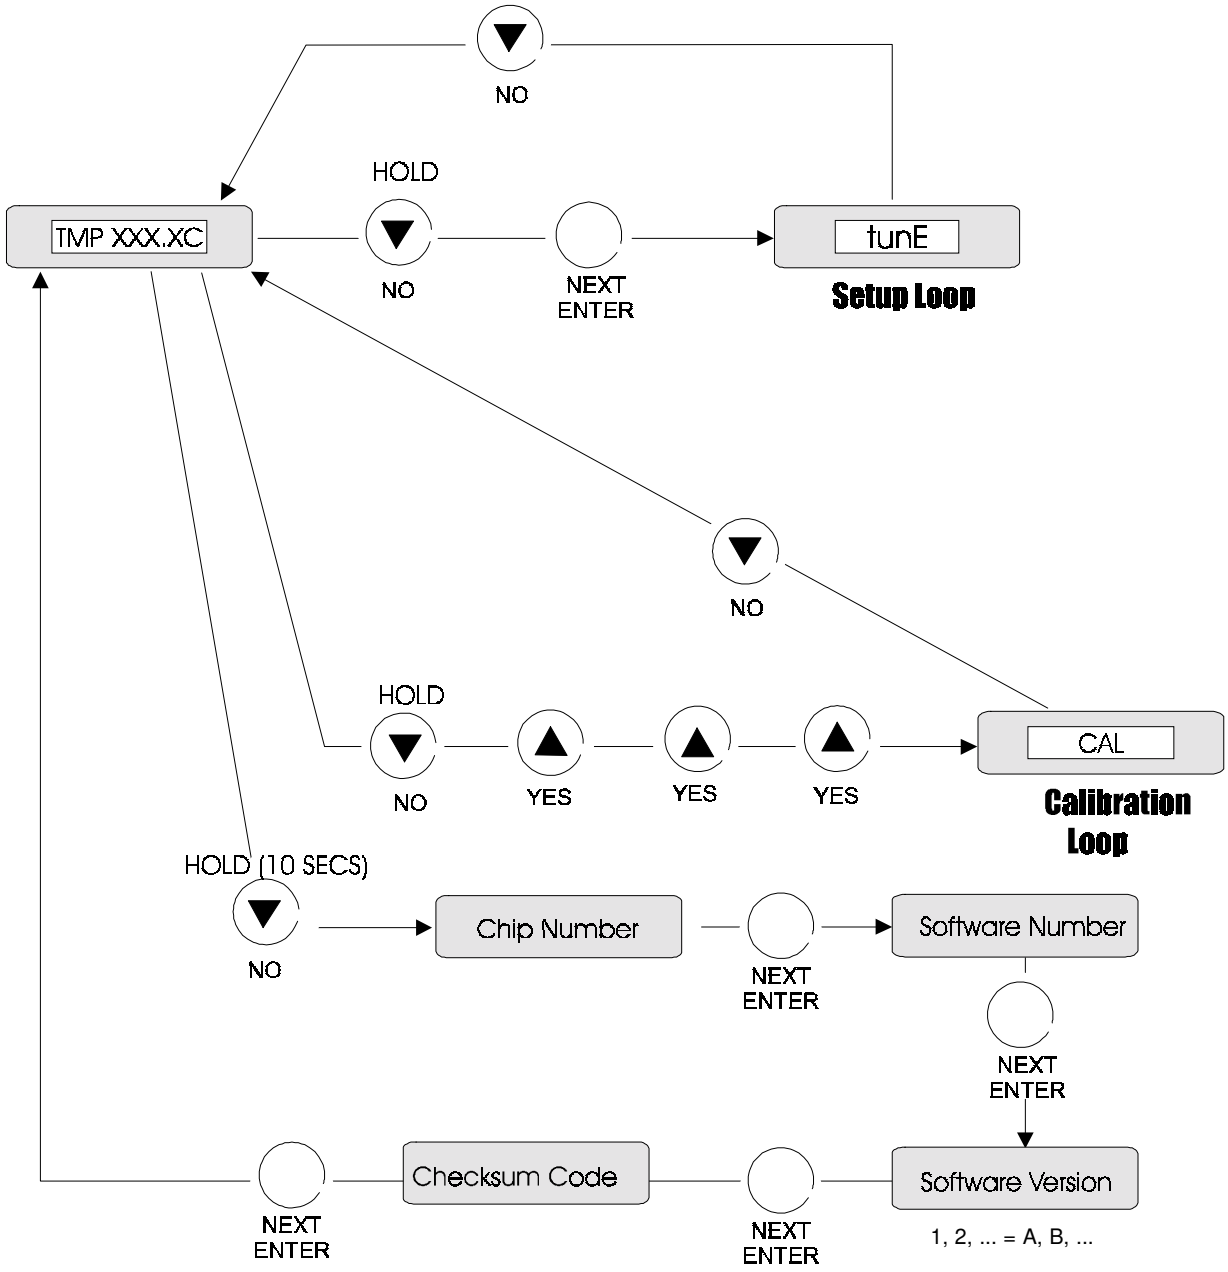


Figure 3 Additional Loops

Calibration Loop

The Calibration Loop is used to calibrate the RTD high and low temperature. The controller's internal temperature sensor is factory calibrated. We recommend calibrating any external sensor.

Enter the Calibration Loop from the Operator's Loop by pressing and holding the NO key while pressing the YES key three times.

Calibration Procedure

Install a calibrated reference thermometer in the bath. (For external mode, also install the sensor in the bath.) Place the cover on the unit.

The procedure uses the Operator's, Setup and Calibration Loops. In the Setup Loop place the unit in either the internal or external RTD mode of operation (RTD1 = Internal , RTD2 = External). Return to the Operator's Loop and adjust the setpoint to an appropriate high-end temperature.

NOTE: When calibrating the external sensor ensure the controller's SENSOR indicator is illuminated.

Once the bath reaches the setpoint and stabilizes, go to the Calibration Loop and, as illustrated on the next page, enter the actual reference thermometer reading at either the r1H or r2H prompt.

Store the change and return to the Operator's Loop. Adjust the setpoint to an appropriate low-end temperature. Once the bath reaches the setpoint and stabilizes, return to the Calibration Loop and enter the reference thermometer reading at either the r1L or r2L prompt. Store the change.

Do not pick points that are outside the safe operating limits of the fluid in your application. For example with a water bath, 90°C and 5°C would be typical calibration points.

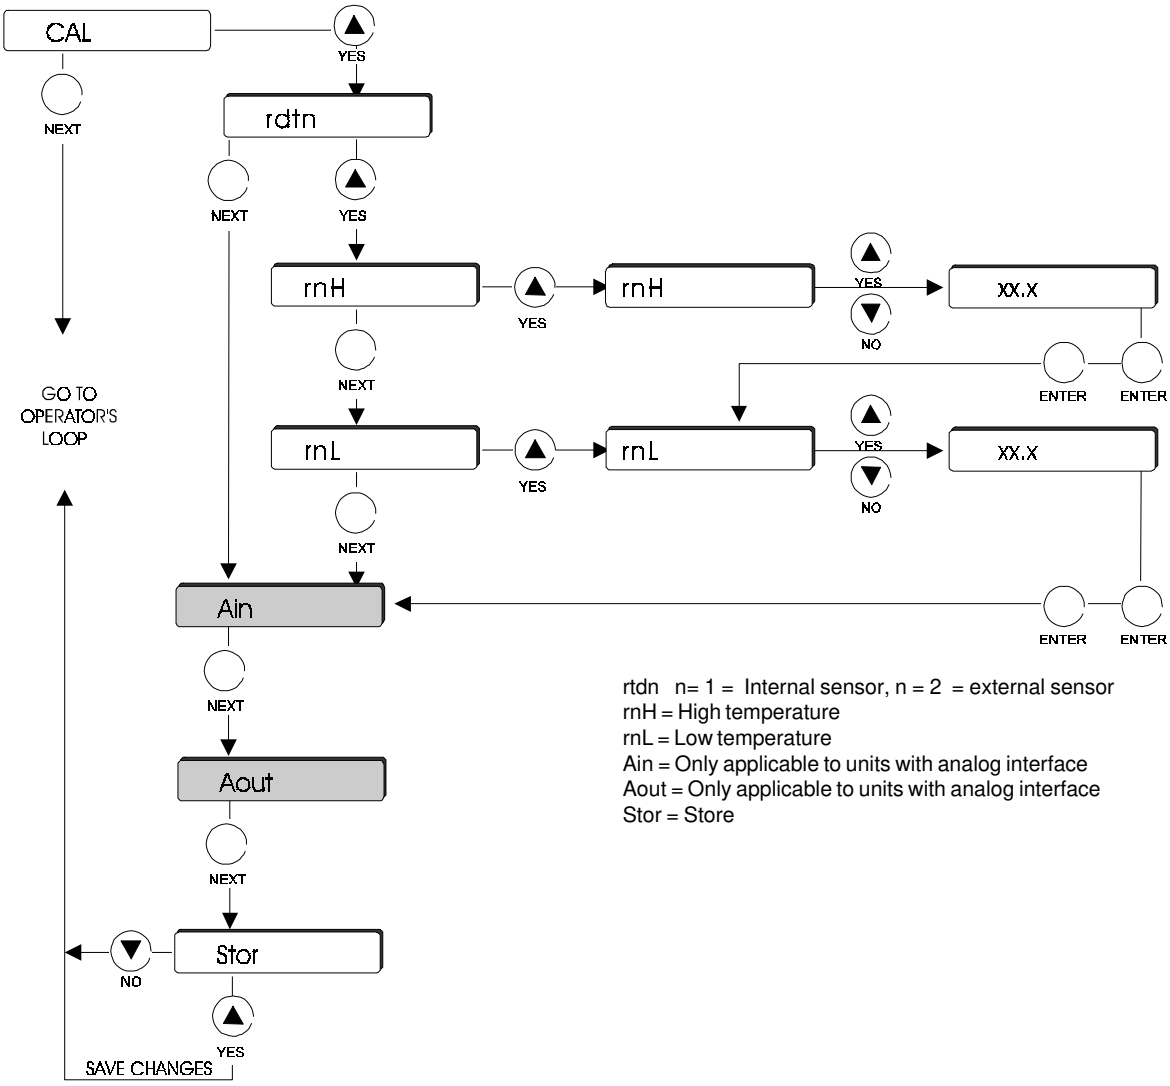

Figure 4 Calibration Loop

NOTE: All changes must be stored, when the display reads **Stor** press **YES**. Should you desire to return to the temperature display and abort *all* changes, when the display reads **Stor** press **NO.**

Section VI Troubleshooting

Checklist

Unit will not start

Make sure the voltage of the power source meets the specified voltage, ±10%. Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Check the High Temperature/Low Liquid Level Safety. If the red LED on the side of the controller is on, make sure the fluid level in the bath is between the marks in the baffle and the HIGH TEMP/LOW LEVEL SAFETY setting is greater than the fluid temperature. Turn the I/O switch off then back on, and attempt to restart.

No external circulation

Make sure the stainless steel plugs on the PUMP INLET and PUMP OUTLET have been removed.

Check for obstructions, kinks, or leaks in the circulation tubing.

Circulation will cease when the pump head has been exceeded.

No/poor temperature control

Check RS232/remote operation on or off.

Selecting the optional Analog Input (AnA) as the mode of temperature control overrides both manual input from the keypad, and any serial communication input.

Check external sensor connection. Perform calibration.

Service Assistance and Technical Support

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Customer Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

Part number
Serial number
Voltage of unit
Voltage of power source
Software Version

Our Service Department can provide you with a wiring diagram and a complete list of spare parts for your unit. Before calling, please obtain the following information:

Appendix Serial Communications Protocol

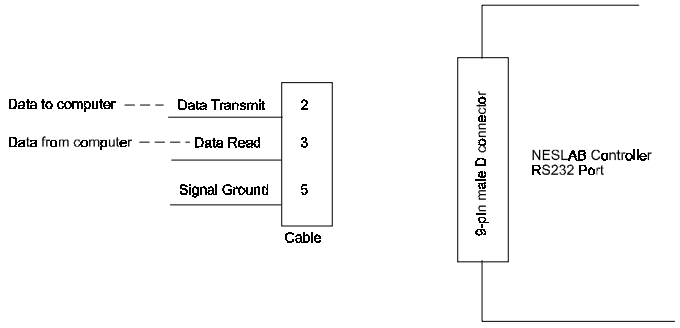
NOTE: This appendix assumes you have a basic understanding of communications protocols.

All data is sent and received in binary form, do not use ASCII. In the following pages the binary data is represented in hexadecimal (hex) format.

The Neslab Serial Communications Protocol, NC, is based on a master-slave model. The master is a host computer, while the slave is the bath's controller. Only the master can initiate a communications transaction (half-duplex). The slave ends the transaction by responding to the master's query. The protocol uses an RS-232 serial interface with the default parameters: 9600 baud, 1 start bit, 8 data bits, 1 stop bit and no parity.

NOTE: Before the unit will communicate, RS232 must be turned on in the controller's Setup Loop.

The unit can be controlled through your computer's serial port by using the unit's standard 9-pin RS-232 connection. Data read of the serial port connects to the data transmit (pin 2) of the bath. Data transmit of the serial port connects to data read (pin 3) of the bath.



Communication cables are available from Thermo NESLAB. Contact our sales department for additional information.

All commands must be entered in the exact format shown in the tables on the following pages. The tables on on the last page of this Appendix show all commands available, their format and responses. Controller responses are either the requested data or an error message. The controller response *must* be received before the host sends the next command.

The host sends a command embedded in a single communications packet, then waits for the controller's response. If the command is not understood or the checksums do not agree, the controller responds with an error command. Otherwise, the controller responds with the requested data. If the controller fails to respond within 1 second, the host should resend the command.

NC Serial Communications Protocol

NOTE: All byte values are shown in hex, hex represents the binary values that must be sent to the bath. **Do not use ASCII.**

The framing of the communications packet in both directions is:

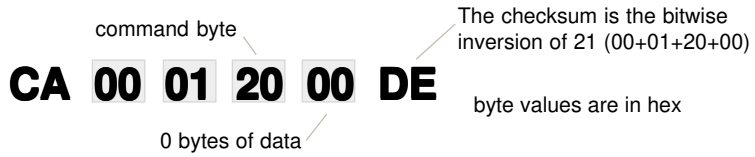
	Checksum region						
Lead char CA	Addr-MSB 00	Addr-LSB 01	Command	n d-bytes	d-byte 1 ...	d-byte n	Checksum

Lead char	CA (hex).
	Device address is 1
Addr-msb	Most significant byte of device address is 00 hex.
Addr-lsb	Least significant byte of device address is 01 hex.
Command	Command byte (see Table 1).
n d-bytes	Number of data bytes to follow (00 to 03 hex).
d-byte 1	1st data byte (the qualifier byte is considered a data byte).
...	...
d-byte n	nth data byte.
Checksum	Bitwise inversion of the 1 byte sum of bytes beginning with the most significant address byte and ending with the byte preceding the checksum. (To perform a bitwise inversion, "exclusive OR" the one byte sum with FF hex.)

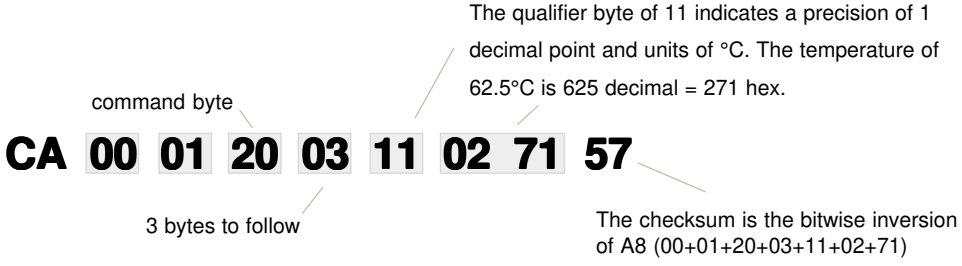
The master requests information by sending one of the Read Functions as shown in Table 1 on page 30. Since no data is sent to the bath during a read request, the master uses 00 for the number of data bytes following the command byte.

The bath will respond to a Read Function by echoing the lead character, address, and command byte, followed by the requested data and checksum. When the bath sends data, a qualifier byte is sent first, followed by a two byte signed integer (16 bit, MSB sent first). The qualifier byte indicates the precision and units of measure for the requested data as detailed in Table 2, see page 30.

As an example, the master requests to read internal temperature by sending:

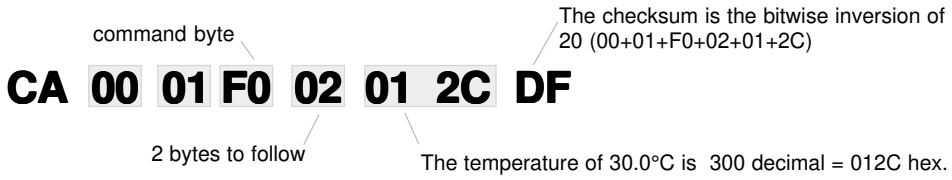


If the temperature is 62.5°C, the slave would reply:



The master sets parameters in the bath by sending one of the Set Functions as shown in Table 1. The master does not send a qualifier byte in the data field. The master should be preprogrammed to send the correct precision and units (it could also read the parameter of interest first to decode the correct precision and units needed).

For example, if the master wants to set the setpoint to 30°C, it would send :



The slave responds:

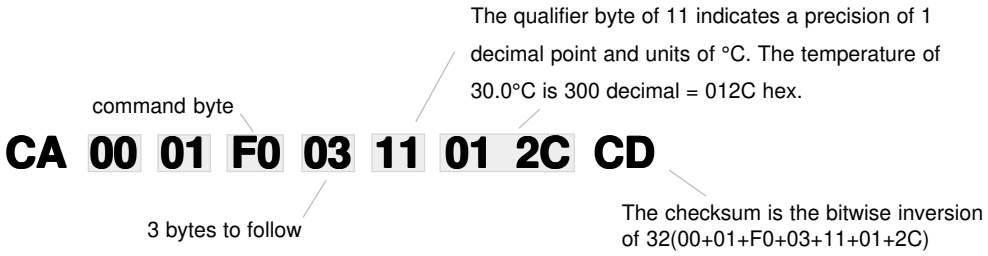


Table 1 (All bytes are in hex)

FUNCTION	MASTER SENDS	BATH RESPONDS
READ		
Read Internal Temperature	CA 00 01 **20** 00 DE	CA 00 01 **20** 03 qb d1 d2 cs
Read External Sensor	CA 00 01 **21** 00 DD	CA 00 01 **21** 03 qb d1 d2 cs
Read Setpoint (control point)	CA 00 01 **70** 00 8E	CA 00 01 **70** 03 qb d1 d2 cs
Read Low Temperature Limit	CA 00 01 **40** 00 BE	CA 00 01 **40** 03 qb d1 d2 cs
Read High Temperature Limit	CA 00 01 **60** 00 9E	CA 00 01 **60** 03 qb d1 d2 cs
Read Proportional Band (P)	CA 00 01 **71** 00 8D	CA 00 01 **71** 03 qb d1 d2 cs
Read Integral (I)	CA 00 01 **72** 00 8C	CA 00 01 **72** 03 qb d1 d2 cs
Read Derivative (D)	CA 00 01 **73** 00 8B	CA 00 01 **73** 03 qb d1 d2 cs
SET		
Set Setpoint (control point)*	CA 00 01 **F0** 02 d1 d2 cs	CA 00 01 **F0** 03 qb d1 d2 cs
Set Low Temperature Limit*	CA 00 01 **C0** 02 d1 d2 cs	CA 00 01 **C0** 03 qb d1 d2 cs
Set High Temperature Limit*	CA 00 01 **E0** 02 d1 d2 cs	CA 00 01 **E0** 03 qb d1 d2 cs
Set Proportional Band (P=1-99.9)	CA 00 01 **F1** 02 d1 d2 cs	CA 00 01 **F1** 03 qb d1 d2 cs
Set Integral (I = 0-9.99)	CA 00 01 **F2** 02 d1 d2 cs	CA 00 01 **F2** 03 qb d1 d2 cs
Set Derivative (D= 0-5.0)	CA 00 01 **F3** 02 d1 d2 cs	CA 00 01 **F3** 03 qb d1 d2 cs
BATH ERROR RESPONSES		
Bad Command	N/A	CA 00 01 **0F** 02 01 ed cs
Bad Checksum	N/A	CA 00 01 **0F** 02 03 ed cs
MISCELLANEOUS		
Request Acknowledge	CA 00 01 **00** 00 FE	CA 00 01 **00** 02 v1 v2 cs

command bytes shown in **bold**
qb = qualifier byte
d1,d2 = 16 bit signed integer of the value being sent or received
cs = the checksum of the string (see text)
ed = echo back of the command byte as received
v1,v2 = protocol version
* = limited to the range of the bath

Table 2

QUALIFIER BYTE

10 hex	0.1 precision, no units of measure
20 hex	0.01 precision, no units of measure
11 hex	0.1 precision, °C units

Example: The temperature of 45.6 °C would be represented by the qualifier 11 hex, followed by the 2 bytes 01 C8 hex (456 decimal).

Appendix B Programming Software

NEScom Software/ RS232 Communication

The Thermo NESLAB Communications Software is a user-friendly software that allows you to automate your temperature control process. The software includes a 3½" disk, comprehensive operator's manual and a toll-free number to a trained technical staff.

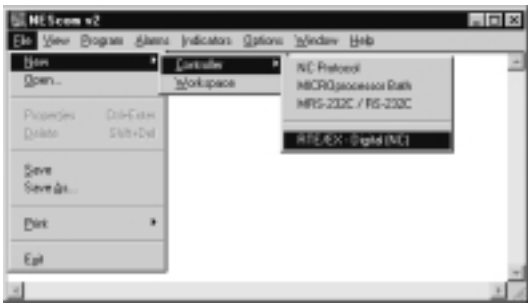
NEScom Software allows you to write custom temperature programs for our Digital or Microprocessor based temperature control apparatus. Choose upper or lower temperature limits and monitor system status with an alarm. NEScom can also record your results on a user selectable graph. NesCom must be used with an IBM or 100% compatible computer.

Select from easy to use product icons.

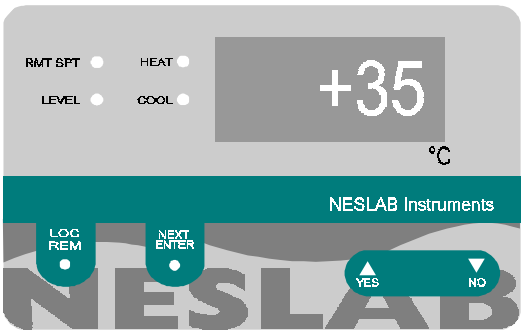
Create graphs and charts.

Easily configure ramping functions that set the setpoint over time.

View pop-up alarm windows that display if an alarm condition occurred.



Select software functions from the easy to use pulldown menus.



View a virtual controller screen which allows remote monitoring and operation of product control panel.

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

WARRANTY

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. The unit control box for microprocessor units is packed in a separate carton. Be sure to locate this separate carton; do not dispose of it by mistake.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact Thermo NESLAB for more information.

After-sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label on the rear of the case top to obtain the following information (see Section II, Description for the serial number label location):

- BOM number _____

- Serial number _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department.

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without bath fluid in the bath.

Never use pure ethylene glycol as a bath fluid. A minimum 80/20 mixture of Ethylene Glycol and tap water is allowed.

For 220 - 240 volt units supplied without a line cord, use a harmonized (HAR) grounded 3-conductor cord, type H 0 5 V V - F , with conductors listed below. A suitable cord end is required for connecting to the equipment (see unit socket) and must terminate with an IEC approved plug for proper connection to power supply.

NON-BOOST HEATER UNITS	**Nominal 1.0 mm² cross section rated 10 Amps** **Unit Socket: IEC - 320 C13**
BOOST HEATER UNITS	**Nominal 1.5 mm² cross section rated 16 Amps** **Unit Socket: IEC - 320 C19**

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the bath before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, personal injury or death.

Section II General Information

Description

The EX Series Bath Circulators are designed to provide temperature control for applications requiring a fluid work area or pumping to an external system.

The units consist of a circulation pump, stainless steel bath, a work area cover, and a microprocessor temperature controller.

Specifications

	EX-111	EX-211
Temperature Range[1]	Ambient to +150°C	
Temperature Stability[2]	±0.01°C	
Pumping Capacity	15 lpm at 0' (0 M) 0 lpm at 16' (4.9 M)	
Heater *Watts* *50 Hz Models*	800 1000	
Bath Work Area (H x W x D) *Inches* *Centimeters*	4 3/4 x 8 x 6 12.1 x 20.3 x 15.2	9 1/4 x 10 x 6 23.5 x 25.4 x 15.2
Bath Volume *Gallons* *Liters*	1.9 7.0	3.2 12.3
Case Dimensions *(L x W x D)* *Inches* *Centimeters*	17 x 10 5/16 x 15 7/8 43.2 x 26.2 x 40.3	17 x 12 3/8 x 18 3/8 43.2 x 31.4 x 46.7
Power Requirements[3]	115 V, 60 Hz, 9 Amps 220/240 V, 50 Hz, 5.5 Amps	

1. Low-end temperature with tap water cooling. The controller may be set to -30°C, however to achieve temperatures below the specified range requires accessory cooling. Contact Thermo Neslab for more details.
2. Stability is a function of the bath fluid temperature. The use of a work area cover and tap water cooling may optimize bath stability for your work.
3. Power Board Transformer Fuse– T 2.0A 250V (Qty 1) [T=Time Delay].

Specifications

1. Low-end temperature with tap water cooling. The controller may be set to -30°C, however to achieve temperatures below the specified range requires accessory cooling. Contact Thermo Neslab for more details.
2. Stability is a function of the bath fluid temperature. The use of a work area cover and tap water cooling may optimize bath stability for your work.
3. Power Board Transformer Fuse- T 2.0A 250V (Qty 1) [T=Time Delay].

Section III Installation

Site

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

Lift the unit by grasping under the case near the rubber feet. Locate the unit on a sturdy table or bench top. Ambient temperatures should be inside the range of +50°F to +80°F (+10°C to +27°C).

Electrical Requirements

Line voltage may be easily accessible inside the pump/control box. Always unplug the unit prior to removing pump/control box cover.

Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

For 220 - 240 volt units supplied without a line cord, use a harmonized (HAR) grounded 3-conductor cord, type H 0 5 V V - F , with conductors listed below. A suitable cord end is required for connecting to the equipment (see unit socket) and must terminate with an IEC approved plug for proper connection to power supply.

BOOST HEATER UNITS	**Nominal 1.5 mm² cross section rated 16 Amps**
	Unit Socket: IEC - 320 C19
NON-BOOST HEATER UNITS	**Nominal 1.0 mm² cross section rated 10 Amps**
	Unit Socket: IEC - 320 C13

Plumbing Requirements

Ensure the unit is off before connecting tubing to the unit.

To prevent damage to the plumbing lines, always support the ¾" fittings while installing/removing the pumping caps and lines.

Hose Connections

The pump connections are located at the rear of the pump box and are labelled PUMP INLET and PUMP OUTLET. These connections are bent upward so the recirculating fluid will drain back into the reservoir when the hoses are disconnected. Both connections are capped with stainless steel serrated plugs.

The pump lines have ¼ inch male pipe threads for mating with standard plumbing fittings. For your convenience stainless steel adapters, ¼ inch female pipe thread to ⅜ inch O.D. serrated fitting, are provided. (To assure proper fit, they should be installed using Teflon® tape around the threads.)

Flexible tubing, if used, should be of heavy wall or reinforced construction. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from Thermo NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the external system as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, make them at the inlet and outlet of the external system, not at the unit.

If substantial lengths of cooling lines are required, they should be pre-filled with bath fluid before connecting them to the unit. This will ensure that an adequate amount of fluid will be in the bath once it is in operation.

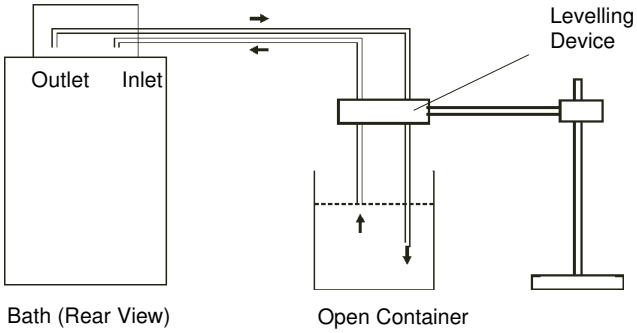
Pumping

The pump is designed to deliver a flow of 15 liters/minute (4 gallons minute) at 0 feet head. To prevent external circulation, the PUMP INLET and PUMP OUTLET lines on the rear of the unit are capped. The caps must be removed when external circulation is required.

To properly secure external hose connections to the unit, wrap Teflon® tape around the pipe line threads before installation. Once the hose connections are made, the hoses must be properly plumbed to an external system. *It is important the bath is not in operation until all plumbing is complete.*

If the bath is not used for external circulation, make sure the stainless steel caps are in place prior to operating the bath.

Circulating to an open container



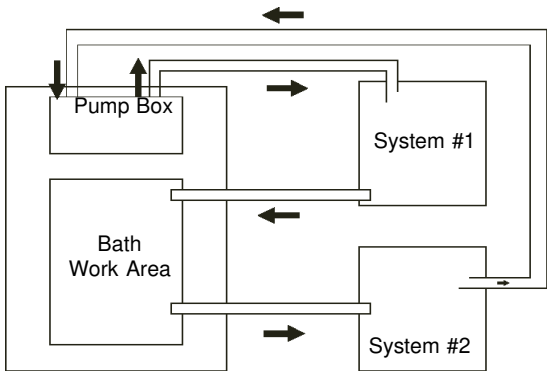
A stainless steel leveling device is available to aid circulation to an open vessel. Contact our Sales Department for more information (see Preface, After-sale Support).

Support the leveling device over the open container with a ringstand. Stagger the tubes in the leveling device so one tube is submerged in the vessel fluid, and the other tube is level with the fluid surface. Connect the deeper tube to the PUMP OUTLET and the shorter tube to the PUMP INLET.

Adjust the flow rate using the accessory flow control valve connected to the PUMP OUTLET, or by partially restricting the outlet tubing. When properly adjusted, the pump inlet will draw an occasional air bubble to prevent over flow, and the pump outlet will force fluid through the submerged tube to prevent aeration of the vessel.

To avoid siphoning the bath work area when the unit is shut off, lift the leveling device out of the vessel and above the level of the unit.

Circulating through two closed loops



Bath (Top View)

The pump can be used to circulate through two closed loop systems. Connect the shortest practical length of flexible tubing from the PUMP OUTLET to the inlet of external system #1. Connect the outlet of system #1 directly into the bath work area. Connect tubing from the bath work area to the inlet of system #2. Connect the outlet of system #2 to the PUMP INLET.

Tap Water Cooling Coils

The unit is equipped with a cooling coil located behind the stainless steel baffle in the bath. The bath can be cooled and temperature stability improved by circulating cold fluid through the coil. For best results, the fluid should be a least 5°C below the temperature setpoint. The required fluid flow rate depends on the type of fluid, the setpoint, and the desired stability.

The plumbing connections for the cooling coil are 3/8 inch OD stainless steel tubes located on the rear of the unit. These connections will accept 3/8 inch or 5/16 inch ID tubing. Tubing is available from Thermo NESLAB. Connect the COOLING COIL IN tube to the cold fluid source. Connect the COOLING COIL OUT tube to the cold fluid return (or drain if tap water is being used).

Drain

Ensure the temperature of the bath fluid is safe before draining the unit.

The unit is equipped with a drain located at the back of the unit at the base of the bath. The drain has ¼ inch male pipe threads and is capped with a stainless steel plug. To drain the reservoir simply remove the cap.

To assure proper fit when replacing the cap, be sure to line the threads with Teflon® tape.

Fluids

Never use flammable or corrosive fluids with this unit.

Filtered tap water is the recommended fluid for operation from +8°C to +80°C.

Above +80°C, the user is responsible for fluids used.

Never use pure ethylene glycol as a bath fluid. A minimum 80/20 mixture of Ethylene Glycol and tap water is allowed.

Filling Requirements

The bath work area has a high and low level marker to guide filling. The markers are 1 inch horizontal slits located in the center of the stainless steel baffle separating the work area and the pump assembly. The correct fluid level falls between these two markers. The heating coils will be exposed and may become damaged if the correct fluid level is not provided.

When pumping to an external system, keep extra fluid on hand to maintain the proper level in both the circulating lines and the external system.

Never run the unit when the work area is empty. Avoid overfilling. Overfilling the bath may damage the insulation and affects stability.

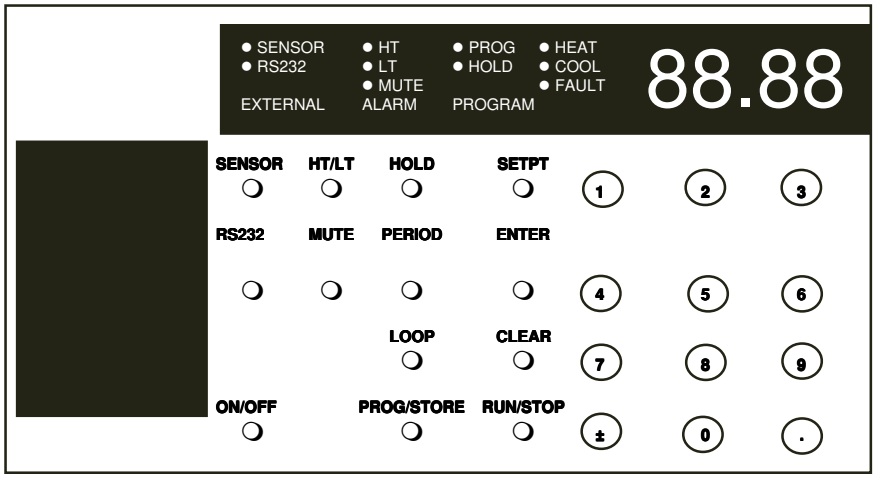
Section IV Microprocessor Controllers

Microprocessor Controller

Description

The microprocessor controller is designed as a separate component from the unit. The controller can be mounted directly on the pump box, or remotely from the bath. The controller provides proportional with integral and derivative (PID) control.

The controller has two sections. The upper section contains the LED indicators and the Main display which provide feedback to you about the controller and bath. The ten individual LED indicators provide output on selected parameters while the Main display will provide information on various unit conditions.[1] The lower section contains the keypad you use to input data to the controller.



Microprocessor Temperature Controller (Front View)

Controller Mounting

The controller can be removed from the bath and placed in a remote location. Extension cables are available from Thermo NESLAB. Contact our Sales Department for more information.

Controller Connection

Microprocessor controllers are supplied with a cable needed to connect the controller to the pump box. Connect the cable to the 25-pin male connector on the control box and the female connector on the pump box. Once the connection is made, the unit is ready for operation.

NOTE: The MAIN POWER should be OFF before connecting/disconnecting cables from the control box.

1. The COOL LED is applicable only to refrigerated units.

LED Indicators

The following table explains the controller LED indicators. The LEDs can be on, off or flashing.

LED	STATUS	INDICATION
SENSOR	OFF	All controller functions are operating from the unit's internal probe.
	ON	All controller functions are operating from remote sensor input.
	FLASHING	The Main display indicates the remote sensor temperature. The controller, however, still uses the internal probe to control the bath temperature.
RS232	OFF	Communication port disabled.
	ON	Communication port enabled.
	FLASHING	Awaiting next key press
LT	OFF	No alarm.
	ON	Main display indicates low limit setpoint.
	FLASHING	Low limit alarm condition.
HT	OFF	No alarm.
	ON	Main display indicates high limit setpoint.
	FLASHING	High limit alarm condition.
HOLD	OFF	Programming hold feature disabled.
	ON	Programming hold feature enabled.
PROG	OFF	No program running.
	ON	The program is suspended[1].
	FLASHING	The program is running.
COOL[2]	OFF	Refrigeration is off.
	ON	Refrigeration is on.
HEAT	OFF	The heater is off.
	ON	The heater is on.
	FLASHING	The heater duty cycle.
MUTE	OFF	The alarm is enabled.
	ON	The alarm horn is disabled.
	FLASHING	The alarm horn has been disabled for any current condition. The alarm horn will automatically reset when the condition is cleared.
FAULT	OFF	No fault condition.
	ON	The high temperature/low level safety has activated.

1. The bath fluid will maintain he setpoint achieved at the time the program is suspended. No operator inputs are available to the controller while in a suspended condition.
2. The COOL LED is applicable only to refrigerated units.

Start Up

Before starting the unit, check all electrical and plumbing connections and make sure the work area has been properly filled with bath fluid.

NOTE: The fluid level should be between the two lateral slots at the rear of the reservoir.

To power the controller on 115V units, place the MAIN POWER switch on the side of the unit to the ON position. This only supplies power to the controller. *The unit itself is not operating.* The Main display on the controller will display OFF.

220V units have a circuit breaker instead of a switch. The circuit breaker is labeled **I** (power on) and **O** (power off). Ensure the circuit breaker is in the **I** position.

Press the keypad ON/OFF button on the controller. The pump will start and the Main display will indicate the temperature of the fluid in the bath. The controller will respond to the current setpoint.

Pressing the keypad ON/OFF button again will disable control of the bath and shut down the pump. The Main display will indicate OFF. (When the controller is in the RS232 mode of operation, see page 13, the ON/OFF button is deactivated. Control of the bath can only be disabled via an RS232 input.)

Temperature Adjustment

To display the temperature setpoint, press SETPT. The Main display will flash the current setpoint. Press ENTER to return the display to the bath's fluid temperature. To adjust the setpoint press SETPT and then press CLEAR, the display will go blank. Use the keypad to input the desired value. If the value is correct press ENTER. If the value is incorrect press CLEAR, the display will go blank. Use the keypad to correct the value and press ENTER.

Low and High Temperature Limits

To display the temperature limits, press HT/LT. Either the HT or LT LED will illuminate and the Main display will flash the corresponding temperature limit. Press ENTER and then press HT/LT again to observe the other temperature limit. The corresponding LED on the controller will illuminate. Should either limit be exceeded an alarm will sound (if not muted) and the corresponding LED will flash.

To adjust either limit, press HT/LT and then press CLEAR, the display will go blank. Use the keypad to input the desired value. If the value is correct press ENTER. If the value is incorrect press CLEAR, the display will go blank. Use the keypad to correct the value and press ENTER. Use the LT or HT LED indicators to verify which temperature limit you are changing.

Alarm/External Functions

Mute Alarm

The alarm audio may be permanently silenced by pressing MUTE, and then immediately (within one second) pressing HOLD. The MUTE LED will now stay lit. To restore the audio, press MUTE and then immediately (within one second) press CLEAR. The MUTE LED will extinguish.

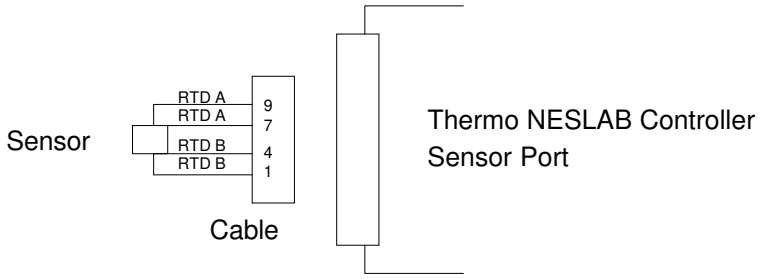
If desired, you may mute the audible portion of an alarm for an existing condition. Press MUTE on the temperature controller. The MUTE LED flashes to indicate a muted alarm horn. The MUTE button acts as a toggle switch to activate/deactivate the alarm horn. The appropriate HT or LT LED will continue to flash during the alarm condition. If the alarm is muted for an existing condition it will automatically reset once the temperature limit problem is corrected. The alarm will resound if a limit is exceeded another time unless MUTE is pressed again.

Sensor

The controller has the capability to enable and/or monitor a remote bath's temperature sensor. (Remote sensor probes of various sizes are available from Thermo NESLAB. Contact our Sales Department for more information.) Pressing SENSOR, when a remote sensor is properly connected to the controller's
9-pin SENSOR connector, will display the remote sensor's temperature on the Main display. The SENSOR LED will flash. *The controller and alarm, however, will continue to respond to the signals from the unit's internal probe.*

To completely transfer all display, control and alarm functions to the remote sensor, press SENSOR and then press ENTER. The SENSOR LED will stay lit. The controller will not respond to the signal from the unit's internal probe.

To disable the remote sensor press SENSOR and then press CLEAR. The SENSOR LED will extinguish. All display and alarm functions will again respond to the signal from the unit's internal probe.



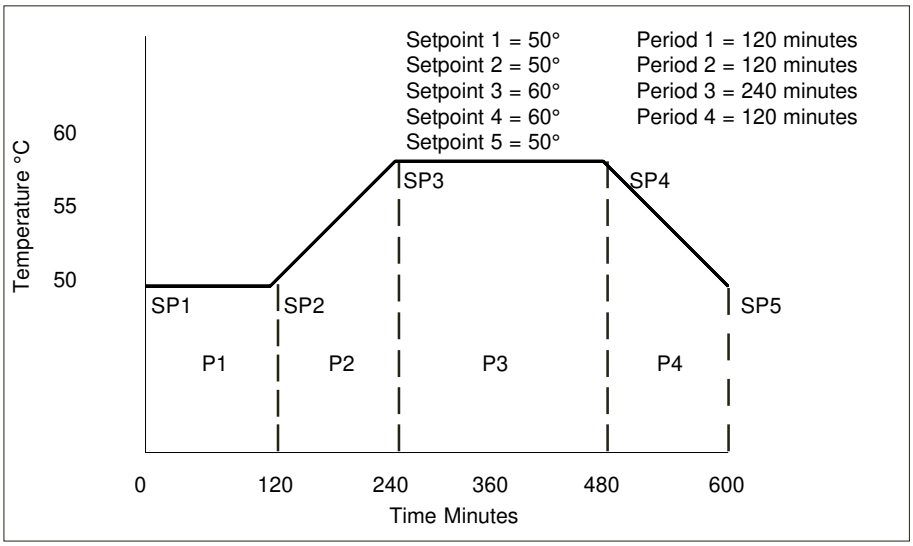
RS232

The unit can be controlled through your computer's serial port by using a standard 9-pin RS232 connection on ther rear of the temperature controller. For complete information see Appendix A.

Program Functions

Programming

The microprocessor controller can store up to 8 temperature programs, each one having up to 15 program steps (16 setpoints). You can select, enter or run one program at a time. The procedure for selecting a program is discusssed in Program Control on page 15. The programs can cover the unit's full temperature operating range in 0.01°C increments. Step times can vary from 0.1 to 6,500 minutes in 0.1 minute increments. Each program can be set up to run as many as 9999 repetitions (LOOPS).



Typical Program

The controller can store all programs in its nonvolatile memory, see Program Control on page 16.

The programming process begins with program definition. Define your program as a series of setpoints with a known period of time interval between each of them. Each interval is one step of the program. Give careful attention to the first part of your program. What conditions must exist at the beginning of your process? For example, you may wish to program an initial period of constant temperature to allow for thermal stabilization.

When a program is started, it begins immediately at the initial program setpoint.

Consider the unit's limitations when designing programs. Temperature or time parameters which exceed the performance capabilities of the bath will result in unsatisfactory operation. It is possible to create a program calling for very rapid changes in temperature. Although the equipment may not be capable of producing such changes, it may be practical to program such steps as a way to cause the fastest *possible* temperature change.

Loops

This option allows for automatic repetition(s) of a program. For example, set the number of loops to three. Once the program reaches the last setpoint, it will loop back to the first setpoint and run the program again. In this instance the program will loop back three times. The entire program will run a total of four times. The maximum number of loops is 9999.

Hold

This option determines what will happen at the end of a program. In the hold mode of operation the setpoint will remain at the final temperature when the program is completed. Without hold the setpoint will return to the starting setpoint when the program is completed. The setpoint may change abruptly, but the fluid temperature will respond as quickly as the system's heating and cooling capacity allows.

The procedures for placing the controller in the hold mode is discussed in Program Control on page 16.

Current Values

While a program is running, the program selected, current period, current setpoint, time remaining for the current step, or the current loop, may be viewed on the Main display. Momentarily depress the appropriate key listed below to view the desired parameter. After several seconds, the Main display will again indicate the temperature of the bath fluid.

SETPT	View Current Setpoint
LOOP	View Current Loop
PERIOD	Time Remaining in Current Period
PERIOD PERIOD	Current Period Number
+/- followed immediately by **PROG/STORE**	Selected Program Number

Assured Soak

This option is used when you need to ensure the bath temperature will reach the next setpoint (regardless of time) before moving onto the next period.

This option is controlled by a DIP switch on the rear of the controller. Turn DIP switch number seven (7) to the ON position to enable this feature.

Period Adjust

This option is used to skip the current period of a running program. See Table 13 on page 18 for the appropriate procedure. **NOTE:** If Assured Soak is activated, the bath *must* reach that setpoint before the program will continue.

Program Control

The following tables show how to use the keypad and Main display to program the controller.

Use Table 1 to select one of the eight programs to be the current program for either entering or running.

TABLE 1

Keypad input	Main Display	Comments
+/-	Current bath temperature	
-PROG/STORE[1]	**Pro** followed by the program number	Enter desired program number.
-ENTER	Current bath temperature	

1. PROG/STORE must be depressed immediately (within one second) after +/-.

Once Table 1 is complete, use Table 2 for entering and storing a two-setpoint program. You would follow this procedure for programming any number of setpoints (up to the 16 setpoint maximum).

TABLE 2

Keypad input	Main Display	Comments
-PROG/STORE	**- - - - - -**	If YES appears you should clear the current program (see Table 10).
-SETPT	**SP-1**	Input setpoint.
-ENTER	Desired setpoint	
-PERIOD	**P-1**	Input time in minutes.
-ENTER	Desired time	
-SETPT	**SP-2**	Input setpoint.
-ENTER	Desired setpoint	
-LOOPS	**LOOPS**	Input number of loops
-ENTER	Desired number of loops	
-PROG/STORE	**FILE?**	
-ENTER	Current bath temperature	

Use Table 3 to abort programming at any time.

TABLE 3

Keypad input	Main Display	Comments
-ENTER	**- - - - -**	
-PROG/STORE	**FILE?**	
-CLEAR	Current bath temperature	

Use Table 4 to scroll through a two-setpoint stored program. You would use this procedure for scrolling any number of setpoints (up to the 16 setpoint maximum).

TABLE 4

Keypad input	Main Display	Comments
-PROG/STORE	**YES**	
-ENTER	**SP-1** followed by actual value	
-ENTER	**SP-2** followed by actual value	
-ENTER	**P-1** followed by actual value	
-ENTER	**LOOPS** followed by actual value	
-ENTER	Current bath temperature	

Use Table 5 to abort scrolling through a program at any time.

TABLE 5

Keypad input	Main Display	Comments
-PROG/STORE	**FILE?**	
-ENTER	Current bath temperature	

Once Tables 1 and 2 are complete, use Table 6 to run a stored program.

TABLE 6

Keypad input	Main Display	Comments
-RUN/STOP	Current bath temperature	**PROG LED** will flash.

Use Table 7 to stop a running program.

TABLE 7

Keypad input	Main Display	Comments
-RUN/STOP	Current bath temperature	**PROG LED** will stay on steady.
-CLEAR	Current bath temperature	**PROG LED** extinguishes.

Use Table 8 to temporarily suspend a running program.

TABLE 8

Keypad input	Main Display	Comments
-RUN/STOP	Current bath temperature	**PROG LED** stays on steady.

Use Table 9 to resume a suspended program.

TABLE 9

Keypad input	Main Display	Comments
-RUN/STOP	Current bath temperature	**PROG LED** flashes.

Use Table 10 to clear a stored program.

TABLE 10

Keypad input	Main Display	Comments
-PROG/STORE	**YES**	
-PROG/STORE	**FILE?**	
-CLEAR	Current bath temperature	

Use Table 11 to add HOLD operation. (Hold must be established before running a program. The hold function is not part of the stored program.)

TABLE 11

Keypad input	Main Display	Comments
-PROG/STORE	**YES**	
-HOLD	**YES**	**HOLD** LED stays on steady.
-PROG/STORE	**FILE?**	
-ENTER	Current bath temperature	

Use Table 12 to clear hold operation.

TABLE 12

Keypad input	Main Display	Comments
-PROG/STORE	**YES**	
-HOLD	**YES**	**HOLD** LED extinguishes.
-PROG/STORE	**FILE?**	
-ENTER	Current bath temperature	

Use Table 13 to force a running program to skip ahead to the next period.

TABLE 13

Keypad input	Main Display	Comments
+/-	Current bath temperature	
-PERIOD[1]	**P-Adj**	(Period adjust)

1. PERIOD must be depressed immediately (within one second) after +/-.

Error Messages

The Main LED will indicate an error message for eight different conditions.

Error1 - Program incomplete or illogical. Re-enter the program.

Error2 - Period entered exceeds 6,500 minutes. Reenter a period.

Error3 - Entered value exceeds allowable limits. Reenter proper value.

Error4 - Loops entered greater than 9,999. Reenter loops

Error5 - Attempted to run a program without a program in memory. Build a program.

Error6 - No period or 0 entered entered for a program. Enter a period.

Error7 - With alarm - SENSOR depressed without a sensor properly connected to controller. Properly connect a sensor. (If sensor is properly connected the sensor may have failed.)
Without alarm - Internal probe failure, unit will shut off.

Error8 - Internal nonvolatile memory has failed. Press ENTER for the controller to reinitialize nonvolatile memory to factory preset parameters. **NOTE:** This will erase any program and setpoints in nonvolatile memory. The unit will have to be recalibrated.

Miscellaneous

Additional Parameters

Two parameters can also be set while the controller is deactivated (Main display shows OFF). You can adjust the light intensity of the Main display and set the controller pushbuttons to "beep" or not when depressed.

To adjust the Main display intensity first press the "±" key on the controller keyboard. Repeatedly depress the "1" key to decrease intensity or the "3" key to increase. Each press changes the intensity an incremental amount. Once the desired intensity is displayed press ENTER.

To silence the "beep" first press the "." key. Press "0" to turn the beep off or press "1" to turn it on. Next, press ENTER.

DIP Switches

Three DIP switches on the rear of the controller are operational. Switch #1 controls the temperature scale. OFF (up position) displays the temperature in °C, ON (down position) displays the temperature in °F.

Switch #6 sets the display update rate the controller uses to display temperature. This will determine how sensitive the display will be to temperature fluctuations. OFF (up position) sets a fast rate, ON (down position) sets a slow rate. (OFF causes more fluctuations than ON.)

Switch #7 controls the assured soak option for programs. ON enables assured soak.

PID Control

PID controllers are best suited for systems that may experience changing heat loads. Proportional control is combined with Integral and Derivative adjustments which allow the controller to automatically compensate for any changes from the setpoint. You may have to experiment with the PID settings to find out which are most suitable to your application.

To change or view any of the PID settings the controller must be operating.

To change or view the proportional band, press "1" and immediately, within one second, press ENTER. The "percent of span" value will flash on the Main display. Press ENTER to accept the value. To change the value press CLEAR and then enter the desired value. Press ENTER to exit this mode.

To change or view the Integral, press "2" and and immediately, within one second, press ENTER. The "repeats per minute" value will flash on the Main display. Press ENTER to accept the value. To change the value press CLEAR and then enter the desired value. Press ENTER to exit this mode.

To change or view the Derivative, press "3" and and immediately, within one second, press ENTER. The "minutes" value will flash on the screen. Press ENTER to accept the value. To change the value press CLEAR and then enter the desired value. Press ENTER to exit this mode.

Restoring Factory Preset Values

To restore the factory preset values hold the "0" button on the keypad and turn the Main Power switch on the side of the unit to the ON position. Release the "0" button and the Main display will indicate OFF. The following preset values will be installed:

P = 0.6%
I = 0.25 repeats per minute
D = 0.05 minutes

In addition, the following values will be preset

BAUD Rate = 9600
Stop bits = 1
Data Bits = 8
Parity = none

Calibration

The microprocessor controller has three different modes of calibration: Self-Cal, Two-point, and One-point. The controller is shipped from the factory with a Two-point calibration so no additional controller calibration may be required. Both the internal probe and the remote sensor input must be independently calibrated. Different calibration modes for each probe can be used if desired. The remote sensor input has been Self-Calibrated at the factory.

Self-Cal is used to initialize the analog-to-digital (A/D) converter input channel before performing the other types of calibrations. This mode removes all previous calibrations and brings the measurement error to less than 2°C. If this is the required accuracy, then no additional calibration is needed.

Two-point calibration is used to negate A/D and probe errors over the full span of the controller. This type of calibration is performed when high accuracy is desired.

One-point calibration (offset) is used to make the controller very accurate at one specific operating temperature.

One-point Calibration can be performed after a Two-point calibration as many times as desired. Each One-point calibration adds a different offset to the original Two-point calibration data (if one was already performed).

Calibration Procedures

Note: The controller should be powered at least 15 minutes before calibration to assure the electronic circuits are at operating temperature. To perform One and Two-point calibrations on the remote sensor input the unit must be in the remote sensor mode. Messages will end with CAL 1 for internal probe calibrations and CAL 2 for remote sensor calibrations.

Self-Cal: The controller must be deactivated (displaying OFF) to access this mode. Press SETPT followed by ENTER to Self-Cal the internal probe input. The message “S-CAL 1” will be followed by “done”. To Self-CAL the sensor input press SENSOR followed by ENTER. The message “S-CAL 2” followed by “done” will be displayed.

Two-point: For high accuracy measurements the controller input can be calibrated at two points. These two points (one high, one low) should be as far apart as practical for good performance.

Do not pick points that are outside the safe operating limits of the fluid in your application. For example with a water bath, 5°C and 90°C would be typical calibration points.

Before a Two-point cal, Self-cal must be performed on the desired sensor input.

With the controller on and measuring from the internal or remote probe, depending on which sensor is being calibrated, set the controller setpoint to the desired high cal temperature. When the bath reaches the setpoint and stabilizes, measure the actual bath temperature with an external calibrated thermometer. Press in quick succession “2” “.” “ENTER”. The message H-CAL # will appear followed by the flashing setpoint. Now enter in the actual bath temperature as measured by the calibrated thermometer and press ENTER. The Main display will indicate the temperature of the bath fluid (the calibrated temperature will not appear until the next step is complete).

Next set the controller setpoint to the desired low cal temperature. When the bath reaches this setpoint and stabilizes, measure the actual bath temperature with an external calibrated thermometer. Press in quick succession “2” “.” “ENTER”. The message L-CAL # will appear followed by the flashing setpoint. Now enter in the actual bath temperature as measured by the calibrated thermometer and press ENTER. The Main display will now indicate the calibrated temperature of the fluid in the bath.

One-point: Before a One-point cal, Self-cal or Two-point cal must be performed on the desired sensor.

With the controller on, and measuring from the internal or remote probe, depending on which sensor is being calibrated, set the controller setpoint to the desired temperature. When the bath reaches this setpoint and stabilizes, measure the actual bath temperature with an external calibrated thermometer. Press in quick succession “1” “.” “ENTER”. The message 1-CAL # will appear followed by the flashing setpoint. Now enter in the actual bath temperature as measured by the calibrated thermometer and press ENTER. The display will now show the calibrated temperature and all temperatures will have this offset added to them.

Calibration clear: At any point the calibration data from a One or Two-point cal can be erased by quickly pressing “2” “.” “CLEAR”. This procedure clears the calibration data only for the selected probe.

High Temperature/ Low Liquid Level Safety

To protect your application, the adjustable High Temperature/Low Liquid Level Safety (HIGH TEMP/LOW LEVEL) ensures the heater will not exceed temperatures which can cause serious damage to your unit. A single temperature sensor, located on the heater coils in the bath, monitors both conditions. A High Temperature/Low Liquid Level fault occurs when the temperature of the sensor exceeds the set temperature limit.

In the event of a fault, the unit will shut down. The cause of the fault must be identified and corrected before the unit can be restarted.

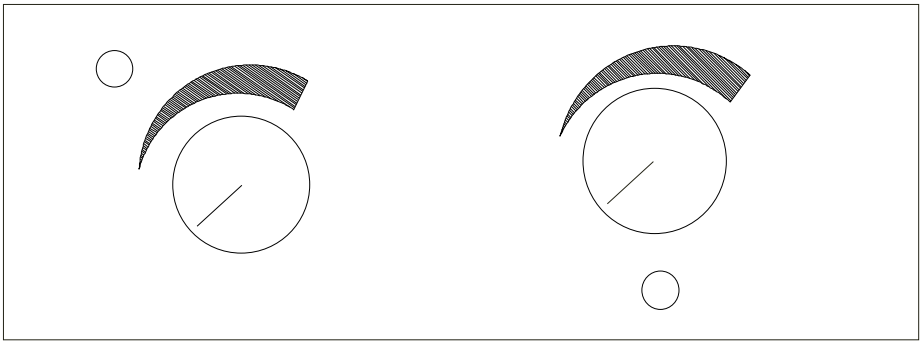
The safety on single heater systems is not preset and must be adjusted during initial installation.

Units with a boost heater have an additional nonadjustable safety located behind the main safety. It has a red reset button but no adjustment knob.

To set the safety, locate the HIGH TEMP/LOW LEVEL SAFETY adjustment dial on the right side of the pump box. Turn the dial fully clockwise and press the red RESET switch. The RESET switch is located NEXT TO the adjustment dial. **NOTE:** For units without a reset switch turn the power switch off and then back on.

Start the unit. Adjust the setpoint for a few degrees higher than the highest desired fluid temperature and allow the bath to stabilize at the temperature setpoint. Turn the HIGH TEMP/LOW LEVEL SAFETY dial counter-clockwise until you hear a click and the unit shuts down. The red FAULT LED on the temperature controller will light to indicate a fault has occurred.

NOTE: The minimum high temperature safety setting is 50°C. For units without a reset switch the temperature range is 0°C to 180°C.



High Temperature/Low Liquid Level Safety
(Some units do not have a rese switrch.)

Section V Maintenance

To avoid electrical shock, disconnect the mains cord prior to removing any access panels or covers.

Service Contracts

Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Reservoir Cleaning

Routine cleaning can be achieved by simply sponging down the seamless stainless steel tank with tap water. (Dish washing detergent may be used but the tank must be thoroughly rinsed.)

To gain access to the entire reservoir the pump box and reservoir cover should be removed.

Remove the line cord from the rear of the unit.

Remove the four screws securing the reservoir's cover.

Carefully raise the controller and cover assembly to remove it from unit.

Place the cover on its side.

Algae

To restrict the growth of algae in the bath, we recommend the bath cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light required for the growth of most common algae.

Thermo NESLAB recommends rthe use ofChloramine-T, 1 gram per 3.8 liters.

Section VI Troubleshooting

Checklist

Unit will not start

Make sure the voltage of the power source meets the specified voltage, ±10%. Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Check the High Temperature/Low Liquid Level Safety. If the FAULT light is on, make sure the fluid level in the bath is between the marks in the baffle and the HIGH TEMP/LOW LEVEL SAFETY setting is greater than the fluid temperature. Push the RESET switch(es), or, for units without a reset switch, turn the power switch off and then back on and attempt to restart.

No external circulation

Make sure the stainless steel plugs on the PUMP INLET and PUMP OUTLET have been removed.

Check for obstructions, kinks, or leaks in the circulation tubing.

Circulation will cease when the pump head has been exceeded.

No communication between bath's microprocessor and your computer

Ensure the bath's microprocessor parameters (baud rate, parity etc.) match your computer requirements.

Ensure the RS-232 light is on steady. **NOTE:** You cannot input data from the keypad when the RS-232 mode is enabled.

Check the cable. The microprocessor reads data on pin 2 and transmit data on pin 3. Ensure the cable is correctly connected. Computer 25-pin and 9-pin communication ports usually have different conventions.

Ensure the only pins connected to the microprocessor are 2, 3 and 5. All other pins must *not* be connected.

Keypad locked up

NOTE: When communication is enabled, or a program is running, data entry and many many keypad functions are disabled. This is normal operation.

If necessary, remove computer cable. Turn off the bath using the main power switch on the side of the unit. While holding the "0" button on the keypad, turn the unit back on. The Main Display will read OFF.

This will also restore the factory preset PID values and also reset the communication parameters and buffer. See Restoring Factory Preset Values on page 20.

Service Assistance and Technical Support

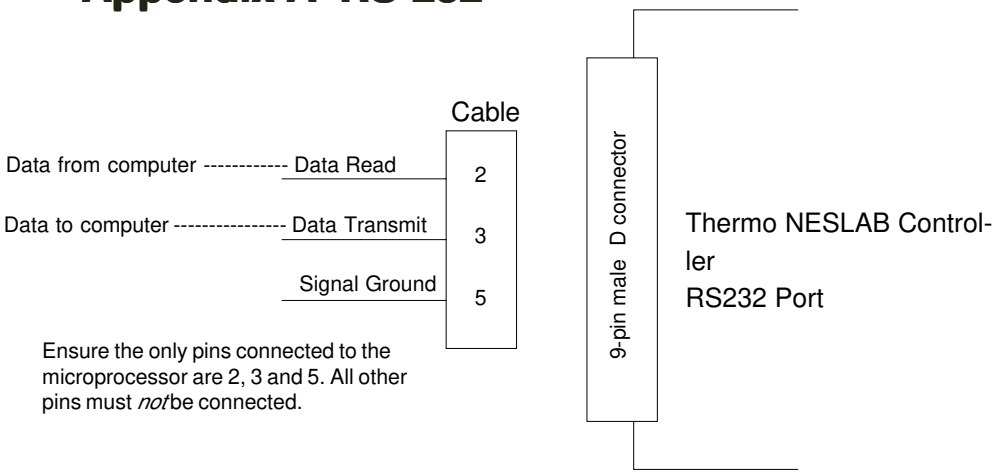
If, after following these troubleshooting steps, your unit fails to operate properly, contact our Customer Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

Part number
Serial number
Voltage of unit
Voltage of power source

In addition to arranging warranty service, our Service Department can provide you with a wiring diagram and a complete list of spare parts for your unit. Before calling, please obtain the following information:

Part number
Serial number

Appendix A RS-232



The unit can be controlled through your computer's serial port by using a standard 9-pin RS232 connection on the rear of the temperature controller. Data transmit of the serial port connects to data read (pin 2) of the bath. Data read of the serial port connects to the data transmit (pin 3) of the bath.

NOTE: Do not use a cable that connects to the unused pins on the bath communications port. This may cause a communication fault. Communication cables are available from Thermo NESLAB. Contact our sales department for additional information.

With a cable properly connected to the controller press RS232, the RS232 LED will start to flash. Press ENTER while the LED is flashing and the RS232 LED will come on steady indicating your computer's serial port can control the unit's operation.

In this mode of operation you cannot manually input data with the keypad. You can, however, observe the setpoint and/or alarm temperature limits by pressing the appropriate button on the controller. Your computer can be used to operate all modes of operation.

NOTE: When serial communication is enabled, and a temperature program is running, no keypad operations are allowed.

Communication Commands

All commands must be entered in the exact format shown in the following four tables. Do not send a [LF] (line feed) after the [CR]. Ensure the specified letter case is used. The tables on the next few pages show all commands available, their format and responses. Controller responses are either the requested data, an exclamation point (!) if the command was properly executed, or a question mark (?) if the controller could not execute the command. A question mark response indicates either an improper command format or an attempt to enter settings that are outside the allowable range. The controller response *must* be received before sending the next command.

NOTE: All responses from the bath are terminated with a single [CR] only. Wait for your computer to respond before sending the next command.

TABLE 1 GENERAL COMMANDS

Command Echo Echo: i = 1, No echo: i = 0 (control returns commands)	SEi[CR]
Set Setpoint -30.00 to +150.00°C or -22.00 to +300.00°F	SSxxx.xx[CR]
Read Setpoint	RS[CR]
Read Main Probe Temperature	RT[CR]
Read Remote Probe Temperature	RR[CR]
Turn Control On or Off On: i = 1, Off: i = 0	SOi[CR]
Set Power Status Flag Set: i = 1, Reset i = 0 (reset when controller power is lost)	SWi[CR]
Read Power Status Flag	RW[CR]
Read F or C Units	RU[CR]

TABLE 2 ALARM COMMANDS

Set High Alarm Limit Same range as setpoint	SHxxx.xx[CR]
Read High Alarm Limit	RH[CR]
Set Low Alarm Limit Same range as setpoint	SLxxx.xx[CR]
Read Low Alarm Limit	RL[CR]
Read Alarm Status Returns: 0 = no alarm, 1 = alarm	RF[CR]

TABLE 3 CONTROL COMMANDS

Set Proportional Bandwidth 0.10 to 10.00 % of full scale	SPxx.xx[CR]
Read Proportional Bandwidth	RP[CR]
Set Integral Compensation 0.00 to 10.00 repeats/minute	SIxx.xx[CR]
Read Integral Compensation	RI[CR]
Set Derivative Compensation 0.00 to 1.00 minutes	SDx.xx[CR]
Read Derivative Compensation	Rd[CR]
Main/Remote Probe Selection Main: i = 0, Remote: i = 1	Sri[CR]
Boost Heater Inhibit Inhibit: i = 0, Enable: i = 1	SBi[CR]

TABLE 4 PROGRAMMING COMMANDS

Set Step Setpoint n = step number	SYn,xxx.xx<[CR]
Read Step Setpoint	RYn[CR]
Set Step Period n = step number	SXn,xxx.xx[CR]
Read Step Period	RXn[CR]
Read Number of Steps	Rs[CR]
Set Number of Loops 0 to 9999 additional loops after first program execution	SKxxxx[CR]
Read Number of Loops	RK[CR]
Set Hold Status Hold: i = 1, No hold: i = 0	SZi[CR]
Pause/Resume Program Resume: i = 1, Pause: i = 0	SGi[CR]
End Program	SR[CR]
Read Elapsed Step Time	RE[CR]
Select Program Number	SVx[CR]
Read Selected Program Number	RV[CR]
Read Current Period	RC[CR]
Skip Ahead One Period	SJ[CR]

To set the communications data format the controller must be deactivated (Main display indicates OFF). Press the RS232 button. The word "Baud" will momentarily appear followed by the current baud rate (9600, 4800, 1200, 600 or 300). Use the keypad to enter the desired change, if any. Press ENTER and "db" will momentarily appear followed by the current number of data bits setting. Again, use the keypad to enter any desired change (7 or 8) and then press ENTER. "Sb" will momentarily appear followed by the current number of stop bits (1 or 2). Change, if needed, and press ENTER and "PAr" will momentarily appear followed by the current parity control setting (0 = none, 1 = odd, 2 = even). Change, if needed, and press ENTER.

To manually exit this mode of operation press RS232. The RS232 LED will start to flash. Press the CLEAR button and the RS232 LED will extinguish.

Communication Command Protocol

The following table lists the communication command protocol for programming the controller via a computer.Use the Ctrl - C key combination to clear the controller receiving buffer if an erroneous character is detected.

FUNCTION	SYNTAX[1]	RETURN MESSAGE[2]
SET SETPOINT	SSxxx.xx[CR]	![CR]
SET LOW LIMIT	SLxxx.xx[CR]	![CR]
SET HIGH LIMIT	SHxxx.xx[CR]	![CR]
SET PROPORTIONAL BAND[3]	SPxx.xx[CR]	![CR]
SET INTEGRAL[4]	SIxx.xx[CR]	![CR]
SET DERIVATIVE[5]	SDx.xx or Sdx.xx[CR]	![CR]
BOOST HEATER INHIBIT	SBi[CR]	![CR]
SET POWER STATUS FLAG	SWi[CR]	![CR]
SET ON/OFF	SOi[CR]	![CR]
SELECT PROGRAM NUMBER	SVx[CR]	![CR]
SET STEP SETPOINT	SYn,xxx.xx[CR]	![CR]
SET STEP PERIOD	SXn,xxx.x[CR]	![CR]
SET NUMBER OF PERIODS	Ssn[CR]	![CR]
SET NUMBER OF LOOPS	SKxxxx[CR]	![CR]
SET HOLD STATUS	SZi[CR]	![CR]
END PROGRAM	SR[CR]	![CR]
ECHO CONTROL[6]	SEi[CR]	![CR]
REMOTE SENSOR CONTROL	Sri[CR]	![CR]
SUSPEND/RESUME PROGRAM	SGi[CR]	![CR]
SKIP AHEAD ONE PERIOD	SJ[CR]	![CR]
READ SETPOINT	RS[CR]	xxx.xx[CR]
READ TEMPERATURE	RT[CR]	xxx.xx[CR]
READ ALARM STATUS	RF[CR]	![CR]
READ REMOTE TEMPERATURE	RR[CR]	xxx.xx[CR]
READ UNITS	RU[CR]	C[CR] or F[CR]
READ CURRENT PERIOD	RC[CR]	xx[CR]
READ ELAPSED TIME	RE[CR]	xxx.x[CR]
READ LOW LIMIT	RL[CR]	xxx.xx[CR]
READ HIGH LIMIT	RH[CR]	xxx.xx[CR]
READ PROPORTIONAL BAND	RP[CR]	xx.xx[CR]
READ INTEGRAL	RI[CR]	xx.xx[CR]
READ DERIVATIVE	Rd[CR]	x.xx[CR]
READ PROGRAM NUMBER	RV[CR]	x[CR]
READ STEP SETPOINT	RYn[CR]	xxx.xx[CR]
READ STEP PERIOD	RXn[CR]	xxx.x[CR]
READ NUMBER OF STEPS	Rs[CR]	x[CR]
READ NUMBER OF LOOPS	RK[CR]	xxxx[CR]
READ POWER STATUS	RW[CR]	x[CR]

1. x = ASCI digit, i = 0 (OFF or STOP) i = 1 (ON or GO), n = step number.
2. Ensure the return message is correct. If not, resend or troubleshoot communication lines.
3. Factory preset at 0.6%.
4. Factory preset at 0.25 repeats per minute.
5. Factory preset at 0.05 minutes.
6. Allows computer to compare send signal to receive signal.

Remote Programming

The bath can be programmed and controlled by a remote computer. Enter step setpoints using the SYn command, time periods using the SXn command, number of loops using the SKxxxx command and number of periods in the program using the Ssn command. Start the program using SG1 and suspend the program using SG0. When the program is finished it will stop automatically. If needed, SR will end the program at any time. Here is a four setpoint, two loop example:

SV1[CR]	Select program number one
SY1,25.00[CR]	First setpoint = 25.00 degrees
SX1,20.0[CR]	First period = 20.0 minutes
SY2,40.00[CR]	Second setpoint = 40.00 degrees
SX2,60.0[CR]	Second period = 60.0 minutes
SY3,40.00[CR]	Third setpoint = 40.00 degrees
SX3,45.0[CR]	Third period = 45.0 minutes
SY4,25.00[CR]	Fourth setpoint = 25.00 degrees
Ss3[CR]	Program has three periods
SK2[CR]	Execute the program three times total
SG1[CR]	Begin executing program
SG0[CR]	Temporarily suspend the program
SR[CR]	Stop the program before it is finished

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

Compliance

Products tested and found to be in compliance with the requirements defined Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a one year warranty against defective parts and workmanship from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact Thermo NESLAB.

After-sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Customer Service Department. Before calling, *please* obtain the following information from the unit's serial number label:

- *BOM number* _____
- *Serial number* _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit, or the information in this manual, contact our Sales Department for assistance.

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

The FTC-350A Flow Through Cooler is a mechanical refrigeration unit designed to allow a Thermo NESLAB EXACAL bath/circulator to operate at temperatures from +40°C to -20°C. The FTC-350A can also be used in conjunction with an EXACAL bath/circulator to maintain or cool the temperature of a closed loop external system.

The unit consists of an air-cooled refrigeration system and a stainless steel heat exchanger.

The unit incorporates design features to prevent damage to the unit in the event that the circulating fluid freezes. If temperatures below 8°C are desired, a non-freezing fluid should be used.

Specifications

Cooling Capacity[1]	450 Watts @ 20°C 180 Watts @ 0°C
Unit Dimensions (HxWxD) *Inches* *Centimeters*	 14 x 8¾ x 12 35.8 x 22.2 x 30.5
Compressor	¼ h p
Heat Exchanger	Stainless Steel

1. Cooling capacity at +25°C ambient, fluid temperature 20°C.
   Specific heat of cooling fluid is 0.5.

Section III Installation

Site

The unit should be placed on a sturdy bench or table. Ambient temperatures should be in the range of +50°F to +90°F (+10°C to +32°C). Never locate the unit where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. Air is drawn through the top of the unit and discharged through the sides and the rear of the unit. The unit should be positioned so the intake and discharge are not impeded. A minimum clearance of 1.5 feet (0.5 meters) on all four sides is necessary for adequate ventilation.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section VI, Maintenance).

The unit will retain its full rated cooling capacity in ambient temperatures up to approximately +75°F (+24°C). Reduce the cooling capacity 1% for every 1°F above +75°F, up to a maximum ambient temperature of +90°F. In terms of Celsius, reduce the cooling capacity 1% for every 0.5°C above +24°C, up to a maximum ambient temperature of +32°C.

Air Intake

The approximate air intake through the condenser is 200 cubic feet/minute (1 cubic foot = 28.35 liters).

Electrical Requirements

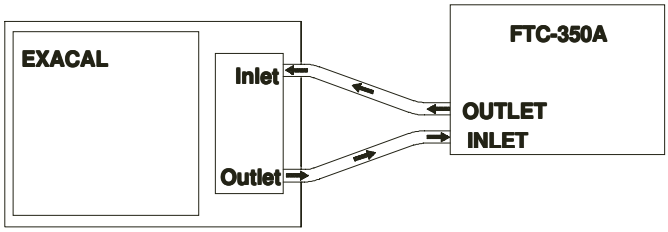
Refer to the table below for the specific electrical requirements of your unit.

Volts	115	220/240
Hertz	60	50
Amps	4.5	2.3

Make sure the voltage the power source meets the specified voltage of the unit, ±10%.

Plumbing Requirements

The inlet and outlet connections are located at the rear of the unit and labelled INLET and OUTLET. These connections are 3/8 inch OD stainless steel serrated tubing. These connections will accept 3/8 or 5/16 inch ID flexible tubing.

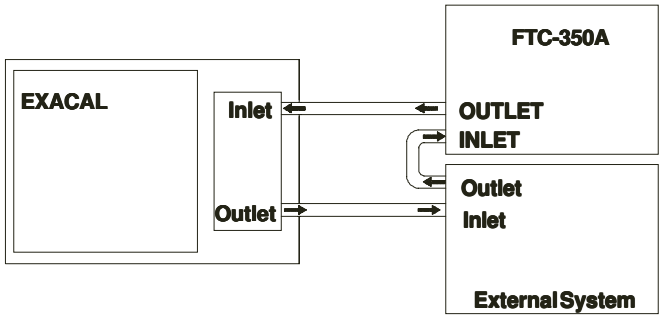


Connect the FTC-350A INLET to the outlet of the EXACAL circulating pump.

Connect the FTC-350A OUTLET to the inlet of the EXACAL circulating pump.

Keep all tubing as short as possible and free of kinks. All tubing should be insulated to prevent the loss of cooling capacity. Tubing and insulation are available from Thermo NESLAB. Contact our Sales Department for more information.

The FTC-350A can be used in conjunction with an EXACAL bath/circulator to maintain or cool temperatures in a closed loop external system. In this case, connect the EXACAL circulation pump to the external system inlet. Connect the external system outlet to the INLET of the FTC-350A.



Use of tubing less than 3/8 inch ID is not recommended and will cause a significant deration of flow. If it is necessary to make a reduction in the tubing size to fit external equipment, the reduction should be made at the inlet of the external equipment, not at the pump outlet. The tubing connecting the external equipment and the FTC-350A should be increased to 3/8 inch ID tubing at the outlet of the external equipment.

Fluids

Filtered tap water is the recommended fluid for operation above +8°C.

Below +8°C, a non-freezing fluid must be used. A 50/50 mixture, by volume, of water and laboratory grade ethylene glycol is recommended.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the equipment.

The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature. Never use flammable or corrosive fluids with this unit.

Filling Requirements

Refer to the filling requirements in the EXACAL bath/circulator manual for complete instructions.

Section IV Operation

Start Up

Never operate the FTC-350A when the EXACAL bath/circulator operating temperature is above +40°C. Excessively hot fluid can damage the heat exchanger in the FTC-350A. Allow the EXACAL bath/circulator to cool below +40°C before starting the unit.

The EXACAL bath/circulator must be operating and pumping fluid through the FTC-350A before the FTC-350A can be turned on. If the FTC-350A is turned on before flow is established, the heat exchanger may be permanently damaged.

Make sure the electrical and plumbing connections are correct (see Section II, Electrical Requirements and Plumbing Requirements) and the unit has been properly filled (see Section II, Fluids and Filling Requirements).

Place the POWER switch in the ON position. The POWER switch will light and the refrigeration system will start.

When shutting down the system, turn off the FTC-350A first and allow 15 minutes before turning off the Exacal bath/circulator. Again, this is to prevent damage to the heat exchanger.

When the FTC-350A is shut off, allow about five minutes before restarting the unit. This allows time for the refrigeration pressures to equalize. If the pressures do not equalize, the refrigeration compressor will short cycle (clicking sound) and no cooling will occur.

Flow Control Switch (Optional)

The flow control switch is designed to protect the unit's heat exchanger from freezing in the event flow from the external bath is stopped. Should the flow rate drop below 2.5 liters per minute the unit will shut down and the FAULT light will illuminate. The unit will restart once the flow rate is restored.

The unit will not start unless the flow rate is higher than 2.5 liters per minute. If sufficient flow is supplied and the unit still will not start, the flow switch may be dirty. Contact our Customer Service Department for instructions on flow switch removal and cleaning.

Section V Maintenance & Troubleshooting

Cleaning

The unit pulls a substantial amount of air through a finned condenser. This condenser, located on top of the unit (air intake), is covered with a filter. A buildup of dust or debris on this filter will impede air flow and may result in a loss of cooling capacity.

Periodic vacuuming of the filter is necessary. The vacuuming frequency depends on the operating environment. We recommend a monthly visual after initial installation. After several months, the cleaning frequency of required should be established.

The filter may be removed and cleaned as follows. Place the edge of the unit over the edge of the bench and remove two screws from either side of the unit. Slide the cover off. Remove the filter, rinse in water, allow it to dry, then replace in the unit.

Checklist

Unit will not start.
Check house circuit breaker.

Check power source for correct voltage output. Power source must be specified voltage, ±10%. Refer to the serial number label on the rear of your unit for the specific electrical requirements.

Loss of cooling capacity.
Check the condenser. A build up of dust or debris can cause a loss of cooling capacity. If dust or debris has accumulated, vacuum the condenser filter (see Section V, Cleaning).

Make sure the heat load has not overcome the cooling capacity of the FTC-350A (see Section I, Specifications).

After the FTC-350A has been shut off, allow five minutes before restarting. The refrigeration compressor will short cycle (clicking sound) if time is not allowed for refrigeration pressures to equalize (see Section IV, Start Up).

The FTC-350A requires proper ventilation for heat removal. If ventilation is poor, the refrigeration compressor will shut down due to heat build up. Ensure the air intake and discharge are not impeded (see Section III, Site).

Check the ambient temperature where the unit is being operated. The ambient range of the unit is +50°F to +90°F (+16°C to +32°C). The unit will retain its full rated capacity in ambient temperatures up to approximately +75°F. Reduce the cooling capacity 1% for every 1°F above +75°F, up to a maximum ambient temperature of +90°F. In terms of Celsius, reduce the cooling capacity 1% for every 0.5°C above +24°C, up to a maximum ambient temperature of +32°C.

Ensure the fluid is suitable for the temperature range (see Section III, Fluids).

Ice build up on the cooling coil in the EXACAL bath/circulator can act as insulation and lower the cooling capacity of the unit. Raise the operating temperature of the EXACAL bath/circulator to de-ice the cooling coil.

Ensure the HEATER light on the pump box of the EXACAL bath/circulator is cycling and not staying on continuously.

No flow through FTC-350

If water is being used as the fluid at temperatures close to freezing, it is possible to freeze the water in the exchanger which will block flow. Shut off the FTC-350 and allow the exchanger to thaw out.

A non-freezing fluid must be used for operation below +8°C.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance. Phone numbers and addresses for all our Thermo NESLAB Sales and Service Centers are located in the back cover of this manual. Before calling, *please* obtain the following:

BOM Number
Serial Number
Voltage
Ambient temperature where the unit is being operated

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

The unit has a warranty against defective parts and workmanship is for one full year from date of shipment. See back page for more details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Customer Service Department. Before calling, please obtain the following information from the unit's serial number label:

- *BOM number* _____

- *Serial number* _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department. Addresses and phone numbers for all our NESLAB Sales and Service Centers are printed on the back cover of this manual.

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never use flammable or corrosive fluids with this unit.

Never operate the unit without bath fluid in the bath.

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the bath before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified technician.

In addition to the warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury, or death.

Section II General Information

Description

The GP-Series Constant Temperature Baths are designed to provide temperature control for applications requiring a fluid work area or pumping to an external system.

The units consist of a heater, stirrer or optional circulation pump, stainless steel bath, and temperature controller.

Specifications

	GP Series
Temperature Range	
Analog Controller	ambient to +150°C
Digital Controller	ambient to +150°C
Temperature Stability[1]	±0.03°C
Pump Capacity[1,2]	
1. Specifications listed for units operating at +37°C bath temperature, +21°C (+70°F) ambient, with tap water as bath fluid.
2. The circulation pump is an optional feature. It is factory installed and must be specified at the time of order.

	GP-100	GP-200	GP-300
Heater			
Watts	1200		
Bath Work Area

Section III Installation

Site

The unit should be located on a sturdy table or bench top. Ambient temperatures should be inside the range of +50°F to +90°F (+10°C to +32°C).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

A minimum clearance of 6 inches (15 centimeters) between the rear of the unit and the nearest wall is required for adequate ventilation through the pump box. This space will also accommodate the pump connections, the tap water cooling coil connections.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section VI, Cleaning).

Electrical Requirements

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is your responsibility to assure that a proper ground connection is provided.

50 Hertz units are equipped with an IEC320 C14 power inlet receptacle. Use the appropriate line cord with respect to the unit's rated voltage.

Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

Plumbing Requirements

Hose Connections (if equipped with circulation pump)
The pump connections are located at the rear of the pump box and are labelled. These connections are stainless steel serrated hose connections that accept 3/8 inch ID flexible tubing.

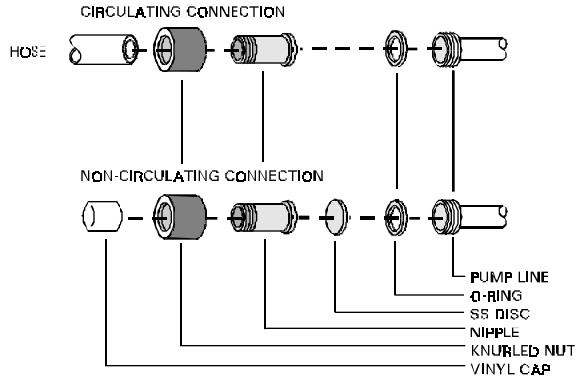
Flexible tubing, if used, should be of heavy wall or reinforced construction. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required for improved temperature control.

Please consider hard plumbing circulation lines when excessively high fluid temperatures are required.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

Pumping (if equipped)
The pump is designed to deliver a flow of 9 liters/minute (2.3 gallons/ minute) at 0 feet of head. To prevent unwanted flow, the bath is supplied with two stainless steel disks which block the PUMP INLET and PUMP OUTLET.

The disks must be removed when flow is required. To prevent leaking around the inlet and outlet connections, be sure the two Teflon® O-rings remain in place. To prevent distortion of the O-rings, only tighten the connections "hand tight." Once the hose connections are made, the pump must be properly plumbed to an external system. It is important the bath is not in operation when all plumbing work is done.



It is important to keep the distance between the unit and the external system as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, make them at the inlet and outlet of the external system, not at the unit.

If the bath is not used for external circulation, make sure the stainless steel disks are in place prior to operating the bath.

Fluids

Tap water is the recommended fluid for operation from ambient to +80°C.

Above +80°C, the user is responsible for fluids used.

Never use flammable or corrosive fluids with this unit.

Filling Requirements

The bath work area has a high and low level marker to guide filling. The markers are 1 inch horizontal slits located in the center of the stainless steel baffle that separates the work area and the pump assembly. The correct fluid level falls between these two markers. If the correct fluid level is not maintained, the heater will be exposed and may become damaged.

When pumping to an external system, keep extra fluid on hand to maintain the proper level as the circulating lines and external system are filled.

Never run the unit when the work area is empty.

Section IV Operation

Digital Controller

Start Up

Before starting the unit, double check all electrical and plumbing connections and make sure the work area has been properly filled with bath fluid.

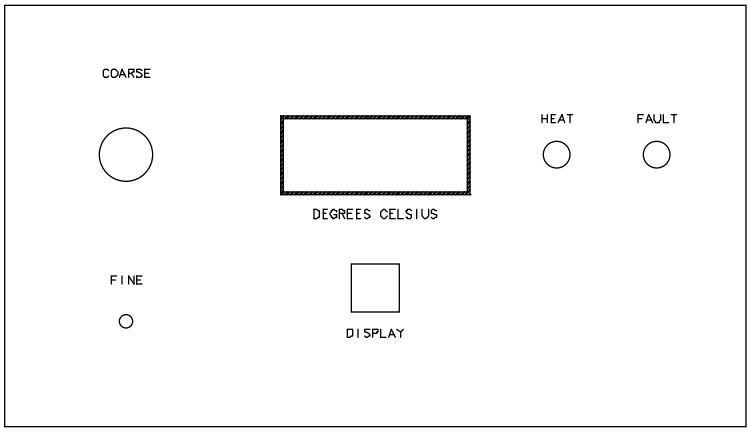
To start the unit, press the MAIN circuit breaker located on the rear of the control box. The pump will start and the DEGREE CELSIUS LED display will indicate the temperature of the bath fluid.

Temperature Adjustment

To display the temperature setpoint, press the DISPLAY button. To adjust the setpoint, press the DISPLAY button and turn the COARSE and FINE dials until the temperature setpoint is indicated on the LED display.

NOTE: Inadvertent movement of the COARSE and/or FINE dials, regardless of the position of the DISPLAY button, will result in a change in the setpoint. This change will not be immediately reflected on the LED display, unless the DISPLAY button is pressed. The display will eventually change as the unit responds to the new setpoint

The HEAT LAMP indicates the status of the heater. As the temperature of the fluid in the bath approaches the temperature setpoint, the LAMP will cycle on and off to indicate the approximate duty cycle of the heater.



Temperature Controller (Front View)

High Temperature/ Low Liquid Level Cutout

The unit is equipped with an adjustable High Temperature/Low Liquid Level Cutout (HIGH TEMP/LOW LEVEL SAFETY). The cutout prevents the heater from reaching excessively high temperatures that can cause serious damage to the unit. A single temperature sensor, located on the heater coils in the bath, is used to monitor both conditions. A High Temperature/Low Liquid Level fault occurs when the temperature of the sensor exceeds the set temperature limit. In the event of a fault, the unit will shut down. The cause of the fault must be identified and corrected before the unit can be restarted.

The temperature range of the cutout is 0°C to 180°C.

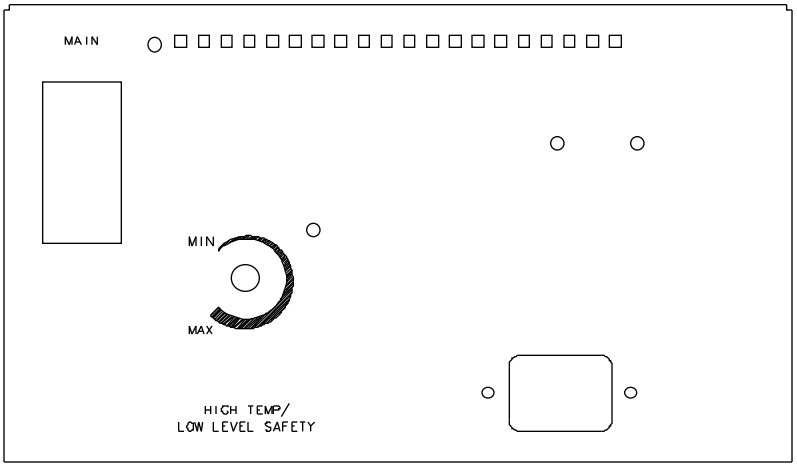
The cutout is not preset and must be adjusted during initial installation.

To set the cutout , locate the adjustment dial on the rear of the control box. It is labelled HIGH TEMP/LOW LEVEL SAFETY. Turn the dial fully clockwise.

Start the unit. Adjust the temperature setpoint for a few degrees higher than the highest desired operating temperature and allow the bath to stabilize at the setpoint. Turn the HIGH TEMP/LOW LEVEL SAFETY dial counter-clockwise until you hear a click and the unit shuts down. The red FAULT lamp on the front of the pump box will light to indicate a fault has occurred.

The cutout is now set. Allow the fluid to cool below the cutout temperature and then, without moving the adjustment dial, turn the MAIN circuit breaker off then back on to reset the cutout.

If a fault occurs, the MAIN circuit breaker must be turned off and then back on before the unit will start.



Temperature Controller (Rear View)

Tap Water Cooling Coil

The unit is equipped with a cooling coil located in the bath. The work area can be cooled and temperature stability improved by circulating cold fluid through the coil. For best results, the fluid should be 5°C or more below the temperature setpoint. The required flow rate of the fluid depends on the type of fluid and the setpoint.

The plumbing connections for the cooling coil are 3/8 inch OD stainless steel tubes located at the rear of the pump box. These connections will accept 3/8 or 5/16 inch ID flexible tubing. A 3/8 inch ID is the minimum recommended tubing diameter. Tubing is available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

Connect one COOLING COIL tube to the cold fluid source. Connect the other COOLING COIL tube to the cold fluid return (or drain, if tap water is being used).

Section V Maintenance

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal downtime for your unit. For more information, contact our Customer Service Department (see Preface, After-sale Support).

Cleaning

Periodically clean the case and stainless steel bath using a mild soapy solution. **Do not use steel wool; its abrasiveness will lead to rusting.** Dry the bath using a soft cloth.

Algae

To restrict the growth of algae in the bath, it is recommended that the bath cover be kept in place and that all circulation lines be opaque. This will minimize the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, one gram per gallon.

Section VI Troubleshooting

Checklist

Unit will not start

Ensure the voltage of the power source meets the specified voltage ±10%. Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Check the High Temperature/Low Liquid Level Safety. If the FAULT light is on, make sure the fluid level in the bath is between the marks in the baffle and the HIGH TEMP/LOW LEVEL SAFETY setting is greater than the bath temperature. Turn the MAIN circuit breaker off and the back on and attempt to restart.

No display on temperature controller

The controller's transformer is circuit protected by a 1/8 Amp, 250 Volt Time Delay 5 mm x 20 mm fuse. Check the fuse.

No external circulation

Make sure the stainless steel disks on the PUMP INLET and PUMP OUTLET have been removed.

Check for obstructions, kinks, or leaks in the circulation tubing.

Circulation will cease when the pump head pressure has been exceeded.

Check the High Temperature/Low Liquid Level Safety. If the FAULT light is on, make sure the fluid level in the bath is between the marks in the baffle and the HIGH TEMP/LOW LEVEL SAFETY setting is greater than the bath temperature. Turn the MAIN circuit breaker off and the back on and attempt to restart.

Service Assistance

If, after following these troubleshooting steps, your units fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

BOM number
Serial number
Voltage of unit
Voltage of power source

Technical Support

Our Customer Service Department can provide you with a wiring diagram and a complete list of spare parts for your unit. Before calling, please obtain the following information:

BOM number
Serial number

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit. With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

The unit has a warranty against defective parts and workmanship is for one full year from date of shipment. See back page for more details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Customer Service Department. Before calling, please obtain the following information from the unit's serial number label:

- *BOM number* _____

- *Serial number* _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department. Addresses and phone numbers for all our NESLAB Sales and Service Centers are printed on the back cover of this manual.

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never use flammable or corrosive fluids with this unit.

Never operate the unit without bath fluid in the bath.

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the bath before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified technician.

In addition to the warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury, or death.

Section II General Information

Description

The GP-Series Constant Temperature Baths are designed to provide temperature control for applications requiring a fluid work area or pumping to an external system.

The units consist of a heater, stirrer or optional circulation pump, stainless steel bath, and temperature controller.

Specifications

	GP Series
Temperature Range	
Analog Controller	ambient to +150°C
Digital Controller	ambient to +150°C
Temperature Stability[1]	±0.03°C
Pump Capacity[1,2]	
1. Specifications listed for units operating at +37°C bath temperature, +21°C (+70°F) ambient, with tap water as bath fluid.
2. The circulation pump is an optional feature. It is factory installed and must be specified at the time of order.

	GP-100	GP-200	GP-300
Heater			
Watts	1200		
Bath Work Area

Pounds	65	130
Kilograms	30	60

Section III Installation

Site

The unit should be located on a sturdy table or bench top. Ambient temperatures should be inside the range of +50°F to +90°F (+10°C to +32°C).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

A minimum clearance of 6 inches (15 centimeters) between the rear of the unit and the nearest wall is required for adequate ventilation through the pump box. This space will also accommodate the pump connections, the tap water cooling coil connections.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section VI, Cleaning).

Electrical Requirements

Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is your responsibility to assure that a proper ground connection is provided.

Plumbing Requirements

Hose Connections (if equipped with circulation pump)
The pump connections are located at the rear of the pump box and are labelled. These connections are stainless steel serrated hose connections that accept $^{3}/_{8}$ inch ID flexible tubing.

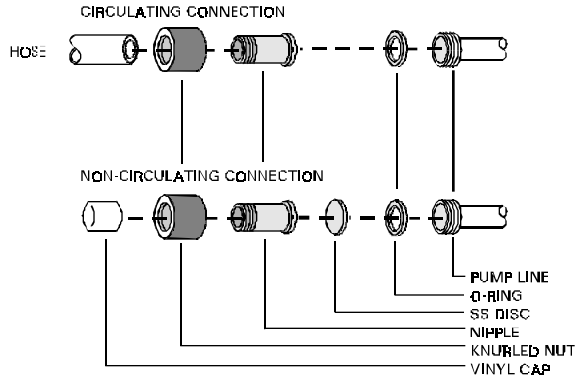
Flexible tubing, if used, should be of heavy wall or reinforced construction. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required for improved temperature control.

Please consider hard plumbing circulation lines when excessively high fluid temperatures are required.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

Pumping (if equipped)
The pump is designed to deliver a flow of 9 liters/minute (2.3 gallons/ minute) at 0 feet of head. To prevent unwanted flow, the bath is supplied with two stainless steel disks which block the PUMP INLET and PUMP OUTLET.

The disks must be removed when flow is required. To prevent leaking around the inlet and outlet connections, be sure the two Teflon® O-rings remain in place. To prevent distortion of the O-rings, only tighten the connections "hand tight." Once the hose connections are made, the pump must be properly plumbed to an external system. It is important the bath is not in operation when all plumbing work is done.



It is important to keep the distance between the unit and the external system as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, make them at the inlet and outlet of the external system, not at the unit.

If the bath is not used for external circulation, make sure the stainless steel disks are in place prior to operating the bath.

Fluids

Tap water is the recommended fluid for operation from ambient to +80°C.

Above +80°C, the user is responsible for fluids used.

Never use flammable or corrosive fluids with this unit.

Filling Requirements

The bath work area has a high and low level marker to guide filling. The markers are 1 inch horizontal slits located in the center of the stainless steel baffle that separates the work area and the pump assembly. The correct fluid level falls between these two markers. If the correct fluid level is not maintained, the heater will be exposed and may become damaged.

When pumping to an external system, keep extra fluid on hand to maintain the proper level as the circulating lines and external system are filled.

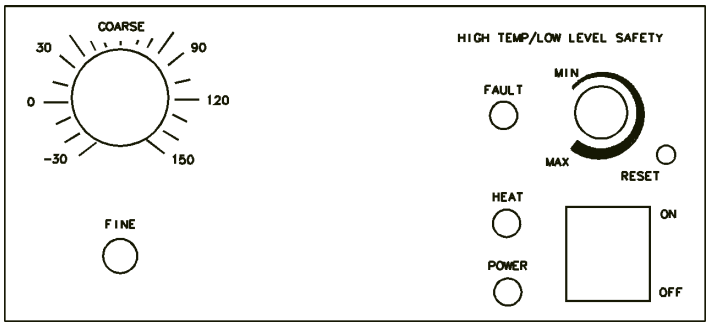
Never run the unit when the work area is empty.

Section IV Controllers

Controllers

Two temperature controllers are available with GP-Series baths: Analog and Digital. This section explain the installation and operation of the controllers.

Analog



Analog Temperature Controller (Front View)

Start Up

Before starting the unit, double check all electrical and plumbing connections and make sure the work area has been properly filled with bath fluid.

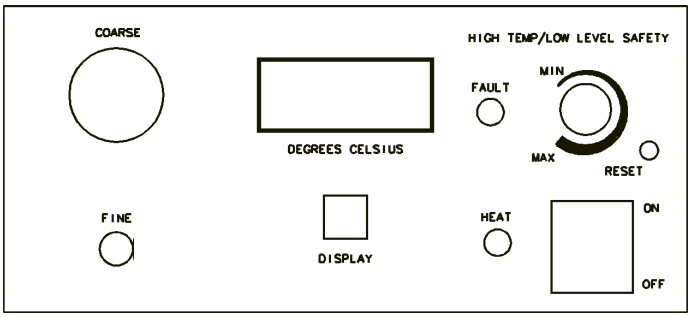
To start the unit, press the ON/OFF button. The pump will start and the ON lamp will light.

Temperature Adjustment

To adjust the bath temperature, turn the calibrated COARSE dial and position the reference line as close to the temperature setpoint as possible. Use the FINE dial and the bath thermometer to make fine adjustments to the bath temperature.

The HEAT lamp indicates the status of the heater. As the temperature of the fluid in the bath approaches the temperature setpoint, the lamp will cycle on and off to indicate the approximate duty cycle of the heater.

Digital



Start Up

Before starting the unit, double check all electrical and plumbing connections and make sure the work area has been properly filled with bath fluid.

To start the unit, press the ON/OFF switch. The pump will start and the display will indicate the temperature of the fluid in the bath.

Temperature Adjustment

To display the temperature setpoint, press the DISPLAY button. To adjust the setpoint, press the DISPLAY button and turn the COARSE and FINE dials until the temperature setpoint is indicated on the LED display.

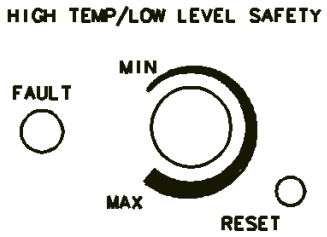
NOTE: Inadvertent movement of the COARSE and/or FINE dials, regardless of the position of the DISPLAY button, will result in a change in the setpoint. This change will not be immediately reflected on the LED display, unless the DISPLAY button is pressed. The display will eventually change as the unit responds to the new setpoint

The HEAT LAMP indicates the status of the heater. As the temperature of the fluid in the bath approaches the temperature setpoint, the LAMP will cycle on and off to indicate the approximate duty cycle of the heater.

High Temperature/ Low Liquid Level Safety

The unit is equipped with an adjustable High Temperature/Low Liquid Level Safety (HIGH TEMP/LOW LEVEL). The safety prevents the heater from reaching excessively high temperatures that can cause serious damage to the unit. A single temperature sensor, located on the heater coils in the bath, is used to monitor both conditions. A High Temperature/Low Liquid Level fault occurs when the temperature of the sensor exceeds the set temperature limit. In the event of a fault, the unit will shut down. The cause of the fault must be identified and corrected before the unit can be restarted.

The safety is not pre-set and must be adjusted during initial installation.



To set the safety, locate the adjustment dial on the front of the control box. It is labelled HIGH TEMP/LOW LEVEL SAFETY. Turn the dial fully clockwise and press the RESET button. **NOTE:** On units without a reset button turn the ON/OFF switch off and then back on.

Start the unit. Adjust the temperature setpoint for a few degrees higher than the highest desired operating temperature and allow the bath to stabilize at the setpoint. Turn the HIGH TEMP/LOW LEVEL SAFETY dial counter-clockwise until you hear a click and the unit shuts down. The red FAULT lamp on the front of the pump box will light to indicate a fault has occurred.

The safety is now set. Allow the fluid to cool below the cutout temperature and then, without moving the adjustment dial, press the RESET button or turn the ON/OFF switch off and then back on.

If a fault occurs, the RESET button must be pressed or the ON/OFF swiitch turned off and then back on before the unit will start.

NOTE: The minimum high temperature safety setting is 50°C.

Tap Water Cooling Coil

The unit is equipped with a cooling coil located in the bath. The work area can be cooled and temperature stability improved by circulating cold fluid through the coil. For best results, the fluid should be 5°C or more below the temperature setpoint. The required flow rate of the fluid depends on the type of fluid and the setpoint.

The plumbing connections for the cooling coil are 3/8 inch OD stainless steel tubes located at the rear of the pump box. These connections will accept 3/8 or 5/16 inch ID flexible tubing. A 3/8 inch ID is the minimum recommended tubing diameter. Tubing is available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

Connect one COOLING COIL tube to the cold fluid source. Connect the other COOLING COIL tube to the cold fluid return (or drain, if tap water is being used).

Thermometer

Units with an Analog temperature controller will accept a glass tube thermometer. Insert the thermometer in the grommet located on the left side of the work area.

Section V Maintenance

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Customer Service Department (see Preface, After-sale Support).

Cleaning

Periodically clean the case and stainless steel bath using a mild soapy solution. **Do not use steel wool; its abrasiveness will lead to rusting.** Dry the bath using a soft cloth.

Algae

To restrict the growth of algae in the bath, it is recommended that the bath cover be kept in place and that all circulation lines be opaque. This will minimize the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, one gram per gallon.

Section VI Troubleshooting

Checklist

Unit will not start

Ensure the voltage of the power source meets the specified voltage ±10%. Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Check the High Temperature/Low Liquid Level Safety. If the FAULT light is on, make sure the fluid level in the bath is between the marks in the baffle and the HIGH TEMP/LOW LEVEL SAFETY setting is greater than the bath temperature. Push the RESET button or, for units without a reset button, turn the ON/OFF switch off and then back on and attempt to restart.

No external circulation

Make sure the stainless steel disks on the PUMP INLET and PUMP OUTLET have been removed.

Check for obstructions, kinks, or leaks in the circulation tubing.

Circulation will cease when the pump head pressure has been exceeded.

Check the High Temperature/Low Liquid Level Safety. If the FAULT light is on, make sure the fluid level in the bath is between the marks in the baffle and the HIGH TEMP/LOW LEVEL SAFETY setting is greater than the bath temperature. Push the RESET button or, for units without a reset button, turn the ON/OFF switch off and then back on and attempt to restart.

Service Assistance

If, after following these troubleshooting steps, your units fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

BOM number
Serial number
Voltage of unit
Voltage of power source

Technical Support

Our Customer Service Department can provide you with a wiring diagram and a complete list of spare parts for your unit. Before calling, please obtain the following information:

BOM number
Serial number

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a one year warranty against defective parts and workmanship starting from the date of shipment. See back page for more details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Service Department. Before calling, please copy the following information off the serial tag on the rear of the unit.

Unit Serial Number _____

Unit BOM Number _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department (see After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in hazardous situations and may void the manufacturer's warranty

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without fluid in the reservoir.

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the reservoir before moving the unit.

Always turn off the unit and disconnect the line cord from the power source before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. The warnings are designated by an exclamation point inside an equilateral triangle with text highlighted in bold print. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

The HTC-1200 Recirculating Heater is designed to provide a continuous flow of heated fluid at a constant flow rate and temperature.

The unit consists of a stainless steel reservoir, a pump, a heater with a high temperature limit device, and a digital temperature controller.

Specifications

Temperature Range[1,2]	Ambient to +90°C
Pumping Capacity[3]	3 gpm, 60 psi
Unit Dimensions[4] (H x W x D) *Inches* *Centimeters*	 19 x 23 1/8 x 18 5/8 48.3 x 58.7 x 47.3
Reservoir Volume *Gallons* *Liters*	 5.5 20.8
Weight *Pounds* *Kilograms*	 85 38.5

1. High temperature ranges are available up to +130°C. Contact us for details.
2. Using water as recirculating fluid, 60°C setpoint, 21°C ambient. Specification will be affected by temperature, ambient or fluid.
3. PD-2 pump, 60Hz unit. 2.5 gpm, 60 psi for 50Hz units. Optional pumps are available.
4. For units with other than PD-2 pumps, dimensions are 35¾" x 23¼" x 18¾" (H x W xD).

Section III Installation

Site

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +55°F to +95°F (+13°C to +35°C).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

Electrical Requirements

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is your responsibility to assure a proper ground protection is provided.

Refer to the serial number on the rear of the unit for the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

Plumbing Requirements

Before installing the unit to an instrument that previously used tap water as a circulating fluid, flush the instrument several times to remove any rust or scale that has built up. The manufacturer of the instrument should be able to recommend a cleaning fluid for their equipment.

The plumbing connections are located on the right side of the unit and are labelled SUPPLY and RETURN. These connections are ½ inch MPT.

Connect the SUPPLY fitting to the inlet of the instrument being heated. Connect the RETURN fitting to the outlet of the instrument being heated.

Flexible tubing, if used, should be of heavy wall or reinforced construction. All tubing should be rate to withstand 80 psi at at the highest operating temperature. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent heat loss.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the instrument being heated as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions

must be made, they should be made at the inlet and outlet of the instrument being heated, not at the unit.

If substantial lengths of lines are required, they should be pre-filled with circulating fluid before connecting them to the unit.

Fluids

The selected circulating fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Never use flammable or corrosive fluids with this unit.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer's warranty.

Filtered tap water is the recommended fluid for operation from +8°C to +80°C. See Water Quality Recommendations on the next page.

Above +80°C, you are responsible for fluids used.

Filling Requirements

The reservoir access panel is located at the left rear of the top cover. To remove the access panel, slide the latch back (towards the rear of the unit) and lift.

The reservoir cover is located below the access panel. Loosen the thumb screws and remove the reservoir cover.

Fill the reservoir with cooling fluid to within 1 inch of the top.

Keep extra fluid on hand until the entire system (HTC-1200, the instrument being heated and the tubing that connects them) is filled.

Replace the reservoir cover and the access panel.

Auto Refill (Optional)

Auto refill maintains the correct fluid level in the reservoir. The device consists of a reservoir float switch, a solenoid valve and a plumbing connection.

The plumbing connection is labelled AUTO REFILL. The connection is a $^{3}/_{8}$ inch OD barbed fitting. Connect this fitting to a make-up fluid source.

Make sure all connections are securely clamped.

Water Quality Recommendations

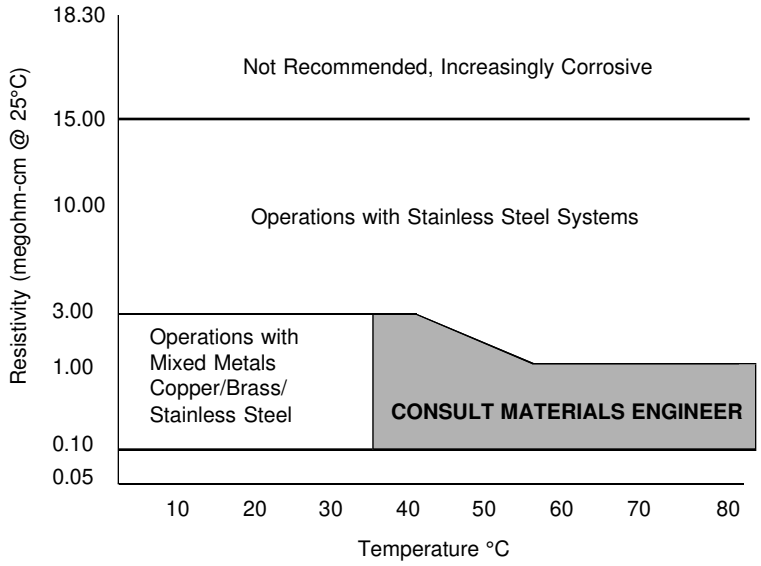
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (as NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (as NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated at 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated at 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated at 25°C).

The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



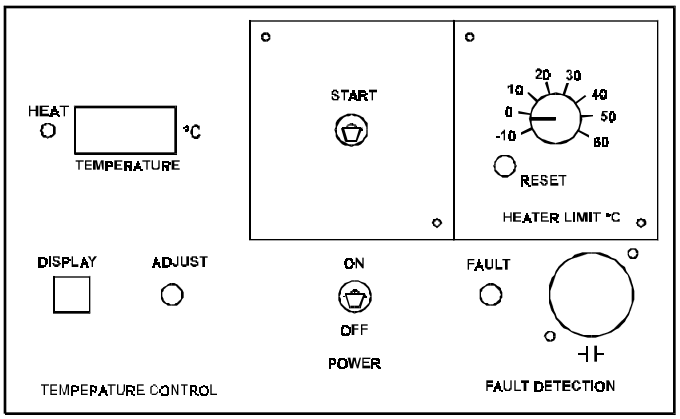
Water Quality Considerations

Section IV Operation

Start Up

Before starting the unit, double check all electrical and plumbing connections and make sure the circulating system (the HTC-1200, the instrument being heated, and the tubing that connects them) has been properly filled with circulating fluid.

To start the unit, place the POWER ON/OFF switch in the ON position and momentarily press the START switch upward. The circulation pump will start and the TEMPERATURE LED will indicate the fluid temperature.



Digital Temperature Controller

Temperature Adjustment

To display the temperature setpoint, press and hold the DISPLAY button. To adjust the temperature setpoint, press and hold the DISPLAY button and turn the ADJUST dial until the desired temperature setpoint is indicated on the TEMPERATURE LED display.

NOTE: Inadvertent movement of the ADJUST dial, regardless of the position of the DISPLAY button, will result in a change in the setpoint. This change will not be immediately reflected on the digital display, unless the DISPLAY button is pressed. The display will eventually change as the unit responds to the new setpoint.

The HEAT LED on the front of the control box indicate the status of the heater. The LED indicates power is supplied to the heater.

Fault Interlock Contact

A set of contacts are connected to a receptacle on the front of the control box. The contacts are rated 15A, 125V. This is not a power inlet or outlet. The receptacle is isolated from the circuitry. Its ground pin is connected to the chassis. The contacts are closed during normal operation and open when the unit is turned off or when a fault occurs.

Low Fluid Level Monitor

The low fluid level monitor is connected to a float switch in the reservoir. A low liquid level fault occurs when the fluid in the reservoir drops below the operating level.

In the event of a low fluid fault, the unit will shut down immediately and the FAULT LED will light. The fault must be identified and corrected before the unit can be restarted.

High Temperature Monitor

The high temperature monitor is connected to a sensor that monitors the fluid temperature as it exits the heat exchanger. The monitor protects the system from exposure to excessively hot fluid. A temperature fault occurs when the circulating fluid temperature exceeds the set temperature limit.

In the event of a high temperature fault, the unit will shut down immediately and the FAULT LED will light. The fault must be identified and corrected before the unit can be restarted.

NOTE: Another adjustable heater limit is located under the bonnet. To set the limit, first turn the dial fully clockwise and press the red RESET button. On units without a reset button recycle the POWER switch OFF then back ON. Next, turn the dial on the front of the control box until the reference line points to the desired temperature. The temperatures surrounding the adjustment dial are in degrees Celsius

Flow Control

The flow control handle is connected to a valve that controls the flow of fluid to the instrument being heated. The handle is located on the right side of the unit, next to the plumbing connections.

When the handle is turned fully counterclockwise, the valve is open and all fluid is supplied to the instrument being heated. When the handle is turned fully clockwise, the valve is closed and no fluid is supplied to the instrument being heated. When the handle is between these two positions, the flow rate of the fluid is between full flow and no flow. Use a flow meter on the SUPPLY line to adjust the desired flow rate.

Make sure the flow control valve is closed position before starting the unit. Once the unit is running, use the handle to slowly open the valve until the desired flow rate is adjusted. Never start the unit with the valve in the open position and never “crank” the valve wide open from the closed position.

Section V Maintenance

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Customer Service Department (see Preface, After-sale Support).

Pressure Relief Valve

On units with PD-2 pumps an adjustable pressure relief valve establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The relief valve does not determine the actual operating pressure; the operating pressure of the system is determined by the back pressure of the connected equipment and the setting of the flow control.

If adjustment is necessary, consult our Service Department for assistance.

For applications requiring a maximum pressure less than 55 psi, an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 psi. Contact our Sales Department for more information (see Preface, After-sale Support). Before calling, please obtain the following information:

BOM number
Serial number

Cleaning

Periodically inspect the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the fluid.

Algae

To restrict the growth of algae in the reservoir, we recommend the reservoir cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, 1 gram per 3.5 liters.

Section VI Service

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Configuration

The unit has a hinged top cover to allow service access. The top cover is secured to the unit base by a hinge between the top cover and base (along the rear of the unit), and by two spring clips located at the front corners. To gain access to the pump or the reservoir area, lift the top cover and tilt it back. A support brace, located on the right side of the inner base, will stop and support the top cover.

Pump Strainer

If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer will most probably become clogged with debris and scale within the first week. Therefore, the strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

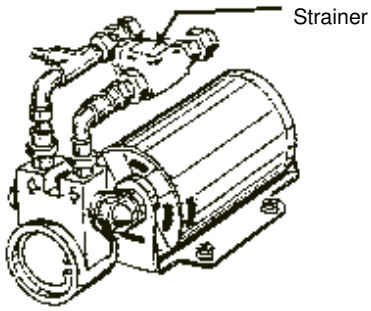
Before cleaning the strainer, disconnect the line cord from the power source and drain the reservoir.

PD-2 Pumps

PD-2 pumps have a wire mesh screen (under hex nut) located in the pump suction line.

Remove the right side access panel. Unscrew the hex nut on the strainer and remove the screen. Clean the screen by rinsing it with water.

When the screen is clean, replace it in the strainer, tighten the hex nut and replace the panel. Refer to Section III, Filling Requirements for instructions on replacing the circulating fluid.



TU Pumps

TU pumps have a wire mesh screen located in the reservoir.

Open the bonnet and remove the access panel located on top of the reservoir cover.

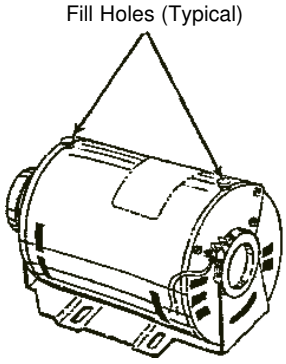
Cover the strainer with a plastic bag to help catch any debris which may become free.

Unscrew the strainer, rinse it with water. Replace the strainer. Refer to Section III, Filling Requirements for instructions on replacing the fluid.

Pump Motor Lubrication

PD recirculating pumps require motor lubrication. Motors used to drive the pump are manufactured by several companies. These motors use sleeve type bearings with large oil reservoirs. Oiling instructions are generally posted on each motor. In the absence of legible lubrication instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil to each bearing on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Each year
Intermittent	Each 2 years
Occasional	Each 5 years



WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

HDT-I Quick Reference Guide

Description
The HTD-I Water-Cooled Chiller is designed to provide a continuous flow of Galden® heat transfer fluid at a constant temperature and flow rate. The unit consists of 2 water-cooled refrigeration systems each with a fluid reservoir, fluid recirculation pump and a microprocessor temperature controller. A 5 kilowatt heater is located in each fluid reservoir.

Specifications

Refer to page 6 for each channel's specifications.

Site
Locate the unit in a laboratory or clean industrial environment where ambient temperatures are inside the range of +68°F to +86°F (+20°C to +30°C). The unit will retain its full rated capacity with cooling water temperatures to approximately 86°F (30°C). Above 86°F, derate the cooling capacity 1% for every 1°F above 86°F.

Never place the unit in a location where excessive heat, moisture, orcorrosive materials are present

Electrical Requirements
Control
Rated Voltage: 208VAC ±10%, 50/60Hz, 1Ø
Rated Current: 5Amps

Electrical Requirements
Power
Rated Voltage: 208VAC ±10%, 50/60Hz, 3Ø
Rated Current: 63Amps

Make sure the voltage of the power source meets the specified voltage, ±10%.

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. It is the user's responsibility to assure that a proper ground connection is provided to the unit.

Each channel is provided with a 4-conductor line cord for power and a 3-conductor line cord for control.

The wiring code is:

Phase 1 A	U BLK
Phase 2 B	V WHT
Phase 3 C	W RED

The green wire is safety ground and must be attached to the ground bar.

NFPA-79, Section 7.8.1, Exception No2, allows this machine to have the main disconnect remotely mounted "through a flexible cord, cable or conduit providing the disconnect means is in sight from, readily accessible to, and no more than 20 feet (6m) from the machine operator."

Plumbing Requirements
The coolant plumbing connections are located on the rear of the unit. The connections are½" Swagelock fittings. Connect the SUPPLY fittings to the application's inlet. Connect the RETURN fittings to your application's outlet.

Keep the distance between the chiller and your application as short as possible, and use the largest diameter tubing practical. The tubing should be straight and without bends. If diameter reductions are needed make them at the inlet and outlet of your application, not at the chiller.

The reservoir DRAIN connections are on the back of the unit. They are Nupro brass plug valves with a $^{3}/_{8}$" O.D. Swagelock connection.

Start Up
Before starting check all electrical connections and ensure the plumbing connections are correctly made to the fittings on the rear of the unit.

To place the chiller in "off" mode (power available but each channel is off)

-connect power cord to 208V 3Ø supply

-connect control cord to 208V 1Ø supply

-place main and control power breakers in closed position

-unit is now in "off" mode (white POWER lamp will illuminate)

-ensure the EMO (Red Emergency Stop Button) is out

-the cover must be on the power box or the power box interlock placed in the maintenance position

-the cover must be on the heater box or the heater box interlock placed in the maintenance position

To start the channel

-depress the ON/OFF or, if channel is in remote, the remote START button

-the chiller will start as long as no failure conditions are present (channel UNIT OK and RUNNING LEDs illuminated)

To stop the channel

-depress the ON/OFF or, if channel is in remote, the remote STOP button

NOTE: Any failure will place the chiller into the "off" mode.

NOTE: Opening the power, depressing the chiller STOP switch or activating the Emergency Stop Button (EMO) switch places the chiller in "off" mode.

Changing a Value
The **YES** key increments the value. The **NO** key decrements the value. The display will flash as soon as either key is depressed, and will continue to flash until the **ENTER** key is pressed to accept the new value.

The new value will not be used by the controller until the **ENTER** key is depressed and the display stops flashing. If the **NEXT** or **LAST** key is pressed while the value is flashing, the new value will not be accepted. The display will stop flashing and the original value will be displayed. In this case the **NEXT** or **LAST** key can be used to abort data entry. The display will not sequence unless the **NEXT** or **LAST** key is depress again.

The controller will not allow you to enter a value above the maximum or below the minimum value, or any illegal value. If you try to enter an illegal value the display will revert to its original value when the last digit is entered.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. This label indicates testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

NOTE: A copy of these instructions is attached to the crate's exterior surface.

Remove the front panel. The panel will serve as a ramp.

Remove the remaining side panels as one piece by unscrewing the lag bolts which hold the sides to the base.

Mount the ramp to the base and install lag bolts to secure the ramp to the base.

Remove the support and strapping.

Extend the four leveling feet on the chiller and then slowly raise the chiller evenly off the support rails.

Remove the support rails by loosening the lag screws.

Lower the chiller onto the castors and then slowly push the chiller towards the ramp.

Reverse these directions to repackage the chiller.

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. Before calling, please refer to the serial number label on the rear of the unit to obtain the following information (see Section II, Description for

serial number label location).

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, please contact our Sales Department (see After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can cause damage.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without fluid in the reservoir.

Always turn off the unit and disconnect the power supply from the power source before performing any service or maintenance, or before moving the unit.

Always empty the reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

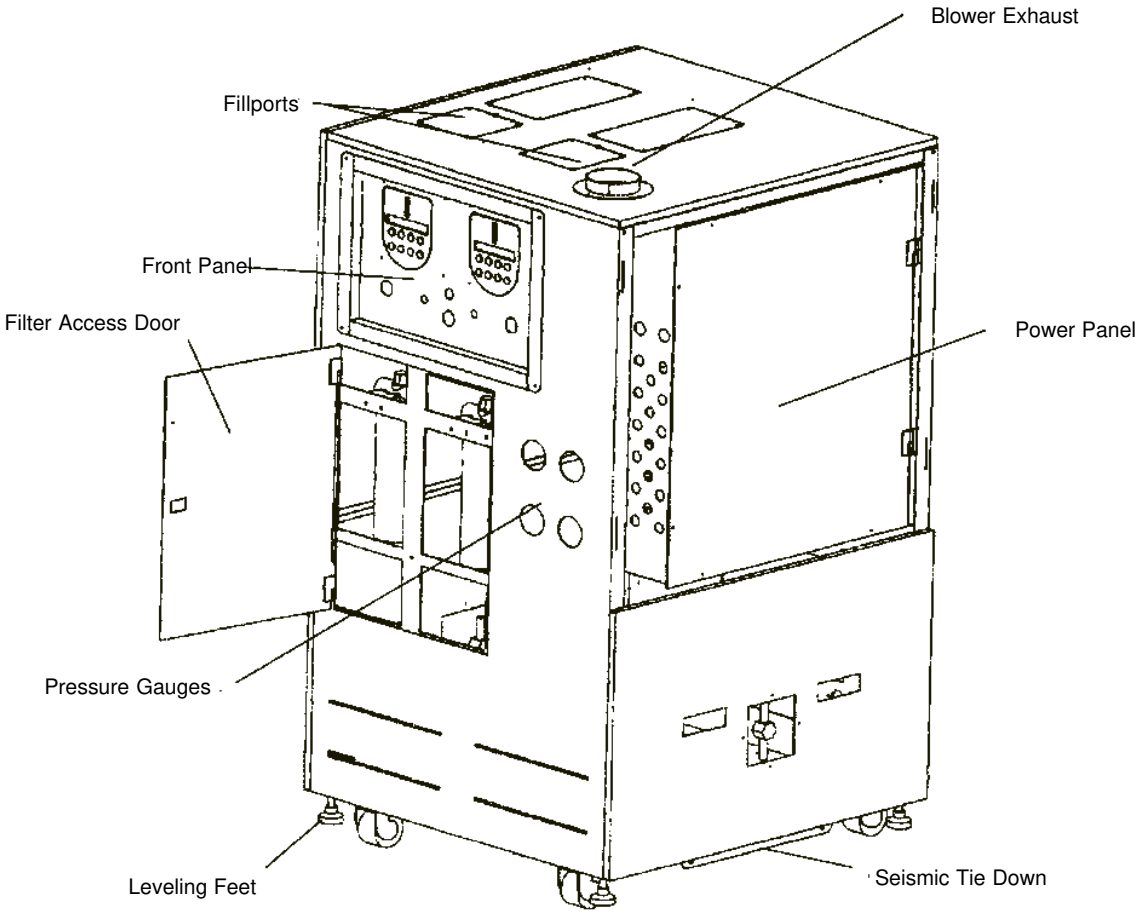
The HTD-I Water-Cooled Chiller is designed to provide a continuous flow of Galden® heat transfer fluid at a constant temperature and flow rate.

The unit consists of 2 water-cooled refrigeration systems, 2 fluid reservoirs, 2 fluid recirculation pumps and 2 microprocessor temperature controllers. A 5 kilowatt heater is located in each fluid reservoir.

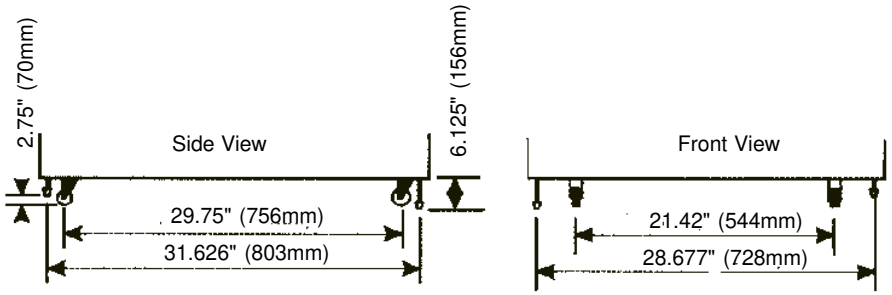
Specifications

Temperature Range	-20°C to 150°C
Reservoir Volume	5 Gallons 19 Liters
Unit Dimensions[1] (Outer Envelope) (H x W x D)	59 x 31 x 34 Inches 149.9 x 81.3 x 86.4 Centimeters
Frame Dimensions (H x W x D)	55 x 31 x 34 Inches 139.7 x 78.7 x 86.4 Centimeters
Cooling Capacity[2]	1050 watts @ -10°C 962 Kcal @ -10°C 3580 BTU/Hr @ -10°C
Heating Capacity	5000 watts @ 208V 4300 Kcal @ 208V 17050 BTU/Hr @ 208V
	15 LPM @ 5 Kg/Cm^2 4 GPM @ 71PSIG

1. Includes casters.
2. Cooling capacities were obtained at 30°C ambient using HT-200 Galden® heat transfer fluid with 208VAC, 50Hz power. Cooling capacities vary depending on the fluid temperature, ambient temperature and cooling fluid .
2. 208VAC, 50 Hz power.



The unit is equipped with four lockable casters and leveling feet. The leveling feet can be retracted 2¾" (70mm) from the floor and extended 6⅛" (156mm) from the unit's case bottom.



Section III Installation

Pumping Capacity[3]

Site

Locate the unit in a laboratory or clean industrial environment where ambient temperatures are inside the range of +20°C to +30°C (+68°F to +86°F).

The unit will retain its full rated capacity with cooling water temperatures to approximately 30°C (86°F). Above 30°C, derate the cooling capacity 1% for every 0.5°C above 30°C.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

Electrical Requirements

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. It is the user's responsibility to assure that a proper ground connection is provided to the unit.

Control
Rated Voltage: 208VAC ±10%, 50/60Hz, 1Ø
Rated Current: 5Amps

Power
Rated Voltage: 208VAC ±10%, 50/60Hz, 3Ø
Rated Current: 63Amps

Make sure the voltage of the power source meets the specified voltage ±10%.

The prototype is provided with a 4-conductor line cord for power and a 3-conductor line cord for control.

The wiring code is:

Phase A	208VAC
Phase B	208VAC
Phase C	208VAC

The green wire is safety ground and must be attached to the ground bar.

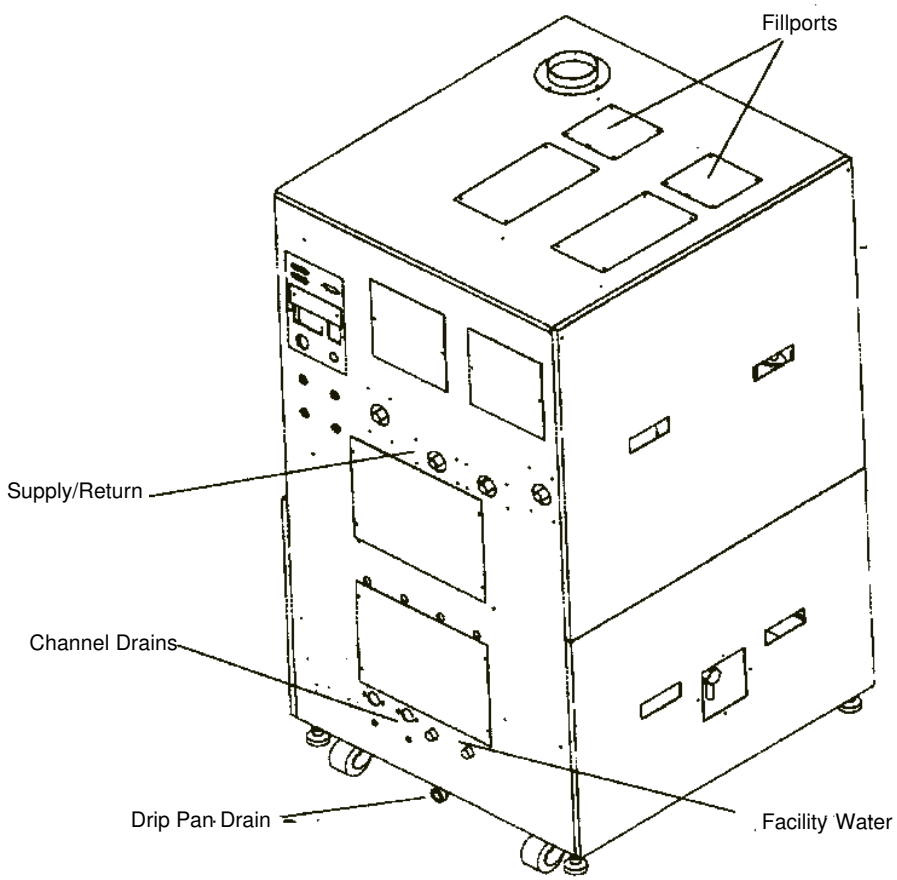
NFPA-79, Section 7.8.1, Exception No 2, allows this machine to have the main disconnect remotely mounted "through a flexible cord, cable or conduit providing the disconnect means is in sight from, readily accessible to, and no more than 20 feet (6m) from the machine operator."

Plumbing Requirements

The plumbing connections are located on the bottom rear of the unit. The connections are ½" Swagelock fittings. Connect the SUPPLY fitting to the inlet of the application. Connect the RETURN fittings to the application outlet.

Keep the distance between the chiller and your application as short as possible, and use the largest diameter tubing practical. The tubing should be straight and without bends. If diameter reductions are needed make them at the inlet and outlet of your application, not at the chiller.

The reservoir DRAIN connections are also on the rear of the unit. They are Nupro brass plug valves with a ⅜" O.D. Swagelock connection. The drain outlet is located directly below the drain valve handle.



Fluids

The unit is designed to use Galden® HT200 or Flourinert 4236 as a heat transfer fluid..

Do not use water as a substitute fluid.

Never use flammable or corrosive fluids with the unit. Do not use automobile antifreeze. Commercial antifreeze contains silicants that can damage the pump seals and cause leaks. Use of automobile antifreeze will void the manufacturer's warranty.

Filling Requirements

Remove the reservoir access cover and then the filler cap from the top of the reservoir. Using a funnel, carefully fill the reservoir with fluid.

Fill the reservoir until the ADD FLUID LED on the microprocessor extinguishes.

The amount of recirculating fluid required depends on the total requirements of the application system. If substantial lengths of recirculating lines are used, add enough fluid to compensate for their volume. The maximum reservoir volume is 5 gallons (19 liters).

Replace the filler cap and access panel.

Section IV Operation

Start Up

Before starting the unit check all electrical connections and ensure the plumbing connections are correctly made to the fittings on the rear of the unit.

To place the chiller in "off" mode (power available but each channel is off)

-connect power cord to 208V 3Ø supply

-connect control cord to 208V 1Ø supply

-place main and control power breakers in closed position

-unit is now in "off" mode (white POWER lamp will illuminate)

-pull out the EMO (Red Emergency Stop Button)

-the cover must be on the power box or the power box interlock placed in the maintenance position

-the cover must be on the heater box or the heater box interlock placed in the maintenance position

To start either channel

-depress the ON/OFF or, if channel is in remote, the remote START button

-the chiller will start as long as no failure conditions are present (channel UNIT OK and RUNNING LEDs illuminated)

To stop either channel

-depress the ON/OFF or, if channel is in remote, the remote STOP button

NOTE: Any failure will place the chiller in the "off" mode.

NOTE: Removing the power or heater box cover, depressing the chiller STOP switch or activating the Emergency Stop Button (EMO) switch places the chiller in "off" mode.

Front Panel Controls

1 POWER light (white)
The POWER light indicated that the main disconnect circuit breaker is on, the phase voltage monitor is operational, and all electrical enclosure doors and interlocks are set.

28 status indicators LEDs (14/channel)

2 vacuum florescent displays, alphanumeric, 10 character (1/channel)

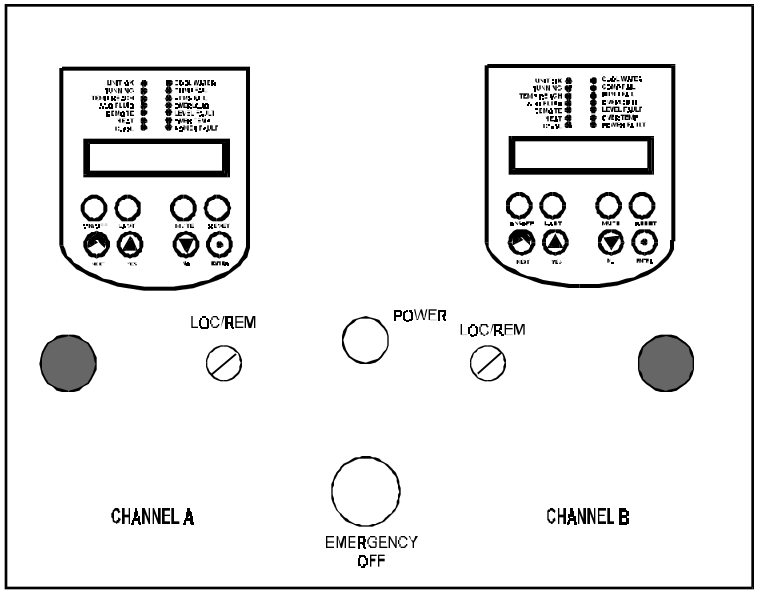
16 control switches, low profile pressure sensitive (8/channel)

1 EMO emergency stop button, push-pull

2 warning/failure buzzers (1/channel)

2 LOCAL/REMOTE selector switches (1/channel)

Temperature control is done through PID algorithms. Heat and cool have separate PID parameters. PID values can be changed, see Display section.



Front Panel Gauges

2 fluid supply pressure gauges. Reads the fluid pressure at each channel outlet.

2 fluid filter inlet pressure gauges. Reads the fluid pressure at each channel filter inlet.

Rear Panel Controls

Main Disconnect Circuit Breakers
The unit is provided with:

1 63 AMP GFI circuit breaker for the power system

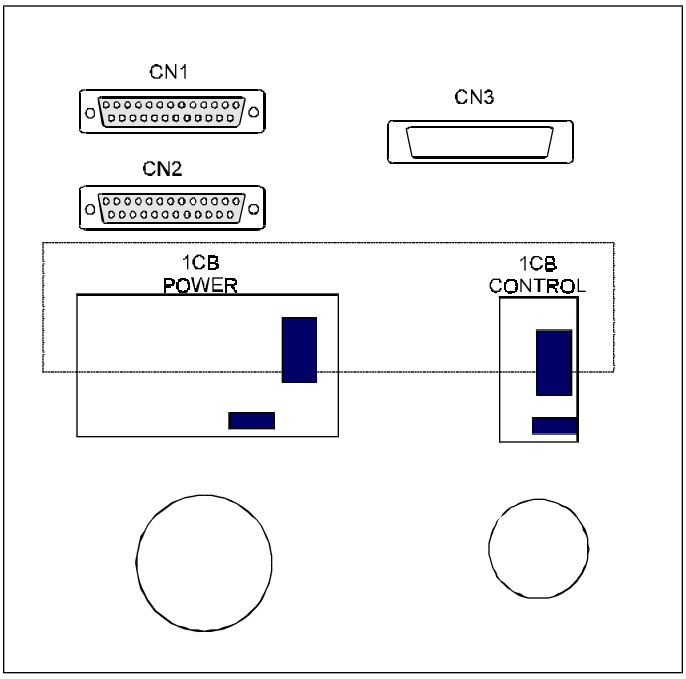
1 16 AMP GFI circuit breaker for the control system

2 25-pin D-subminiature connectors (CN1, CN2) for RS-232 communications (1/channel)

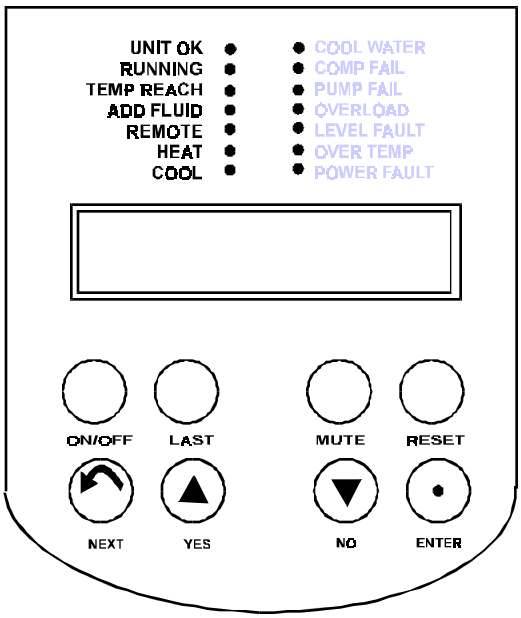
1 24-pin Type 57F connector (CN3) for control signal I/O

1 power cable, #4 AWG with 4 conductors. "SO" line cord, 10 meters in length

1 control cable, #12 AWG with 3 conductors. "SO" line cord, 10 meters in length.



Controller Keypad



ON/OFF Toggles the controller between on and off. The controller will not switch to the on mode unless proper condition exist inside the unit. See Error Messages in this section.

LAST Scrolls backward through the displays.

MUTE Toggles audible alarm silence function for the current alarm. The MUTE key will not prevent a new warning or failure condition.

RESET Clears the warning or failure condition status.

NEXT Scrolls forward through the menus.

YES Answers Yes to Y/N questions, increments numerical values upward for setting numeric values.

NO Answers NO to Y/N questions, increments numerical values downward for setting numeric values.

ENTER Used to accept new values.

Indicator Lamps

UNIT OK (Yellow Light)
When lit, the unit is in either stand by or running. No chiller failures or warnings are present.

RUNNING (Yellow Light)
When lit, the unit is running and cooling/heating is taking place. No chiller failures or warnings present.

TEMP REACH (Yellow Light)
When lit, the unit is running and cooling/heating is taking place. The fluid temperature matches the setpoint (± the ready width).

ADD FLUID (Yellow Light)
When lit, the unit is in run or off and the coolant level is below the low level value set on the controller. The unit continues to operate and the audible alarm will sound. The LEVEL OK lamp is extinguished and the WARNING SIGNAL is given.

REMOTE (Yellow Light)
When lit, the unit will respond to the remote setpoint, ready width and remote start/stop.

HEAT (Yellow Light)
When lit, the unit is in run. The lamp is on steady when the controller is supplying 100% heat. The lamp is off when the controller is not supplying any heat. The lamp is flashing when the controller is controlling the temperature inside the heat PID proportional band.

COOL (Yellow Light)
When lit, the unit is in run. The lamp is on steady when the controller is in full cool mode. The lamp is off when the controller is not supplying any cooling. The lamp is flashing when the controller is controlling the temperature inside the cool PID proportional band.

COOL WATER (Red Light)

When lit, a cooling water failure exists. The lamp is on when no cooling water is available to the chiller channel. There will be no flow indication on the flow meter, the high pressure cutout will activate and the UNIT OK lamp will extinguish.

NOTE: To restart the channel, the limit switch or failure must be cleared or repaired the alarm reset button must be pressed.

COMP FAIL (Red Light)
When lit, the unit was running and cooling/heating was taking place. This condition is reached by the following:

1) high pressure limit switch opening,

2) low pressure switch opening,

3) high injector temperature exceeded.

The channel stops and the audible alarm sounds. A FAIL SIGNAL is given, and the COMP FAIL lamp illuminates.

NOTE: To restart the unit, the limit switch or failure must be cleared or repaired, the alarm reset button is pressed and the unit placed in run.

PUMP FAIL (Red Light)
When lit, the unit was running and cooling/heating was taking place. This condition is reached by the following:

1) low or no Galden® fluid flow,

2) pump overload relay shorted,

3) pump breaker tripped.

A FAIL SIGNAL is given, the PUMP FAIL lamp illuminates, and the UNIT OK lamp extinguishes.

NOTE: To restart the channel, the limit switch or failure must be cleared or repaired and the alarm reset button is pressed.

OVERLOAD (Red Light)
When lit, the unit was running and cooling/heating was taking place. This condition is reached by the following:

1) main GFI breaker tripped,

2) compressor breaker tripped,

3) pump breaker tripped,

4) heater breaker tripped

5) pump overload relay tripped,

6) compressor overload tripped.

A FAIL SIGNAL is given, the OVERLOAD lamp illuminates and the UNIT OK lamp extinguishes.

NOTE: To restart the channel, the limit switch or failure must be cleared or repaired and the alarm reset button is pressed.

LEVEL FAULT (Red Light)
When lit, the unit was running or in the off mode and the coolant level was below the low level value or above the high level value set on the controller. The channel turns off and the audible alarm sounds. A FAIL SIGNAL is given, the LEVEL FAULT lamp illuminates, and the UNIT OK lamp extinguishes.

NOTE: To restart the unit, the limit switch must be cleared and the unit placed in run.

OVERTEMP (Red Light)
When lit, the unit was running and cooling/heating was taking place. This condition is reached by the following:

1) high Galden® fluid temperature in the tank,

2) high cabinet temperature,

3) high fluid outlet temperature.

A FAIL SIGNAL is given, the OVERTEMP lamp illuminates, and the UNIT OK lamp extinguishes

NOTE: To restart the channel, the limit switch or failure must be cleared or repaired and the alarm reset button pressed.

POWER FAULT (Red Light)
When lit, the unit was running or in the off mode and:

1) the phase and voltage monitor relay detected a problem,

2) the door interlock is tripped,

3) loss of 12VDC.

NOTE: To restart the unit, the limit switch must be cleared, the alarm reset button pressed and the unit placed in run.

Failure and warning Condition Table

Error Message	Indications	Type	Corrective action
FLUID RTD	UNIT OK off, RUNNING off	Failure	Check connection, replace RTD.
INJ RTD	UNIT OK off, RUNNING off	Failure	Check connection, replace RTD.
PHASE VOLT	UNIT OK off, RUNNING off, POWER FAULT on	Failure	Check input voltage for 208±10%, check for three phase power, and check for phase voltage imbalance.
EMG STOP	UNIT OK off, RUNNING off	Failure	Reset emergency stop button by pulling out.
DOOR INTLK	UNIT OK off, RUNNING off, POWER FAULT on	Failure	Check that power box and heater door are in place. Check that door interlocks are working properly.
PUMP OVLD	UNIT OK off, RUNNING off, PUMP FAIL on, OVERLOAD on	Failure	Overload must be reset before unit will run. If overload has tripped more than twice investigation of pump is required.
COMP OVLD	UNIT OK off, RUNNING off, COMP FAIL on, OVERLOAD on,	Failure	Overload must be reset before unit will run. If overload has tripped more than twice investigation of compressor is required.
LOW PRESS	UNIT OK off, RUNNING off, COMP FAIL on	Failure	Reset low pressure cutout and if LPC trips again check charge in compressor.
HIGH PTESS	UNIT OK off, RUNNING off, COMP FAIL on	Failure	Reset high pressure cutout and if HPC trips again check charge in compressor.
COOL WATER	UNIT OK off, RUNNING off, COOL WATER on	Failure	Reset high pressure cutout and research loss of facility cooling water.
TEMP FAIL	UNIT OK off, RUNNING off, OVERTEMP on	Failure	Check cooling fan for proper airflow.
HI INJ TEMP	UNIT OK off, RUNNING off, COMP FAIL on	Failure	Check for proper injector solenoid operation.
HI HTR TEMP	UNIT OK off, RUNNING off, OVERTEMP on	Failure	Check for proper heater operation.
HI LIQ TEMP	UNIT OK off, RUNNING off, OVERTEMP on	Failure	Check for proper heater operation.
HI TNK TEMP	UNIT OK off, RUNNING off, OVERTEMP on	Failure	Check for proper heater operation.

Error Message	Indications	Type	Corrective action
NO FLOW	UNIT OK off, RUNNING off, PUMP FAIL on	Failure	Check blockage in supply line, check flow out of pump.
LOW FLOW	UNIT OK off, RUNNING on, PUMP FAIL on	Warning	Check blockage in supply line, check flow out of pump.
LOW LEVEL	UNIT OK off, RUNNING off, LEVEL FAULT on	Failure	Add fluid until level resets, check for leaks.
HIGH LEVEL	UNIT OK off, RUNNING off, LEVEL FAULT on	Failure	Drain fluid until level resets.
ADD FLUID	UNIT OK off, RUNNING on, ADD FLUID on	Warning	Add fluid until level resets, check for leaks.
CHAN BKR	UNIT OK off, RUNNING off, OVERLOAD on	Failure	Breaker must be reset before unit will run. If breaker has tripped more than twice investigation of channel is required.
PUMP BKR	UNIT OK off, RUNNING off, OVER LOAD on	Failure	Breaker must be reset before unit will run. If breaker has tripped more than twice investigation of pump is required.
HEATER BKR	UNIT OK off, RUNNING off, OVER LOAD on	Failure	Breaker must be reset before unit will run. If breaker has tripped more than twice investigation of heater is required.
COMP BKR	UNIT OK off, RUNNING off, COMP FAIL on, OVERLOAD on	Failure	Breaker must be reset before unit will run. If breaker has tripped more than twice investigation of compressor is required.
LOSS 12VDC	UNIT OK off, RUNNING off	Failure	Check FU12 and FU13, replace if blown. Also check 1PWS and replace if necessary.
REM STOP	UNIT OK off, RUNNING off		This is not a fault condition. To restart the unit locally place the LOCAL/REMOTE selector switch to the LOCAL position.
TEMP WARN	UNIT OK off, RUNNING on, OVERTEMP on	Warning	Check cooling fan for proper airflow.

Changing a Value

The **YES** key increments the value. The **NO** key decrements the value.

The display will flash as soon as either key is depressed, and will continue to flash until the **ENTER** key is pressed to accept the new value.

The new value will not be used by the controller until the **ENTER** key is depressed and the display stops flashing.

If the **NEXT** key is pressed while the value is flashing, the new value will not be accepted. The display will stop flashing and the original value will be displayed. In this case the **NEXT** key can be used to abort data entry. The display will not sequence unless the **NEXT** key is depress again.

For large values the display can be changed by manipulating the individual digits. Press the **YES** key and the **NO** key at the same time. The most significant digit will start to flash. The **YES** key increments or the **NO** key decrements the digit. Press the **ENTER** key to accept the digit and to move to the next most significant digit. Repeat until all digits are entered. Pressing the **NEXT** key before all digit are entered will abort the procedure and return the display to the original value.

The controller will not allow you to enter a value above the maximum (+150°C) or below the minimum (-20°C). If you try to enter an value outside the range, the display will revert to its original value.

Controller Displays

An alphanumeric display presents numeric readings of various operating conditions within the chiller. Display function is selected by pressing the appropriate keys to move through a menu of available information.

Various controller loops allow you to display and/or alter different parameters of the controller. They can be accessed from the temperature display by pressing and holding the key combinations shown on Figure 1 on the next page. Public loops are designed for day-to-day operation, private loops should be run by only qualified technicians.

When the controller is first powered up it goes through a short self test and then enters the Operator's Loop, displaying the reservoir fluid temperature.

NOTE: Should you desire to return to the temperature display and abort any changes, keep pressing the **NEXT** until the display reads **SAVE?** Press **NO**.

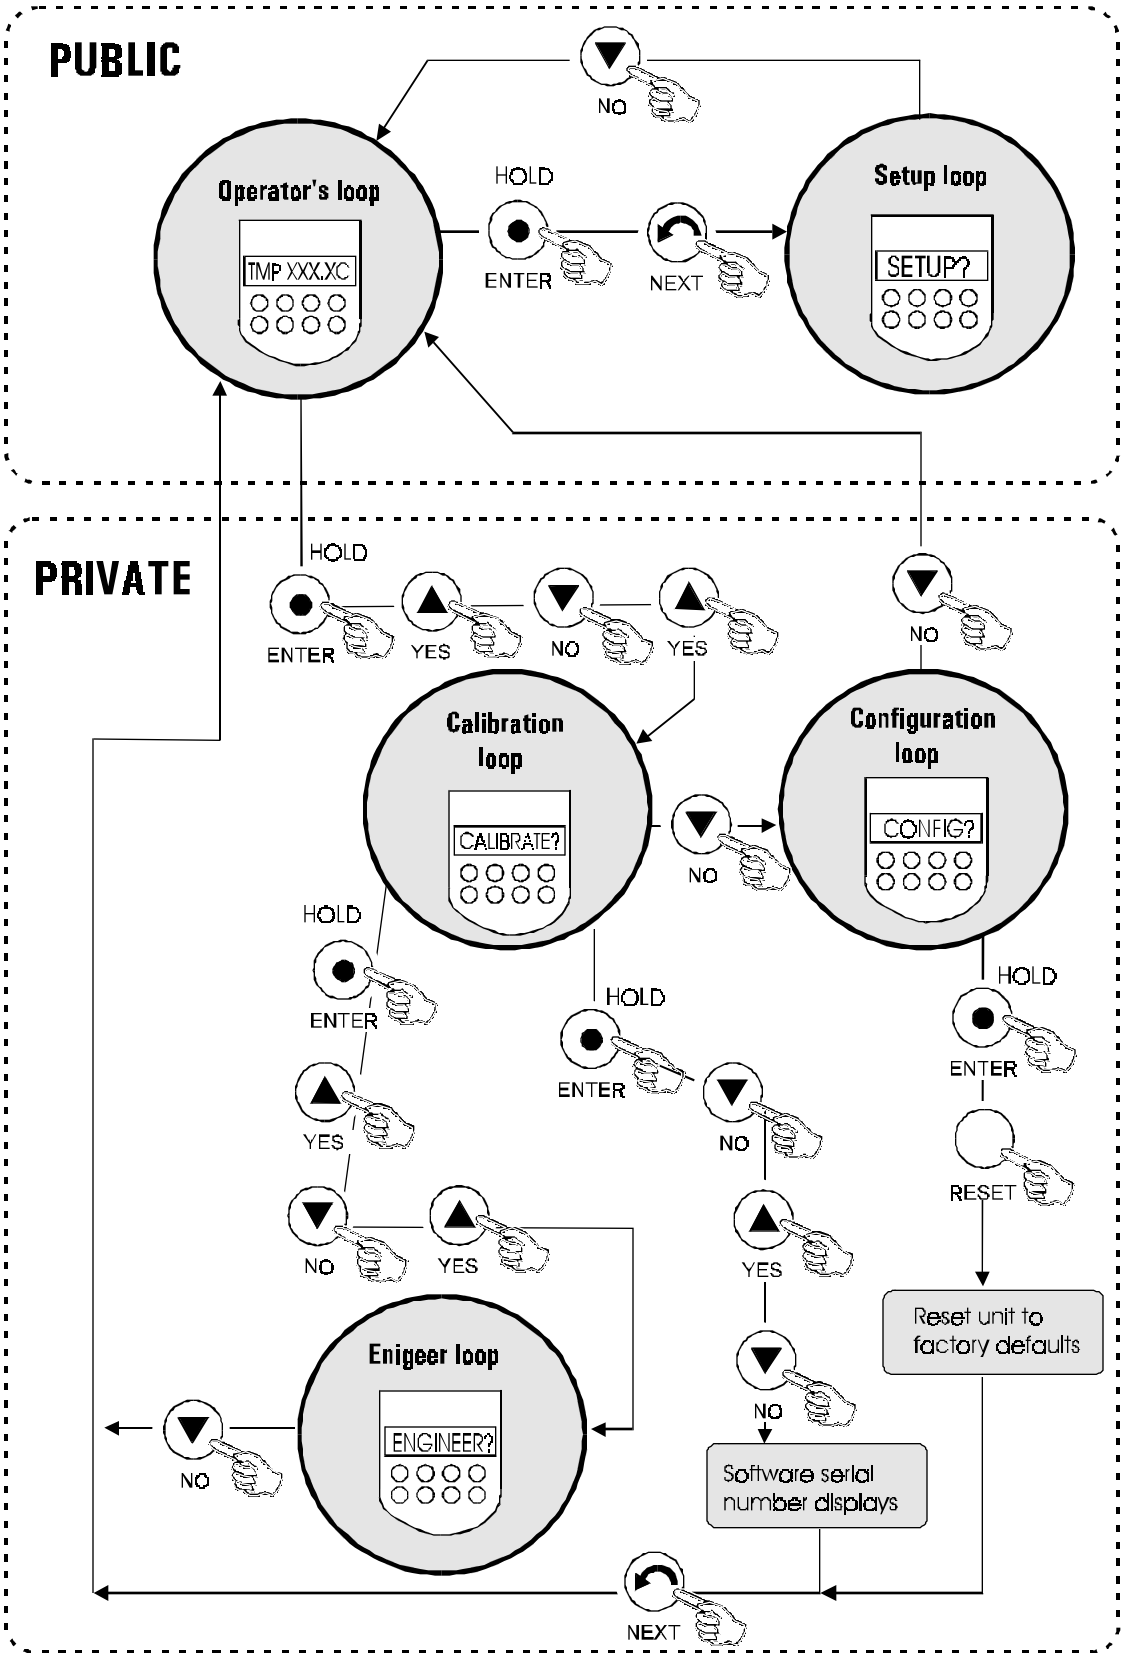


Figure 1 Changing Loops

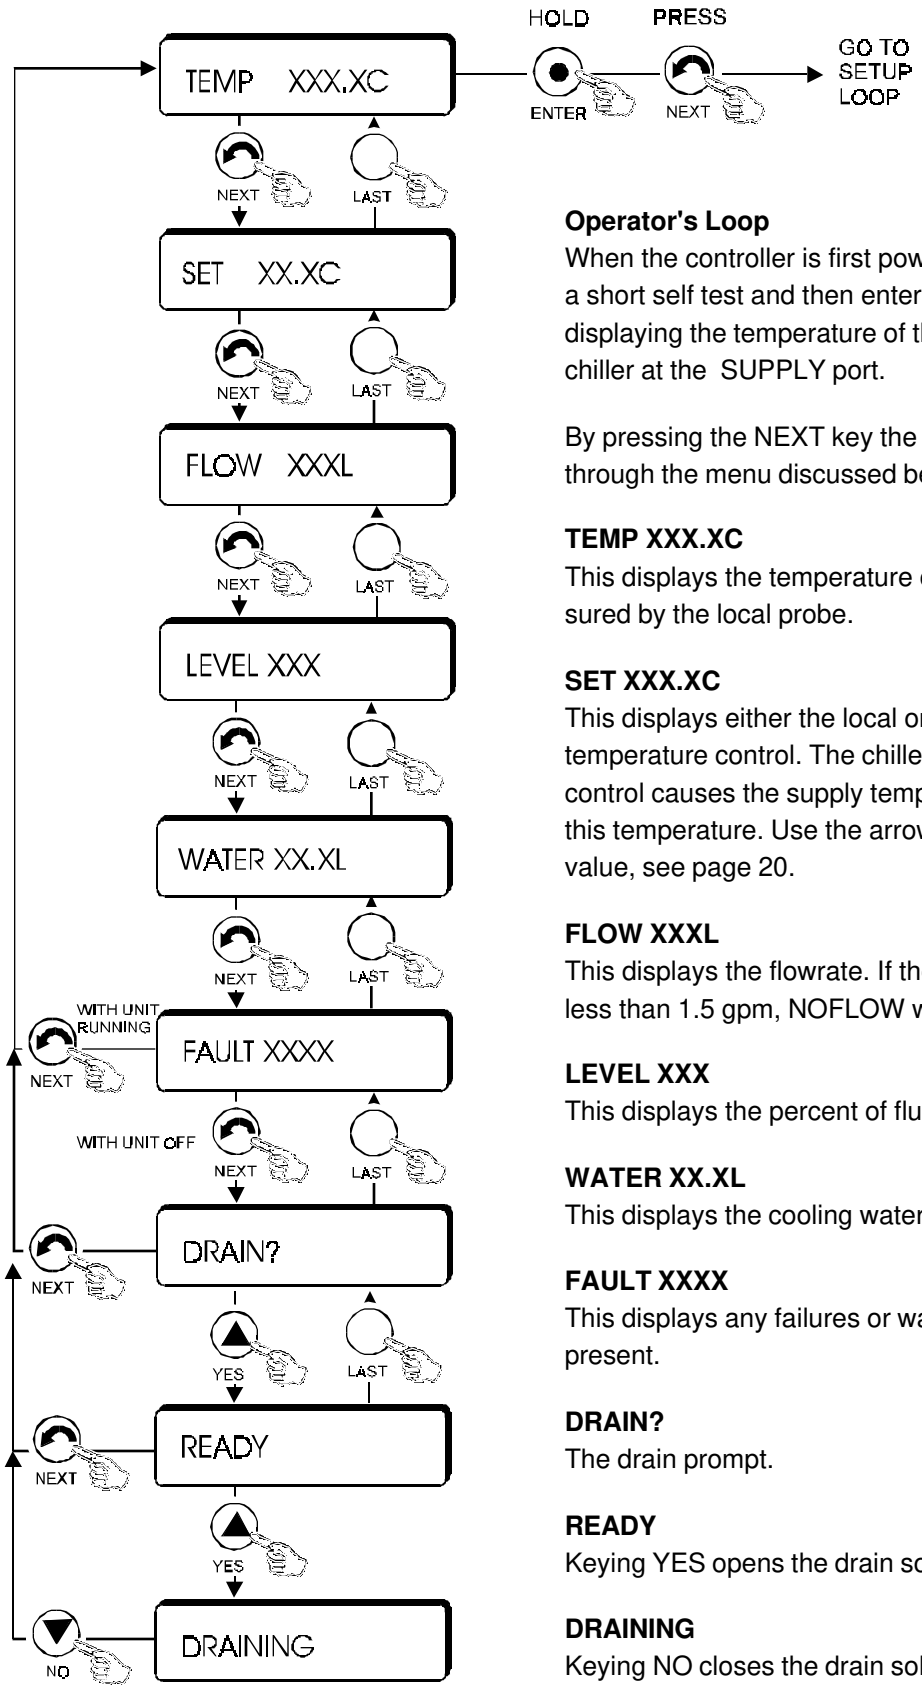

Operator's Loop
When the controller is first power up it goes through a short self test and then enters the Operator's Loop, displaying the temperature of the coolant leaving the chiller at the SUPPLY port.

By pressing the NEXT key the controller will step through the menu discussed below.

TEMP XXX.XC
This displays the temperature of the coolant measured by the local probe.

SET XXX.XC
This displays either the local or remote setpoint for temperature control. The chiller's temperature control causes the supply temperature to be equal to this temperature. Use the arrow keys to change the value, see page 20.

FLOW XXXL
This displays the flowrate. If the flow alarm is set for less than 1.5 gpm, NOFLOW will be displayed.

LEVEL XXX
This displays the percent of fluid in the tank.

WATER XX.XL
This displays the cooling water flow rate.

FAULT XXXX
This displays any failures or warnings that are present.

DRAIN?
The drain prompt.

READY
Keying YES opens the drain solenoid valve.

DRAINING
Keying NO closes the drain solenoid valve.

Figure 2 Operator's Loops

Setup Loop

The Setup Loop allows the operator to change the low flow setpoint and low flow; the normal level setpoint and alarm; the ready width and delay time; and the controller constants.

To enter this loop you must be in the Operator's Loop and displaying the temperature. Depress and hold the ENTER key and then press the NEXT key. Adjust values with the up and down arrow keys. Press ENTER for the controller to accept each new entry.

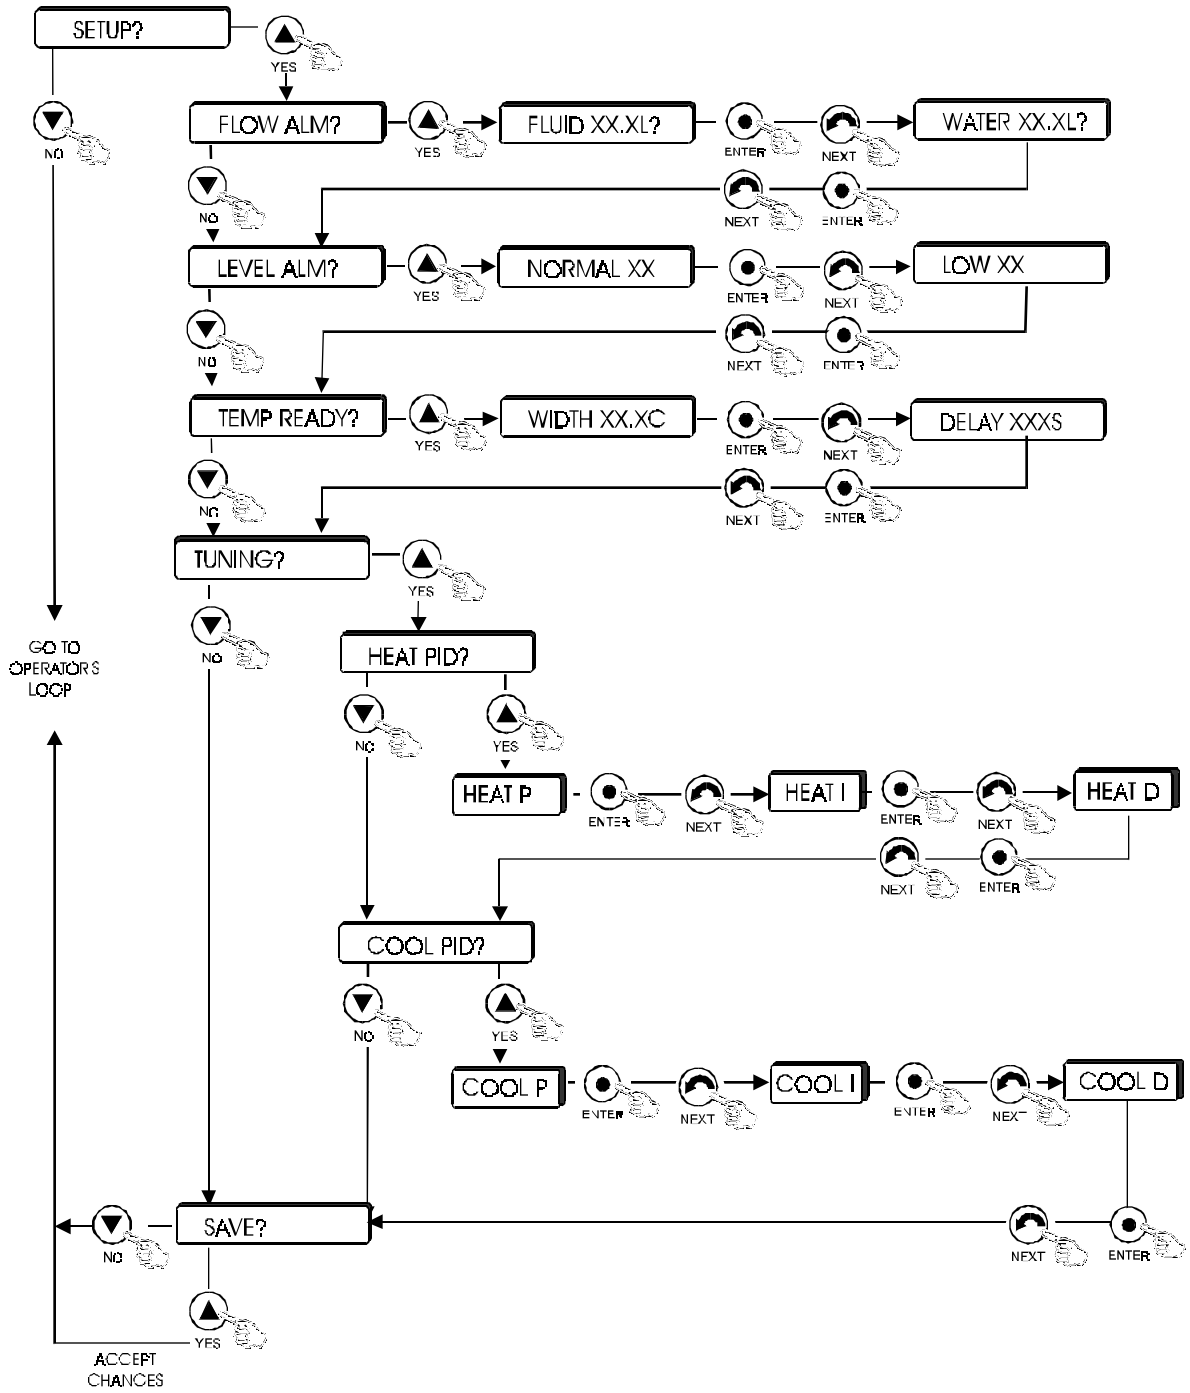

Figure 3 Setup Loop

Calibration Loop

The unit is factory calibrated. Changing any values will nullify temperature indications. Only qualified technicians should use this loop. Improper calibration can affect product temperature measurements.

To enter this loop you must be in the Operator's Loop and displaying the temperature. Depress and hold the ENTER key. While holding the ENTER key enter the key sequence YES-NO-YES. Answer YES to CALIBRATE? Adjust values with the up and down arrow keys. Press ENTER for the controller to accept each new entry.

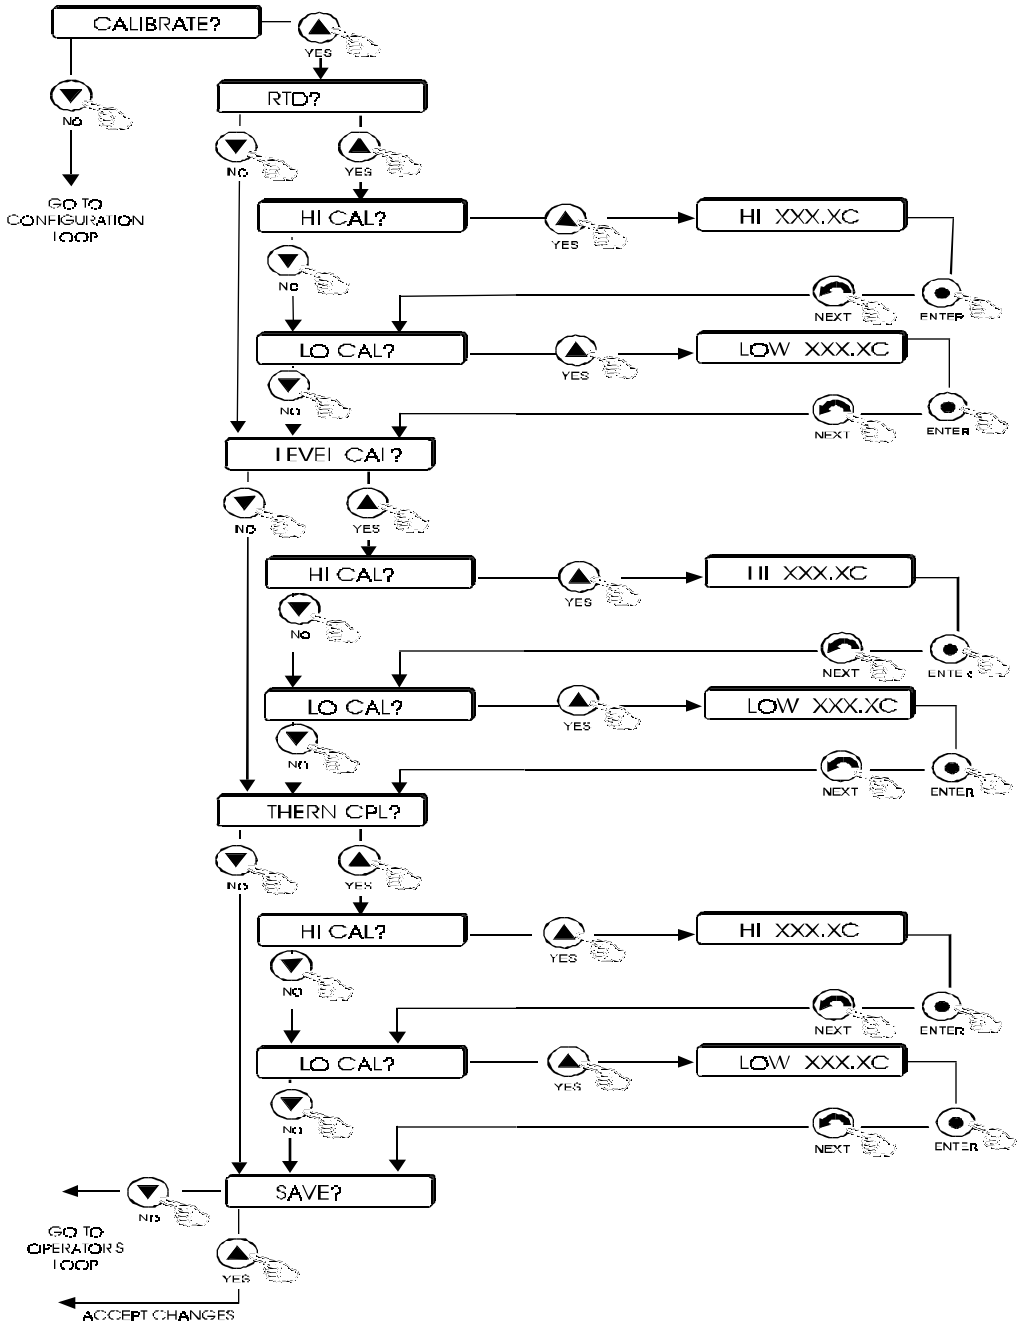

Figure 4 Calibration Loop

Configuration Loop

The unit is factory configured. Changing any values will nullify temperature indications. Only qualified technicians should use this loop. Improper calibration can affect product temperature measurements.

The Configuration Loop allows you to adjust frequency; cooling valve cycle time; and adjust the blower for high, low, or low only operation.

To enter this loop you must be in the Operator's Loop and displaying the temperature. Depress and hold the ENTER key. While holding the ENTER key enter key the sequence YES-NO-YES. Answer NO to CALIBRATE? and then YES to CONFIGURE? Adjust values with the up and down arrow keys. Press ENTER for the controller to accept each new entry.

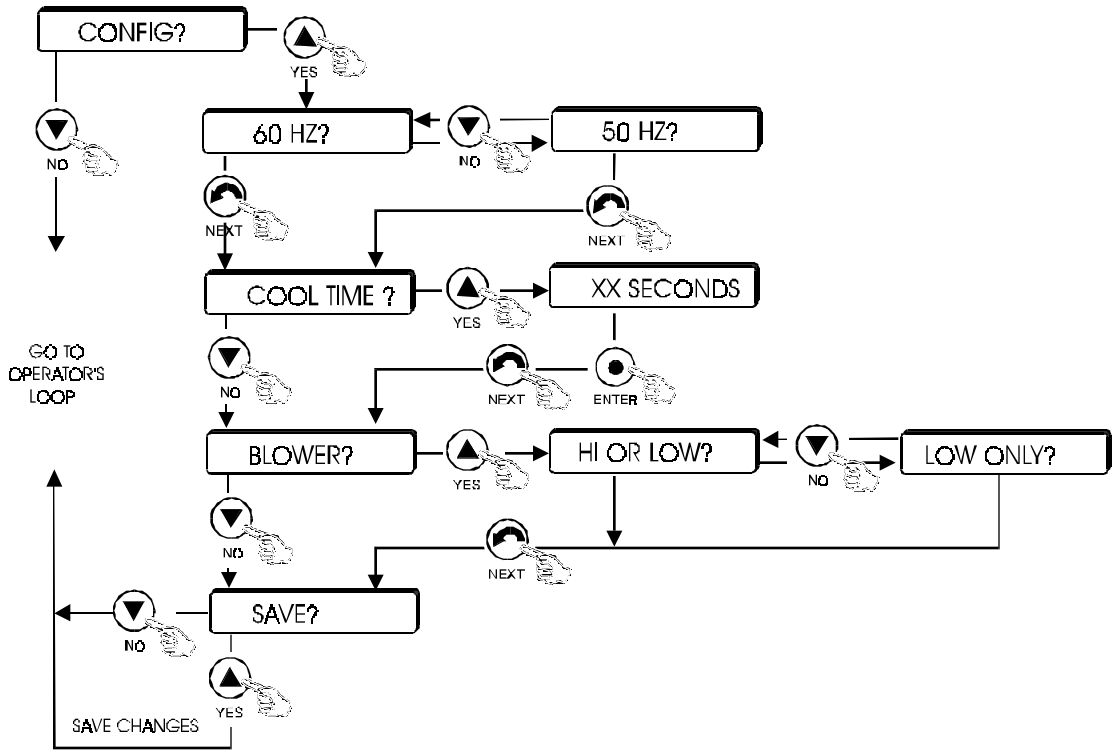

Figure 5 Configuration Loop

Engineer Loop

The Engineer Loop allows you to set the unit alarms and adjust the blower.

To enter this loop you must be at the CALIBRATE? prompt. While holding the ENTER key enter the key sequence NO-YES-NO.

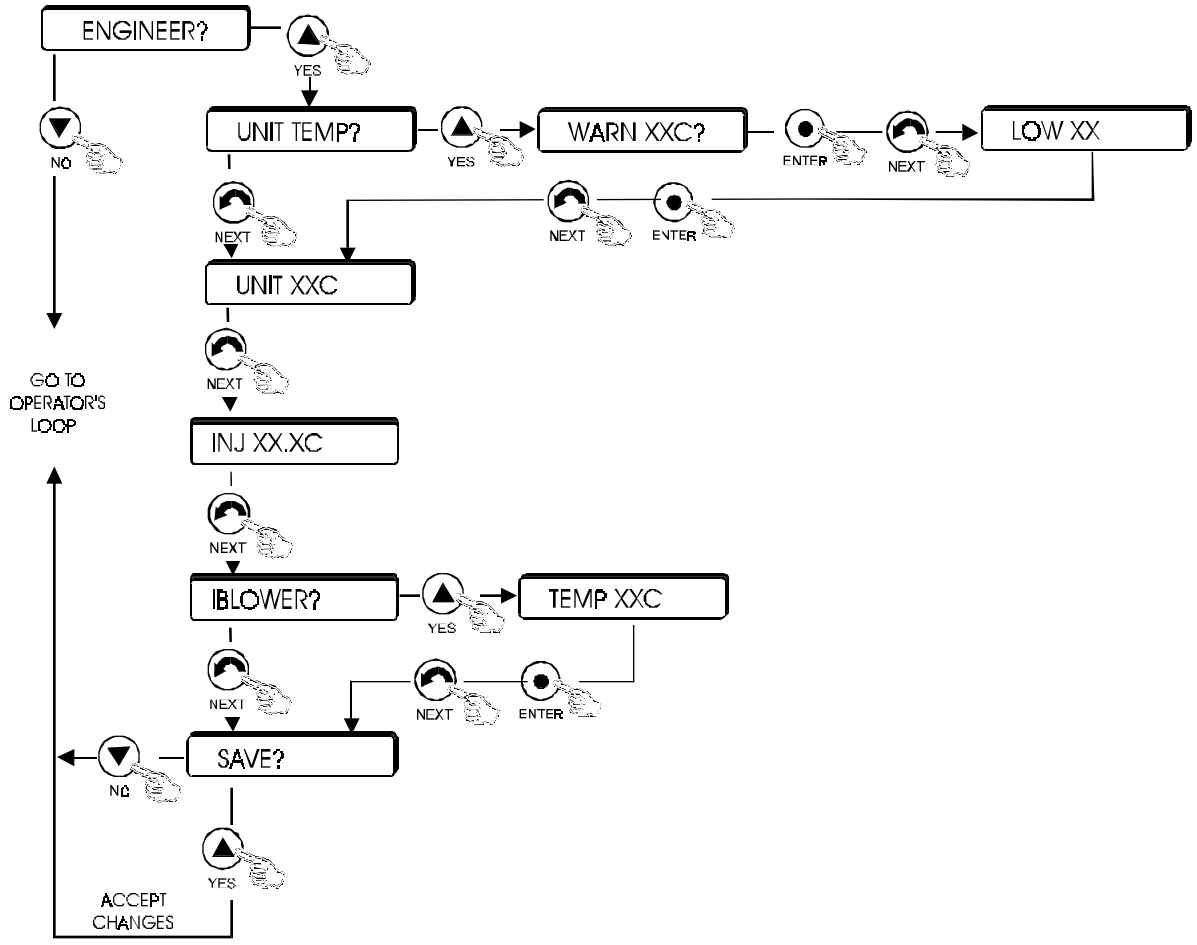

Figure 6 Engineer Loop

Error Messages

Error messages are displayed whenever certain conditions are detected. When this occurs the error message will be displayed by alternating the error message and the normal display. The keys and menus will perform normally.

All error messages will disappear when the error condition is corrected.

FLUID RTD
Indicates the internal temperature probe has failed, i.e. shorted or opened. Upon failure the channel enters the off mode.

PHASE VOLT
Indicates the phase voltage monitor relay has detected an incoming power problem, i.e., loss of phase, phase voltage imbalance, phase reversal, and low voltage. Upon failure the channel enters the off mode.

PUMP OVLD
Indicates the pump motor overload has tripped. Upon failure the channel enters the off mode.

COMP OVLD
Indicates the compressor motor overload has tripped. Upon failure the channel enters the off mode.

LOW PRESS
Indicates the refrigeration system low pressure switch has detected low pressure. Upon failure the channel enters the off mode. The switch must be manually reset.

HIGH PRESS
Indicates the refrigeration system high pressure switch has detected high pressure. Upon failure the channel enters the off mode. The switch must be manually reset.

HI HTR TEM
Indicates the heater high temperature cutout has detected over temperature. Upon failure the channel enters the off mode.

HI INJ TEM
Indicates the refrigeration system high temperature cutout has detected over temperature. Upon failure the channel enters the off mode.

HI LIQ TEM
Indicates the controller sensed a liquid temperature over normal operating range. Upon failure the channel enters the off mode.

NO FLOW
Indicates the controller sensed a liquid line flow loss, i.e., less than 5.75 LPM. Upon failure the channel enters the off mode.

LOW LEVEL
Indicates the controller sensed a liquid level in the tank that is below the heater level. Upon failure the channel enters the off mode.

HIGH LEVEL
Indicates the controller sensed a liquid level in the tank that is above the proper operating level range. Upon failure the channel enters the off mode.

REM STOP
With the channel in the remote mode, indicates the remote stop button is open.

MAIN BKR
Indicates the main breaker has tripped. Upon failure the channel enters the off mode. The breaker must be manually reset.

CHAN BKR
Indicates the channel breaker has tripped. Upon failure each channel enters the off mode. The breaker must be manually reset.

PUMP BKR
Indicates the pump breaker has tripped. Upon failure the channel enters the off mode. The breaker must be manually reset.

COMP BKR
Indicates the compressor breaker has tripped. Upon failure the channel enters the off mode. The breaker must be manually reset.

HEATER BKR
Indicates the heater breaker has tripped. Upon failure the channel enters the off mode. The breaker must be manually reset.

TEMP FAIL
Indicates the internal thermal couple has detected an over temperature condition. Upon failure the channel enters the off mode.

HI TNK TEM
Indicates the tank High Temperature Cutout (HTC) has detected an over temperature condition. Upon failure the channel enters the off mode. The HTC must be manually reset.

EMO
Indicates the EMO button is depressed. Each channel enters the off mode.

DOOR INTLK
Indicates a door interlock (heater boxes or power box) is open. Each channel enters the off mode.

LOSS 12VDC
Indicates the internal 12 volt power supply has failed. Each channel enters the off mode.

COOL WATER
Indicates no cooling water detected so the high pressure cutout opened. The channel enters the off mode.

INJ RTD
Indicates the refrigeration system liquid injector temperature sensor has failed, i.e., shorted or opened.

LOW FLOW
Indicates the controller senses a liquid line flow that is less than a proper operating flow.

ADD FLUID
Indicates the controller senses a tank liquid level that is less than a proper operating level.

TEMP WARM
Indicates the internal thermal couple has detected an over temperature condition. The fan enters the high mode, if possible.

Section IV Special Features

Heater Package

Each heater package consists of a 5000 watt (@208V, 3Ø) immersion heater in the unit's fluid reservoir, and a high temperature limit device. The high temperature limit device disconnects power to the heater if the heater surface temperature exceeds a preset limit.

The heater high temperature limit device senses the surface temperature of the heater. If the heater temperature becomes too high, the limit device opens a mechanical relay to remove power to the heater and pump.

The heater surface temperature may operate several degrees higher than the reservoir fluid. The limit device is factory set to 200°C.

For personal safety and equipment reliability, do not adjust the high temperature limit device.

To reset a tripped temperature limit device depress the reset switch on the back of the unit.

NOTE: The microprocessor controller will indicate a fault and must be manually reset before the unit can be placed in the run mode.

Pump Motor Overload Protector

The unit is equipped with a pump motor overload protector. The overload protector prevents the pump motor from damage due to excessive current. If an overload occurs, due, for example, to excessive pressure or flow, or excessive ambient temperatures, the overload protector will shut off the pump motor.

NOTE: The microprocessor controller will indicate a fault and must be manually reset before the unit can be placed in the run mode.

Compressor Motor Overload Protector

The unit is equipped with a compressor motor overload protector. The overload protector prevents the compressor motor from damage due to excessive current. If an overload occurs, due, for example, to excessive pressure, excessive ambient temperatures, or high suction temperatures, the overload protector will shut off the compressor.

NOTE: The microprocessor controller will indicate a fault and must be manually reset before the unit can be placed in the run mode.

Pressure Relief Valves

The pressure relief valve establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass fluid within the unit to limit the pressure. The valve does not determine the system operating pressure; the system operating pressure is determined by the back pressure of the connected equipment. If adjustment seems necessary, consult our service department for assistance.

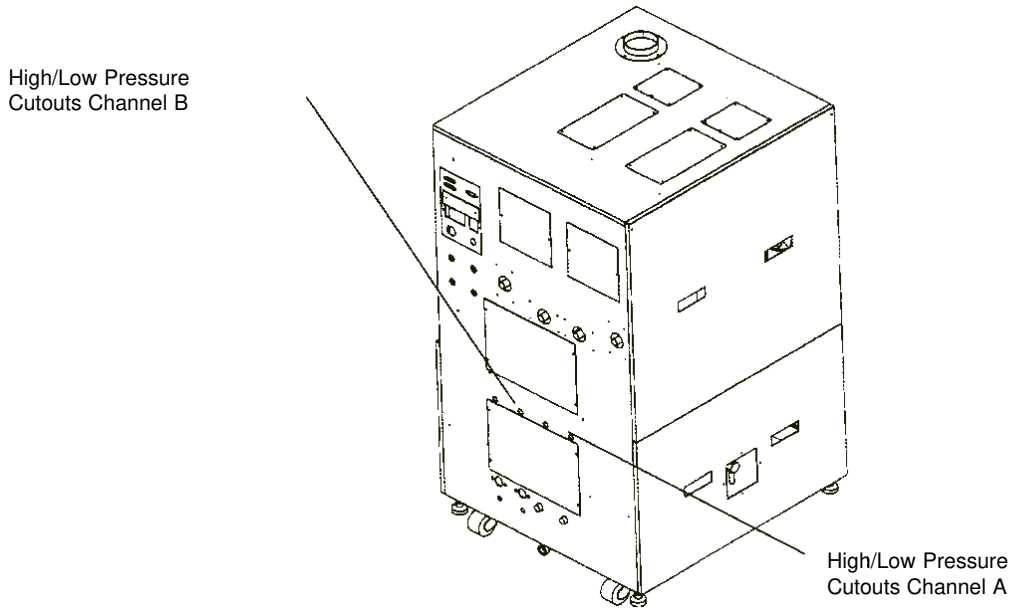
High Pressure Cutout

If the unit's refrigeration discharge pressure become too high, the high pressure cutout activates and shuts down the unit. High pressure can be caused by a lack of cooling water flow to the condenser or debris in the refrigeration lines. The cutout is located on the back of the unit.

Once the cause of the problem has been identified and corrected you must manually reset the cutout. Locate the white reset switch on the high pressure cutout. Press in on the switch until a "click" is heard. If the reset does not "click" the cutout was not activated and the unit shut down occurred for another reason.

NOTE: The microprocessor controller will indicate a fault and must be manually reset before the unit can be placed in the run mode.

NOTE: A main cause of high discharge pressure is insufficient facility cooling water flow or pressure change. Refer to Section VII, Troubleshooting on page 42.



Low Pressure Cutout

If the unit's refrigeration discharge pressure become too low, the low pressure cutout activates and shuts down the unit. The cutout is located on the back of the unit.

Once the cause of the problem has been identified and corrected you must manually reset the cutout. Locate the white reset switch on the low pressure cutout. Press in on the switch until a "click" is heard. If the reset does not "click" the cutout was not activated and the unit shut down occurred for another reason.

NOTE: The microprocessor controller will indicate a fault and must be manually reset before the unit can be placed in the run mode.

High Temperature Cutout

Each channel's tank is equipped with a High Temperature Cutout (HTC). Each HTC is installed on the channel's tank outlet. Should the tank's fluid temperature become too high, the HTC trips and that channel enters the off mode. The HTC is located on the back of the unit.

Once the cause of the problem has been identified and corrected, you must manually reset the HTC.

NOTE: The microprocessor controller will indicate a fault and must be manually reset before the unit can be placed in the run mode.

Cabinet High Temperature

The chiller is equipped with a thermal couple that monitors the power box temperature. Should the unit's internal temperature become too high (>55°C), Channel A enters the off mode.

NOTE: The microprocessor controller will indicate a fault and must be manually reset before the unit can be placed in the run mode.

Electrical Interlocks

Each heater electrical box and the unit's power box is equipped with mechanical interlocks. If any is removed while the chiller is operating, the main chiller power will be disconnected and each channel will enter the off mode.

NOTE: Each interlock can be pulled out to override normal operation and allow the chiller to operate during servicing.

Tank Relief Valve

For safety reasons each reservoir is equipped with pressure and vacuum relief valves. Each valve is a Nupro® check valve. The pressure and vacuum valves are designed to operate at 0.7 kg/cm^2 (10PSI) and 0.02 kg/cm^2 (0.33PSI) respectively.

High Injector Temperature

If the unit's refrigeration suction temperature become too high, the high injector temperature sensor will indicate an over temperature to the controller and the channel will enter the off mode. High temperature can be caused by a defective liquid injection system.

Once the cause of the problem is identified and corrected the cutout automatically resets.

NOTE: The microprocessor controller will indicate a fault and must be manually reset before the unit can be placed in the run mode.

Phase Voltage Monitor

Power input problems activates the phase voltage monitor and places the chiller in the standby mode. Input problems can be caused by low voltage, loss of phase, phase imbalance, and phase reversal.

Once the cause of the problem is identified and corrected the cutout automatically resets.

NOTE: The microprocessor controller will indicate a fault and must be manually reset before the unit can be placed in the run mode.

Temperature Control

Fluid temperature control is achieved by activating a refrigeration system, pump, and a tank heater. PID microprocessor algorithms control both the refrigeration system and the heater.

Flow Monitors

Each recirculating channel is equipped with a flow sensor. The flow sensor confirms proper flow returning from your application.

Each channel is also equipped with a water flow transducer to help diagnose facility water flow problems.

Low Level Monitors

There is an analog level switch in each reservoir. When the fluid level drops to 50%, the ADD FLUID lamp illuminates and a warning signal is sent to the tool. If the fluid level should drop to 25%, the LEVEL FAULT lamp illuminates.

Temperature Sensor

A temperature sensor is located in each recirculating process fluid outlet line. Sensor temperature readings are communicated to the tool via the RS-232 communication port.

Accessory Connector

CN1 RS232

Channel A current temperature, output signal target temperature (setpoint), input signal temperature and deviation value input signal.

CN2 RS232

Channel B current temperature, output signal target temperature (setpoint), input signal temperature and deviation value input signal.

Section VI Maintenance

For personal safety and equipment reliability, the following procedures should only be performed by a qualified technician. Contact our ... Service Department for assistance (see Preface, After-sale Support).

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide . extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Draining

NOTE: The procedure for draining either channel is identical.

Open Channel A or B drain valve located on the rear of the unit.

When the fluid finishes draining close the drain valve. Open the lower rear access panel. Locate and open the secondary drain. (The secondary drain is located just below the opening on the right side for Channel A, left side for Channel B.) The secondary drain removes the last few ounces in the lower part of the heat exchanger into the drip pan.

Close the secondary valve when the draining is complete.

Remove the insulation off the bottom of the filter cannister and then remove the cannister's bottom drain plug.

When draining is complete replace the cannister's O-ring, reinstall the plug and insulation.

Use the following procedure to drain the exchanger's lines and completely drain either channel.

Open Channel A or B drain valve located on the rear of the unit.

After 2 - 3 gallons (8 - 12 liters) have drained, use the channel control system to manually open the solenoid valve.

The drain option is the seventh display on the main menu. (**NOTE:** The **DRAIN?** display appears only if the channel is off, see Section IV.)

With **DRAIN?** displayed press **YES**.

READY will be displayed, press **YES** to open the valves.

DRAINING will be displayed. When draining is complete press **YES** to close the valves. The fluid temperature will be displayed.

Close the drain valve on the rear of the chiller.

When the fluid finishes draining close the drain valve. Open the lower rear access panel and locate and open the secondary drain. (The secondary drain is located just below the opening on the right side for Channel A, left side for Channel B.) The secondary drain removes the last few ounces in the lower part of the heat exchanger into the drip pan.

Close the secondary valve when the draining is complete.

Remove the insulation off the bottom of the filter cannister and then remove the cannister's bottom drain plug.

When draining is complete replace the cannister's O-ring, reinstall the plug and insulation.

Reservoir Cleaning

Periodically inspect the fluid inside the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the recirculating fluid.

Filter Cartridge Cleaning

If debris is drawn into the system, the filter prevents the material from being drawn into the fluid loop.

Check the pressure drop across the filter assembly. If the drop is greater than 15 PSI, change or clean the filter cartridge.

Drain the reservoir. The drain for each channel is located on the unit's back.

Drain the fluid from the filter by removing the plug on the sump housing.

Reinstall the plug onto the housing. Unscrew the ring nut from the filter head and slide the sump housing down off the head. Empty the remaining fluid from the sump housing and remove the stainless steel filter cartridge.

The stainless steel cartridge can be cleaned by using either ultrasound or rinsing with Galden® or alcohol.

NOTE: If rinsed, ensure the stainless steel filter cartridge is dry before reinstalling.

Replace the O-ring when the housing is reinstalled.

Reinstall the cannister.

Hand tighten the ring nut and check for leaks.

Preventive Maintenance

NOTE: Every installation can be different, therefore a preventive maintenance can be established after a series of monthly checks.

Requirement	Monthly	Semiannual	Annual
Filter			
Check and record differential pressure	x		
Clean Filter*		x	
Check fluid level	x		
Fluid sampling		x	
Grease pump motor housing			x
Replace pump gears			x
Clean case vents			x
Clean blower inlet and outlet			x
Check calibration of RTDS			x
Check calibration of cabinet thermocouple			x
Check operation of HTCs			x
Check operation of LPCs and HPCs			x
Check operation of circuit breakers			x
Check operation of door interlocks			x
Check operation of motor overloads			x
Verify LEDs**			x
Check low level fault indication			x

* or of differential pressure exceeds 15 PSI.
**can be done with the controller self test during power up.

Section VII Troubleshooting

Main power is not available to unit

-Check main breaker on rear of chiller
-Check incoming power supply
-Check cable connection in the power box and at your application
-Check door interlock on power box
-Check door interlock on heater box
-Check EMO

Unit fails to enter run mode

-Check microprocessor for fault conditions
-See Failure and Warning Condition Table on page 18

Unit will not circulate fluid

-Check tubing between chiller and application
-Check pump circuit breaker
-Check pump overloads
-Check pressure drop across the filter assembly
-Check for proper fluid level

Inadequate temperature control

-Check compressor circuit breaker
-Check heater circuit breaker
-Check temperature probe
-Check for fluctuating input power
-Check microprocessor for proper calibration
-Check for refrigeration system failure

Control system fails to power up

-Check control breaker on the rear of the unit
-Check incoming power supply
-Check cable connection in the power box and at your application

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 1000-4-2:1995
	IEC 1000-4-3:1994
	IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

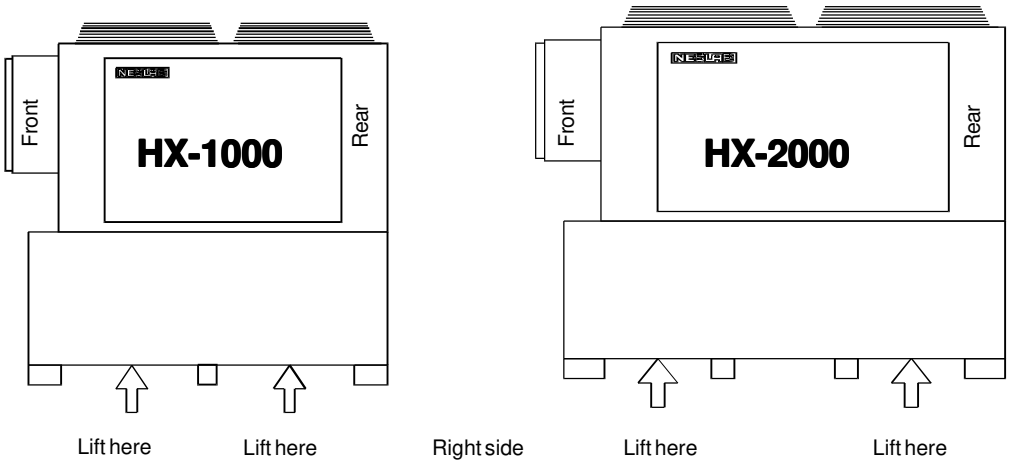
Units sold in North America are shipped on a wooden pallet and wrapped in protective plastic. Do not remove the banding or protective plastic until the unit is in its final location.

Units sold outside North America are shipped in a wooden crate. Do not disassemble the crate until the unit is in its final location.

The unit is secured to the pallet by lag bolts. HX-1000 units have 10 bolts, HX-2000 units have 12. Remove the lag bolts and the pallet before placing the unit on the foundation.

Lift Points

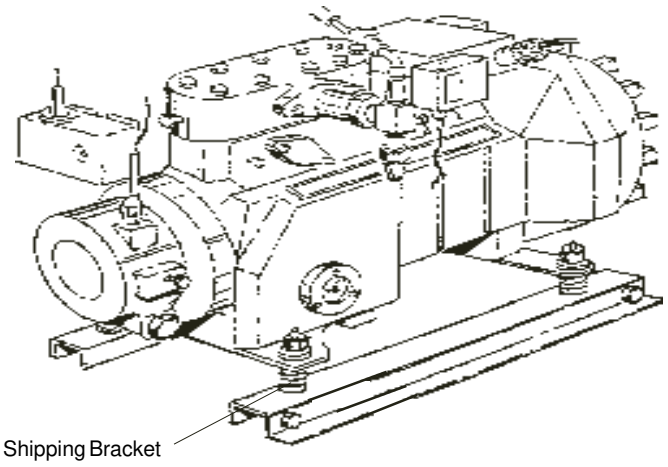
The unit is constructed on 4 inch (10.16 centimeter) high feet, each made of 14 gauge steel. HX-1000 units have 6 feet, HX-2000 units have 8. The unit construction provides a 4 inch clearance from the ground. Use a fork lift truck to lift and move the unit. Insert the forks as shown.



Pre-Start Up

Remove the panels to access the compressor area.

Loosen the four compressor mounting nuts until there is approximately 1/8" clearance between each compression mounting foot and the shipping bracket. This allows the compressor to "float" on the mounting rings.



To avoid damage to the compressor, tighten the mounting nuts before moving the unit.

Warranty

The unit has a warranty against defective parts and workmanship is for one full year from date of shipment. See back page for more details.

After-Sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, please contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, please contact our Customer Service Department.

Before calling, *please* refer to the serial number label in the electrical enclosure to obtain the following information:

- BOM number _____

- Serial number _____

- Software version (see page 25) _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Never operate the unit without cooling fluid.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Always turn off the unit and disconnect from the line cord before performing any service or maintenance procedures.

Never operate equipment with damaged line cords.

In addition to the safety warnings listed above, warnings are posted through out the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with test highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

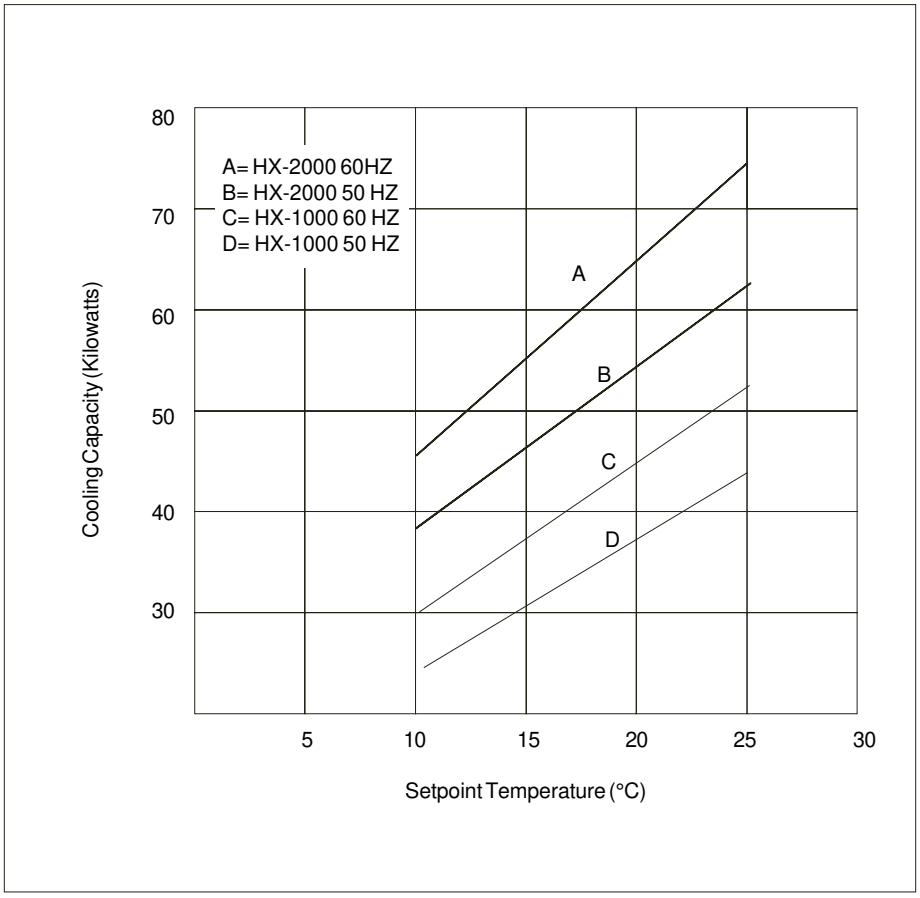
Your HX Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and pressure.

The unit consists of a reservoir, circulating pump, air-cooled refrigeration system, and a digital temperature controller. The unit can run from a remote monitoring/controlling device.

The unit is designed for all-weather use. This allows heat produced by the instrument being cooled to be discharged outdoors. The high capacity pump allows the unit to be located a great distance from the instrument being cooled. The pump flow is adjustable at the unit.

Specifications

Cooling Capacity



Temperature Range	+10°C to +25°C
Temperature Stability[1]	±1.0°C
Pump Capacity	
	HX-1000	**HX-2000**
Compressor	10 hp	20 hp
Dimensions (H x W x D)		
Inches	73½ X 58 X 30	76 x 67¼ x 34
Centimeters	186.7 x 147.3 x 76.2	193.0 X 170.8 X 86.4
Shipping Weight		
Pounds	1612	2061
Kilograms	731	945

1. Specifications listed for units under full load circulating at 25°C, ambient 21°C, with 50% water and 50% Ethylene Glycol as coolant. Specifications will be affected by changes in temperature, ambient, or fluids. Specifications subject to change.

Section III Installation

Site

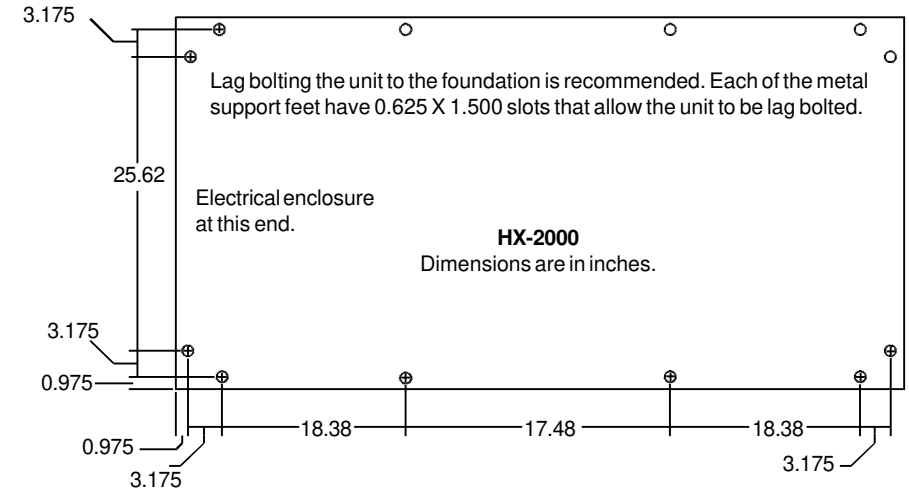
Install the unit on a well-constructed level surface, able to withstand a distributed load of 3000 pounds (1360 kilograms) for HX-2000 units, 1700 pounds (770 kilograms) for HX-1000 units.

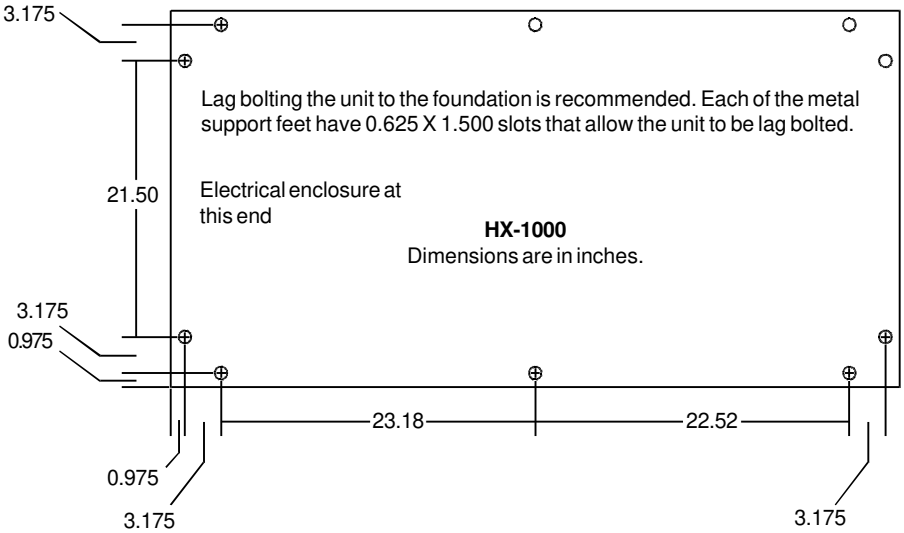
The unit has an air-cooled refrigeration system. Air is drawn through the slotted metal grilles on either side of the unit, and exhausted through the fans on top of the unit. Air flow through the fans is 12300 feet^3/minute for HX-2000 units, 6500 feet^3/minute for HX-1000 units.

The unit should be placed in an area where the air intake and discharge are not impeded. A minimum clearance of 3.5 feet (1 meter) on all four sides and 7 feet (2 meters) above the unit is necessary for adequate air flow and easy access to the side panels for service and maintenance.

The ambient range of the unit is -10°F to +110°F (-22°C to +43°C).

NOTE: If the chiller is subject to high-ambient temperatures (above 100°F), Thermo Thermo NESLAB recommends providing it as much shade as possible. High-ambient temperatures and direct sunlight can generate high-refrigerant pressures capable of shutting down the unit.





Pre-Start Up

Remove the two side access panels and the rear access panel (opposite end from the electrical enclosure) to access the compressor area. Check the compressor oil level through the sight glass on the compressor crankcase. It is identified as the glass port hole in the compressor wall. The oil level should be no less than ½ full. If the oil is below ½, contact Thermo Thermo NESLAB Service.

Check the refrigerant sightglass. If the dot in the middle of the sightglass is green, the refrigerant is normal. If the dot is yellow, the refrigerant is contaminated. Contact our Service Department for assistance.

Close the COOLING WATER INLET and OUTLET by turning the valve handles fully clockwise.

Make sure the grilles on the sides of the unit (covering condensers) and the fans on the top of the unit are free of obstructions.

After all electrical and plumbing connections have been completed, close the enclosure door and secure the door latch arm (disconnect).

The unit is equipped with a set of valves on the tank inlet and outlet which prevent the tank from overflowing when the pump is off.

The unit has an automatic compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant and the crankcase oil from mixing. Before initial start up, or after storage, the unit must be connected to the power source for at least 12 hours before turning the unit on. This will allow time for the crankcase oil to be heated and the refrigerant to separate from the oil.

For HX-2000 units, apply power to the unit for a minimum of three minutes before starting. This allows the compressor motor overload timer to complete cycling. If the START button is pressed too early, the compressor will not start until the timer has finished its cycle. On some units this may trigger a compressor fault and a shutdown cycle. In this case, wait approximately another three minutes then clear all alarms. Restart the unit.

Electrical Requirements

Refer to the serial number label on the inside of the electrical enclosure for the specific electrical requirements of your unit. Also on the inside of the enclosure, ensure the voltage setting on the phase monitor voltage arrow is correct.

Electrical Connections

For personal safety and equipment reliability, this procedure should be performed by a qualified service technician familiar with the safety procedures required for working inside an energized disconnect box.

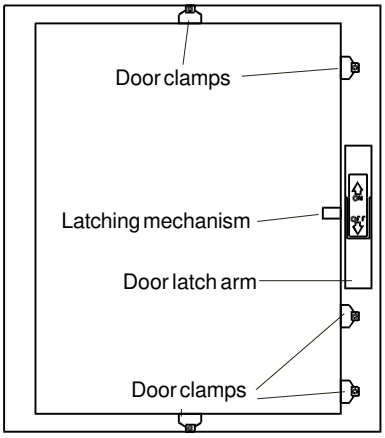
A unit wiring diagram is located in the document sleeve inside the door of the electrical enclosure. Wire the unit in conformance to local, state and federal electrical codes. Check all wiring to make sure it is properly connected and protected from the elements.

Install a conduit connector in the wall of the electrical enclosure; a hole must be drilled in the enclosure to accommodate the connector. The location of the hole is user-defined; the hole can be drilled in any of the four enclosure wall (except the upper left side wall, where the control panel is located). This allows the power supply to be installed in the enclosure at a point that is convenient for the user.

Use four-wire cable to connect the appropriate power supply (see Electrical Requirements) to the main circuit breaker located on the right side of the enclosure. For ground, use the copper terminal board on the bottom of the enclosure. Install a second circuit breaker at the power source. This second circuit breaker prevents exposure to “live” wires during installation.

The door latch arm on the enclosure activates the main disconnect for the power supply to the unit. When the door is closed, the disconnect is engaged when the latch arm is pulled up to the ON position. The POWER ON lamp on the control panel indicates the status of the disconnect.

The five door clamps must be secured for the enclosure to be weather-tight.



Electrical enclosure (the door has been omitted for clarity)

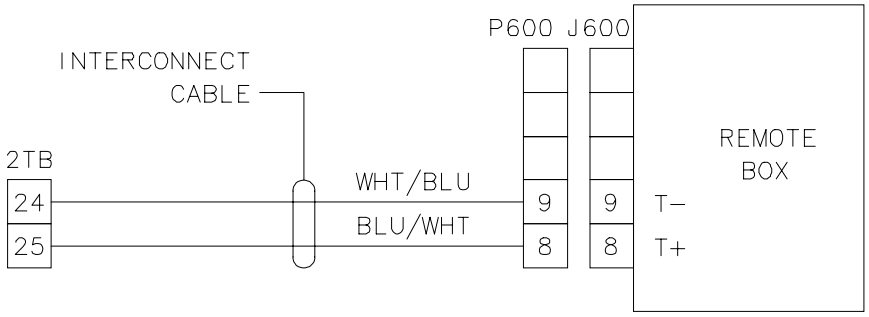
Remote Box Electrical Connections

For personal safety and equipment reliability, this procedure must be performed by a qualified service technician familiar with the safety procedures required for working inside an energized disconnect box.

Wiring diagrams are located inside the document sleeve inside the electrical enclosure. Wire the unit in conformance to all local, state and federal electrical codes. Check all wiring and make sure it is properly connected and protected from the elements.

Install a conduit connector in the wall of the unit's electrical enclosure. A hole must be drilled in the electrical enclosure to accommodate the connectors. The location of the hole is user-defined; this allows the connecting cable to be installed in the electrical enclosure at a point that is convenient to the user. The hole can be drilled in any of the four enclosure walls.

Wire the connections for the remote box as shown. 2TB is located inside the electrical enclosure, on the left-hand side.



Plumbing Requirements

The inlet and outlet of the unit are labelled COOLING WATER INLET and OUTLET. These connections are 1¼ inch FPT.

Follow good plumbing practices to minimize unnecessary bends and restrictions that will increase the pressure drop through the circulating lines. Refer to Pressure Drop Chart on the next page to estimate the pressure drop through various diameter tube lengths.

Insulate all tubes and fittings to minimize loss of cooling capacity. This is extremely important in areas of ambient extremes or when the unit is located a great distance from the instrument being cooled. All tubing and fittings should be weather resistant, able to endure high and low ambient conditions, and able to withstand a maximum pressure of 120 psi.

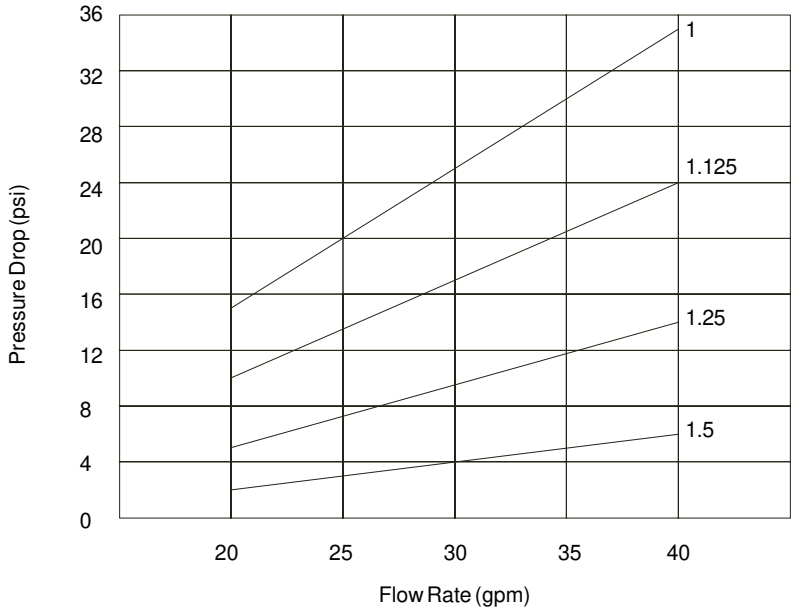
Insulating hose is available from Thermo Thermo NESLAB. Contact our Sales Department for more information.

	A	B	C	D
HX-1000	9.375	8.5	5	16.3125
HX-2000	9.375	10.215	5	18.875

Dimensions of the inlet and outlet.
Dimensions are in inches.

Use the Pump Capacity Chart (see Specifications) and the Pressure Drop Chart to calculate the maximum distance you can locate the unit from the system being cooled. Find the point on the Pump Capacity Chart that matches the flow and pressure requirements of the system being cooled. From that point, estimate the pressure difference between the pump performance line, and the point you have chosen on the graph. This net pressure value, used with the Pressure Drop Chart, will help determine the maximum distance from the chiller to the system being cooled and the tubing diameter (ID).

NOTE: The unit is equipped with a set of valves on the tank inlet and outlet which prevent the tank from overflowing when the pump is off.



Material: 100 feet copper tubing. Dimensions are inside diameter (ID), measured in inches.

Fluid

A non-freezing fluid is required for operation at any recirculating or ambient temperature. The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Due to the physical nature of a plate heat exchanger, and its response to temperature changes, 100% water must not be used as a circulating fluid. Using 100% water may cause the plate heat exchanger to rupture.

Never use corrosive or flammable fluids with this unit.

Never use automotive antifreeze. Commercial antifreeze contains silicates that can cause permanent damage to the pump seals.

Noncompliance with the statements in the section can result in damage to the unit and will void the manufacturer's warranty. For more information contact our Sales Department (see Preface, After-sale Support).

The wetted parts are:

- *Stainless steel*
- *Bronze*
- *Brass*
- *Copper*
- *PVC Plastic*

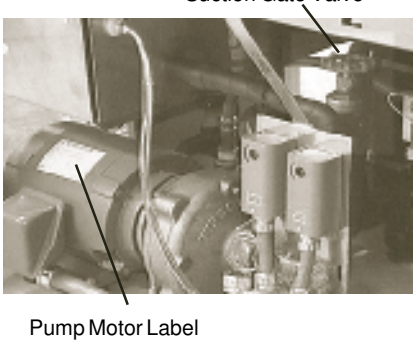
Filling Requirements

Ensure the INLET and OUTLET valves on the front of the outside of the unit are closed.

Open the unit's lower-right hand side panel and locate the 1¼" suction gate valve. (It is the largest valve in the unit and is located between the reservoir and compressor.)

Ensure the suction gate valve is fully closed.

The unit is equipped with a low flow cutout. While filling the unit it is important to ensure that the cutout senses a minimum of 10 gpm through the return line, and that the reservoir does not run dry.



Running the reservoir dry may permanently damage the pump seals.

Three possible options for filling the lines without running the reservoir dry or causing the unit to cut out on low flow are:

Option #1

1. Connect the INLET/OUTLET recirculation lines from the HX to your application.
2. Pre-fill the circulation lines with the appropriate mixture of a non-freezing fluid.
3. Remove the reservoir cover located under the electrical enclosure. Fill the reservoir approximately ¾ full. Start the unit and allow it to run 15 - 20 minutes.
4. Slowly open the OUTLET valve. **Opening the valve too quickly will cause water-hammering.**
5. Keep the reservoir topped off to within one inch of the top. (There could be some substantial splashing from the reservoir as air is purged from the lines.)
6. Your application may be started at this time.
7. As the recirculation lines continue to fill, keep topping off the reservoir.
8. When the reservoir no longer needs additional fluid, fully open the suction gate valve.
9. Allow the unit to run 10 to 15 minutes to purge any remaining air.
10. Ensure the reservoir is filled to within one inch of the top.
11. Close the reservoir cover.
12. Install the unit's lower right-hand side panel.

Option # 2

Refer to the diagram below and install a bypass assembly with two ball-valves and a flow meter in the circulation lines.

1. Ensure both ball-valves are closed.

2. Remove the reservoir cover located under the electrical enclosure. Fill the reservoir approximately ¾ full. Start the unit and allow it to run 15-20 minutes.

3. Slowly open the OUTLET valve. **Opening the valve too quickly will cause water-hammering.**

4. Slowly open the bypass ball-valve so the flow on the return line is 20 gpm.

5. Slowly open the supply line ball-valve. A reservoir fluid loss will occur as the lines start to fill, continually fill the reservoir as the fluid level drops. Open the supply line ball-valve to a point where there is enough flow to fill the lines in a reasonable amount of time, and at a flow rate equal to the ability to replenish the reservoir fluid. **If the flow drops below 10 gpm the low-flow cutout will trip.**

6. Ensure all the circulation lines are full and free of air, and that the reservoir is filled to within 1 inch of the top. If desired, calculate the total amount of fluid required to fill the lines and stop filling when that amount is consumed. It will take some time to bleed air from the system.

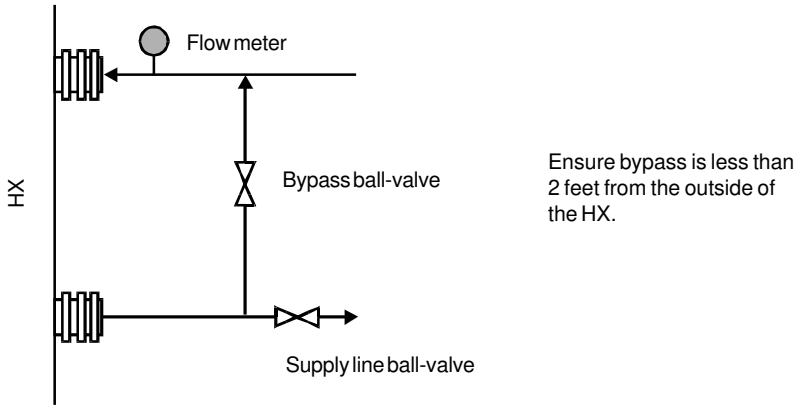
7. Your application may be started at this time.

8. Fully open the supply line ball-valve.

9. Slowly close the bypass ball-valve. Ensure the flow rate does not drop below 10 gpm.

10. When the reservoir no longer needs additional fluid, fully open the suction gate valve.

11. Close the reservoir cover.



12. Install the unit's lower right-hand side panel.

Option 3

Arrange for a Thermo Thermo NESLAB service technician to be on-site in order to perform and installation inspection and assist with starting the unit.

Section IV Operation

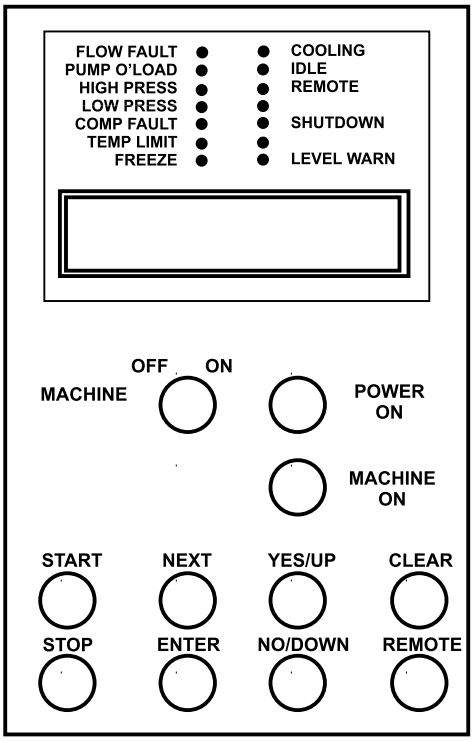
Start Up

Ensure the door latch arm (disconnect) has been on with the POWER ON lamp lit for at least 12 hours. This will allow time for the crankcase oil to be heated and the refrigerant to separate from the oil.

Review the filling requirements given on the previous page.

Partially open the COOLING WATER INLET and OUTLET by turning the valve handles counterclockwise.

Turn the MACHINE OFF/ON switch to the ON position. The MACHINE ON lamp will light. Press the START button. The display will flash STARTING for approximately two minutes.



NOTE: For HX-2000 units, leave the MACHINE ON/OFF switch in the ON position for a minimum of three minutes before starting. This allows the compressor motor overload timer to complete cycling. If the START button is pressed too early, the compressor will not start until the timer has finished its cycle. On some units this may trigger a COMPRESSOR FAULT and a SHUTDOWN cycle. In this case, wait approximately another three minutes then CLEAR all alarms.

NOTE: On starting, if the reservoir fluid temperature is outside the unit's temperature range the unit will run but the TEMP LIMIT LED will flash until the fluid temperature is within the limits.

Shut Down

When the unit is manually shut down using the STOP button, a time delay is activated that allows the refrigeration system and the pump to continue to operate. The system will run in the shutdown mode for 30 seconds. This additional run time allows all refrigerant to be removed from the heat exchanger and for the heat exchanger to warm up.

NOTE: The unit is equipped with a set of valves on the tank inlet and outlet designed to prevent the tank from overflowing when the pump is off.

Shutting the unit off using the MACHINE OFF button, a circuit breaker or other device on the line side of the relay will defeat the purpose of the off cycle and is not recommended. Implement remote on/off control through the controller's serial port.

Unit Controller

MACHINE ON
Energizes the control circuits in preparation for operation.

MACHINE OFF
Immediately de-energizes the control circuits. Do not use this button for normal on/off control, use the STOP button. MACHINE OFF will stop all motors immediately and defeat the normal shut down sequence.

START
Starts the pump, compressor, and heater.

STOP
Initiates shut down sequence.

NEXT
Scrolls through the menus.

ENTER
Confirms entry of numeric values.

YES
Answers Yes to Y/N questions, increments numerical values.

NO
Answers NO to Y/N questions, decrements numerical values.

CLEAR
Clears alarm indications after fault condition has been corrected. Alarm LEDs will remain lit after problem is eliminated to provide indication of problem cause. CLEAR removes these indicators, see Corrective Action on the next page.

REMOTE
Toggles the unit between local and remote operation.

Status LEDs

LED	Indication	Response	Corrective Action
FLOW FAULT	Flow through heat exchanger is low. Pressure drop across exchanger too high (blocked) or flow rate is too low.	Pump and refrigeration stops.	Check recirculating system for flow blocked, frozen exchanger. Press CLEAR, START.
PUMP O'LOAD	Pump motor overload. Overload protector tripped.	Pump and refrigeration stops.	Check supply voltage, pump bearings. Reset motor protector, press CLEAR, START.
HIGH PRESS	Refrigeration high pressure condition. High pressure switch opened.	Refrigeration stops.	Check condenser air flow, dirty condenser. Press CLEAR, START.
LOW PRESS	Refrigeration low pressure condition. Low pressure switch open.	Refrigeration stops.	Check control malfunction, refrigerant leak. Press CLEAR, START.
COMP FAULT	Compressor oil pressure low or motor overload. Oil pressure switch open, motor overload protector trips.	Refrigeration stops.	Check oil sight glass, line voltage. Reset oil pressure switch, press CLEAR, START.
TEMP LIMIT	Temperature has exceed high or low limit settings. Measured temperature is abnormal. The LED may flash during start up, this is normal.	Pump and refrigeration stops.	Check measurement and control systems. LED goes out when temperature is within limits.
FREEZE	Flow through heat exchanger is low and pressure is increasing.	Unit shuts down.	Check fluid mixture for optimum freeze point.
COOLING	Refrigeration active.	Normal operation.	NA
IDLE	Heating active.	Normal Operation.	NA

LED	Indication	Response	Corrective Action
REMOTE	Remote control is selected. Normal operation.	Unit uses remote commands, settings.	NA. Press REMOTE to cancel.
SHUTDOWN	System is in shutdown sequence. Normal operation, motors will stop after ~30 seconds.	Normal shutdown sequence.	NA.
LEVEL WARN	Fluid level is low. Reservoir upper level switch is open.	Normally, pump and refrigeration stops. Unit can be configured to keep running.	Fill reservoir.

Changing a Value

The **YES** key increments the value. The **NO** key decrements the value.

The display will flash as soon as either key is depressed, and will continue to flash until the **ENTER** key is pressed to accept the new value.

The new value will not be used by the controller until the **ENTER** key is depressed and the display stops flashing.

If the **NEXT** key is pressed while the value is flashing, the new value will not be accepted. The display will stop flashing and the original value will be displayed. In this case the **NEXT** key can be used to abort data entry. The display will not sequence unless the **NEXT** key is depress again.

For large values the display can be changed by manipulating the individual digits. Press the **YES** key and the **NO** key at the same time. The most significant digit will start to flash. The **YES** key increments or the **NO** key decrements the digit. Press the **ENTER** key to accept the digit and to move to the next most significant digit. Repeat until all digits are entered. Pressing the **NEXT** key before all digit are entered will abort the procedure and return the display to the original value.

The controller will not allow you to enter a value above the maximum (+40°C) or below the minimum (0°C). If you try to enter an illegal value outside the operating range, the display will revert to its original value.

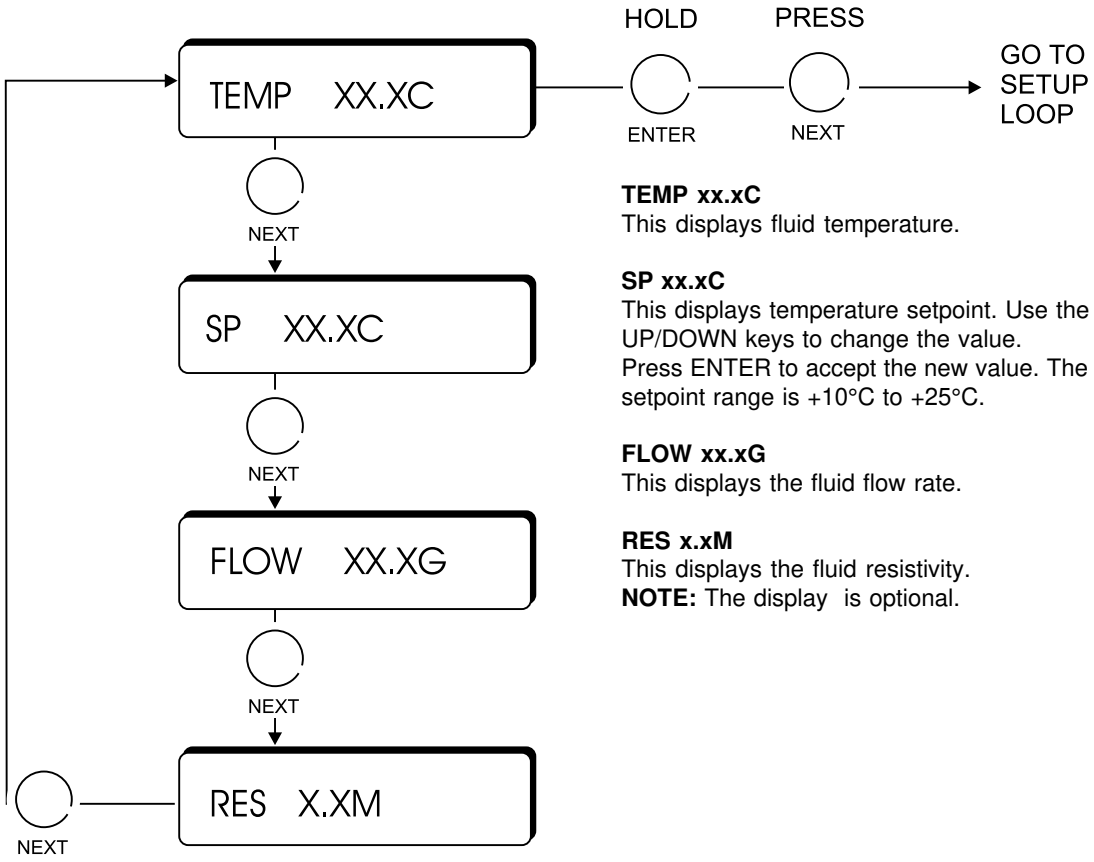
Controller Displays

An alphanumeric display presents numeric readings of various operating conditions within the chiller. Display function is selected by pressing the appropriate keys to move through a menu of available information.

Operator's Loop

When the controller is first powered it goes through a short self-test and then enters the Operator's Loop, displaying the reservoir fluid temperature.

By pressing the NEXT key the controller will step through the menu shown below.



TEMP xx.xC
This displays fluid temperature.

SP xx.xC
This displays temperature setpoint. Use the UP/DOWN keys to change the value. Press ENTER to accept the new value. The setpoint range is +10°C to +25°C.

FLOW xx.xG
This displays the fluid flow rate.

RES x.xM
This displays the fluid resistivity.
NOTE: The display is optional.

Figure 1 Operator's Loop

Setup Loop

The Setup Loop allows the operator to change the temperature fault setpoints, low flow rate (10 GPM minimum), the controller's COOL PID parameters, and to select a low level condition to act as a fault or warning. **NOTE:** Thermo Thermo NESLAB recommends configuring the unit to fault; after a power lose the unit will automatically default to the fault mode.

To enter this loop you must be in the Operator's Loop and displaying the reservoir fluid temperature. Depress and hold the ENTER key then press NEXT. Adjust values with the UP and DOWN keys. Press ENTER for the controller to accept each new entry.

NOTE: Should you desire to return to the supply line temperature display and abort any changes, keep pressing the NEXT until the display reads **SAVE?** then press NO**.**

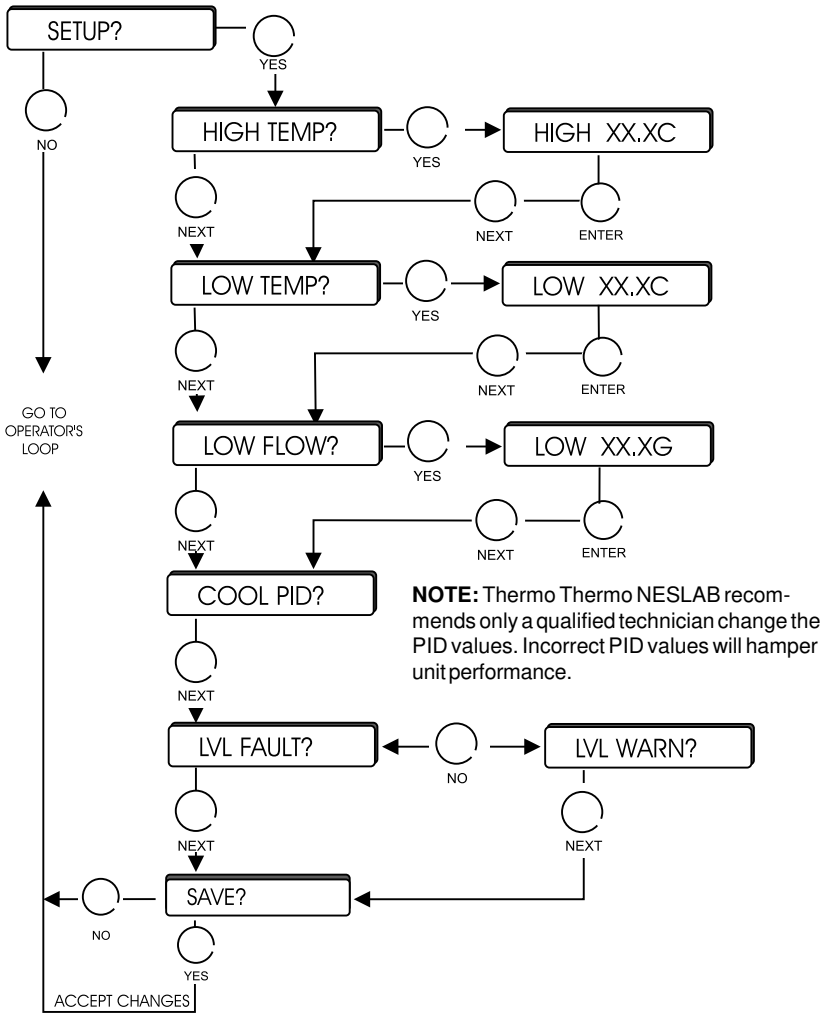


Figure 2 Setup Loop

Remote Operation

Follow the safety precautions and installation procedures outlined in Electrical Connections for the proper remote box installation instructions.

To start the unit the MACHINE ON lamp must be energized.

To operate using the remote box press the REMOTE button on the local controller. The remote box will momentarily display ####### and then display the current reservoir temperature. ####### indicates that communication is not yet established between the local unit and the remote box. If the ####### display does not extinguish check the connections and then toggle the power to the unit. The REMOTE ENABLED LED on the remote box and the REMOTE LED on the local controller will both illuminate.

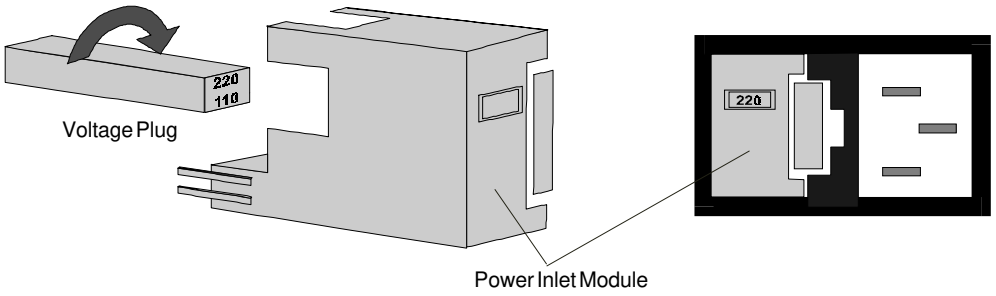
NOTE: If you press STOP on the remote box, you cannot re-enable the remote mode from the remote box.

While in the remote mode, the local controller only mirrors the remote controller's display. However, you can use the local controller to return to the local mode. Press REMOTE, the REMOTE LED will turn off.

The remote box also has a 15-pin connector for standard 10mV/°C temperature output (between pin 7 and referenced to pin 6). It can be used for a chart recorder or other recording device. An optional 0 - 10VDC signal is available.

Configuration

The remote box can be configured for 110V or 220V operation. The voltage is displayed on the power inlet module located on the rear of the remote box. To change the voltage pry the module out from the power connection. Remove the voltage plug from the module and rotate it 180°. Reinstall the plug. The desired voltage should be displayed. Reinstall the inlet module.



Flow Rate

Adjust the flow rate to the system being cooled by turning the COOLING WATER OUTLET valve. Use a flow meter on the COOLING WATER OUTLET to adjust the desired flow rate.

High and Low Temperature Cutout

The High and Low Temperature Cutouts (HTC/LTC) monitor the cooling fluid temperature as it exits the heat exchanger. They prevent the cooling fluid from reaching excessively high or low temperatures that can damage the unit.

In the event of a high temperature fault, the TEMP LIMIT LED will illuminate, and the unit will enter the shut down mode. The unit will remain off and must be manually restarted.

In the event of a low temperature fault, the TEMP LIMIT LED will illuminate and the compressor will shut down. The compressor will remain off until the cooling fluid temperature rises above the cut off point.

The HTC is set at +80°F (+27°C). The LTC is set at +25°F (-6°C). If adjustments are needed, contact our Customer Service Department for assistance.

High and Low Pressure Cutout

The High and Low Pressure Cutouts (HPC/LPC) monitor the refrigeration pressure at the compressor. They prevent excessively high or low pressures that can damage the unit. In the event of a high pressure fault, the HIGH PRESS LED will illuminate and the unit will enter the shut down mode until the refrigeration pressure drops below the cut in point.

During a low pressure fault, the LOW PRESS LED will illuminate and the compressor and discharge fans shut down until the refrigeration pressure rises above the cut in point.

When either condition is identified and corrected, press the CLEAR key before restarting the unit.

Phase Rotation & Voltage Monitor Device

If the POWER ON light is on but the MACHINE ON light is not when the MACHINE ON button is pressed, the input power phase rotation is reversed. This condition may occur at installation. If rotation is reversed, remove power, swap any two line leads at the power entry and then restore power. This should correct a rotation fault.

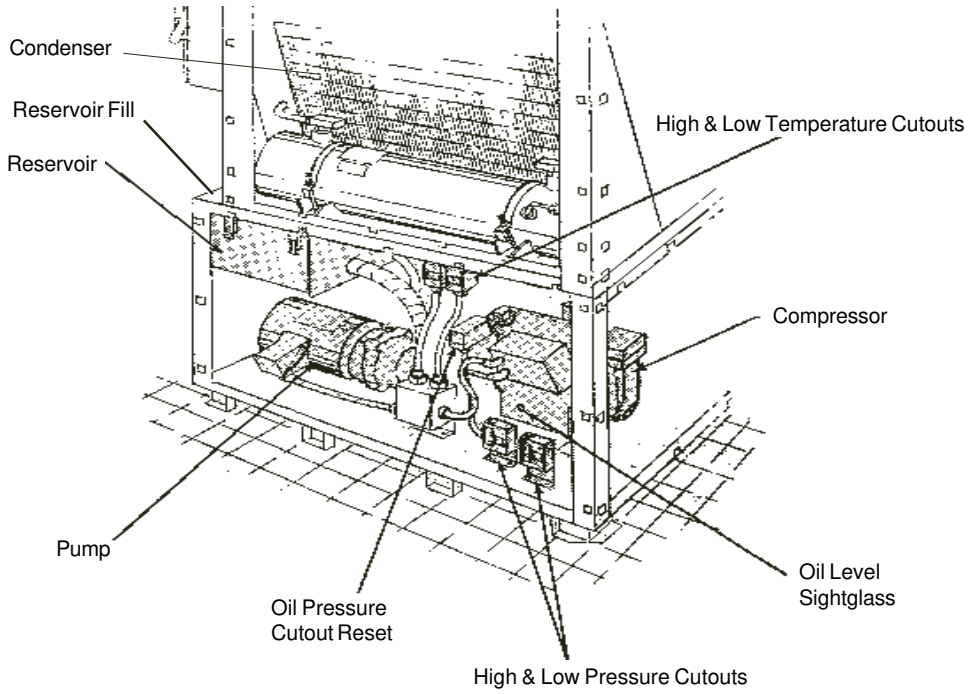
NOTE: With the POWER ON lamp lit, if the red light on the phase voltage monitor located in the electrical enclosure is also lit, the phase rotation is correct.

Oil Pressure Cutout

In the event of low compressor oil pressure, the Oil Pressure Cutout will shut down the compressor and the discharge fans.

After the failure has been corrected, the cut out must be reset. Push the Oil Pressure Cutout Reset button located next to the compressor.

Press the CLEAR button before restarting the unit.



NOTE: Refrigerant sightglass is located on the other side of the unit (opposite to the compressor).

Section VI Safety Features

Safety Features

The unit is equipped with the following safety features designed to protect the unit in case of failure. LED lamps are mounted on the control panel on the electrical enclosure, and indicate operational status.

Low Fluid Level

The low fluid level monitor is connected to a float switch in the reservoir. If the reservoir level drops below a safe operating level, the LEVEL WARN LED will light. The unit's reaction will depend on how it is configured in the Setup Loop.

Pump

In the event of any of the following conditions, the PUMP O'LOAD LED will illuminate and the unit will shut down. The failure must be identified and corrected before the unit can be restarted.

- Loss of circulating flow, in the event of pump failure or ruptured pump lines.

- Pump motor thermal overload.

- High cooling fluid temperature (adjustable).

- High refrigeration pressure.

Refrigeration

In the event of any of the following conditions, the COMP FAULT will illuminate and the compressor and discharge fans will shut down. The pump/circulating system will remain operating until the STOP button is depressed, or until the operating temperature reaches the High Temperature Cutout setting. This allows a temporary supply of cooling fluid to the instrument being cooled until the instrument being cooled can safely be turned off.

- Low compressor oil pressure.

- Low refrigeration pressure.

- Low cooling fluid temperature (adjustable).

- Compressor motor thermal overload.

In the event of any of the following conditions, the COMP FAULT LED will illuminate and the unit will shut down:

- High refrigeration pressure.

- High cooling fluid temperature (adjustable).

If your unit fails to operate properly, contact our Customer Service Department for assistance.

Section VII Maintenance

Service Contracts

Thermo Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down time for your unit. For more information, contact our Customer Service Department.

Displaying Software Version

To display the software version ensure the controller is in the Operator's Loop and displaying the reservoir fluid temperature. Depress and hold the ENTER key. Press the YES NO YES keys and the display will indicate CALIBRATE? While continuing to hold the ENTER key press the YES NO YES keys again. The display will now indicate the software version, for example 000550.64B.

Press NO and the display will return to the Operator's Loop.

Compressor Oil

Check the compressor oil level after 24 hours of operation. The minimum oil level is ½ full. If the level is lower, contact our Customer Service Department.

Cleaning

A build up of dust and debris on the condenser can cause a loss of cooling capacity. Periodically clean the condensers by removing the expanded metal grilles and blowing compressed air through the condensers or by hosing them down with water. The frequency of cleaning depends on the operating environment.

Refrigeration Data

Set High pressure switch: cut out 390 psi / cut in 250 psi.
Set Low pressure switch: cut out 5 psi / cut in 40 psi.

Charge unit with R-22 refrigerant as shown in the table. Run unit with recirculating fluid maintained at 27°C. Adjust pressures to conform:

	US measure	**Metric measure**
Amount	75 pounds	34 kg
Hot gas valve	60 PSIG	415 kPa
Suction pressure	68 - 85 PSIG	470 - 586 kPa
Discharge pressure	280 - 320 PSIG	1930 - 2200 kPa
Speed check	not specified	not specified

Hot Gas setting is observed on the suction gauge when the unit is in the heat/idle cycle.

Parts List

Our Customer Service Department can provide you with a complete list of spare parts for your unit. Phone numbers and addresses for all our Thermo Thermo NESLAB Sales Centers are located in the front of this manual (see Preface, After-sale Support). Before calling, *please* obtain the following information:

Software version

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. Thermo NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Thermo NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 1000-4-2:1995
	IEC 1000-4-3:1994
	IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

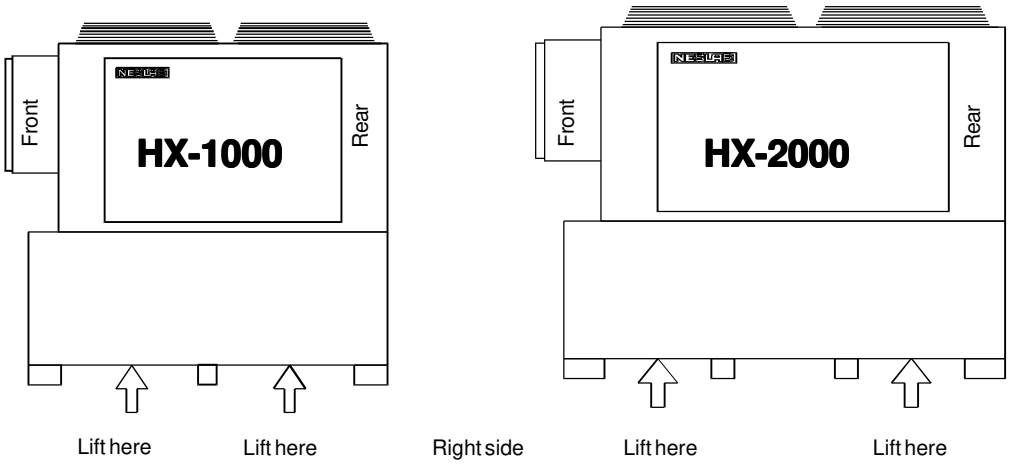
Units sold in North America are shipped on a wooden pallet and wrapped in protective plastic. Do not remove the banding or protective plastic until the unit is in its final location.

Units sold outside North America are shipped in a wooden crate. Do not disassemble the crate until the unit is in its final location.

The unit is secured to the pallet by lag bolts. HX-1000 units have 10 bolts, HX-2000 units have 12. Remove the lag bolts and the pallet before placing the unit on the foundation.

Lift Points

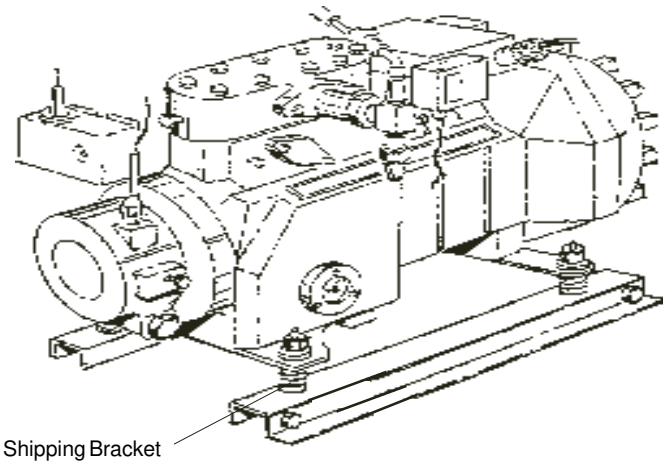
The unit is constructed on 4 inch (10.16 centimeter) high feet, each made of 14 gauge steel. HX-1000 units have 6 feet, HX-2000 units have 8. The unit construction provides a 4 inch clearance from the ground. Use a fork lift truck to lift and move the unit. Insert the forks as shown.



Pre-Start Up

Remove the panels to access the compressor area.

Loosen the four compressor mounting nuts until there is approximately 1/8" clearance between each compression mounting foot and the shipping bracket. This allows the compressor to "float" on the mounting rings.



To avoid damage to the compressor, tighten the mounting nuts before moving the unit.

Warranty

The unit has a warranty against defective parts and workmanship is for one full year from date of shipment. See back page for more details.

After-Sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, please contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, please contact our Customer Service Department.

Before calling, *please* refer to the serial number label in the electrical enclosure to obtain the following information:

- BOM number _____

- Serial number _____

- Software version (see page 25) _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Never operate the unit without cooling fluid.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Always turn off the unit and disconnect from the line cord before performing any service or maintenance procedures.

Never operate equipment with damaged line cords.

In addition to the safety warnings listed above, warnings are posted through out the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with test highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

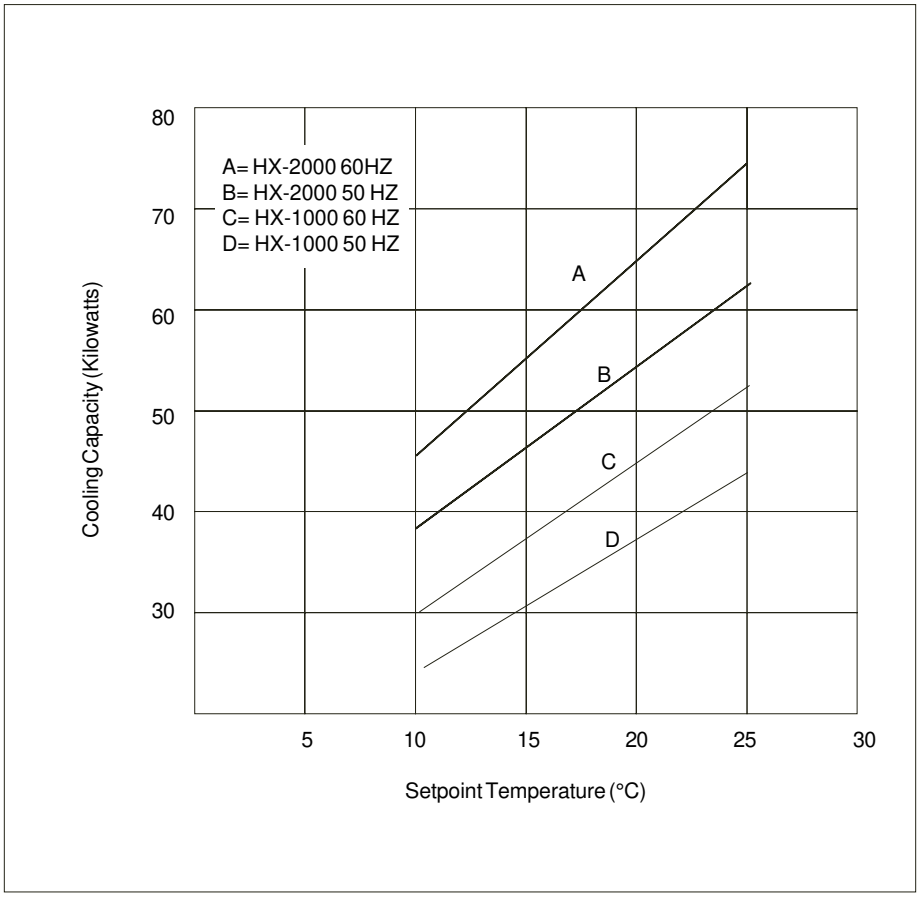
Your HX Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and pressure.

The unit consists of a reservoir, circulating pump, air-cooled refrigeration system, and a digital temperature controller. The unit can run from a remote monitoring/controlling device.

The unit is designed for all-weather use. This allows heat produced by the instrument being cooled to be discharged outdoors. The high capacity pump allows the unit to be located a great distance from the instrument being cooled. The pump flow is adjustable at the unit.

Specifications

Cooling Capacity



Temperature Range	+10°C to +25°C
Temperature Stability[1]	±1.0°C
Pump Capacity	
	HX-1000	**HX-2000**
Compressor	10 hp	20 hp
Dimensions (H x W x D)		
Inches	73½ X 58 X 30	76 x 67¼ x 34
Centimeters	186.7 x 147.3 x 76.2	193.0 X 170.8 X 86.4
Shipping Weight		
Pounds	1612	2061
Kilograms	731	945

1. Specifications listed for units under full load circulating at 25°C, ambient 21°C, with 50% water and 50% Ethylene Glycol as coolant. Specifications will be affected by changes in temperature, ambient, or fluids. Specifications subject to change.

Section III Installation

Site

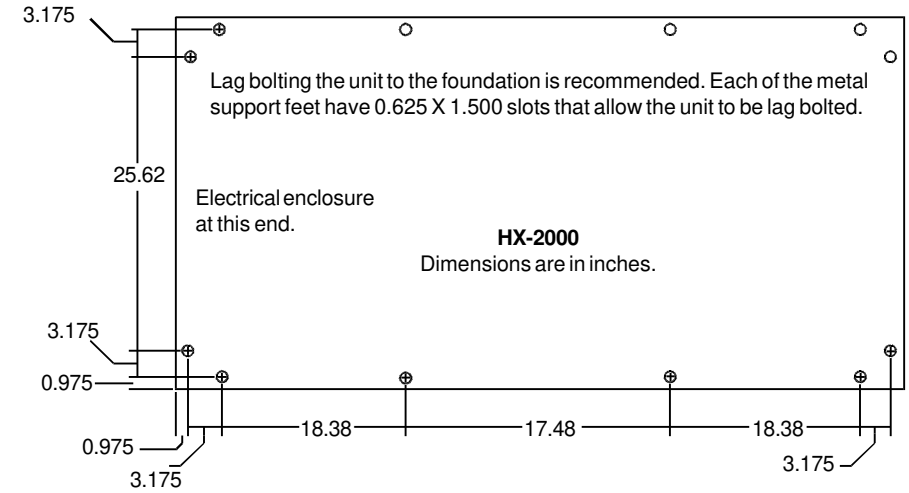
Install the unit on a well-constructed level surface, able to withstand a distributed load of 3000 pounds (1360 kilograms) for HX-2000 units, 1700 pounds (770 kilograms) for HX-1000 units.

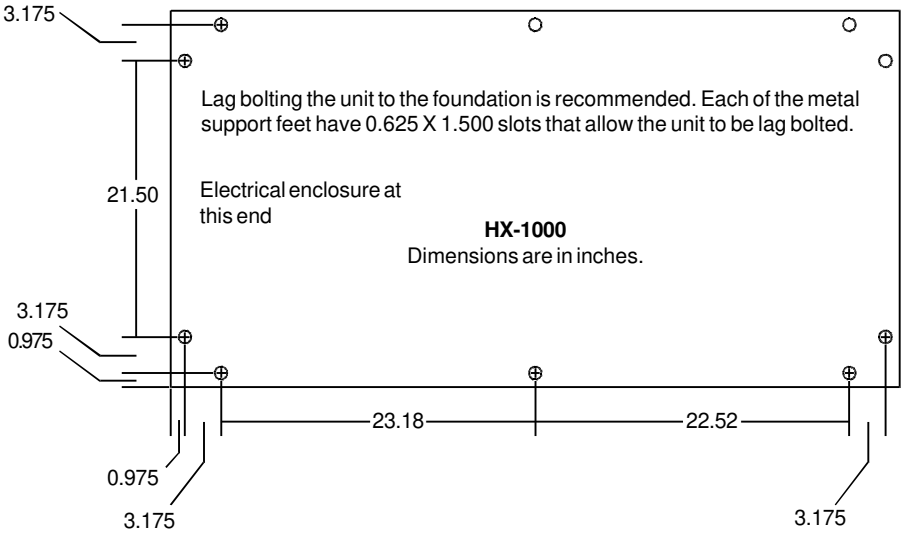
The unit has an air-cooled refrigeration system. Air is drawn through the slotted metal grilles on either side of the unit, and exhausted through the fans on top of the unit. Air flow through the fans is 12300 feet^3/minute for HX-2000 units, 6500 feet^3/minute for HX-1000 units.

The unit should be placed in an area where the air intake and discharge are not impeded. A minimum clearance of 3.5 feet (1 meter) on all four sides and 7 feet (2 meters) above the unit is necessary for adequate air flow and easy access to the side panels for service and maintenance.

The ambient range of the unit is -10°F to +110°F (-22°C to +43°C).

NOTE: If the chiller is subject to high-ambient temperatures (above 100°F), Thermo Thermo NESLAB recommends providing it as much shade as possible. High-ambient temperatures and direct sunlight can generate high-refrigerant pressures capable of shutting down the unit.





Pre-Start Up

Remove the two side access panels and the rear access panel (opposite end from the electrical enclosure) to access the compressor area. Check the compressor oil level through the sight glass on the compressor crankcase. It is identified as the glass port hole in the compressor wall. The oil level should be no less than ½ full. If the oil is below ½, contact Thermo Thermo NESLAB Service.

Check the refrigerant sightglass. If the dot in the middle of the sightglass is green, the refrigerant is normal. If the dot is yellow, the refrigerant is contaminated. Contact our Service Department for assistance.

Close the COOLING WATER INLET and OUTLET by turning the valve handles fully clockwise.

Make sure the grilles on the sides of the unit (covering condensers) and the fans on the top of the unit are free of obstructions.

After all electrical and plumbing connections have been completed, close the enclosure door and secure the door latch arm (disconnect).

The unit is equipped with a set of valves on the tank inlet and outlet which prevent the tank from overflowing when the pump is off.

The unit has an automatic compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant and the crankcase oil from mixing. Before initial start up, or after storage, the unit must be connected to the power source for at least 12 hours before turning the unit on. This will allow time for the crankcase oil to be heated and the refrigerant to separate from the oil.

For HX-2000 units, apply power to the unit for a minimum of three minutes before starting. This allows the compressor motor overload timer to complete cycling. If the START button is pressed too early, the compressor will not start until the timer has finished its cycle. On some units this may trigger a compressor fault and a shutdown cycle. In this case, wait approximately another three minutes then clear all alarms. Restart the unit.

Electrical Requirements

Refer to the serial number label on the inside of the electrical enclosure for the specific electrical requirements of your unit. Also on the inside of the enclosure, ensure the voltage setting on the phase monitor voltage arrow is correct.

Electrical Connections

For personal safety and equipment reliability, this procedure should be performed by a qualified service technician familiar with the safety procedures required for working inside an energized disconnect box.

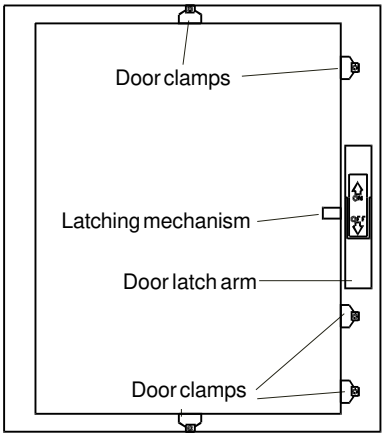
A unit wiring diagram is located in the document sleeve inside the door of the electrical enclosure. Wire the unit in conformance to local, state and federal electrical codes. Check all wiring to make sure it is properly connected and protected from the elements.

Install a conduit connector in the wall of the electrical enclosure; a hole must be drilled in the enclosure to accommodate the connector. The location of the hole is user-defined; the hole can be drilled in any of the four enclosure wall (except the upper left side wall, where the control panel is located). This allows the power supply to be installed in the enclosure at a point that is convenient for the user.

Use four-wire cable to connect the appropriate power supply (see Electrical Requirements) to the main circuit breaker located on the right side of the enclosure. For ground, use the copper terminal board on the bottom of the enclosure. Install a second circuit breaker at the power source. This second circuit breaker prevents exposure to “live” wires during installation.

The door latch arm on the enclosure activates the main disconnect for the power supply to the unit. When the door is closed, the disconnect is engaged when the latch arm is pulled up to the ON position. The POWER ON lamp on the control panel indicates the status of the disconnect.

The five door clamps must be secured for the enclosure to be weather-tight.



Electrical enclosure (the door has been omitted for clarity)

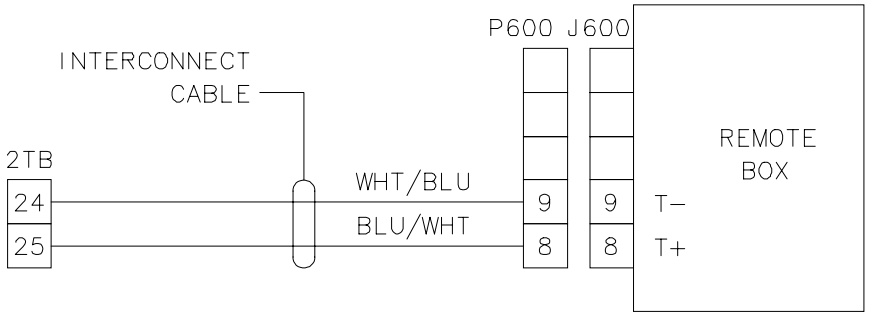
Remote Box Electrical Connections

For personal safety and equipment reliability, this procedure must be performed by a qualified service technician familiar with the safety procedures required for working inside an energized disconnect box.

Wiring diagrams are located inside the document sleeve inside the electrical enclosure. Wire the unit in conformance to all local, state and federal electrical codes. Check all wiring and make sure it is properly connected and protected from the elements.

Install a conduit connector in the wall of the unit's electrical enclosure. A hole must be drilled in the electrical enclosure to accommodate the connectors. The location of the hole is user-defined; this allows the connecting cable to be installed in the electrical enclosure at a point that is convenient to the user. The hole can be drilled in any of the four enclosure walls.

Wire the connections for the remote box as shown. 2TB is located inside the electrical enclosure, on the left-hand side.



Plumbing Requirements

The inlet and outlet of the unit are labelled COOLING WATER INLET and OUTLET. These connections are 1¼ inch FPT.

Follow good plumbing practices to minimize unnecessary bends and restrictions that will increase the pressure drop through the circulating lines. Refer to Pressure Drop Chart on the next page to estimate the pressure drop through various diameter tube lengths.

Insulate all tubes and fittings to minimize loss of cooling capacity. This is extremely important in areas of ambient extremes or when the unit is located a great distance from the instrument being cooled. All tubing and fittings should be weather resistant, able to endure high and low ambient conditions, and able to withstand a maximum pressure of 120 psi.

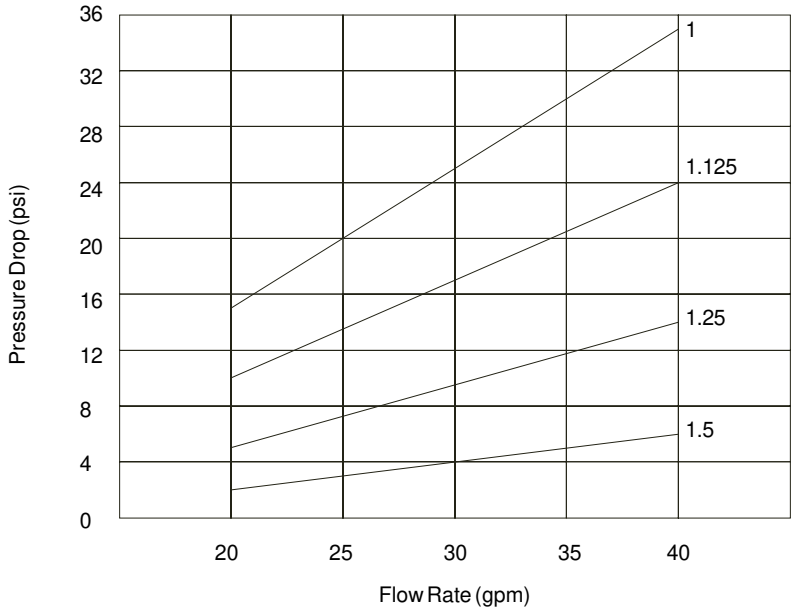
Insulating hose is available from Thermo Thermo NESLAB. Contact our Sales Department for more information.

	A	B	C	D
HX-1000	9.375	8.5	5	16.3125
HX-2000	9.375	10.215	5	18.875

Dimensions of the inlet and outlet.
Dimensions are in inches.

Use the Pump Capacity Chart (see Specifications) and the Pressure Drop Chart to calculate the maximum distance you can locate the unit from the system being cooled. Find the point on the Pump Capacity Chart that matches the flow and pressure requirements of the system being cooled. From that point, estimate the pressure difference between the pump performance line, and the point you have chosen on the graph. This net pressure value, used with the Pressure Drop Chart, will help determine the maximum distance from the chiller to the system being cooled and the tubing diameter (ID).

NOTE: The unit is equipped with a set of valves on the tank inlet and outlet which prevent the tank from overflowing when the pump is off.



Material: 100 feet copper tubing. Dimensions are inside diameter (ID), measured in inches.

Fluid

A non-freezing fluid is required for operation at any recirculating or ambient temperature. The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Due to the physical nature of a plate heat exchanger, and its response to temperature changes, 100% water must not be used as a circulating fluid. Using 100% water may cause the plate heat exchanger to rupture.

Never use corrosive or flammable fluids with this unit.

Never use automotive antifreeze. Commercial antifreeze contains silicates that can cause permanent damage to the pump seals.

Noncompliance with the statements in the section can result in damage to the unit and will void the manufacturer's warranty. For more information contact our Sales Department (see Preface, After-sale Support).

The wetted parts are:

- *Stainless steel*
- *Bronze*
- *Brass*
- *Copper*
- *PVC Plastic*

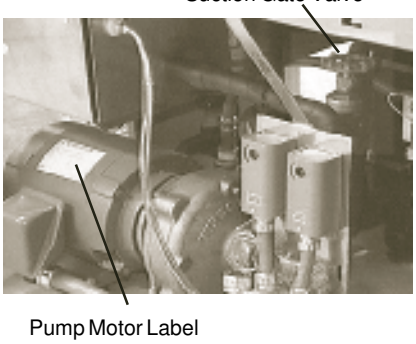
Filling Requirements

Ensure the INLET and OUTLET valves on the front of the outside of the unit are closed.

Open the unit's lower-right hand side panel and locate the 1¼" suction gate valve. (It is the largest valve in the unit and is located between the reservoir and compressor.)

Ensure the suction gate valve is fully closed.

The unit is equipped with a low flow cutout. While filling the unit it is important to ensure that the cutout senses a minimum of 10 gpm through the return line, and that the reservoir does not run dry.



Running the reservoir dry may permanently damage the pump seals.

Three possible options for filling the lines without running the reservoir dry or causing the unit to cut out on low flow are:

Option #1

1. Connect the INLET/OUTLET recirculation lines from the HX to your application.
2. Pre-fill the circulation lines with the appropriate mixture of a non-freezing fluid.
3. Remove the reservoir cover located under the electrical enclosure. Fill the reservoir approximately ¾ full. Start the unit and allow it to run 15 - 20 minutes.
4. Slowly open the OUTLET valve. **Opening the valve too quickly will cause water-hammering.**
5. Keep the reservoir topped off to within one inch of the top. (There could be some substantial splashing from the reservoir as air is purged from the lines.)
6. Your application may be started at this time.
7. As the recirculation lines continue to fill, keep topping off the reservoir.
8. When the reservoir no longer needs additional fluid, fully open the suction gate valve.
9. Allow the unit to run 10 to 15 minutes to purge any remaining air.
10. Ensure the reservoir is filled to within one inch of the top.
11. Close the reservoir cover.
12. Install the unit's lower right-hand side panel.

Option # 2

Refer to the diagram below and install a bypass assembly with two ball-valves and a flow meter in the circulation lines.

1. Ensure both ball-valves are closed.

2. Remove the reservoir cover located under the electrical enclosure. Fill the reservoir approximately ¾ full. Start the unit and allow it to run 15-20 minutes.

3. Slowly open the OUTLET valve. **Opening the valve too quickly will cause water-hammering.**

4. Slowly open the bypass ball-valve so the flow on the return line is 20 gpm.

5. Slowly open the supply line ball-valve. A reservoir fluid loss will occur as the lines start to fill, continually fill the reservoir as the fluid level drops. Open the supply line ball-valve to a point where there is enough flow to fill the lines in a reasonable amount of time, and at a flow rate equal to the ability to replenish the reservoir fluid. **If the flow drops below 10 gpm the low-flow cutout will trip.**

6. Ensure all the circulation lines are full and free of air, and that the reservoir is filled to within 1 inch of the top. If desired, calculate the total amount of fluid required to fill the lines and stop filling when that amount is consumed. It will take some time to bleed air from the system.

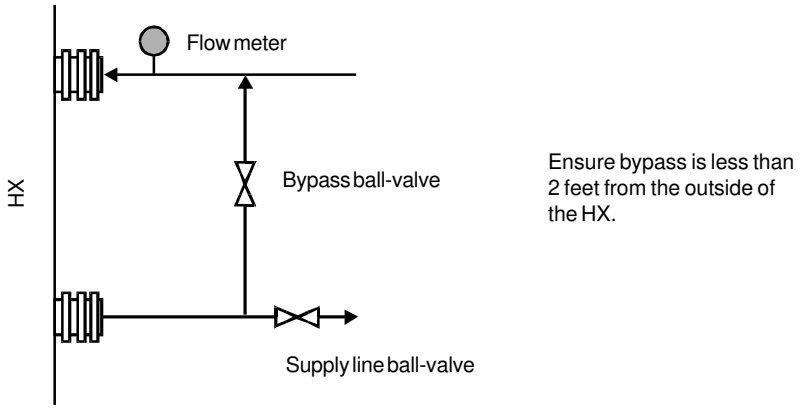
7. Your application may be started at this time.

8. Fully open the supply line ball-valve.

9. Slowly close the bypass ball-valve. Ensure the flow rate does not drop below 10 gpm.

10. When the reservoir no longer needs additional fluid, fully open the suction gate valve.

11. Close the reservoir cover.



12. Install the unit's lower right-hand side panel.

Option 3

Arrange for a Thermo Thermo NESLAB service technician to be on-site in order to perform and installation inspection and assist with starting the unit.

Section IV Operation

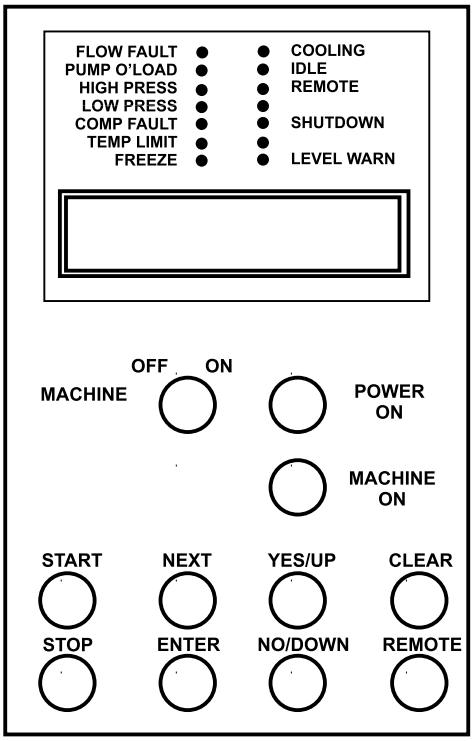
Start Up

Ensure the door latch arm (disconnect) has been on with the POWER ON lamp lit for at least 12 hours. This will allow time for the crankcase oil to be heated and the refrigerant to separate from the oil.

Review the filling requirements given on the previous page.

Partially open the COOLING WATER INLET and OUTLET by turning the valve handles counterclockwise.

Turn the MACHINE OFF/ON switch to the ON position. The MACHINE ON lamp will light. Press the START button. The display will flash STARTING for approximately two minutes.



NOTE: For HX-2000 units, leave the MACHINE ON/OFF switch in the ON position for a minimum of three minutes before starting. This allows the compressor motor overload timer to complete cycling. If the START button is pressed too early, the compressor will not start until the timer has finished its cycle. On some units this may trigger a COMPRESSOR FAULT and a SHUTDOWN cycle. In this case, wait approximately another three minutes then CLEAR all alarms.

NOTE: On starting, if the reservoir fluid temperature is outside the unit's temperature range the unit will run but the TEMP LIMIT LED will flash until the fluid temperature is within the limits.

Shut Down

When the unit is manually shut down using the STOP button, a time delay is activated that allows the refrigeration system and the pump to continue to operate. The system will run in the shutdown mode for 30 seconds. This additional run time allows all refrigerant to be removed from the heat exchanger and for the heat exchanger to warm up.

NOTE: The unit is equipped with a set of valves on the tank inlet and outlet designed to prevent the tank from overflowing when the pump is off.

Shutting the unit off using the MACHINE OFF button, a circuit breaker or other device on the line side of the relay will defeat the purpose of the off cycle and is not recommended. Implement remote on/off control through the controller's serial port.

Unit Controller

MACHINE ON
Energizes the control circuits in preparation for operation.

MACHINE OFF
Immediately de-energizes the control circuits. Do not use this button for normal on/off control, use the STOP button. MACHINE OFF will stop all motors immediately and defeat the normal shut down sequence.

START
Starts the pump, compressor, and heater.

STOP
Initiates shut down sequence.

NEXT
Scrolls through the menus.

ENTER
Confirms entry of numeric values.

YES
Answers Yes to Y/N questions, increments numerical values.

NO
Answers NO to Y/N questions, decrements numerical values.

CLEAR
Clears alarm indications after fault condition has been corrected. Alarm LEDs will remain lit after problem is eliminated to provide indication of problem cause. CLEAR removes these indicators, see Corrective Action on the next page.

REMOTE
Toggles the unit between local and remote operation.

Status LEDs

LED	Indication	Response	Corrective Action
FLOW FAULT	Flow through heat exchanger is low. Pressure drop across exchanger too high (blocked) or flow rate is too low.	Pump and refrigeration stops.	Check recirculating system for flow blocked, frozen exchanger. Press CLEAR, START.
PUMP O'LOAD	Pump motor overload. Overload protector tripped.	Pump and refrigeration stops.	Check supply voltage, pump bearings. Reset motor protector, press CLEAR, START.
HIGH PRESS	Refrigeration high pressure condition. High pressure switch opened.	Refrigeration stops.	Check condenser air flow, dirty condenser. Press CLEAR, START.
LOW PRESS	Refrigeration low pressure condition. Low pressure switch open.	Refrigeration stops.	Check control malfunction, refrigerant leak. Press CLEAR, START.
COMP FAULT	Compressor oil pressure low or motor overload. Oil pressure switch open, motor overload protector trips.	Refrigeration stops.	Check oil sight glass, line voltage. Reset oil pressure switch, press CLEAR, START.
TEMP LIMIT	Temperature has exceed high or low limit settings. Measured temperature is abnormal. The LED may flash during start up, this is normal.	Pump and refrigeration stops.	Check measurement and control systems. LED goes out when temperature is within limits.
FREEZE	Flow through heat exchanger is low and pressure is increasing.	Unit shuts down.	Check fluid mixture for optimum freeze point.
COOLING	Refrigeration active.	Normal operation.	NA
IDLE	Heating active.	Normal Operation.	NA

LED	Indication	Response	Corrective Action
REMOTE	Remote control is selected. Normal operation.	Unit uses remote commands, settings.	NA. Press REMOTE to cancel.
SHUTDOWN	System is in shutdown sequence. Normal operation, motors will stop after ~30 seconds.	Normal shutdown sequence.	NA.
LEVEL WARN	Fluid level is low. Reservoir upper level switch is open.	Normally, pump and refrigeration stops. Unit can be configured to keep running.	Fill reservoir.

Changing a Value

The **YES** key increments the value. The **NO** key decrements the value.

The display will flash as soon as either key is depressed, and will continue to flash until the **ENTER** key is pressed to accept the new value.

The new value will not be used by the controller until the **ENTER** key is depressed and the display stops flashing.

If the **NEXT** key is pressed while the value is flashing, the new value will not be accepted. The display will stop flashing and the original value will be displayed. In this case the **NEXT** key can be used to abort data entry. The display will not sequence unless the **NEXT** key is depress again.

For large values the display can be changed by manipulating the individual digits. Press the **YES** key and the **NO** key at the same time. The most significant digit will start to flash. The **YES** key increments or the **NO** key decrements the digit. Press the **ENTER** key to accept the digit and to move to the next most significant digit. Repeat until all digits are entered. Pressing the **NEXT** key before all digit are entered will abort the procedure and return the display to the original value.

The controller will not allow you to enter a value above the maximum (+40°C) or below the minimum (0°C). If you try to enter an illegal value outside the operating range, the display will revert to its original value.

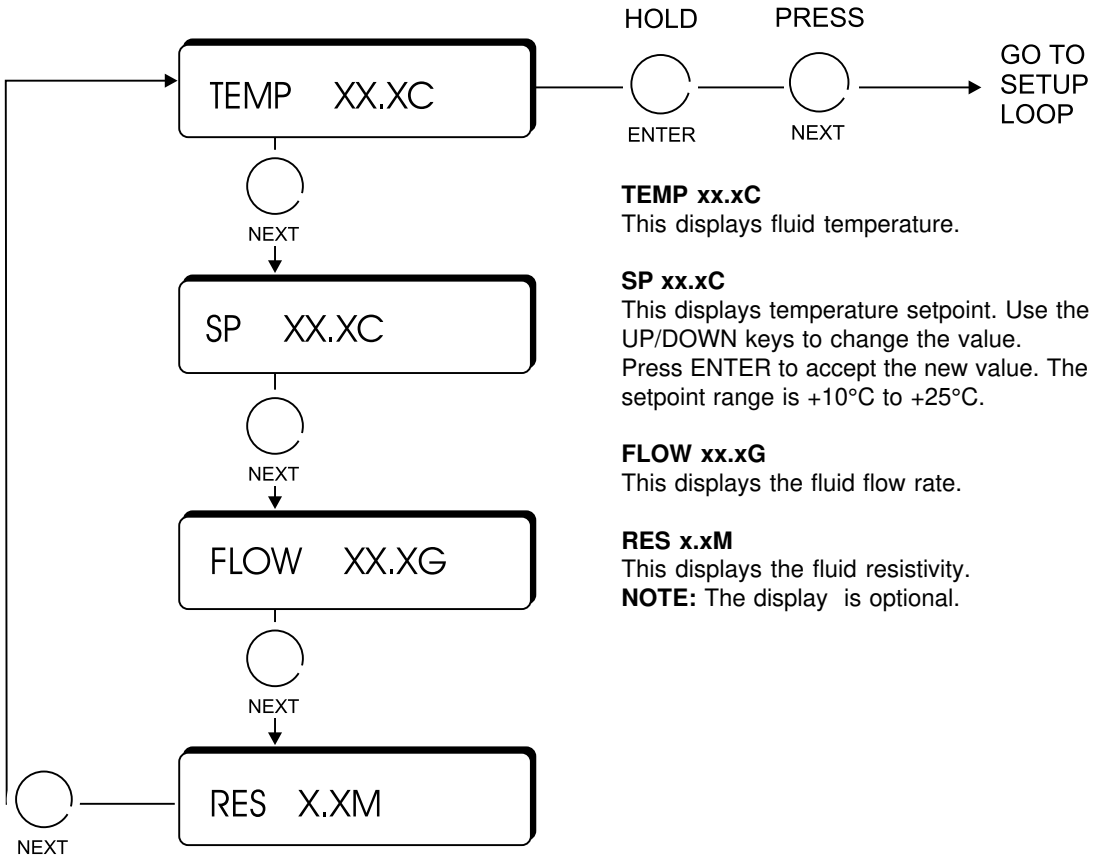
Controller Displays

An alphanumeric display presents numeric readings of various operating conditions within the chiller. Display function is selected by pressing the appropriate keys to move through a menu of available information.

Operator's Loop

When the controller is first powered it goes through a short self-test and then enters the Operator's Loop, displaying the reservoir fluid temperature.

By pressing the NEXT key the controller will step through the menu shown below.



TEMP xx.xC
This displays fluid temperature.

SP xx.xC
This displays temperature setpoint. Use the UP/DOWN keys to change the value. Press ENTER to accept the new value. The setpoint range is +10°C to +25°C.

FLOW xx.xG
This displays the fluid flow rate.

RES x.xM
This displays the fluid resistivity.
NOTE: The display is optional.

Figure 1 Operator's Loop

Setup Loop

The Setup Loop allows the operator to change the temperature fault setpoints, low flow rate (10 GPM minimum), the controller's COOL PID parameters, and to select a low level condition to act as a fault or warning. **NOTE:** Thermo Thermo NESLAB recommends configuring the unit to fault; after a power lose the unit will automatically default to the fault mode.

To enter this loop you must be in the Operator's Loop and displaying the reservoir fluid temperature. Depress and hold the ENTER key then press NEXT. Adjust values with the UP and DOWN keys. Press ENTER for the controller to accept each new entry.

NOTE: Should you desire to return to the supply line temperature display and abort any changes, keep pressing the NEXT until the display reads **SAVE?** then press NO**.**

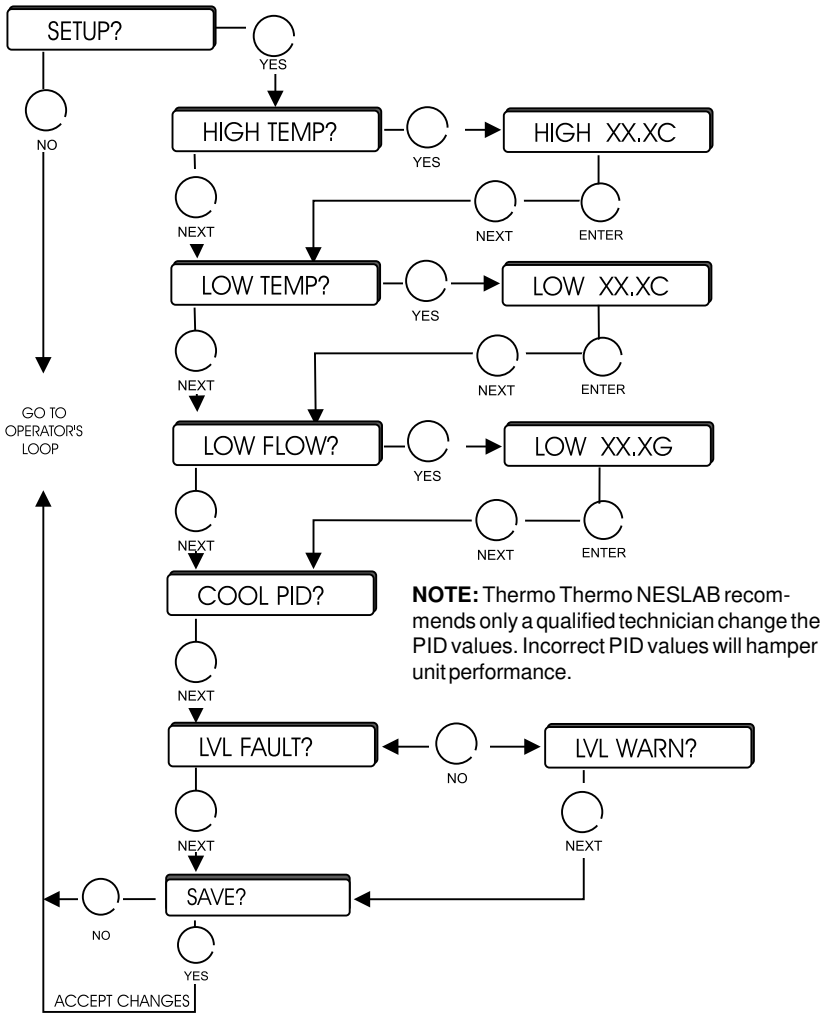


Figure 2 Setup Loop

Remote Operation

Follow the safety precautions and installation procedures outlined in Electrical Connections for the proper remote box installation instructions.

To start the unit the MACHINE ON lamp must be energized.

To operate using the remote box press the REMOTE button on the local controller. The remote box will momentarily display ####### and then display the current reservoir temperature. ####### indicates that communication is not yet established between the local unit and the remote box. If the ####### display does not extinguish check the connections and then toggle the power to the unit. The REMOTE ENABLED LED on the remote box and the REMOTE LED on the local controller will both illuminate.

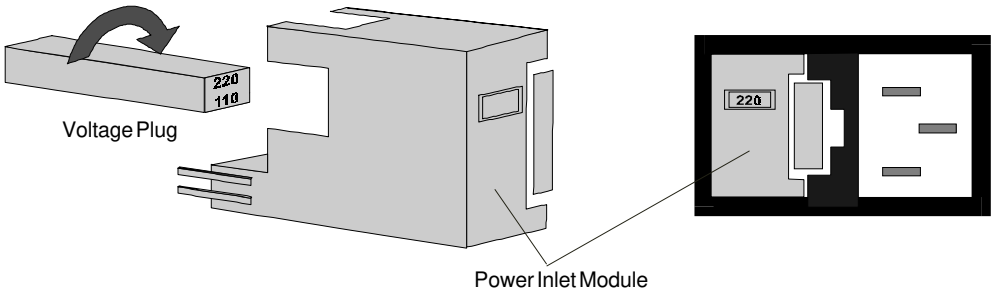
NOTE: If you press STOP on the remote box, you cannot re-enable the remote mode from the remote box.

While in the remote mode, the local controller only mirrors the remote controller's display. However, you can use the local controller to return to the local mode. Press REMOTE, the REMOTE LED will turn off.

The remote box also has a 15-pin connector for standard 10mV/°C temperature output (between pin 7 and referenced to pin 6). It can be used for a chart recorder or other recording device. An optional 0 - 10VDC signal is available.

Configuration

The remote box can be configured for 110V or 220V operation. The voltage is displayed on the power inlet module located on the rear of the remote box. To change the voltage pry the module out from the power connection. Remove the voltage plug from the module and rotate it 180°. Reinstall the plug. The desired voltage should be displayed. Reinstall the inlet module.



Flow Rate

Adjust the flow rate to the system being cooled by turning the COOLING WATER OUTLET valve. Use a flow meter on the COOLING WATER OUTLET to adjust the desired flow rate.

High and Low Temperature Cutout

The High and Low Temperature Cutouts (HTC/LTC) monitor the cooling fluid temperature as it exits the heat exchanger. They prevent the cooling fluid from reaching excessively high or low temperatures that can damage the unit.

In the event of a high temperature fault, the TEMP LIMIT LED will illuminate, and the unit will enter the shut down mode. The unit will remain off and must be manually restarted.

In the event of a low temperature fault, the TEMP LIMIT LED will illuminate and the compressor will shut down. The compressor will remain off until the cooling fluid temperature rises above the cut off point.

The HTC is set at +80°F (+27°C). The LTC is set at +25°F (-6°C). If adjustments are needed, contact our Customer Service Department for assistance.

High and Low Pressure Cutout

The High and Low Pressure Cutouts (HPC/LPC) monitor the refrigeration pressure at the compressor. They prevent excessively high or low pressures that can damage the unit. In the event of a high pressure fault, the HIGH PRESS LED will illuminate and the unit will enter the shut down mode until the refrigeration pressure drops below the cut in point.

During a low pressure fault, the LOW PRESS LED will illuminate and the compressor and discharge fans shut down until the refrigeration pressure rises above the cut in point.

When either condition is identified and corrected, press the CLEAR key before restarting the unit.

Phase Rotation & Voltage Monitor Device

If the POWER ON light is on but the MACHINE ON light is not when the MACHINE ON button is pressed, the input power phase rotation is reversed. This condition may occur at installation. If rotation is reversed, remove power, swap any two line leads at the power entry and then restore power. This should correct a rotation fault.

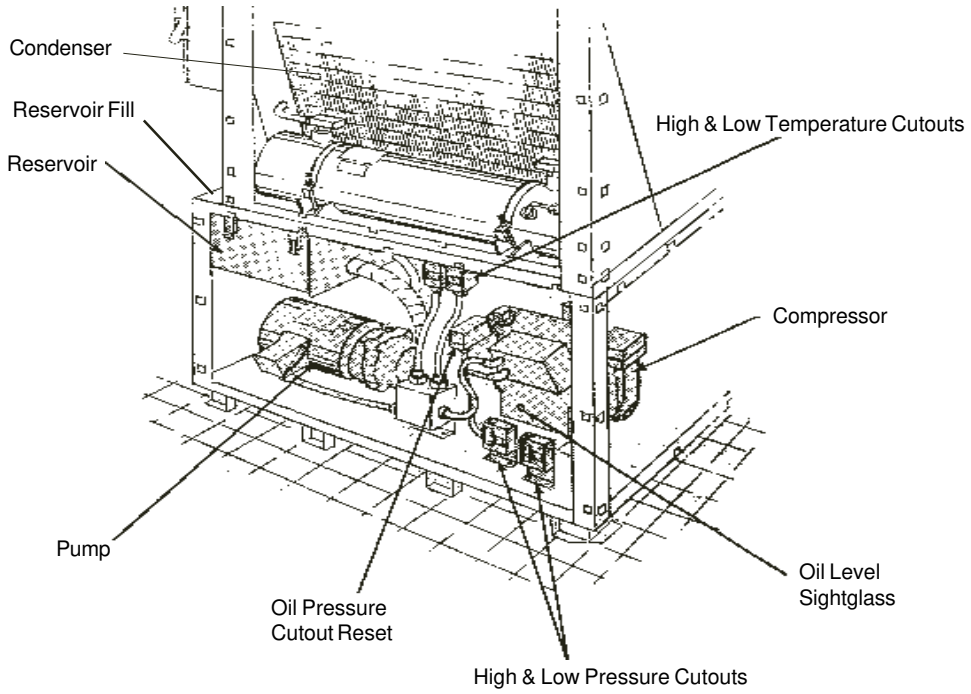
NOTE: With the POWER ON lamp lit, if the red light on the phase voltage monitor located in the electrical enclosure is also lit, the phase rotation is correct.

Oil Pressure Cutout

In the event of low compressor oil pressure, the Oil Pressure Cutout will shut down the compressor and the discharge fans.

After the failure has been corrected, the cut out must be reset. Push the Oil Pressure Cutout Reset button located next to the compressor.

Press the CLEAR button before restarting the unit.



NOTE: Refrigerant sightglass is located on the other side of the unit (opposite to the compressor).

Section VI Safety Features

Safety Features

The unit is equipped with the following safety features designed to protect the unit in case of failure. LED lamps are mounted on the control panel on the electrical enclosure, and indicate operational status.

Low Fluid Level

The low fluid level monitor is connected to a float switch in the reservoir. If the reservoir level drops below a safe operating level, the LEVEL WARN LED will light. The unit's reaction will depend on how it is configured in the Setup Loop.

Pump

In the event of any of the following conditions, the PUMP O'LOAD LED will illuminate and the unit will shut down. The failure must be identified and corrected before the unit can be restarted.

- Loss of circulating flow, in the event of pump failure or ruptured pump lines.

- Pump motor thermal overload.

- High cooling fluid temperature (adjustable).

- High refrigeration pressure.

Refrigeration

In the event of any of the following conditions, the COMP FAULT will illuminate and the compressor and discharge fans will shut down. The pump/circulating system will remain operating until the STOP button is depressed, or until the operating temperature reaches the High Temperature Cutout setting. This allows a temporary supply of cooling fluid to the instrument being cooled until the instrument being cooled can safely be turned off.

- Low compressor oil pressure.

- Low refrigeration pressure.

- Low cooling fluid temperature (adjustable).

- Compressor motor thermal overload.

In the event of any of the following conditions, the COMP FAULT LED will illuminate and the unit will shut down:

- High refrigeration pressure.

- High cooling fluid temperature (adjustable).

If your unit fails to operate properly, contact our Customer Service Department for assistance.

Section VII Maintenance

Service Contracts

Thermo Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down time for your unit. For more information, contact our Customer Service Department.

Displaying Software Version

To display the software version ensure the controller is in the Operator's Loop and displaying the reservoir fluid temperature. Depress and hold the ENTER key. Press the YES NO YES keys and the display will indicate CALIBRATE? While continuing to hold the ENTER key press the YES NO YES keys again. The display will now indicate the software version, for example 000550.64B.

Press NO and the display will return to the Operator's Loop.

Compressor Oil

Check the compressor oil level after 24 hours of operation. The minimum oil level is ½ full. If the level is lower, contact our Customer Service Department.

Cleaning

A build up of dust and debris on the condenser can cause a loss of cooling capacity. Periodically clean the condensers by removing the expanded metal grilles and blowing compressed air through the condensers or by hosing them down with water. The frequency of cleaning depends on the operating environment.

Refrigeration Data

Set High pressure switch: cut out 390 psi / cut in 250 psi.
Set Low pressure switch: cut out 5 psi / cut in 40 psi.

Charge unit with R-22 refrigerant as shown in the table. Run unit with recirculating fluid maintained at 27°C. Adjust pressures to conform:

	US measure	**Metric measure**
Amount	75 pounds	34 kg
Hot gas valve	60 PSIG	415 kPa
Suction pressure	68 - 85 PSIG	470 - 586 kPa
Discharge pressure	280 - 320 PSIG	1930 - 2200 kPa
Speed check	not specified	not specified

Hot Gas setting is observed on the suction gauge when the unit is in the heat/idle cycle.

Parts List

Our Customer Service Department can provide you with a complete list of spare parts for your unit. Phone numbers and addresses for all our Thermo Thermo NESLAB Sales Centers are located in the front of this manual (see Preface, After-sale Support). Before calling, *please* obtain the following information:

BOM number

Serial number

Software version

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. Thermo NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Thermo NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 1000-4-2:1995
	IEC 1000-4-3:1994
	IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

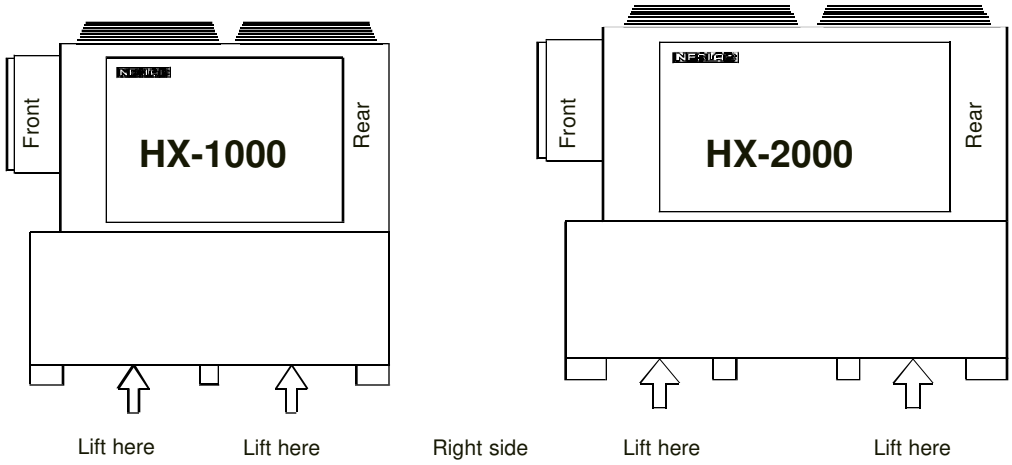
Units sold in North America are shipped on a wooden pallet and wrapped in protective plastic. Do not remove the banding or protective plastic until the unit is in its final location.

Units sold outside North America are shipped in a wooden crate. Do not disassemble the crate until the unit is in its final location.

The unit is secured to the pallet by lag bolts. HX-1000 units have 10 bolts, HX-2000 units have 12. Remove the lag bolts and the pallet before placing the unit on the foundation.

Lift Points

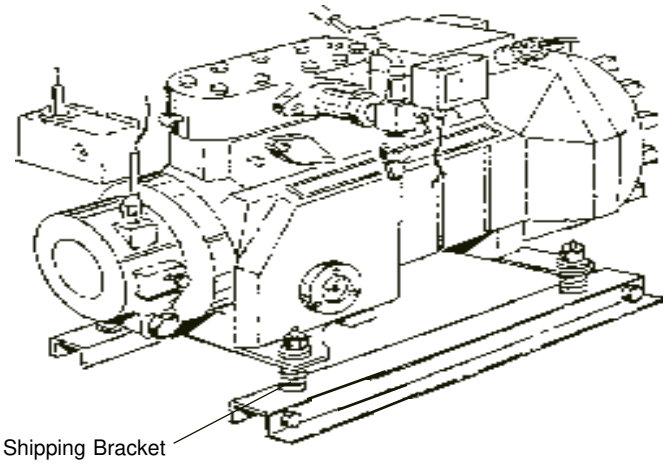
The unit is constructed on 4 inch (10.16 centimeter) high feet, each made of 14 gauge steel. HX-1000 units have 6 feet, HX-2000 units have 8. The unit construction provides a 4 inch clearance from the ground. Use a fork lift truck to lift and move the unit. Insert the forks as shown.



Pre-Start Up

Remove the panels to access the compressor area.

Loosen the four compressor mounting nuts until there is approximately 1/8" clearance between each compression mounting foot and the shipping bracket. This allows the compressor to "float" on the mounting rings.



To avoid damage to the compressor, tighten the mounting nuts before moving the unit.

Warranty

The unit has a warranty against defective parts and workmanship is for one full year from date of shipment. See back page for more details.

After-Sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, please contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, please contact our Customer Service Department.

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Never operate the unit without cooling fluid.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Always turn off the unit and disconnect from the line cord before performing any service or maintenance procedures.

Never operate equipment with damaged line cords.

In addition to the safety warnings listed above, warnings are posted through out the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with test highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

Your HX Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and pressure.

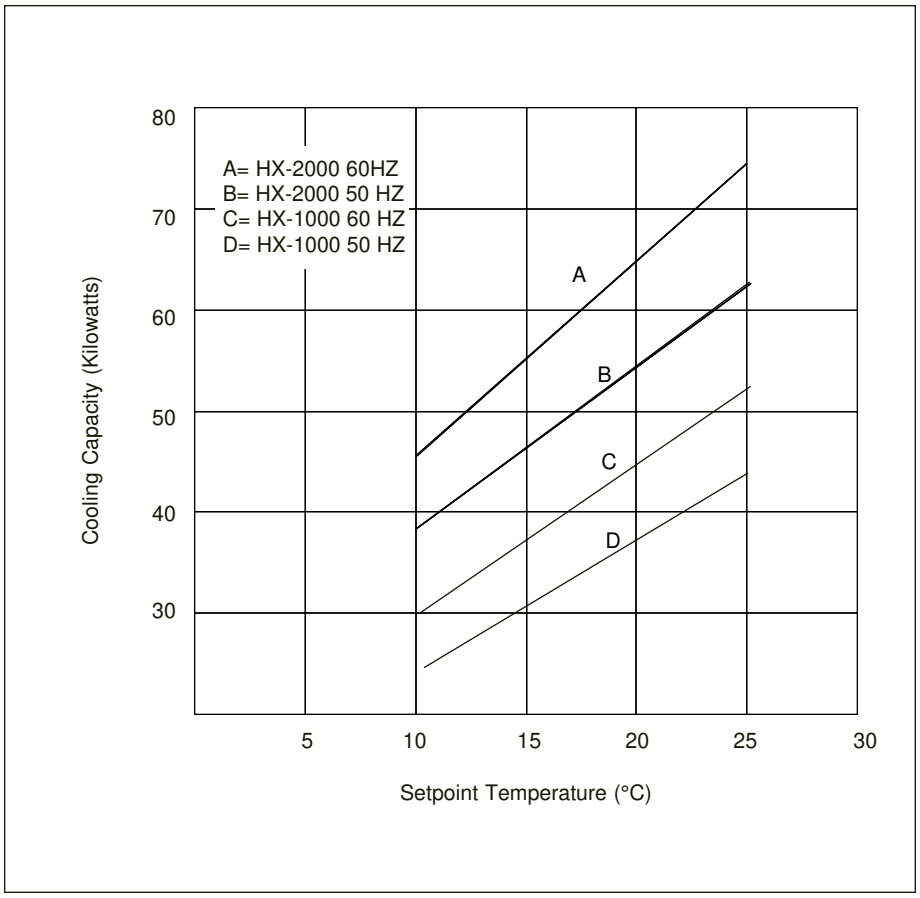
The unit consists of a reservoir, circulating pump, air-cooled refrigeration system, and a digital temperature controller.

The unit is designed for all-weather use. This allows heat produced by the instrument being cooled to be discharged outdoors. The high capacity pump allows the unit to be located a great distance from the instrument being cooled. The pump flow is adjustable at the unit.

The unit can be modified to run from a remote monitoring/controlling device.

Specifications

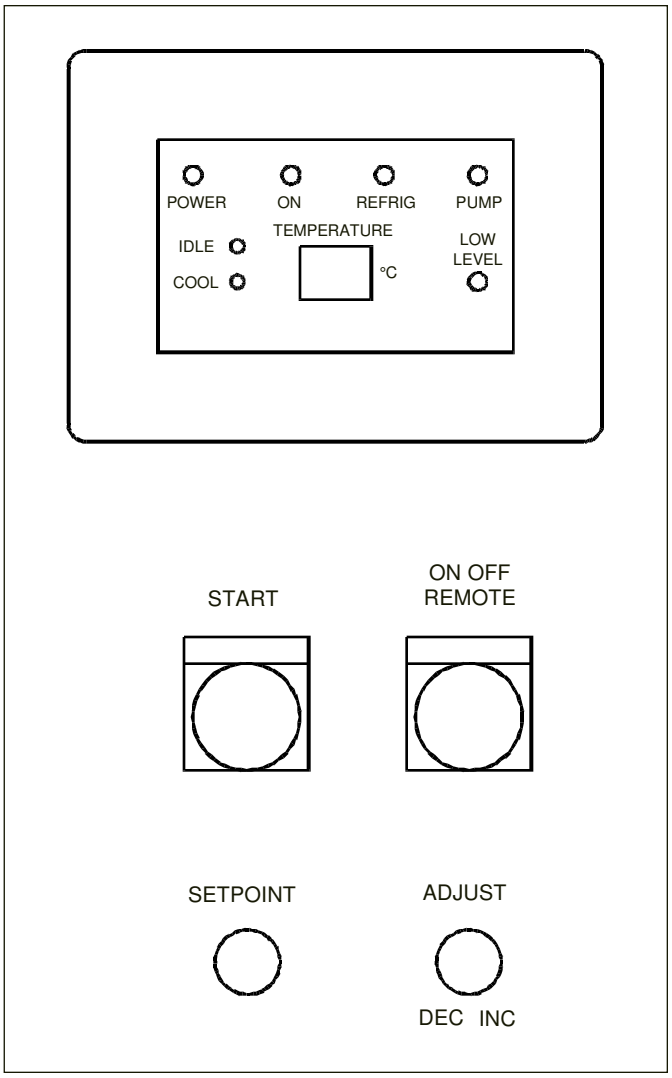
Cooling Capacity



Temperature Range	+10°C to +25°C
Temperature Stability	±1.0°C
Pump Capacity	
	HX-1000	**HX-2000**
Compressor	10 hp	20 hp
Dimensions (H x W x D)		
Inches	73 ½ X 58 X 30	76 x 67 ¼ x 34
Centimeters	186.7 x 147.3 x 76.2	193 X 170.8 X 86.4
Shipping Weight		
Pounds	1612	2061
Kilograms	731	945

1. Specifications listed for units circulating at 25°C, ambient 21°C, with 50% water and 50% Ethylene Glycol as coolant. Specifications will be affected by changes in temperature, ambient, or fluids.

Controls



POWER
Power is supplied to the unit.

ON
The unit is operating.

REFRIG
The refrigeration system is on.

PUMP
The pump is operating.

IDLE
The unit is in hot gas by-pass mode of operation.

COOL
The refrigeration system is removing heat from the cooling fluid.

TEMPERATURE °C
Indicates operating or setpoint temperature in degrees Celsius.

LOW LEVEL
A low level fault has occurred.

START
Activates unit (only when the ON OFF REMOTE switch is in the ON position).

ON OFF REMOTE
ON position, the unit can be monitored and controlled only from the control panel on the unit.

OFF position, the unit is off.

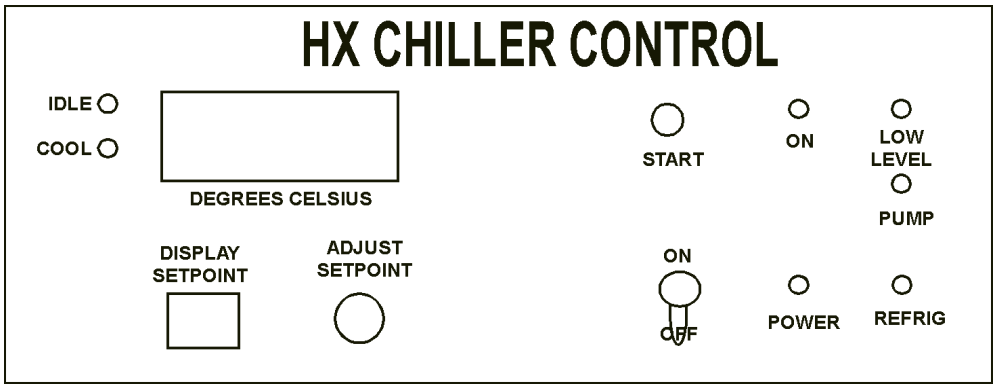
REMOTE position, the unit can be switched on and off from a remote control device.

SETPOINT
When pressed, TEMPERATURE °C display will indicate the temperature setpoint. When released, display will indicate operating temperature.

ADJUST
Adjusts the temperature setpoint.

Remote Controller

The control box should be located in a laboratory or clean industrial environment. Never place the control box in a location where excessive heat, moisture, or corrosive materials are present.



Controls

IDLE
The unit is in hot gas by-pass mode of operation.

COOL
The refrigeration system is removing heat from the cooling fluid.

DEGREES CELSIUS
Indicates operating or setpoint temperature.

DISPLAY SETPOINT
When pressed, TEMPERATURE °C display will indicate the temperature setpoint. When released, display will indicate operating temperature.

ADJUST SETPOINT
Adjusts the temperature setpoint.

START
Activates unit (when the main unit's ON OFF REMOTE switch is in the REMOTE position and the remote's ON/OFF switch is in the ON position).

ON
The unit is operating (START button depressed).

LOW LEVEL
A low level fault has occurred.

PUMP
The pump is operating.

ON/OFF
Used to start or stop the unit from the remote.

POWER
Power is supplied to the unit (ON/OFF switch in the ON position).

REFRIG
The refrigeration system is on.

Section III Installation

Site

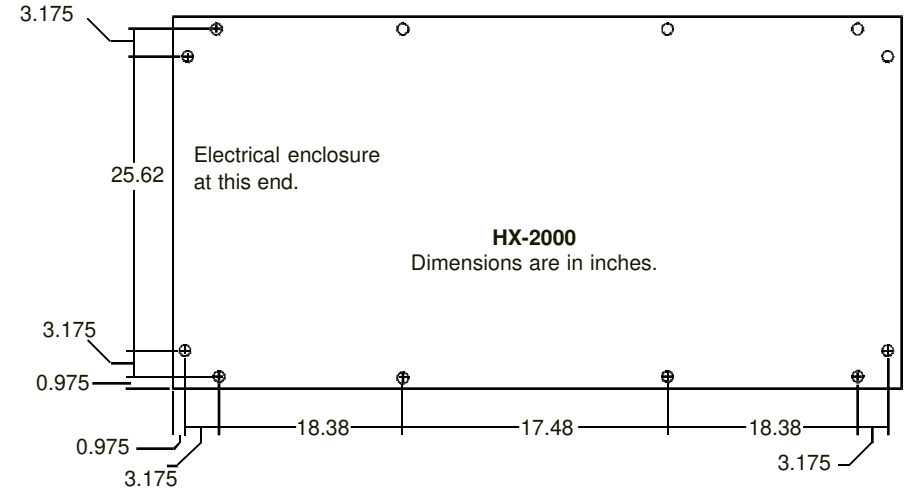
Install the unit on a well-constructed level surface, able to withstand a distributed load of 3000 pounds (1360 kilograms) for HX-2000 units, 1700 pounds (770 kilograms) for HX-1000 units.

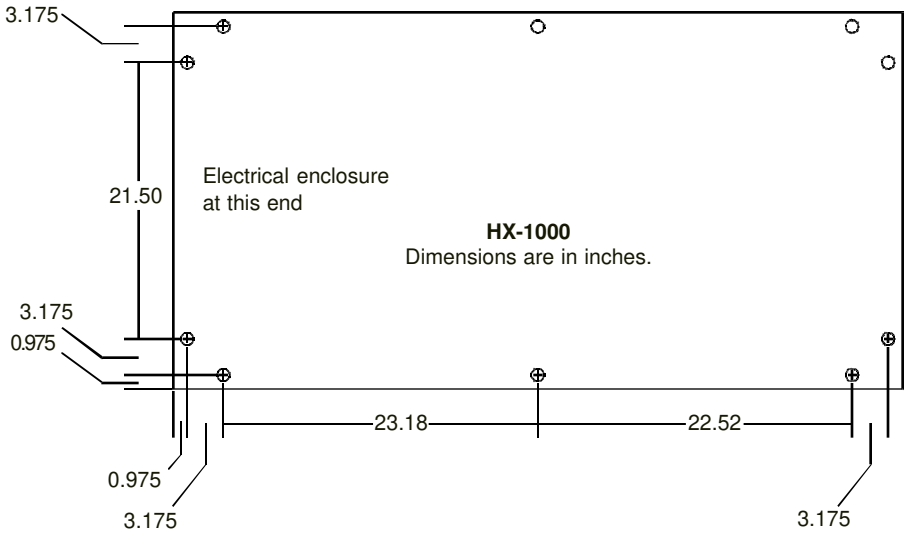
The unit has an air-cooled refrigeration system. Air is drawn through the slotted metal grilles on either side of the unit, and exhausted through the fans on top of the unit. Air flow through the fans is 12300 feet^3/minute for HX-2000 units, 6500 feet^3/minute for HX-1000 units.

The unit should be placed in an area where the air intake and discharge are not impeded. A minimum clearance of 3.5 feet (1 meter) on all four sides and 7 feet (2 meters) above the unit is necessary for adequate air flow and easy access to the side panels for service and maintenance.

The ambient range of the unit is -10°F to +110°F (-22°C to +43°C).

Lag bolting the unit to the foundation is recommended. Each of the metal support feet have 0.625 X 1.500 slots that allow the unit to be lag bolted.





Pre-Start Up

Remove the two side access panels and the rear access panel (opposite end from the electrical enclosure) to access the compressor area.

Check the compressor oil level through the sight glass on the compressor crankcase. It is identified as the glass port hole in the compressor wall. The oil level should be no less than ½ full. If the oil is below ½, contact our Service Department.

Check the refrigerant sightglass. If the dot in the middle of the sightglass is green, the refrigerant is normal. If the dot is yellow, the refrigerant is contaminated. Contact our Service Department for assistance.

Close the COOLING WATER INLET and OUTLET by turning the valve handles fully clockwise.

Make sure the grilles on the sides of the unit (covering condensers) and the fans on the top of the unit are free of obstructions.

After all electrical and plumbing connections have been completed, close the enclosure door and secure the door latch arm (disconnect).

The unit is equipped with a set of valves on the tank inlet and outlet which prevent the tank from overflowing when the pump is off.

The unit has an automatic compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant and the crankcase oil from mixing. Before initial start up, or after storage, the unit must be connected to the power source for at least 12 hours before turning the unit on. This will allow time for the crankcase oil to be heated and the refrigerant to separate from the oil.

Electrical Requirements

Refer to the serial number label on the inside of the electrical enclosure for the specific electrical requirements of your unit.

Electrical Connections

For personal safety and equipment reliability, this procedure should be performed by a qualified service technician familiar with the safety procedures required for working inside an energized disconnect box.

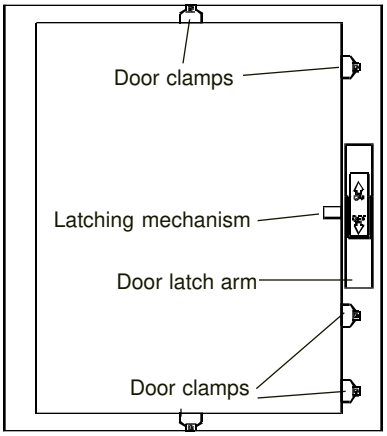
A unit wiring diagram is located in the document sleeve inside the door of the electrical enclosure. Wire the unit in conformance to local, state and federal electrical codes. Check all wiring to make sure it is properly connected and protected from the elements.

Install a conduit connector in the wall of the electrical enclosure; a hole must be drilled in the enclosure to accommodate the connector. The location of the hole is user-defined; the hole can be drilled in any of the four enclosure wall (except the upper left side wall, where the control panel is located). This allows the power supply to be installed in the enclosure at a point that is convenient for the user.

Use four-wire cable to connect the appropriate power supply (see Electrical Requirements) to the main circuit breaker located on the right side of the enclosure. Install a second circuit breaker at the power source. This second circuit breaker prevents exposure to “live” wires during installation.

The door latch arm on the enclosure activates the main disconnect for the power supply to the unit. When the door is closed, the disconnect is engaged when the latch arm is pulled up to the ON position. The POWER lamp on the control panel indicates the status of the disconnect.

The five door clamps must be secured for the enclosure to be weather-tight.



Electrical enclosure (the door has been omitted for clarity)

Remote Electrical Connections (Optional)

For personal safety and equipment reliability, this procedure must be performed by a qualified service technician familiar with the safety procedures required for working inside an energized disconnect box.

Wiring diagrams are located inside the document sleeve inside the electrical enclosure. Wire the unit in conformance to all local, state and federal electrical codes. Check all wiring and make sure it is properly connected and protected from the elements.

Install a conduit connector in the wall of the unit's electrical enclosure and in the wall of the control box. A hole must be drilled in both the electrical enclosure and the control box to accommodate the connectors. The location of these holes is user-defined; this allows the connecting cable to be installed in both the electrical enclosure and the control box at a point that is convenient to the user. The hole can be drilled in any of the four enclosure walls (except the upper left side wall, where the control panel is located). Similarly, the hole can be drilled in any of the control box walls as long as it does not interfere with the controls and lamps on the front panel.

Connect the terminal strips in the remote control box to the terminal strip located in the upper right corner of the electrical enclosure (wire number to wire number).

Plumbing Requirements

The inlet and outlet of the unit are labelled COOLING WATER INLET and OUTLET. These connections are 1¼ inch FPT.

Follow good plumbing practices to minimize unnecessary bends and restrictions that will increase the pressure drop through the circulating lines. Refer to Pressure Drop Chart on the next page to estimate the pressure drop through various diameter tube lengths.

Insulate all tubes and fittings to minimize loss of cooling capacity. This is extremely important in areas of ambient extremes or when the unit is located a great distance from the instrument being cooled. All tubing and fittings should be weather resistant, able to endure high and low ambient conditions, and able to withstand a maximum pressure of 120 psi.

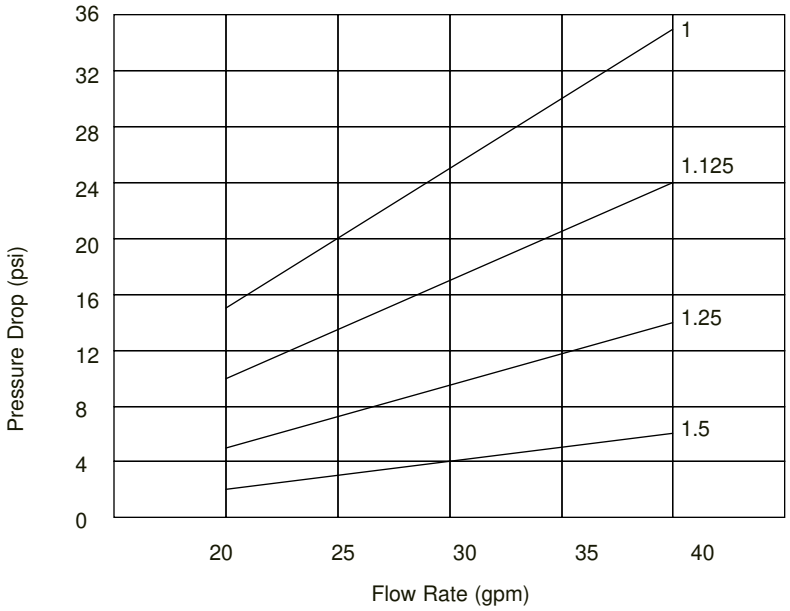
	A	B	C	D
HX-1000	9.375	8.5	5	16.3125
HX-2000	9.375	10.215	5	18.875

Dimensions of the inlet and outlet.
Dimensions are in inches.

Insulating hose is available from NESLAB. Contact our Sales Department for more information.

Use the Pump Capacity Chart (see Specifications) and the Pressure Drop Chart to calculate the maximum distance you can locate the unit from the system being cooled. Find the point on the Pump Capacity Chart that matches the flow and pressure requirements of the system being cooled. From that point, estimate the pressure difference between the pump performance line, and the point you have chosen on the graph. This net pressure value, used with the Pressure Drop Chart, will help determine the maximum distance from the chiller to the system being cooled and the tubing diameter (ID).

NOTE: The unit is equipped with a set of valves on the tank inlet and outlet which prevent the tank from overflowing when the pump is off.



Material: 100 feet copper tubing. Dimensions are inside diameter (ID), measured in inches.

Fluid

A non-freezing fluid is required for operation at any recirculating or ambient temperature. The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Due to the physical nature of a plate heat exchanger, and its response to temperature changes, 100% water must not be used as a circulating fluid. Using 100% water may cause the plate heat exchanger to rupture.

Never use corrosive or flammable fluids with this unit.

Never use automobile anti-freeze. Commercial anti-freeze contains silicates that can cause permanent damage to the pump seals.

Non-compliance with the statements in the section can result in damage to the unit and will void the manufacturer's warranty. For more information contact our Sales Department (see Preface, After-sale Support).

The wetted parts are:

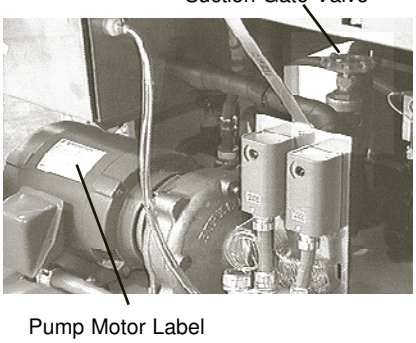
- *Stainless steel*
- *Bronze*
- *Brass*
- *Copper*
- *PVC Plastic*

Filling Requirements

Ensure the INLET and OUTLET valves on the front of the outside of the unit are closed. Connect the INLET/OUTLET recirculation lines from the HX to your application.

Open the unit's lower-right hand side panel and locate the 1¼" suction gate valve. (It is the largest valve in the unit and is located between the reservoir and compressor.)

Ensure the suction gate valve is fully closed.



Remove the reservoir cover. Fill the reservoir approximately ¾ full. Start the unit and allow it to run 15 - 20 minutes.

Have enough fluid on hand to fill the unit's reservoir, the recirculation lines to your application, and your application itself.

Slowly open the OUTLET valve. **Opening the valve too quickly will cause water-hammering.**

A qualified technician should ensure the pump amperage draw does not exceed the stated draw on the pump motor label. (Check the amperage using either line 39, 40 or 41 on the motor thermal protector (1TOR) located at the lower left hand corner of the NEMA box.)

As the recirculation lines fill with fluid, keep the reservoir topped off to within one inch of the top. (There could be some substantial splashing from the reservoir as air is purged from the lines.)

While still monitoring the amperage draw, slowly open the INLET valve.

Your application may be started at this time.

As the recirculation lines continue to fill, keep topping off the reservoir.

When the reservoir no longer needs additional fluid, fully open the suction gate valve.

Allow the unit to run 10 to 15 minutes to purge any remaining air.

Ensure the reservoir is filled to within one inch of the top.

Close the reservoir cover.

Install the unit's lower-right hand side panel.

Section IV Operation

Off Cycle

When the unit is manually shut down, a time delay is activated that allows the refrigeration system and the pump to continue to operate. The system will run in the IDLE mode (hot gas by-pass) for two minutes. This additional run time allows all refrigerant to be removed from the heat exchanger and for the heat exchanger to warm up.

NOTE: The unit is equipped with a set of valves on the tank inlet and outlet which prevent the tank from overflowing when the pump is off.

In the event of a fault, the unit will not start the pump-down cycle but will shut down immediately.

Shutting the unit off using a circuit breaker or other device on the line side of the relay will defeat the purpose of the off cycle and is not recommended. If remote operation is desired contact our service department.

Start Up (non-Remote units)

Ensure the door latch arm (disconnect) has been secured for at least 12 hours.

Partially open the COOLING WATER INLET and OUTLET by turning the valve handles counterclockwise.

Turn ON OFF REMOTE switch to ON and push the START switch.

The unit has a time delay that bypasses the Low Pressure Cutout and allows the unit to run for approximately three minutes, regardless of the amount of pressure in the refrigeration system. If the unit runs for three minutes, then shuts down, a refrigeration leak may be present. Contact our Customer Service Department for assistance.

Remote (Optional)

The unit can be operated using an optional remote monitoring/controlling device. Follow the safety precautions and installation procedures outlined in Electrical Connections for the proper installation instructions.

To operate from a remote device, turn the ON OFF REMOTE switch to the REMOTE position.

Temperature Adjustment

The temperature controller is located below the control panel on the left side of the electrical enclosure.

To adjust the temperature setpoint, the system needs to be on, circulating cooling fluid, and under a heat load. Press and hold the SETPOINT button. Turn the ADJUST knob until the temperature setpoint is indicated on the TEMPERATURE °C display. Turn the knob counterclockwise to raise the temperature setpoint and clockwise to lower the temperature setpoint. Release the SETPOINT button. The TEMPERATURE °C display will indicate the operating temperature.

The temperature controller range is from +10°C to +25°C.

If for some reason the unit stops, allow at least 2 minutes for “Reset” before attempting restart.

Flow Rate

Adjust the flow rate to the system being cooled by turning the COOLING WATER OUTLET valve. Use a flow meter on the COOLING WATER OUTLET to adjust the desired flow rate.

High and Low Temperature Cutout

The High and Low Temperature Cutouts (HTC/LTC) monitor the temperature of the cooling fluid as it exits the heat exchanger. They prevent the cooling fluid from reaching excessively high or low temperatures that can damage the unit.

In the event of a high temperature fault, the REFRIG and PUMP lamps will go out, and the unit will shut down. The unit will remain off and must be manually restarted.

In the event of a low temperature fault, the REFRIG lamp will go out and the compressor will shut down. The compressor will remain off until the cooling fluid temperature rises above the cut off point.

The HTC is set at +80°F (+27°C). The LTC is set at +25°F (-6°C). If adjustments are needed, contact our Customer Service Department for assistance.

High and Low Pressure Cutout

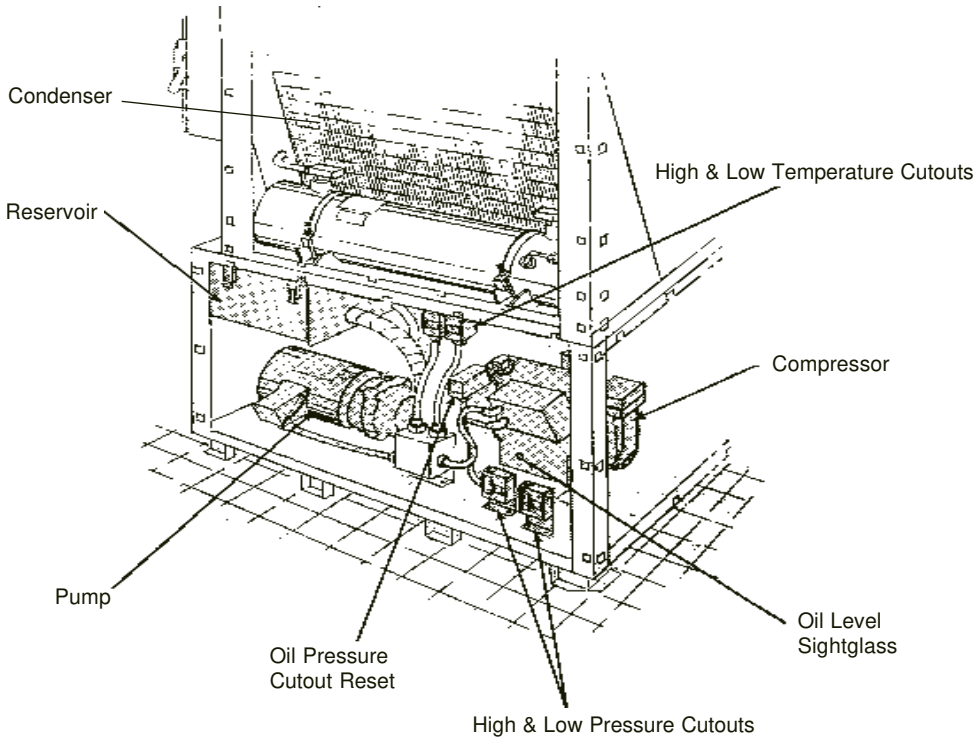
The High and Low Pressure Cutouts (HPC/LPC) monitor the refrigeration pressure at the compressor. They prevent excessively high or low pressures that can damage the unit. In the event of a high pressure fault, the REFRIG and PUMP lamps will go out and the unit will shut down until the refrigeration pressure drops below the cut in point.

During a low pressure fault, the REFRIG lamp is out and the compressor and discharge fans shut down until the refrigeration pressure rises above the cut in point.

Oil Pressure Cutout

In the event of low compressor oil pressure, the Oil Pressure Cutout will shut down the compressor and the discharge fans.

After the failure has been corrected, the cut out must be reset. Push the Oil Pressure Cutout Reset button located next to the compressor (see Figure 2).



NOTE: Refrigerant Sightglass is located on the other side of the unit (opposite to the compressor).

Section V Safety Features

Safety Features

The unit is equipped with the following safety features designed to protect the unit in case of failure. LED lamps are mounted on the control panel on the electrical enclosure, and indicate operational status.

Low Fluid Level

The Low Fluid Level monitor is connected to a float switch in the reservoir. If the reservoir level drops below a safe operating level, the LOW LEVEL lamp will light, but the unit will not shut off.

Pump

In the event of any of the following conditions, the PUMP lamp will go out and the unit will shut down. The failure must be identified and corrected before the unit can be restarted.

- Loss of circulating flow, in the event of pump failure or ruptured pump lines.

- Pump motor thermal overload.

- High cooling fluid temperature (adjustable).

- High refrigeration pressure.

Refrigeration

In the event of any of the following conditions, the REFRIG lamp will go out and the compressor and discharge fans will shut down. The pump/circulating system will remain operating until the ON OFF REMOTE switch is manually turned OFF, or until the operating temperature reaches the High Temperature Cutout setting. This allows a temporary supply of cooling fluid to the instrument being cooled until the instrument being cooled can safely be turned off.

- Low compressor oil pressure.

- Low refrigeration pressure.

- Low cooling fluid temperature (adjustable).

- Compressor motor thermal overload.

In the event of any of the following conditions, the REFRIG lamp will go out and the unit will shut down:

- High refrigeration pressure.

- High cooling fluid temperature (adjustable).

If your unit fails to operate properly, contact our Customer Service Department for assistance.

Section VI Maintenance

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down time for your unit. For more information, contact our Customer Service Department.

Compressor Oil

Check the compressor oil level after 24 hours of operation. The minimum oil level is ½ full. If the level is lower, contact our Customer Service Department.

Cleaning

A build up of dust and debris on the condenser can cause a loss of cooling capacity. Periodically clean the condensers by removing the expanded metal grilles and blowing compressed air through the condensers or by hosing them down with water. The frequency of cleaning depends on the operating environment.

Parts List

Our Customer Service Department can provide you with a complete list of spare parts for your unit. Phone numbers and addresses for all our NESLAB Sales Centers are located in the front of this manual (see Preface, After-sale Support). Before calling, please obtain the following information:

BOM number

Serial number

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

Preface

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition.

On units with a remote control box, the box is packed in a separate carton. Be sure to locate this separate carton; do not dispose of it by mistake.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

The unit has a warranty against defective parts and workmanship for one full year from date of shipment. Refer to the last page of this manual for complete warranty details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label on the rear of the case top to obtain the following information (see Section II, Description for the serial number label location):

- BOM number _____

- Serial number _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department for assistance (see Preface, After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Do not attempt to defeat any of the interlock switches or safety features built into the unit.

Observe all warning labels.

Never remove warning label.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the fluid reservoir.

Make sure the unit is off before connecting or disconnecting the power cord or other cables.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the fluid reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified NESLAB technician.

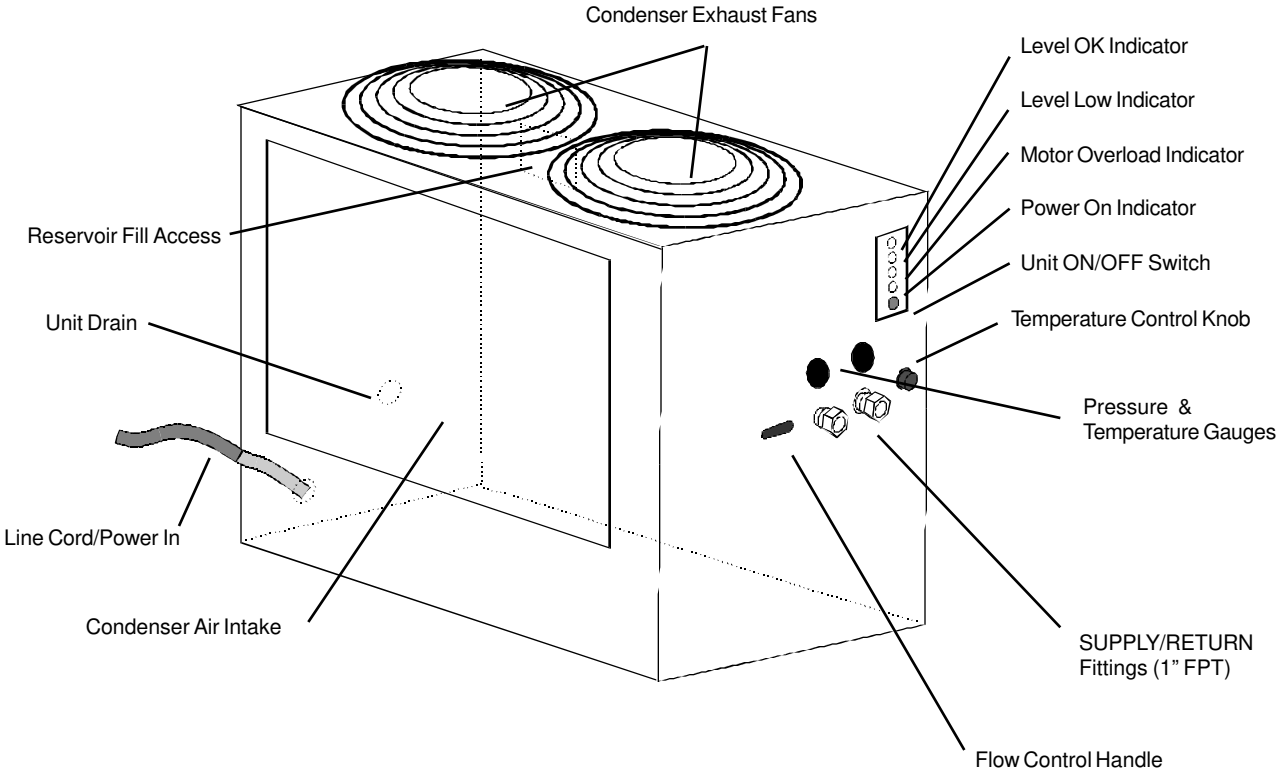
In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

The HX-500 Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and volume. The unit consists of an air-cooled refrigeration system, a stainless steel fluid reservoir, a fluid recirculation pump, and a thermostatic temperature controller.

Throughout the manual, you will be asked to consult the unit's serial number label, or the pump identification label, or both, for specific information. Both labels are located on the unit's right side.



Specifications

Temperature Range	+10°C to +30°C
Cooling Capacity (60Hz) *Watts* *BTU/Hr*	15700 @ 20°C 53500 @ 20°C
CP-55 Pumping Capacity	Unit Dimensions[2] (H x W x D) *Inches* *Centimeters*	59½ x 46½ x 29½ 151.1 x 118.1 x 75.0
Reservoir Volume *Gallons* *Liters*	8 30
Shipping Weight *Pounds* *Kilograms*	900 408

Section III Installation

Site

The unit should be located on a well constructed level surface in a clean environment where ambient temperatures are inside the range of -20°F to +110°F (-29°C to +43°C).

The unit will retain its full rated capacity in ambient temperatures to 110°F.

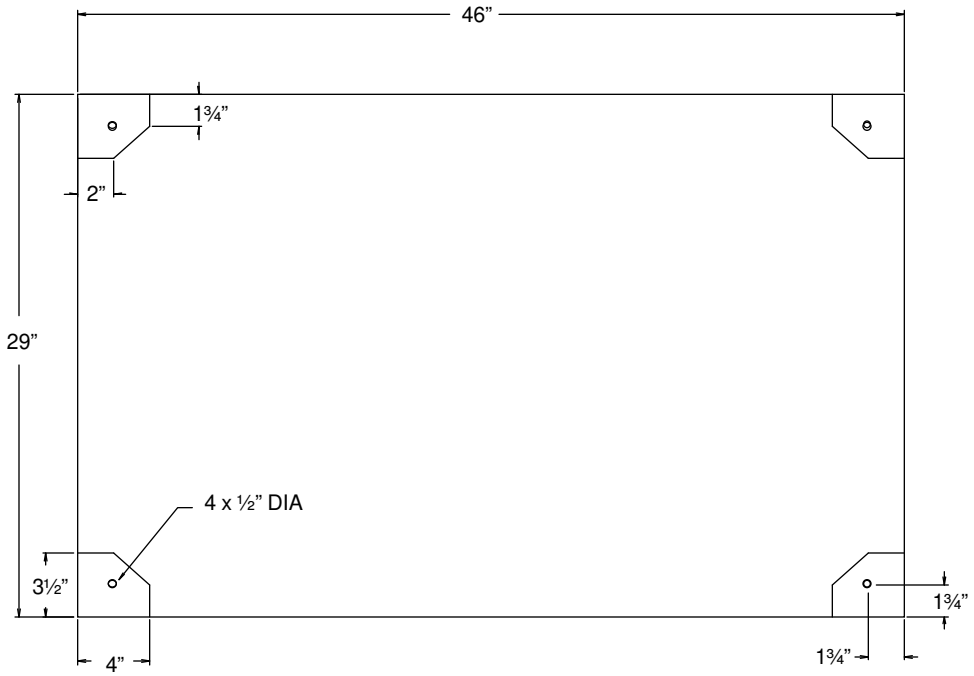
Never place the unit in a location where excessive heat or corrosive materials are present.

The unit has an air-cooled refrigeration system. It must be positioned so the air intake and discharge are not impeded. Air is drawn through the front of the unit and discharged through the top. A minimum of 5 feet (1.5 meters) on the front of the unit is necessary for ventilation.

In some applications where space is at a premium, the minimum ventilation clearance can be compromised. However, consult our Sales Department before positioning the unit in a location with less minimum clearance than listed above. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section VI, Condenser Cleaning).

The illustration below shows the bolt pattern for the unit's base.

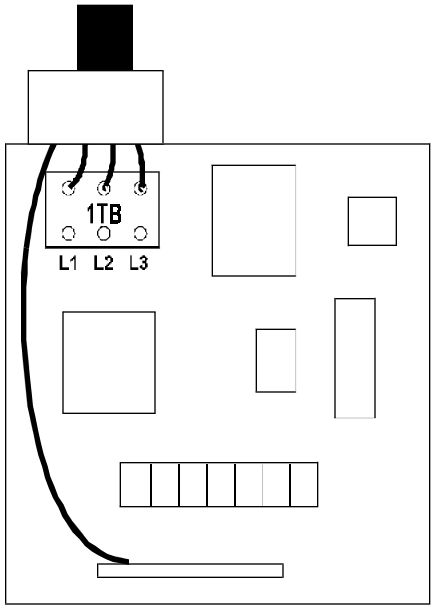


Electrical Requirements

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. It is the user's responsibility to assure a proper ground connection is provided.

Verify electrical requirements by reviewing the ratings listed on the nameplate on the unit's right side. Ensure the voltage of the power source agrees with the unit's voltage and frequency rating. The unit is designed to tolerate deviations of ±10% from the rated line voltage.

A line cord must be installed on the unit. Remove the unit's left side panel and bring the line cord through the strain relief located on the unit's base. Remove the electrical enclosure cover. Pass the line cord through the second strain relief located on the top of the electrical enclosure. A large terminal strip, labelled 1TB, is used to make the proper connections. Connect L1, L2 and L3 to the corresponding labelled connections on the terminal strip. The ground connection is located at the base of the enclosure.



Install the unit in conformance with National Electric Code, UL, and all other local, state and federal electrical codes. Check all wiring to ensure it is both properly connected and protected from the elements.

Units are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant. The unit is equipped with a receiver heater which warms the refrigerant for cold-ambient starting.

NOTE: Whenever power is applied, the unit's POWER ON indicator will be illuminated.

Plumbing Requirements

Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. Consult the manufacturer of the instrument for a cleaning fluid recommendation.

The plumbing fittings used to connect the HX to the instrument being cooled are located on the right side of the unit (labelled SUPPLY and RETURN). These connections are 1 inch FPT.

Remove the protective plugs from the SUPPLY and RETURN connections. Connect the SUPPLY fitting to the inlet of the instrument being cooled. Connect the RETURN fitting to the outlet of the instrument being cooled.

The RESERVOIR DRAIN connection, located on the bottom left of the unit, is a ½ inch FPT fitting connected internally to the unit's fluid reservoir. This fitting is for draining the reservoir. The unit is shipped with a ½ inch MPT plug installed in this fitting. Remove the plug to drain the reservoir.

If the unit is "hard plumbed" to the instrument being cooled or to the cooling water supply, damage can occur if the unit is bumped or jolted from its site. Provisions should be made to prevent the unit from being moved after installation. Once the unit is plumbed, the unit may be attached to the floor using lag bolts. There are ½" holes provided on the unit's feet.

Flexible tubing, if used, should be heavy wall or reinforced construction. All tubing should be rated to withstand 110 psi at +35°C. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, they should be made at the inlet and outlet of the instrument being cooled, not at the HX.

If substantial lengths of connecting tubing are required, they should be pre-filled with cooling fluid before connecting them to the unit.

Fluids

The selected cooling fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Tap water is the recommended fluid for operation from +8°C to +35°C.

Below +8°C or in an outdoor environment where temperatures may drop below 0°C, a non-freezing solution is required. A 50/50 mixture, by volume, of water and laboratory grade ethylene glycol is suggested.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer's warranty.

Filling Requirements

Before filling, ensure the unit's reservoir drain plug is properly installed.

The reservoir cover is located under the fill access panel located on the rear of the unit. Open the panel, loosen and remove the cover.

Initially fill the reservoir with five gallons of cooling fluid and then turn the unit on. Continue to fill the fluid reservoir with cooling fluid until the green LEVEL OK indicator illuminates.

The fluid capacity of the instrument being cooled and the recirculation lines may be significant. To prevent the lowering of the fluid level in the reservoir below the operating level, have extra cooling fluid on hand to keep the reservoir filled to just below the hand guard.

When the recirculating system is full, replace the reservoir cover and close the access panel.

Perform periodic checks of the fluid level by checking the LEVEL OK indicator.

Section IV Temperature Control

Thermostatic Mixing Valve

The unit uses an adjustable Thermostatic Mixing Valve (TMV) for temperature control. The valve balances the unit's refrigeration capacity against any applied heat load to maintain the desired temperature. As the heat load changes, the shift in balance will cause the temperature to vary and the valve to adjust in response.

For start up we recommend the valve be set to the maximum position (full clockwise). After your application is on adjust the valve to the desired temperature. If your application is momentarily shut off the temperature of the coolant will drop. NOTE: As long as the valve is not readjusted the coolant temperature will return to the desired setting when the application is turned on.

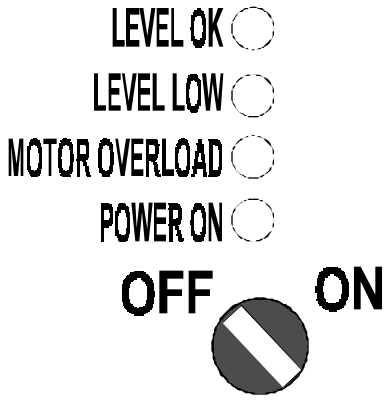
Because refrigerant capacity varies with ambient temperature, adjust the valve for changes in ambient temperatures.

Refrigeration

The refrigeration system is not adjustable. Factory preset mechanical refrigeration valves limit the refrigeration upper and lower limits. These valves should be adjusted only by a qualified NESLAB service technician.

Start Up

Before starting the unit, double check all electrical and plumbing connections and ensure the recirculating system (the HX, your application, and the tubing connecting them) has been properly filled with cooling fluid (see Section V, Flow Control).



The unit's MAIN POWER indicator illuminates to indicate the unit's main power circuit is energized. To start the unit, place the ON/OFF switch to the ON position. The pump and refrigeration will start and the LEVEL and MOTOR OVERLOAD indicators will be operational. Check the pump for proper rotation (see Phase Rotation in Section VI).

Cold-Ambient Start Up

A temperature sensor located in the reservoir keeps the refrigerant compressor off until the reservoir temperature reaches 0°C. Above 0°C the compressor and condenser fans energize. NOTE: The pump motor operates as soon as the ON/OFF switch is placed to the ON position.

Temperature Adjustment

Adjust the temperature by turning the TMV adjustment knob. Turning the knob clockwise increases the unit's cooling capacity. After adjusting the knob wait two to three minutes for the unit to respond. Readjust as necessary to achieve the desired temperature. The temperature gauge next to the knob provides coolant temperature reading.

Fault Response

All the fault indicators are located above the ON/OFF switch. The unit is designed to run under all fault conditions. Two fault conditions are monitored - low reservoir and pump motor overload.

The red LEVEL LOW indicator indicates the reservoir level has dropped below the low level switch. Add fluid to the reservoir.

The yellow MOTOR OVERLOAD indicates the pump motor overload relay has tripped. The relay is located in the electrical enclosure, immediately behind where the power cord enters the unit. Open the enclosure and depress the relay reset. **NOTE:** With a MOTOR OVERLOAD fault there is no circulation of coolant to your application (see Pump Motor Overload Protector in Section V).

Section V Operation

Flow Control

The RECIRCULATING FLOW CONTROL handle, located on the right-hand side of your unit, is connected to a valve that controls the flow rate of the cooling fluid to the instrument being cooled.

When the handle is in the “+” position, the valve is open and all possible cooling fluid is supplied to the instrument being cooled. When the handle is in the “-” position, the valve is closed and no cooling fluid is supplied to the instrument being cooled. When the handle is between these two positions, the flow rate of the cooling fluid is between full flow and no flow. Use a flow meter on the SUPPLY line to adjust the desired flow rate.

To prevent “water hammering” always move the flow control handle slowly.

Pressure Gauge

The RECIRCULATING PRESSURE gauge is located near to the flow control handle. The gauge indicates the operating pressure of the system.

Pump Motor Overload Protector

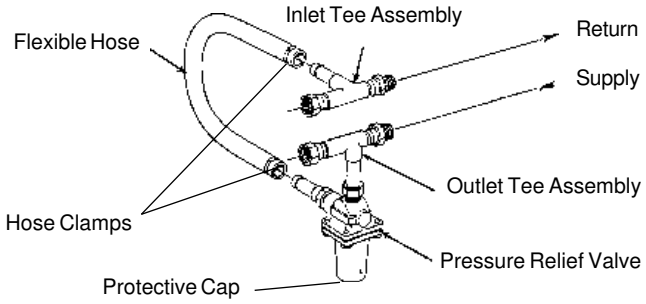
Three phase units with three phase pump motors are equipped with a pump motor overload protector. The overload protector prevents the pump motor from exposure to excessive current. If an overload fault occurs, due, for example, to excessive pressure or flow, or excessive ambient temperature, the overload protector will shut off the pump motor. The unit’s compressor will continue to operate. The fault must be manually reset after the cause is identified and corrected (see Preface, After-sale Support).

The overload relay (with reset switch) is located in the main electrical enclosure. The indicator, located above the ON/OFF switch, illuminates when a fault is detected.

External Pressure Regulator (Optional)

For applications requiring a maximum pressure less than 55 psi, an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 psi. If the pressure of the fluid leaving the unit exceeds the valve setting the relief valve will bypass the fluid back into the unit to relieve the pressure. The pressure of the system is determined by the back pressure of the connected equipment and the flow rate of the recirculating fluid to your application.

Connect the EPR assembly as shown below. Tighten the hose clamps tight enough to prevent leakage. Do not overtighten or the clamps will “bite” into the flexible tubbing and can cause excessive wear.



Connect the outlet tee assembly to the inlet of your application. Connect the inlet tee assembly to the outlet of your application.

Adjustment

When adjusting the relief valve some leaking may occur, place a container under the valve during adjustment.

Remove the protective cap and locate a threaded fitting with a slot for a large screwdriver. Hold the threaded fitting in place and loosen the lock nut on the valve body until it is almost flush with the threaded fitting. Unscrew the threaded fitting three to four turns. (If the threaded fitting unscrews completely from the valve housing, screw it back in two to three turns.)

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and your application. Monitor the operating pressure of the HX unit. Turn the threaded fitting until the desired relief pressure is set (the EPR valve cannot be set lower than the total back pressure of your instrument, or flow will not be received).

Tighten the locknut to secure the position of the threaded fitting. Open the hose between the EPR outlet tee assembly and your application.

Section VI Maintenance & Service

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Configuration

Service Access Panels
Three service access panels (one on the rear, one on the right side and one on the left) allow easy access to the pump and refrigeration assemblies.

Disconnect the unit from its power source before removing any of the access panels.

Condenser Cleaning

For proper operation, the unit needs to pull substantial amounts of air through a finned condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The frequency of cleaning depends on the operating environment. It is recommended that a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Exercise caution not to damage the condenser fins or coil. Condenser fin or coil damage can result in a loss of performance and, in extreme cases, refrigeration system failure.

Algae

To restrict the growth of algae in the fluid reservoir, it is recommended that the reservoir cover be kept in place and that all recirculation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, one gram per gallon.

Phase Rotation

Check the pump for proper rotation.

Disconnect the unit from its power source, open the rear electrical junction box. Reverse any two line conductors on the line side of the relay.

Never remove the green ground wire.

Close the electrical box. Reconnect the unit to its power source. If the unit will not start, contact our Customer Service Department.

Section VII Troubleshooting

Checklist

Unit will not start

Verify main power circuit is energized. The white Main Power light on the controller panel should be lit when the unit is energized.

Some units are equipped with a flow switch. On these units the flow control valve must be opened slightly to allow the fluid to circulate through the flow switch that monitors the flow rate. A flow rate of more than 0.3 gallons per minute (1.0 liters per minute) is necessary. If the flow is completely shut off, or if flow is not adequate, a low flow fault will occur and the unit will not start.

The phase rotation may be reversed (see Section VII, Phase Rotation).

Check power source for correct voltage output. Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit. Power source must be specified voltage, ±10%.

The unit has high and low refrigeration pressure switches which require manual reset if activated. Both switches are located directly behind the rear panel. Depress the reset button located on each switch. If the button does not “click” when pressed the switch was not activated and the unit shut down for another reason.

Unit will not circulate fluid

Check the tubing between the unit and your application for obstructions or for cleaning/replacement.

The unit will not circulate if the back pressure of your application is too high (>50psi).

Inadequate temperature control

Make sure the installation of the unit is in compliance with the conditions described in Section III.

Make sure the heat load of the instrument being cooled is not greater than the cooling capacity of the unit.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

- BOM number
- Serial number

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

WARRANTY

HX-540 Quick Reference Operating Procedures

Installation

Position the unit in a clean environment with easy access to facility cooling water and a drain. The facility water requirements must meet those specified in the instruction manual or unit performance will be derated. Inadequate water supply could cause the compressor to overheat and turn the unit off.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled FACILITY WATER INLET and OUTLET, and RECIRCULATING FLUID INLET and OUTLET. Remove the plastic protective plugs from all the plumbing connections. Connect the FACILITY WATER INLET fitting to the facility cooling water and the FACILITY WATER OUTLET fitting to a drain. Connect the RECIRCULATING FLUID INLET fitting to the outlet of your application and the RECIRCULATING FLUID OUTLET fitting to the inlet of your application.

A non-freezing fluid is required for operation at any recirculating or ambient temperatures. The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within two inches of the top when the unit is at the desired operating temperature. If the fluid capacity of your application and recirculation lines are significant, have extra fluid on hand.

Operation

Before starting the unit, ensure the compressor mounting nuts have been loosened and that the facility water is on and properly connected to the unit. Double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

Verify/configure the control transformer position in the power enclosure. Switch on all the enclosure's circuit beakers. Close and latch the enclosure's door.

The unit must be connected to the power source for at least 12 hours to allow the oil to be heated and separated from the refrigerant.

Switch on the main circuit breaker (1CB), press the START button, and then press the ON button located on the controller.

The LEDs on the controller indicate the status of the refrigeration system. Cool is on when the unit is removing heat from the cooling fluid. As the operating temperature approaches the setpoint, the Cool LEDs cycles.

To display the temperature setpoint, while in the Operator's Loop press and NEXT key. To adjust the temperature setpoint use the YES/NO keys as described in this manual.

Flow Control

The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the "+" position you receive full flow, the "-" position is no flow.

Periodic Maintenance

Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

The unit has a pump strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact Thermo NESLAB for more information.

After-sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, *please* refer to the serial number label on the rear of the case top to obtain the following information:

- BOM number _____

- Serial number _____

- Software version (see page 46) _____

Section I Safety

Warnings

Make sure you read and understand all the instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department (see Preface, After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Always disconnect the line cord from the power source before performing any maintenance procedures, or before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified Thermo NESLAB technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instruction. Failure to observe these instruction can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

The HX-540 Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and pressure.

The unit consists of a water-cooled refrigeration system, stainless steel reservoir, recirculating pump, and a microprocessor controller.

An important characteristic of the unit is its ability to track a set temperature virtually independent of changing heat loads. Once the desired operating temperature is set, the operating temperature will not shift more than a few tenths of a degree.

Specifications

Cooling Capacity[1]	Temperature Range	-40°C to +25°C
Temperature Stability	± 0.5°C
Fluid Capacity[2] *Gallons* *Liters*	 5 19

1. Specific heat of cooling fluid is 0.6 BTU/lb°F.
2. Total fluid volume of the reservoir, exchanger, and all internal plumbing lines.

Pump Capacity[3]	Dimension[4] *(H x W X D)* *Inches* *Centimeters*	44 x 34 x 25.5 111.8 x 86.3 x 64.7
Weight *Pounds* *Kilograms*	915 415

3. Specific gravity is 0.5.
4. Add 9 inches (22.9 cm) to depth for electrical enclosure.

Section III Installation

Site

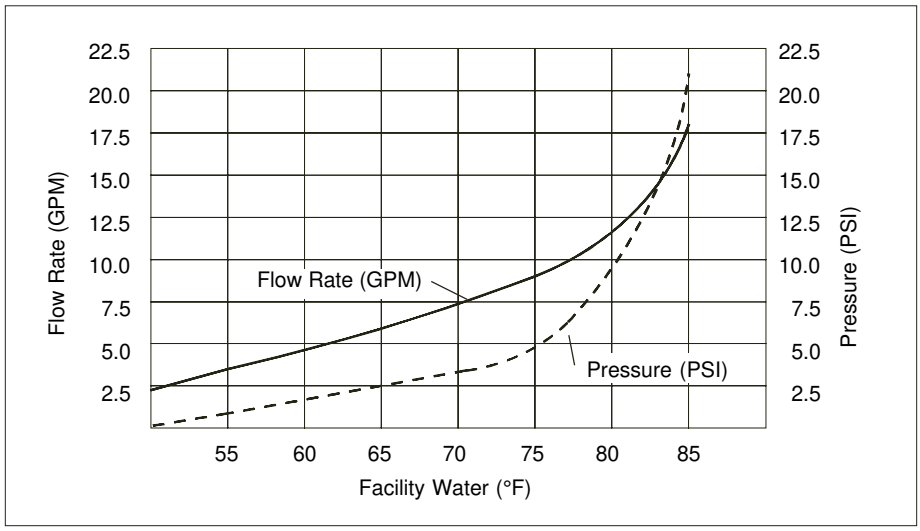
The unit is designed for indoor operation in a laboratory or clean industrial environment. Ambient temperatures should be in the range of +50°F to +100°F (+10°C to +38°C).

Never install the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has a water-cooled refrigeration system. It should be placed in a location with easy access to a facility water source and a drain.

Facility Water Requirements

The facility water must meet or exceed the following requirements for the unit to retain its full rated capacity. If the facility water does not meet these standards, the cooling capacity will be reduced.



The unit has a water regulating valve located in the FACILITY WATER INLET line. The valve regulates the flow rate of the facility water that passes through the heat exchanger based on the heat load. Flow through the heat exchanger is stopped when the unit turned off. If the facility water temperature or pressure do not meet the specified requirements, contact our Service Department for assistance.

Electrical Requirements

Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

All power connections should be made by a qualified electrician.

The facility power source connection is the main 20A circuit breaker (1CB) plus a ground connection. It will operate on a Delta or Wye system, a neutral connection is not required. Ensure an adequate ground connection is provided. Use the ground bar located in the power enclosure as a facility power source ground.

The facility power source connection may be made by removing the panel located on the lower right power enclosure. Use a knockout and the appropriate size conduit fitting for your facility power source requirements.

The unit has an automatic compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant and oil from mixing. Before initial start up, or after storage, the unit should be connected to the power source for at least 12 hours before turning the unit on. This will allow time for the crankcase oil to be heated and the refrigerant to separate from the oil.

Ensure the main 20A circuit breaker (1CB) and the crank case heater (4CB) are on during this 12-hour period. Refer to the unit's wiring diagram for complete details.

NOTE: Some units are equipped with a disconnect power receptacle, IEC 309 plug, and a line cord. Use the appropriate facility power source interface where applicable.

The HX-540 Recirculating Chiller is a three phase unit. The unit is equipped with a phase rotation interlock. This interlock prevents the unit from starting if the phase rotation is wrong. If the unit will not start, see Section VI, Troubleshooting. If the options in the checklist are not applicable, the problem may be phase rotation.

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician.

For phase reversal, disconnect the unit from the power source. Shut off the main 20A circuit breaker (1CB) and open the power enclosure. Reverse any two line cord leads on the line side of 1CB.

Never remove the green ground wire.

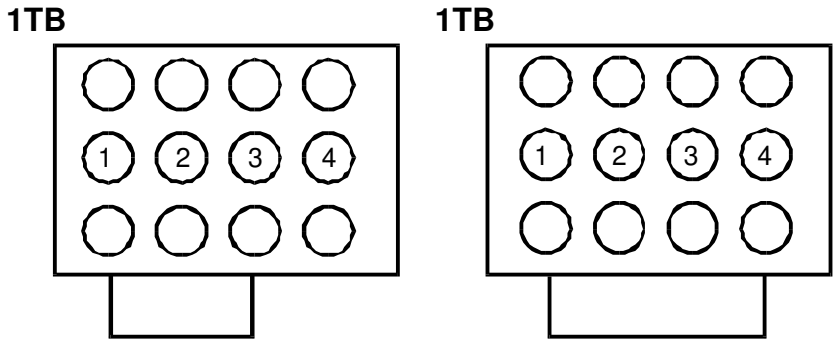
If the unit will not start, contact our Customer Service Department.

Facility Power Source Configuration

Control transformer (1T) must be configured for the appropriate facility power source. Refer to the drawing below and the label located in the power enclosure for details.

For 50/60 Hertz units the jumper wire will be installed between 1TB-1 and 1TB-2. The unit is shipped in this configuration.

When installing the unit the jumper wire should be installed for the appropriate facility power source.

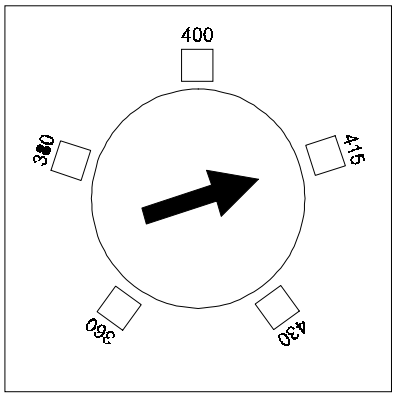


FACILITY MAIN VOLTAGE
RANGE: 420V - 480V
CONNECT 1TB-1 TO 1TB-3

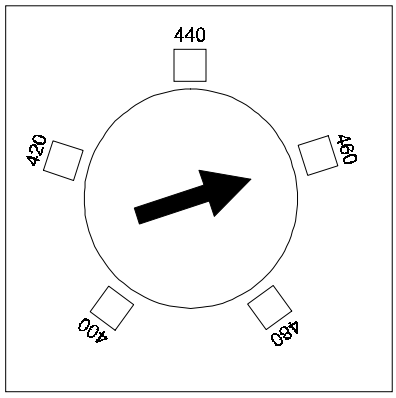
FACILITY MAIN VOLTAGE
RANGE: 360V - 415V
CONNECT 1TB-1 TO 1TB-4

3 Phase Monitor

Check the unit's power requirements on the serial tag located in the power enclosure. For 50 Hertz units the voltage range is 360 - 430 volts. For 60 Hertz the range is 400 - 480 volts. For 50/60 Hertz units there are no voltage adjustment requirements. Set the phase monitor's voltage arrow to the closest nominal facility input voltage. See illustration on next page.



50 Hetrz Units



60 Hetrz Units

Plumbing Requirements

The plumbing connections are located at the rear of the unit.

The facility water connections are labelled FACILITY WATER INLET and OUTLET. These connections are 1 inch FPT.

The cooling fluid connections are labelled RECIRCULATING FLUID INLET and OUTLET. These connections are ¾ inch FPT.

Connect the FACILITY WATER INLET to the facility water source.

Connect the FACILITY WATER OUTLET to the drain.

Connect the RECIRCULATING FLUID INLET to the outlet of the instrument being cooled.

Connect the RECIRCULATING FLUID OUTLET to the inlet of the instrument being cooled.

All tubing should be rated to withstand 100 psi. Make sure all tubing connections are securely clamped. Avoid running lines near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity. Tubing and insulation are available from Thermo NESLAB. Contact our Sales Department for information.

Before installing the unit to a instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. The manufacturer of the instrument should be able to recommend a cleaning fluid to clean their equipment.

It is important to keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing

practical. Tubing should be straight, without bends or kinks. If reductions must be made, they should be made at the inlet and outlet of the instrument being cooled, not at the HX.

An externally mounted flow meter and temperature readout are required with this unit. These monitors will indicate whether the facility water requirements are being met (see Section III, Facility Water Requirements). It is the users responsibility to provide adequate facility water to the unit.

Both devices should be installed in the FACILITY WATER INLET line.

Fluids

A non-freezing fluid is required for operation at any recirculating or ambient temperature. Use a fluid capable of operating at -60°C without freezing.

Due to the physical nature of a plate heat exchanger, and its response to temperature changes, 100% water must not be used as a circulating fluid. Using 100% water may cause the plate heat exchanger to rupture.

Do not use automotive anti-freeze. Commercial anti-freeze contains silicates that can damage pump seals.

Never use flammable or corrosive fluids with this unit.

Highly distilled and deionized water may be aggressive and cause material corrosion. Please contact Thermo NESLAB before subjecting this unit to prolonged exposure to highly distilled or deionized water.

The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Filling Requirements

The fluid capacity of the connecting tubes and your application may be appreciable. Have extra cooling fluid on hand until the entire system is filled.

Thermal expansion and contraction of the cooling fluid must be taken into account when filling the unit. Lift the hinged access panel on the unit's cover. Loosen the two thumbscrews and remove the reservoir cover.

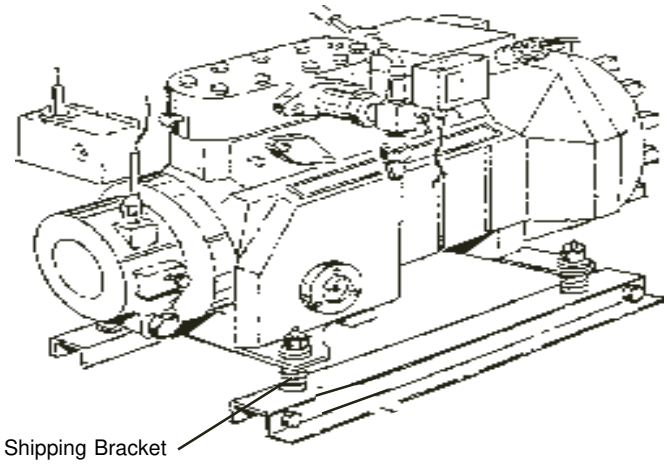
Fill the reservoir with cooling fluid so that the fluid level will be within 2 inches of the top when the unit is at the desired operating temperature.

Replace the reservoir cover. Tighten the thumbscrews. Close the panel.

Pre-Start Up

Remove the two side access panels and the rear access panel (opposite end from the electrical enclosure) to access the compressor area.

Loosen the four compressor mounting nuts. There should be approximately 1/8" clearance between each compression mounting foot and shipping bracket to allow the compressor to "float" on the mounting springs.



Disconnect facility power to the unit. Shut off the main circuit breaker, 1CB, using the handle located on the right side of the power enclosure.

Open the power enclosure, use a flat blade screw driver on the ¼" fasteners.

Verify and/or configure the unit's control transformer and 3 phase monitor according to the instructions located on the enclosure door or on page 10 of this manual.

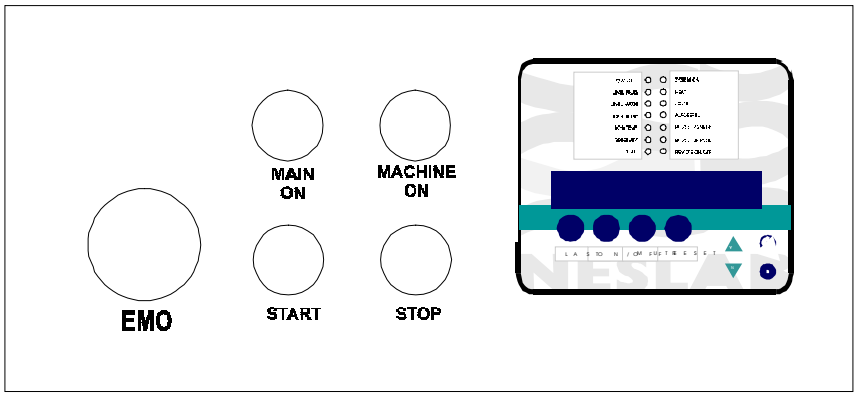
Switch on all circuit breakers located in the power enclosure.

Close the power enclosure door and secure the fasteners.

Provide facility power to the unit and switch on 1CB.

Section IV Operation

Panel Controls



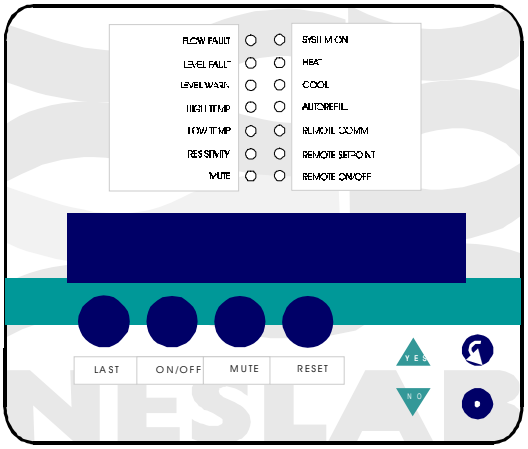
MAIN ON
Indicates facility power is supplied to the unit. Also, the main circuit breaker (1CB) is on, the control circuit breaker (3CB) is on, and the machine on/off circuit breaker (7CB) is on.

MACHINE ON
Indicates the machine control circuit is on.

START
Push to power the machine control circuit. The MACHINE ON indicator will illuminate and the controller will go through a self test. After the self test, the controller will enter a stand-by mode.

STOP
Push to remove power from the machine control circuit. The MACHINE ON indicator will extinguish.

EMERGENCY OFF Button
When pressed, the unit will shut off immediately, bypassing the unit's HG shutdown cycle, see page 22. This button is intended for emergencies only. Do not use it as a normal shut down procedure. The button must be pulled out following an emergency shut down in order to perform the normal start up procedure.



Controller Keypad

The front panel mounted unit/temperature controller allows the operator to start, control and monitor many features of the unit.

LAST
Scrolls backward through the menus and for optional remote operation.

ON/OFF
Energizes/De-energizes process control, pump, compressor, and temperature display.

MUTE
Toggles audible alarm silence function for the current alarm. When alarm is silenced, the MUTE LED lights.

RESET
Clears alarm indications after fault condition has been corrected. Alarm LEDs will remain lit after problem is eliminated to provide indication of problem cause for operator. RESET clears these indicators.

YES, ▲
Answers Yes to Y/N questions, increments numerical values upward for setting numeric values.

NO, ▼
Answers NO to Y/N questions, increments numerical values downward for setting numeric values.

NEXT
Scrolls forward through the menus.

ENTER
Confirms entry of numeric values.

NOTE: If NEXT is pressed while the value still flashes, the new value will not be accepted. The display will stop flashing and the original value will be displayed. In this case the NEXT key can be used to abort data entry. The display will not sequence unless the NEXT key is depressed again.

For large values, the displayed can be changed by manipulating the individual digits. Press YES and NO at the same time, the most significant digit will start to flash. The YES key increments and the NO key decrements the digit. Press the ENTER key to accept the digit and to move to the next most significant digit. Repeat until all digits are entered. Pressing the NEXT key before all digits are entered will abort the procedure and return the display to the original value.

The controller will not allow you to enter a value above the maximum or below the minimum value, or any illegal value. If you try to enter an illegal value the display will revert to its original value when the last digit was entered.

Status Indicators

Units can be configured in one of two ways. Units are designed to either shut down in the case of a fault, Cutout Option (fault condition), or, for those customers willing to take the risk of damage to their unit in order to continue providing all available cooling to their application, a Switches Option (warning condition). Contact our Service Department for more information.

If the Switch Option is chosen, FLOW FAULT, HIGH TEMP, and LOW TEMP ***do not*** shut down the unit but, they are serious conditions and require immediate attention. Once the cause of the fault is identified and corrected, push the controller's RESET button to clear the flashing indication.

NOTE: LEVEL FAULT shuts the unit down immediately. This fault is independent of the switches/cutout option.

Status indicators are provided to show the state of the various functions.

FLOW FAULT indicates the unit flow is too low. The default is 2 gpm. The unit will shut down in the Cutout mode, but will continue to operate in the Switch mode.

LEVEL FAULT indicates the reservoir level is too low for safe operation. The unit will shut down.

LEVEL WARN indicates the reservoir level is below the float switch mounted in the reservoir. The unit will continue to run. **NOTE:** This indication is operable only on units with autorefill.

HIGH TEMP indicates that the reservoir temperature is above the high temperature limit setpoint. The default is 30°C.

For safety reasons, if the unit is configured for the Cutout Option and the HIGH TEMP is set for a value less than the fluid temperature, **the unit will not start.** If required, set the limit after the unit is started.

Should the reservoir go above the high limit setpoint the unit continues to run in the Switch Option, but shuts down in the Cutout Option.

LOW TEMP indicates that the reservoir temperature is below the low temperature limit setpoint. The default is -45°C.

For safety reasons, if the unit is configured for the Cutout Option and the LOW TEMP is set for a value higher than the fluid temperature, **the unit will not start.** If required, set the limit after the unit is started.

Should the reservoir temperature subsequently go below the low limit setpoint the unit continues to run in the Switch Option, but shuts down in the Cutout Option.

RESISTIVITY (Optional) displays measurement value on the controller and a 0-10VDC signal to the analog interface connector on the rear of he unit.

The controller is designed to measure and/or control resistivity. Should the resistivity go above the specific level set in the Setup Loop (see page 20), a warning will be declared.

MUTE indicates the buzzer has been turned off.

SYSTEM ON indicates unit is running.

HEAT (optional) indicates heat capacity is being added to the reservoir system to maintain constant temperature.

COOL indicates the refrigeration system is removing heat from the reservoir system to maintain constant temperature.

As the fluid temperature approaches the temperature setpoint, the COOL indicator cycles on and off to indicate the duty cycle of the system. The unit can be in COOL or HEAT mode, but never both at the same time. A balance between COOL and HEAT controls the temperature.

AUTOREFILL (optional) depends upon configuration of unit to automatically refill the reservoir.

REMOTE COMM (optional) indicates the unit is configured to receive communication via an optional interface located on the side of the electrical enclosure.

REMOTE SETPT indicates the temperature setpoint is being remotely controlled via the J100 INTERFACE on the side of the electrical enclosure.

REMOTE ON/OFF indicates the unit is configured to receive a remote on/off input signal via the J100 INTERFACE on the side of the electrical enclosure.

Changing a Value

The **YES** key increments the value. The **NO** key decrements the value.

The display will flash as soon as either key is depressed, and will continue to flash until the **ENTER** key is pressed to accept the new value. The new value will not be used by the controller until the **ENTER** key is depressed and the display stops flashing.

If the **NEXT** key is pressed while the value is flashing, the new value will not be accepted. The display will stop flashing and the original value will be displayed. In this case the **NEXT** key can be used to abort data entry. The display will not sequence unless the **NEXT** key is depress again.

For large values the display can be changed by manipulating the individual digits. Press the **YES** key and the **NO** key at the same time. The most significant digit will start to flash. The **YES** key increments or the **NO** key decrements the digit. Press the **ENTER** key to accept the digit and to move to the next most significant digit. Repeat until all digits are entered. Pressing the **NEXT** key before all digit are entered will abort the procedure and return the display to the original value.

The controller will not allow you to enter a value below the minimum or above the maximum. If you try to enter an illegal value outside the operating range, the display will revert to its original value.

Controller Displays

An alphanumeric display presents numeric readings of various operating conditions within the chiller. Display function is selected by pressing the appropriate keys to move through a menu of available information.

An Operator's Loop and a Setup Loop loops allow you to display and/or alter different parameters of the controller. The Setup Loop can be accessed from the temperature display by pressing and holding the key combinations shown on Figure 1 on the next page.

When the controller is first powered up it goes through a short self test and then enters the Operator's Loop, displaying the reservoir fluid temperature.

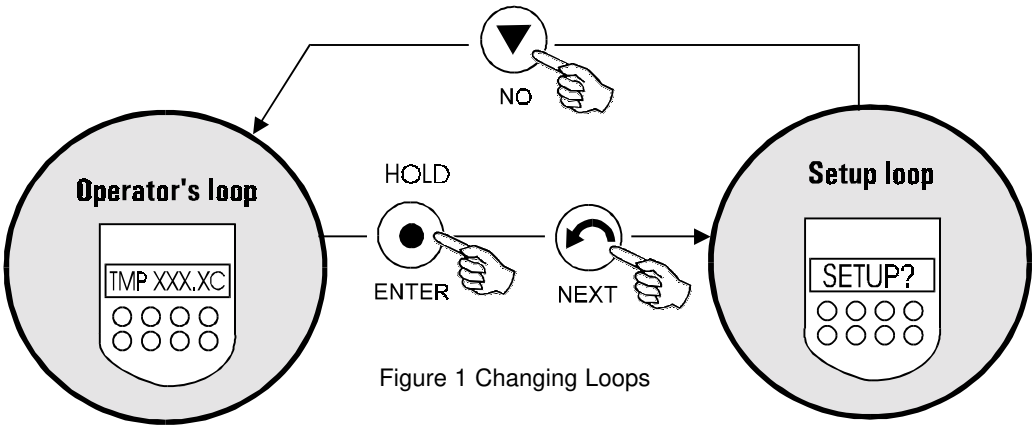


Figure 1 Changing Loops

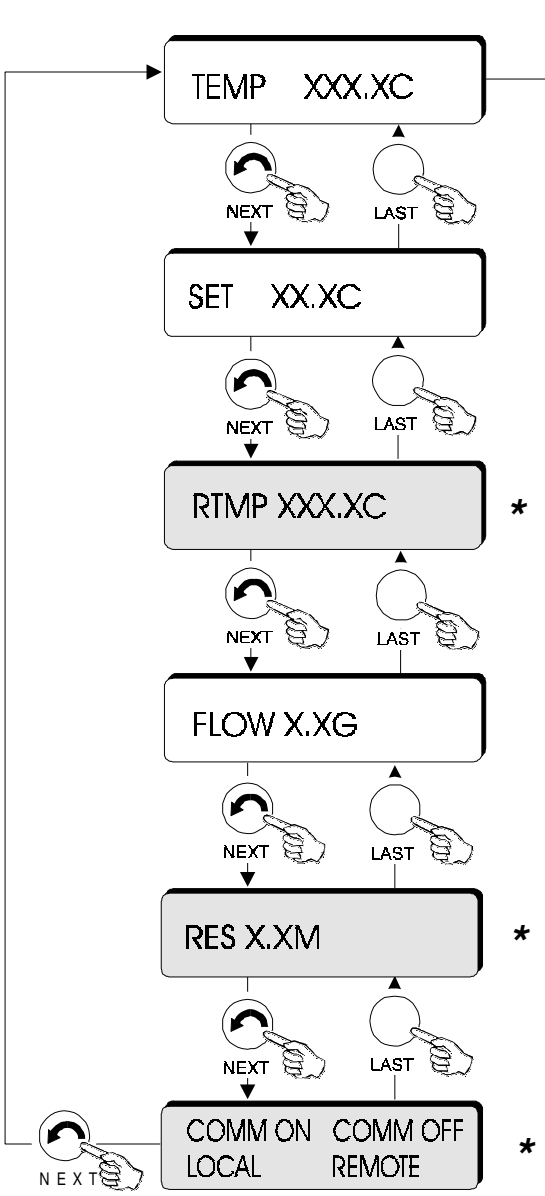

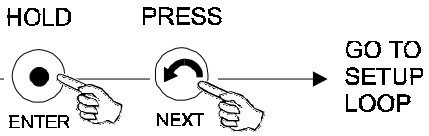

TEMP xxx.xC
This displays the temperature of coolant in the reservoir.

SET xx.xC
This displays the setpoint for temperature control. The chiller's temperature controller causes the fluid temperature to equal this temperature.

RTMP xxx.xC*
For units using the remote probe, this feature displays the application's remote temperature. The application's remote temperature control cannot exceed the unit's operational temperature range ±5°C or the unit will shut down.

FLOW x.xG*
This displays the flow rate at the RETURN port in gallons per minute.

RES x.xM*
This displays the fluid resistivity.

COMM ON*
For units with a remote control box, this displays one of the four possible communication configurations created in the Setup Loop.

* Display is shown only when option is enabled in Configuration Loop, contact our Service Department for assistance.

Figure 2 Operator's Loop

Setup Loop

The setup loop allows the operator to change temperature and flow limits, change resistivity limit (optional), to change the temperature controller's tuning constants, and, for units with a remote control box, to change the communication operations.

NOTE: If the unit is configured for the remote operation option, the temperature limits are for the remote probe. For safety reasons, if the unit's fluid reservoir temperature exceeds 5°C of either end of the unit's temperature range, **the unit will shut down.**

To enter this loop you must be in the Operator's Loop and displaying temperature, see Figure 2. Depress and hold the **ENTER** key then press **NEXT**. Adjust values with the **YES** and **NO** keys. Press **ENTER** for the controller to accept each new entry.

NOTE: Changes are not initiated until they are saved at the end of the loop.

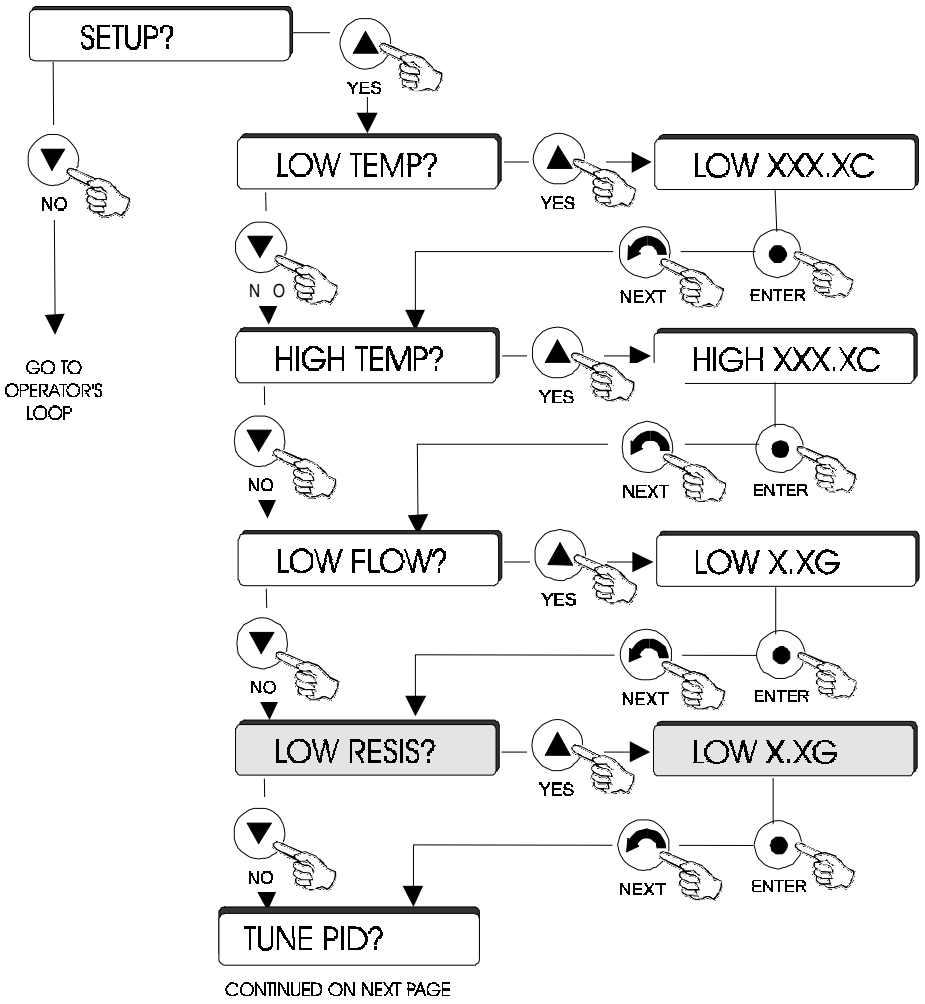

Figure 3 Setup Loop (1 of 2)

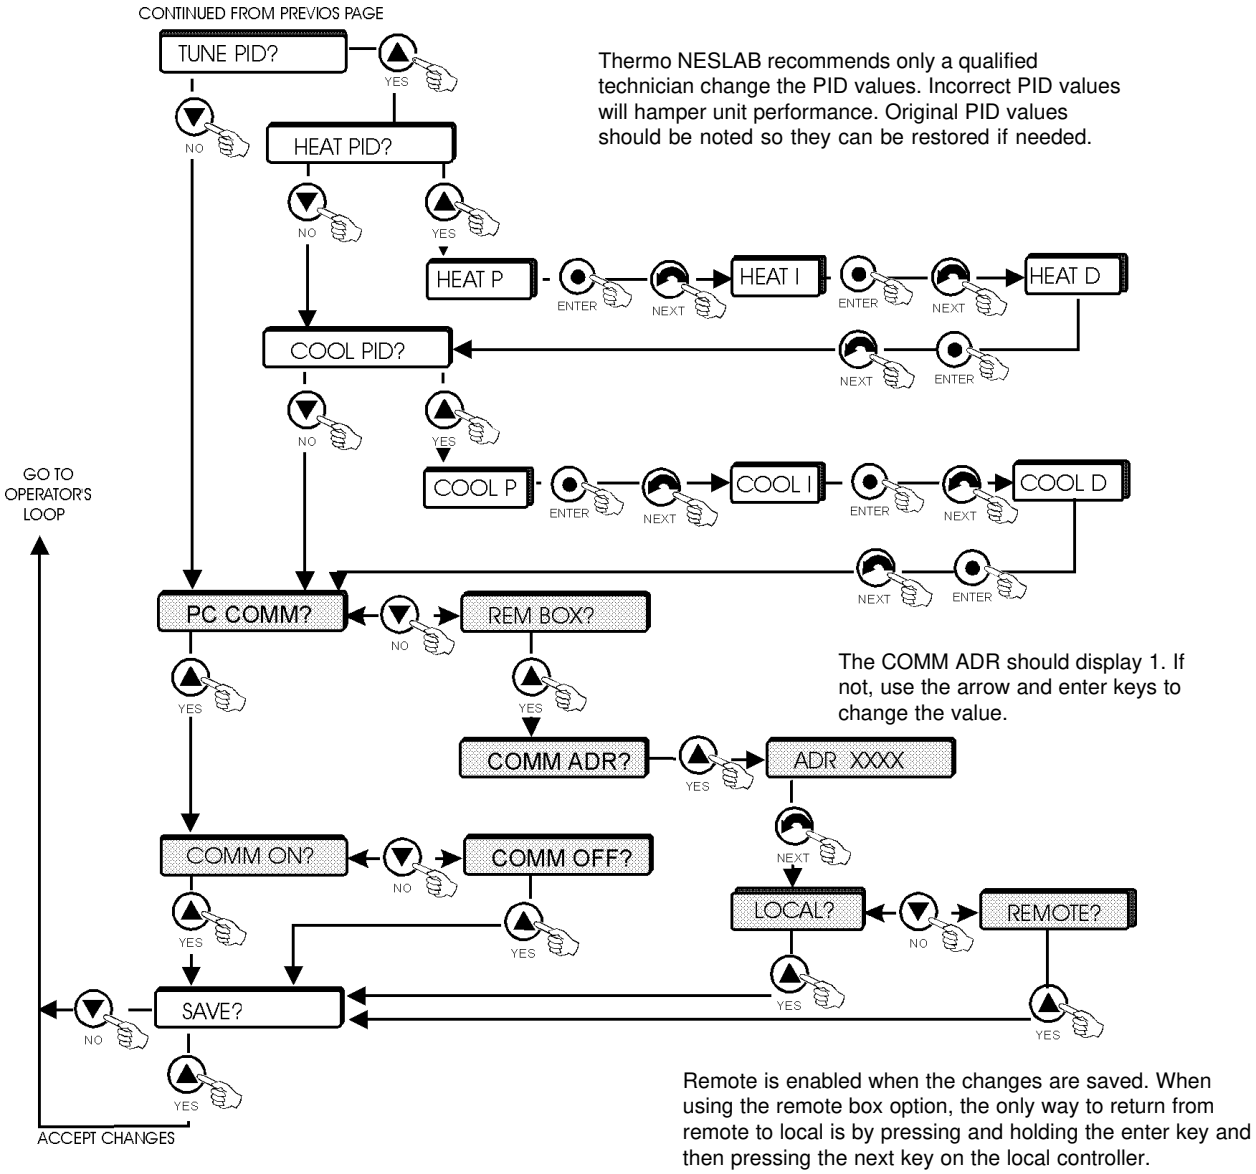

Figure 3 Setup Loop (2 of 2)

NOTE: Should you desire to return to the temperature display and abort *all* changes, keep pressing next until the display reads **SAVE?** Press **NO.**

Start Up

Ensure the facility water is on and make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection.

LOCAL Start Up

Place the LOCAL REMOTE switch to the LOCAL position. Press the ON/OFF key on the temperature controller. The unit will start and the SYSTEM ON indicator will illuminate. The controller will indicate the temperature of the reservoir fluid.

To stop the unit depress the ON/OFF key on the temperature controller.

REMOTE Start Up

Place the LOCAL REMOTE switch to the REMOTE position. This enables the J100 INTERFACE connector located on the side of the electrical enclosure. See Appendix A for details. On the INTERFACE connect pin 1 to pin 14. The unit will start and the SYSTEM ON indicator will illuminate. The controller will indicate the temperature of the reservoir fluid.

To stop the unit disconnect pin 1 from pin 14.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Hot Gas Shut Down Cycle

The Hot Gas (HG) shut down cycle is designed to extend the compressor's life. A shut down cycle allows the compressor and hot gas solenoid valve to continue to run for approximately 30 seconds before the unit shuts down. This additional running time allows the refrigerant in the compressor to be removed and stored.

The following conditions will initiate an HG shut down:

System off from the controller's keypad. **NOTE:** A MACHINE OFF from the panel controls or shutting the unit off using a device (circuit breaker machine off) on the line side of the controller defeats the purpose of the HG cycle and is not recommended. Refer to the unit's wiring diagram.

System off from remote box or serial communications, if applicable.

Refrigeration Shut Down Cycle

The ReFrigeration (RF) shutdown cycle is designed to prevent plate exchanger failure due to ice formation. A shut down cycle allows the compressor and hot gas solenoid valve to continue to run for approximately 30 seconds before the unit shuts down. This additional running time allows the refrigerant to heat the plate exchanger and pump to remove any collected ice.

The following conditions will initiate an RF shut down: Activation of the differential pressure switch.

Flow Control

The flow control handle is located on the right side of the unit. The handle is connected to a valve that controls the flow of fluid to your application. When the handle is in the vertical "**+**" position, the valve is open and all fluid is supplied to your application. When the handle is in the horizontal "**-**" position, the valve is closed and no fluid is supplied to your application. When the handle is between these two positions, the flow rate of the fluid is between full flow and no flow. Use a flow meter on the RECIRCULATING FLUID OUTLET to adjust the desired flow rate.

Ensure the flow control handle is in a slightly open position before starting the unit. Once the unit is running, slowly adjust the handle to the desired flow rate. Never start the unit with the handle in the full closed "**-**" position and never rapidly turn the valve wide open from the closed or slightly open position.

The pressure gauge next to the flow control valve (labelled RECIRCULATING PRESSURE) indicates the operating pressure of the system.

Flow Transducer

A magnetically coupled flow transducer is located in the return line, underneath the unit's top. The flow rate can be displayed on the controller.

High and Low Pressure Switch Cutout

The switches are located in the right, rear of the unit. Remove the rear panel to access the switches.

The high pressure switch monitors the refrigeration pressure on the discharge side of the compressor. In the event of a high pressure fault the compressor will shut down. The compressor will automatically restart once the pressure returns to an acceptable level.

The low pressure switch monitors the refrigeration pressure on the suction side of the compressor. In the event of a low pressure fault the compressor will shut down. The compressor will automatically restart once the pressure returns to an acceptable level.

Differential Pressure Switch Cutout

The switch is located under the top of the unit, below the flow transducer.

The differential pressure switch monitors the pressure differential across the plate exchanger. In the event of an obstruction is present (i.e. ice formation), a fault signal will generate RF shutdown. See Operation for details.

Compressor Oil Pressure Sensing System (Senstronic)

The compressor is equipped with an electronic oil pressure sensing system that monitors the differential pressure between the compressor crankcase and the compressor oil pump. In the event of a fault the compressor will shut down. Once the pressure returns to an acceptable level reset the Senstronic.

Remove the right-lower panel to access the reset.

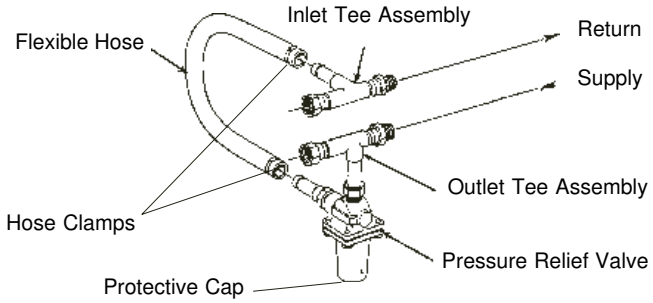
Pump Motor Overload Protector

An overload protector prevents the pump motor from exposure to excessively high current. If an overload condition occurs, due, for example, to a heavy work load, the overload protector shuts the pump and compressor down. The overload protector automatically resets after approximately two minutes. The source of the overload must be identified and corrected before the pump and compressor will restart.

External Pressure Regulator (Optional)

For applications requiring a maximum pressure less than 55 psi, an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 psi. If the pressure of the fluid leaving the unit exceeds the valve setting the relief valve will bypass the fluid back into the unit to relieve the pressure. The pressure of the system is determined by the back pressure of the connected equipment and the flow rate of the recirculating fluid to your application.

Connect the EPR assembly as shown below. Tighten the hose clamps tight enough to prevent leakage. Do not over-tighten or the clamps will “bite” into the flexible tubbing and can cause excessive wear.



Connect the outlet tee assembly to the inlet of your application. Connect the inlet tee assembly to the outlet of your application.

Adjustment

When adjusting the relief valve some leaking may occur, place a container under the valve during adjustment.

Remove the protective cap and locate a threaded fitting with a slot for a large screwdriver. Hold the threaded fitting in place and loosen the lock nut on the valve body until it is almost flush with the threaded fitting. Unscrew the threaded fitting three to four turns. (If the threaded fitting unscrews completely from the valve housing, screw it back in two to three turns.)

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and your application. Monitor the operating pressure of the HX unit. Turn the threaded fitting until the desired relief pressure is set (the EPR valve cannot be set lower than the total back pressure of your instrument, or flow will not be received).

Tighten the locknut to secure the position of the threaded fitting. Open the hose between the EPR outlet tee assembly and your application.

Section V Maintenance

Service Contracts

Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal downtime for your unit. For more information, contact our Service Department. Phone numbers and addresses for all our Sales and Service Centers are located in the front of this manual (see Preface, After-sale Support) and on the back cover of this manual.

Cleaning

Periodically inspect the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically when operating at low temperatures. The concentration of water in the cooling fluid will increase over time, leading to a reduction in the cooling capacity.

Before changing the cooling fluid, raise the operating temperature of the unit to de-ice the reservoir. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Pump Strainer

A wire mesh pump strainer is located in the reservoir on the pump suction line. If debris is drawn into the reservoir, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

Inspect the strainer whenever the reservoir is checked for cleanliness. If the strainer is visibly clogged, cleaning is required.

Disconnect the line cord from the power source and drain the reservoir before cleaning the strainer.

Cover the strainer with a baggie to catch any debris which may become free. Unscrew the strainer and rinse it with water. Replace the strainer. Refer to III, Filling Requirements for instructions on replacing cooling fluid.

Strainer

Section VI Troubleshooting

Displaying Software Version

To display the software version ensure the controller is in the Operator's Loop and displaying the reservoir fluid temperature. Depress and hold the enter key . Press the YES NO YES keys and the display will indicate CALIBRATE? While continuing to hold the enter key press the YES NO YES keys again. The display will now indicate the software version, for example 000550.63a. Press NO to return to the temperature display.

Checklist

Unit will not start or cycles on and off

For CE Mark units, check the circuit breaker setting on the rear of the bonnet.

Check the position of the EMO button.

Check for a fault condition.

Check the position of the LOCAL REMOTE switch. In REMOTE, check the INTERFACE connection.

Check power source for correct voltage output. Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit. Power source must be specified voltage, ±10%.

Check house circuit breaker.

On three phase units with three phase pump motors, the phase rotation may be reversed (see Section III, Electrical Requirements).

Ensure the facility water is on and make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection. Check the High Pressure Cutout, it may need to be reset (see Section IV, High and Low Pressure Switch Cutout).

Unit will not circulate.

Check for obstructions or kinks in the tubing between the unit and the instrument being cooled.

Check pressure gauge reading. If reading is “0” with flow, the gauge may be faulty. Verify by placing a second gauge in the RECIRCULATING WATER OUTLET line.

Check pump strainer (see Section V, Pump Strainer).

Check for a pump motor overload.

Inadequate temperature control.

Check installation of unit for compliance with conditions in Section III.

Make sure instrument being cooled has not overcome the cooling capacity of the unit (see Section II, Specifications).

Service Assistance

If, after these troubleshooting steps, your unit fails to operate properly, contact our Service Department.

Our Service Department can provide you with a complete list of spare parts for your HX-540 Recirculating Chiller. Phone numbers and addresses for all our Sales and Service Centers are printed on the back cover of this manual. Before calling, *please* obtain the following information:

BOM number
Serial number
Voltage of unit
Voltage of power source
Temperature of facility water

Appendix A Interface Definitions

J-100 INTERFACE

The LOCAL/REMOTE switch is used to enable the INTERFACE connector located on the side of the electrical enclosure. With the interface enabled the unit can be controlled and monitored with various electronic accessories.

NOTE: Placing the switch to REMOTE without the interface connected will shut down the unit.

PIN	NAME	NOTES	DEFINITION
1	12VDC COMMON		Common for digital inputs (pins 13 and 14)
2	RESISTIVITY OUT		0-10VDC Analog Voltage Output: Reference to pin 6 This voltage output is proportional to the resistivity of the reservoir fluid: 0.5VDC / M-cm. (Ex 9.0V = 18Mohm-cm) (Max Load @ 10V = 5mA)
3	LOW LEVEL	Note 1	Dry Relay Contact: Reference to pin 11. Closes if either level switch is in the “low” position for more than 1 second.
4	TEMP/SENSOR	Note 1	Dry Relay Contact: Reference to pin 11. Closes immediately when any of the following occur: 1. High Temp Fault, 2. High Temp Warn, 3. Low Temp Fault, 4. Low Temp Warn, 5. RTD1 Fault/Warn, 6. RTD2 Fault/Warn, or 7. Resistivity Warn.
5	PUMP ON	Note 1	Dry Relay Contact: Reference to pin 11. Closes immediately when pump is turned on. Opens immediately when pump is turned off.
6	ANALOG GROUND		Common for analog signals (pins 2, 7 and 15)
7	RESERVOIR TEMP OUT		0-10VDC Analog Voltage Output: Reference to pin 6 This voltage output is proportional to the reservoir fluid temperature: Scale = 10mV / ^{O}C. (Ex 200mV = 20°C) (Max Load @ 10V = 5mA) * Optional Range = 0 – 10V (where: 0V = Low Temp Span, 10V = Hi Temp Span) Contact Factory for details
8	LOW FLOW	Note 1	Dry Relay Contact: Reference to pin 11. Closes immediately when a low flow occurs while the pump is on. Note: To allow the pump to get up to speed at startup, the pump is allowed to run for 3 seconds before the low flow sensor is read.
9	FAULT NO	Note 1	Dry Relay Contact: Reference to pin 11. Closes immediately when any of the following faults occur: 1. Low Flow, 2. Low Level, 3. Temp/Sensor, 4. High Pressure Fault, or 5. Heater High Temp Cutout.
10	FAULT NC	Note 1	Dry Relay Contact: Reference to pin 11. Compliment of pin 9 (Open when pin 9 is closed)
11	RELAY COMMON		Common for all relay contacts (pins 3, 4, 5, 8, 9, 10)
12	(Not used)		
13	REMOTE SETPOINT ENABLE		Digital Input: Reference to pin 1. Connect to pin 1 to allow the setpoint to be changed remotely through pin 15 “Remote Setpoint In”.
14	REMOTE ON/OFF		Digital Input: Reference to pin 1. Connect to pin 1 to turn unit on. Disconnect to turn unit off. Note: The front panel LOCAL/REMOTE switch, must be in the REMOTE position to allow operation from this pin.
15	REMOTE SETPOINT IN		Analog Voltage Input: Reference to pin 6 Apply a DC voltage to this pin to adjust the unit’s setpoint: Range = 10mV / ^{O}C. (Ex 200mV = 20°C) (Max Input Voltage = 10VDC, Input Impedance > 600K) * Optional Range = 0 – 10V (where: 0V = Low Temp Span, 10V = Hi Temp Span) Contact Factory for details

Note 1:

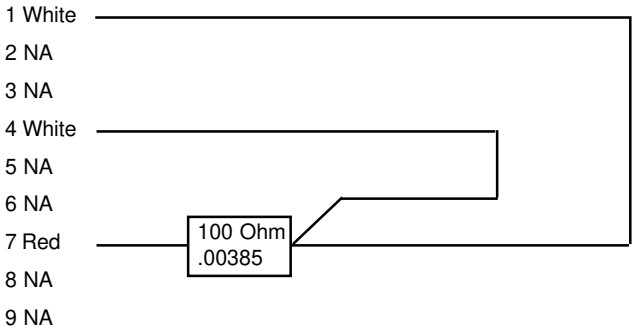
All relay contacts (except for Pin 10) are normally OPEN when power is off. Pin 10 contacts are normally CLOSED when power is off. All relay contacts are rated: 250V/3A, <= .08 Ohm.

SENSOR (Optional)

The unit can be configured to have its temperature controlled from a remote location. Temperature is read on the controller's RTMP display. In the Operator's Loop, RTMP is your application's temperature, TEMP indicates the HX's tank temperature.

The remote probe is connected by a 9-pin male "D-sub" located on the rear of the unit. Ensure your remote application does not cause the HX to exceed its temperature range. For safety reasons the HX will shut down if either limit is exceeded by 7°C.

This is a 3-wire RTD probe. It must be calibrated before initial use, see Appendix B.



COMM (Optional)

J105 is a 9-pin female "D-sub" located on the side of the electrical enclosure used for remote operation. The unit can be configured to operate from a PC comm or remote box option. For remote box operation/configuration see pages 20-21. For serial communications protocol, see Appendix C. For NEScom software information, see Appendix D.

When using the remote box option, the quickest way to return from remote to local is by pressing and holding the enter key and then pressing the next key on the local controller.

Going from local to remote is not available at the remote box.

The pin out information for either configuration is:

RS-232 (NC com)		RS-485 (Remote Box)	
1	Not used	1	Ground
2	TX	2 -7	Not used
3	RX	8	T+
4	Not used	9	T-
5	Ground		
6-9	Not used		

Appendix B Remote Probe Calibration

Before using the optional remote probe it must be calibrated. This is done by running the unit to its temperature extremes and using the controller's Calibration Loop.

Install the remote probe into the SENSOR 9-pin "D-sub" located on the rear of the unit.

Use the Operator's Loop to run the unit to its high-end temperature limit. When the setpoint is reached press and hold the ENTER key and then press YES-NO-YES to display CALIBRATE? Press YES.

Press NEXT until RMT RTD? is displayed. Press YES to display HI CAL? HI xxx.xC will be displayed, use the YES/NO keys to reach the desired temperature and the press ENTER. Press the NEXT key until SAVE? is displayed, press YES to return to the Operator's Loop.

Use the Operator's Loop to run the unit to its low-end temperature limit. When the setpoint is reached press and hold the ENTER key and then press YES-NO-YES to display CALIBRATE? Press YES.

Press NEXT until RMT RTD? is displayed. Press YES to display HI CAL? Press NO and LOW CAL? is displayed. Press YES and LOWxxx.xC will be displayed, use the YES/NO keys to reach the desired temperature and the press ENTER. Press the NEXT key until SAVE? is displayed, press YES to return to the Operator's Loop.

The probe is now calibrated. Re-calibrate as necessary or if the probe is replaced.

Appendix C Serial Communications Protocol

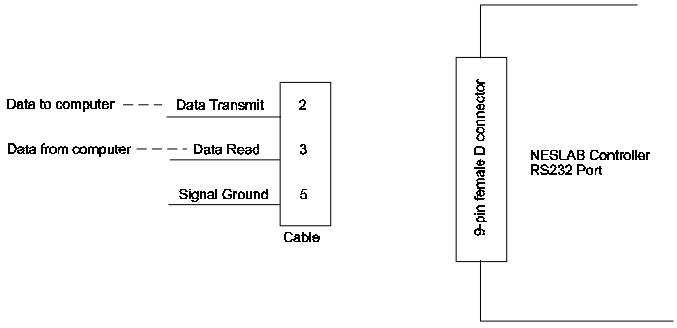
NOTE: This appendix assumes you have a basic understanding of communications protocols.

All data is sent and received in binary form, do not use ASCII. In the following pages the binary data is represented in hexadecimal (hex) format.

The Thermo NESLAB Serial Communications Protocol, NC, is based on a master-slave model. The master is a host computer, while the slave is the chiller's controller. Only the master can initiate a communications transaction (half-duplex). The slave ends the transaction by responding to the master's query. The protocol uses an RS-232 serial interface with the parameters: 9600 baud, 8 data bits, 1 stop bit and no parity.

NOTE: Before the unit will communicate, RS232 must be turned on in the controller's Setup Loop.

The unit can be controlled through your computer's serial port by using the unit's standard 9-pin RS-232 connection. Data read of the serial port connects to the data transmit (pin 2) of the unit. Data transmit of the serial port connects to data read (pin 3) of the unit.



Communication cables are available from Thermo NESLAB. Contact our sales department for additional information.

All commands must be entered in the exact format shown in the tables on the following pages. The tables on the last two page of this Appendix show all commands available, their format and responses. Controller responses are either the requested data or an error message. The controller response *must* be received before the host sends the next command.

The host sends a command embedded in a single communications packet, then waits for the controller's response. If the command is not understood or the checksums do not agree, the controller responds with an error command. Otherwise, the controller responds with the requested data. If the controller fails to respond within 1 second, the host should resend the command.

NC Serial Communications Protocol

NOTE: All byte values are shown in hex, represents the binary values that must be sent to the chiller. **Do not use ASCII.**

The framing of the communications packet in both directions is:

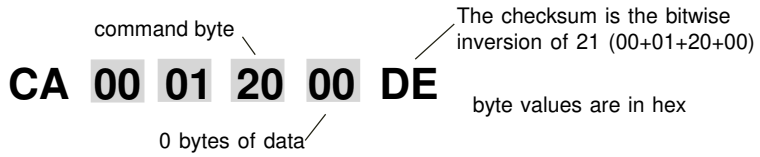
	Checksum region						
Lead char CA	Addr-MSB 00	Addr-LSB 01	Command	n d-bytes	d-byte 1 ...	d-byte n	Checksum

Lead char	CA (hex).
	Device address is 1
Addr-msb	Most significant byte of device address is 00 hex.
Addr-lsb	Least significant byte of device address is 01 hex.
Command	Command byte (see Table 1).
n d-bytes	Number of data bytes to follow (00 to 03 hex).
d-byte 1	1st data byte (the qualifier byte is considered a data byte).
...	...
d-byte n	nth data byte.
Checksum	Bitwise inversion of the 1 byte sum of bytes beginning with the most significant address byte and ending with the byte preceding the checksum. (To perform a bitwise inversion, "exclusive OR" the one byte sum with FF hex.)

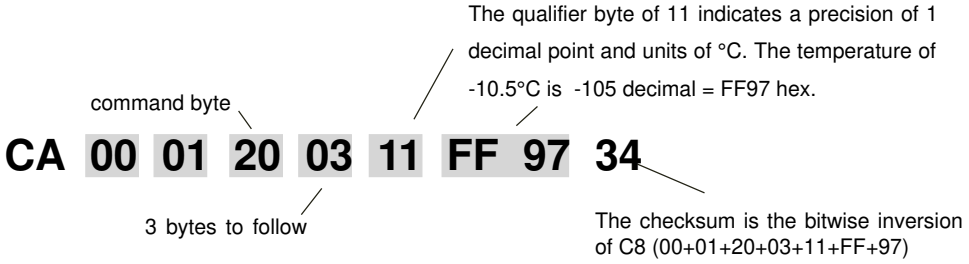
The master requests information by sending one of the Read Functions as shown in Table 1. Since no data is sent to the chiller during a read request, the master uses 00 for the number of data bytes following the command byte.

The chiller will respond to a Read Function by echoing the lead character, address, and command byte, followed by the requested data and checksum. When the chiller sends data, a qualifier byte is sent first, followed by a two byte signed integer (16 bit, MSB sent first). The qualifier byte indicates the precision and units of measure for the requested data as detailed in Table 2.

As an example, the master requests to read internal temperature by sending:

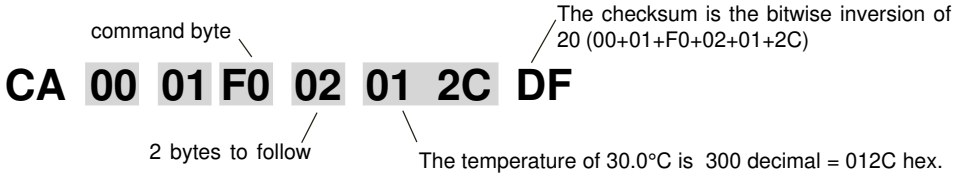


If the temperature is -10.5°C, the slave would reply:



The master sets parameters in the chiller by sending one of the Set Functions as shown in Table 1. The master does not send a qualifier byte in the data field. The master should be preprogrammed to send the correct precision and units (it could also read the parameter of interest first to decode the correct precision and units needed).

For example, if the master wants to set the setpoint to 30°C, it would send :



The slave responds:

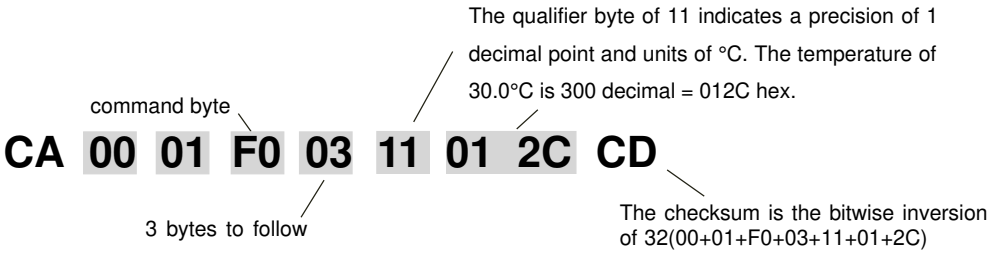


Table 1 Commands (All bytes are in hex)

FUNCTION	MASTER SENDS	UNIT RESPONDS
READ		
Read Internal Temperature	CA 00 01 **20** 00 DE	CA 00 01 **20** 03 qb d1 d2 cs

MISCELLANEOUS		
Request Acknowledge	CA 00 01 **00** 00 FE	CA 00 01 **00** 02 v1 v2 cs

command bytes shown in **bold**
qb = qualifier byte
d1,d2 = 16 bit signed integer of the value being sent or received
cs = the checksum of the string (see text)
ed = echo back of the command byte as received
v1,v2 = protocol version
* = limited to the range of the chiller
xx = no valid data, include in checksum

Table 2
QUALIFIER BYTE

00 hex	0 precision, no units of measure
01 hex	0 precision, °C
02 hex	0 precision, °F
10 hex	0.1 precision, no units of measure
11 hex	0.1 precision, °C units
12 hex	0.1 precision, °F units
13 hex	0.1 precision, LPM
14 hex	0.1 precision, GPM
08 hex	0 precision, MOhm-cm
18 hex	0.1 precision, MOhm-cm
20 hex	0.01 precision, no units of measure

Example: The temperature of 45.6°C would be represented by the qualifier 11 hex, followed by the 2 bytes 01 C8 hex (456 decimal).

Appendix D Programming Software

The Thermo NESLAB Communications Software is a user friendly software that allows you to automate your temperature control process. The software includes a 3½" disk, comprehensive operator's manual and a toll-free number to a trained technical staff.

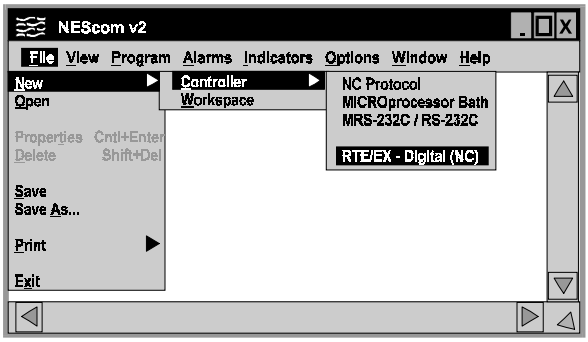
NEScom Software allows you to write custom temperature programs for our Digital or Microprocessor based temperature control apparatus. Choose upper or lower temperature limits and monitor system status with an alarm. NEScom can also record your results on a user selectable graph. NEScom must be used with an IBM or 100% compatible computer.

Select from easy to use product icons.

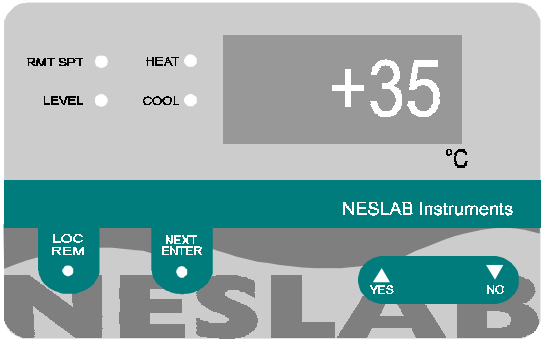
Create graphs and charts.

Easily configure ramping functions which set the setpoint over time.

View pop-up alarm windows which display if an alarm condition occurred.



Select software functions from the easy to use pulldown menus.



View a virtual controller screen which allows remote monitoring and operation of product control panel.

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. Thermo NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Thermo NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

APPENDIX B

International Quick Reference Guides

WARRANTY

HX-540 Quick Reference Operating Procedures

Installation
Position the unit in a clean environment with easy access to facility cooling water and a drain. The facility water requirements must meet those specified in the instruction manual or unit performance will be derated. Inadequate water supply could cause the compressor to overheat and turn the unit off.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled FACILITY WATER INLET and OUTLET, and RECIRCULATING FLUID INLET and OUTLET. Remove the plastic protective plugs from all the plumbing connections. Connect the FACILITY WATER INLET fitting to the facility cooling water and the FACILITY WATER OUTLET fitting to a drain. Connect the RECIRCULATING FLUID INLET fitting to the outlet of your application and the RECIRCULATING FLUID OUTLET fitting to the inlet of your application.

A non-freezing fluid is required for operation at any recirculating or ambient temperatures. The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within two inches of the top when the unit is at the desired operating temperature. If the fluid capacity of your application and recirculation lines are significant, have extra fluid on hand.

Operation
Before starting the unit, ensure the compressor mounting nuts have been loosened and that the facility water is on. Double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

The unit must be connected to the power source for at least 12 hours to allow the oil to be heated and separated from the refrigerant

To start the unit, place the Power Switch to the On position. The Cool and Idle LEDs on the front panel indicate the status of the refrigeration system. Cool is on when the unit is removing heat from the cooling fluid, Heat is on when the unit is in the hot gas by-pass mode. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

To display the temperature setpoint, press and hold the Setpoint/Actual Temp switch. To adjust the temperature setpoint, press and hold the Setpoint/Actual switch and turn the Adjust knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the Setpoint/Actual switch. The display will now indicate the temperature of the fluid in the reservoir.

The unit may be equipped with one of several optional controllers. In this case please refer to the instruction manual for details on their operation.

Flow Control
The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the "+" position you receive full flow, the "-" position is no flow.

Periodic Maintenance
Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

The unit has a pump strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against parts and workmanship for one full year from date of shipment. See back page for more details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Service

Department. Before calling, please obtain the following information from the unit's serial number label:

- *BOM number* _____
- *Serial number* _____

Section I Safety

Warnings

Make sure you read and understand all the instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department (see Preface, After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Always disconnect the line cord from the power source before performing any maintenance procedures, or before moving the unit.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified NESLAB technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold print. Read and follow these important instruction. Failure to observe these instruction can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

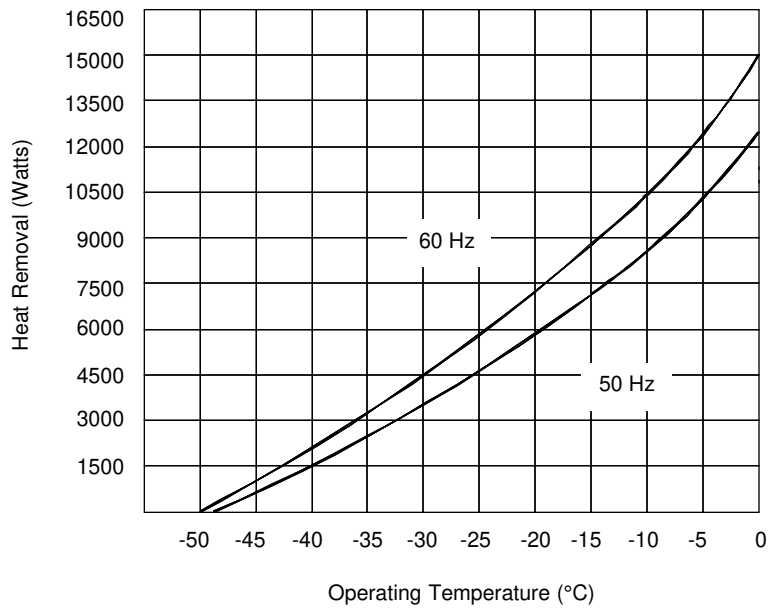
The HX-540 Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and pressure.

The unit consists of a water-cooled refrigeration system, stainless steel reservoir, recirculating pump, and a digital controller.

An important characteristic of the unit is its ability to track a set temperature virtually independent of changing heat loads. Once the desired operating temperature is set, the operating temperature will not shift more than a few tenths of a degree.

Specifications

Cooling Capacity[1]



Temperature Range	-40°C to 0°C
Temperature Stability	± 0.5°C
Fluid Capacity[2] *Gallons* *Liters*	 5 19

1. Specific heat of cooling fluid is 0.6 BTU/lb°F.
2. Total fluid volume of the reservoir, exchanger, and all internal plumbing lines.

Pump Capacity[3]	Dimension[4] *(H x W X D)* *Inches* *Centimeters*	 44 x 34 x 25.5 111.8 x 86.3 x 64.7
Weight *Pounds* *Kilograms*	 915 415

3. Specific gravity is 0.5.
4. Add 9 inches (22.9 cm) to depth for electrical enclosure.

Section III Installation

Site

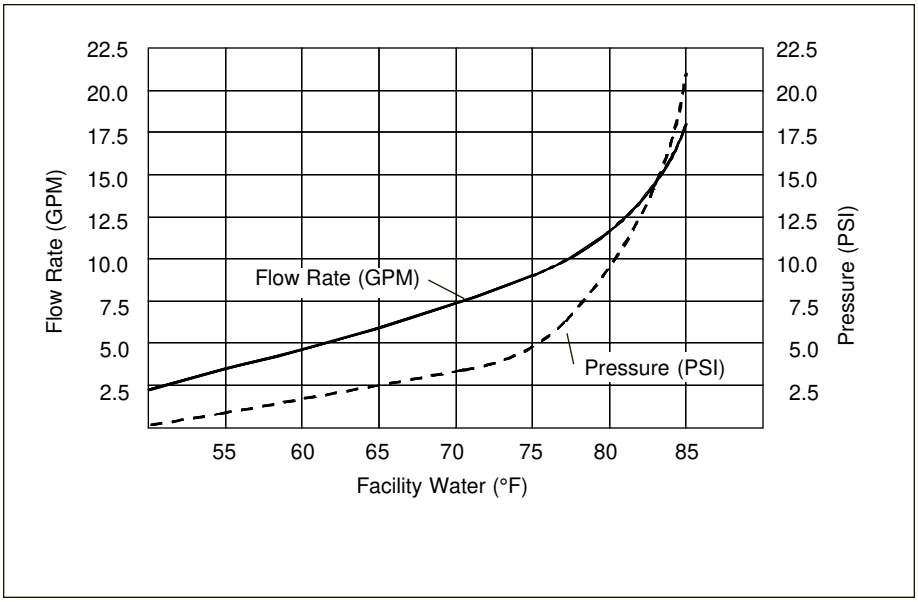
he unit is designed for indoor operation in a laboratory or clean industrial environment. Ambient temperatures should be in the range of +50°F to +100°F (+10 to +38°C). **Never install the unit in a location where excessive heat, moisture, or corrosive materials are present.**

The unit has a water-cooled refrigeration system. It should be placed in a location with easy access to a facility water source and a drain.

The unit will retain its full rated capacity with facility water temperatures to approximately +85°F (+30°C). Above 85°F, derate the cooling capacity 1% for every 1°F above +85°F, to a maximum facility water temperature of +95°F. In degrees Celsius, derate the cooling capacity 1% for every 0.5°C above +30°C, to a maximum facility water temperature of +35°C.

Facility Water Requirements

The facility water must meet or exceed the following requirements for the unit to retain its full rated capacity. If the facility water does not meet these standards, the cooling capacity will be derated.



The unit has a water regulating valve located in the FACILITY WATER INLET line. The valve regulates the flow rate of the facility water that passes through the heat exchanger based on the heat load. Flow through the heat exchanger is stopped when the unit turned off. If the facility water temperature or pressure do not meet the specified requirements, contact our Service Department for assistance.

Electrical Requirements

Refer to the serial number label on the rear of the unit to identify the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

All power connections should be made by a qualified electrician. The power connection is three wire terminal block plus a ground connection and will operate on a delta or wye system. Make sure an adequate ground connection is provided.

The unit has an automatic compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant and oil from mixing. Before initial start up, or after storage, the unit should be connected to the power source for at least 12 hours before turning the unit on. This will allow time for the crankcase oil to be heated and the refrigerant to separate from the oil.

The HX-540 Recirculating Chiller is a three phase unit. The unit is equipped with a phase rotation interlock. This interlock prevents the unit from starting if the phase rotation is wrong. If the unit will not start, see Section VI, Trouble-shooting. If the options in the checklist are not applicable, the problem may be phase rotation.

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician.

Disconnect the power source from the power source. Remove the rear panel and the junction box cover. Reverse any two line cord leads on the line cord side of the relay.

Never remove the green ground wire.

Replace the rear panel and connect the power source. If the unit will not start, contact our Customer Service Department for assistance.

Plumbing Requirements

The plumbing connections are located at the rear of the unit.

The facility water connections are labelled FACILITY WATER INLET and OUTLET. These connections are 1 inch FPT.

The cooling fluid connections are labelled RECIRCULATING FLUID INLET and OUTLET. These connections are ¾ inch FPT.

Connect the FACILITY WATER INLET to the facility water source.

Connect the FACILITY WATER OUTLET to the drain.

Connect the RECIRCULATING FLUID INLET to the outlet of the instrument being cooled.

Connect the RECIRCULATING FLUID OUTLET to the inlet of the instrument being cooled.

All tubing should be rated to withstand 100 psi. Make sure all tubing connections are securely clamped. Avoid running lines near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity. Tubing and insulation are available from NESLAB. Contact our Sales Department for information.

Before installing the unit to a instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. The manufacturer of the instrument should be able to recommend a cleaning fluid to clean their equipment.

It is important to keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing practical. Tubing should be straight, without bends or kinks. If reductions must be made, they should be made at the inlet and outlet of the instrument being cooled, not at the HX.

An externally mounted flow meter and temperature readout are required with this unit. These monitors will indicate whether the facility water requirements are being met (see Section III, Facility Water Requirements). It is the users responsibility to provide adequate facility water to the unit.

Both devices should be installed in the FACILITY WATER INLET line.

Fluids

A non-freezing fluid is required for operation at any recirculating or ambient temperature. Use a fluid capable of operating at -60°C without freezing.

Due to the physical nature of a plate heat exchanger, and its response to temperature changes, 100% water must not be used as a circulating fluid. Using 100% water may cause the plate heat exchanger to rupture.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage pump seals.

Never use flammable or corrosive fluids with this unit.

Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Filling Requirements

The fluid capacity of the connecting tubes and the instrument being cooled may be appreciable. Have extra cooling fluid on hand until the entire system is filled.

Thermal expansion and contraction of the cooling fluid must be taken into account when filling the unit.

Lift the hinged access panel on the unit's cover. Loosen the two thumb-screws and remove the reservoir cover.

Fill the reservoir with cooling fluid so that the fluid level will be within 2 inches of the top when the unit is at the desired operating temperature.

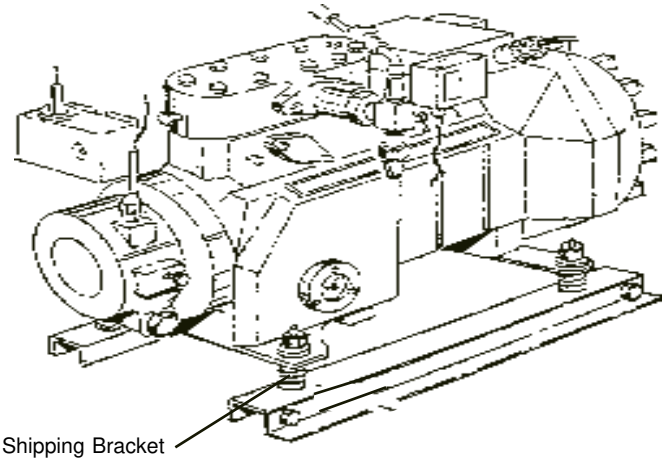
Replace the reservoir cover. Tighten the thumbscrews. Close the panel.

Section IV Operation

Pre-Start Up

Remove the two side access panels and the rear access panel (opposite end from the electrical enclosure) to access the compressor area.

Loosen the four compressor mounting nuts. There should be approximately 1/8" clearance between each compression mounting foot and shipping bracket to allow the compressor to "float" on the mounting springs.



Pump Down Cycle

The pump down cycle is designed to extend the life of the compressor in the refrigeration system. After the unit has been manually shut down, the refrigeration system will continue to run for about 30 seconds and will shut down when a low pressure fault occurs (see High and Low Pressure Cutout). This additional running time allows the refrigerant in the compressor to be removed and stored in the receiver.

In the event that a fault occurs, the unit will not start the pump down cycle, but will shut down immediately.

Shutting the unit off using a circuit breaker or other device on the line side of the relay defeats the purpose of the pump down cycle and is not recommended. If remote operation is desired, contact our Sales Department.

Electrical Enclosure (Optional)

Panel Controls

MAIN POWER
Indicates power is supplied to the unit.

SYSTEM ON
Indicates main contactor is closed. The contactor must be closed for the unit to start.

MACHINE ON
Indicates machine is running.

PUMP FAULT
Indicates a pump overload fault has occurred.

COMPRESSOR FAULT
Indicates a high or low refrigeration pressure fault has occurred.

PUSH/SYSTEM ON Button (Unlabelled)
Closes main contactor. Main contactor must be closed for the unit to start.

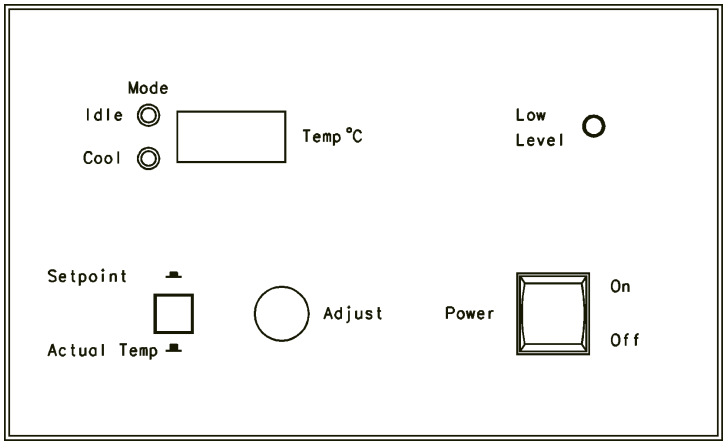
STOP/RUN/START Switch
To start the unit locally, turn the switch to the momentary START position. The RUN position is the normal operating position for the switch. To shut the unit off locally, turn the switch to the STOP position. The unit will start the pump down cycle.

EMERGENCY OFF Button (Optional)
When pressed, the unit will shut off immediately, bypassing the unit's pump down cycle. This button is intended for emergencies only. Do not use it as a normal shut down procedure. The button must be pulled out following an emergency shut down in order to perform the normal start up procedure.

AUTO RESTART Switch
The AUTO RESTART switch is located inside the electrical enclosure. If the switch is in the ON position, the unit will automatically restart when power is restored following an outage (see Interface Access. panel).

Interface Receptacles
The REMOTE and ACCESSORY receptacles and the ENABLE/DISABLE switch are located on a panel on the right side of the electrical enclosure (facing the enclosure). Both receptacles and the switch are connected to the Interface Access. Panel located inside the electrical enclosure. Refer to the Interface Access. Panel description for more details, and to the Digital Temperature Controller (Remote) for installation instructions.

Panel Mounted Digital Temperature Controller



Digital Temperature Controller

Temperature Control

The Cool and Idle LEDs indicate the status of the refrigeration system. The Idle indicator is lit when the unit is in the hot gas by-pass mode. The Cool indicator is lit when the refrigeration system is removing heat from the cooling fluid. As the fluid temperature approaches the temperature setpoint, the LEDs cycle on and off to indicate the duty cycle of the system. The unit can be in the Cool or the Idle mode, but never both at the same time. A balance between Cool and Idle controls the temperature.

Start Up

Before starting the unit, check all electrical and plumbing connections and make sure the recirculating system (the HX, the instrument being cooled, and the recirculation lines) has been properly filled with cooling fluid. Also make sure the facility water is turned on and the flow control valve is fully closed (see Section V, Flow Control).

To start the unit, place the Power On/Off switch in the On position. The pump and refrigeration system will start. The Temp°C display will indicate the temperature of the fluid in the reservoir. After starting recheck the fluid level, a “top off” may be needed. To shut the unit off, place the Power On/Off switch in the Off position.

When the unit is shut off, wait approximately 5 minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Temperature Adjustment

To display the temperature setpoint, press and hold the Setpoint/Actual Temp button. To adjust the setpoint, press and hold the Setpoint/Actual Temp button and turn the Adjust dial until the desired temperature setpoint is indicated on the Temp°C LED display. Once the setpoint is adjusted, release the Setpoint/Actual Temp button. The Temp°C LED display will indicate the temperature of the fluid in the reservoir.

Inadvertent movement of the Adjust dial will result in a change in the setpoint. The change will not be immediately reflected on the Temp°C display unless the Setpoint/Actual Temp button is pressed. The display will eventually change as the unit responds to the new setpoint

Low Level Warning

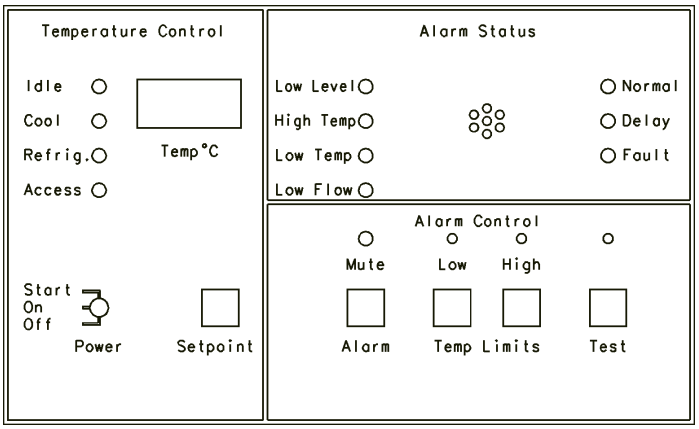
The Low Level indicator is connected to a float switch in the reservoir. The indicator warns the user of a low cooling fluid level in the reservoir. A low fluid level condition occurs when the cooling fluid in the reservoir drops below the operating level. The indicator serves only as a warning. The unit will not shut down as a result of a low fluid level condition.

Series II Controller (Optional)

Description

The Series II temperature controller features are divided into four sections. Three are mounted on the controller front panel: Temperature Control, . Alarm Control, and Alarm Status. The fourth section, the Interface Access. panel is located inside the electrical enclosure.

The four controller sections all work together, but for ease of explanation, are described separately.



Series II Temperature Controller

Temperature Control

This section of the temperature controller turns the unit on and off, adjusts and displays the fluid and setpoint temperatures, and indicates general refrigeration status.

Before starting the unit, double check all electrical and plumbing connections and make sure the circulating system (the HX, the instrument being cooled, and the tubing that connects them) has been properly filled with cooling fluid. Ensure the facility water is turned on.

To display the temperature setpoint, press and hold the Setpoint button. To adjust the setpoint, press and hold the Setpoint button and turn the dial above the Setpoint button until the desired temperature setpoint is indicated on the Temp°C LED display. Once the setpoint is adjusted, release the Setpoint button. The Temp°C LED display will indicate the fluid temperature.

Inadvertent movement of the Setpoint dial will result in a change in the setpoint. The change will not be immediately reflected on the Temp°C LED display unless the Setpoint button is pressed. The temperature will eventually change as the unit responds to the new setpoint

The Temperature Control section is equipped with four indicators: Idle, Cool, Refrig. (refrigeration), and Access (accessory).

The Cool and Idle indicators indicate the status of the refrigeration system. The Idle indicator is lit when the unit is in the hot gas by-pass mode. The Cool indicator is lit when the refrigeration system is removing heat from the cooling fluid. As the fluid temperature approaches the temperature setpoint, the indicators cycle on and off to indicate the duty cycle of the system. The unit can be in the Cool or the Idle mode, but never both at the same time. A balance between Cool and Idle is needed to control temperature.

The Refrig. indicator displays the status of the refrigeration compressor. The indicator is lit when the compressor is running.

The Access indicator displays the status of the ACCESS. ENABLE/DISABLE switch on the Interface Access. panel. The indicator is lit when the switch is in the ENABLE position. See Interface Access. panel for more information.

Alarm Control

The Alarm Control section adjusts the high and low temperature limits of the alarm, tests the alarm, and activates/de-activates the audible alarm.

To display the high or low temperature limit, press the corresponding button. When the button is pressed, the limit is indicated on the Temp°C display.

To adjust either temperature limit, press the corresponding button and turn the slotted potentiometer located directly above the button (a small screw-driver is required). The high and low values must be at least 4°C apart for the unit to operate.

The Test button simulates high and low temperature conditions to test the temperature limits.

To test the temperature limits, press the Test button and turn the dial located directly above the button. The simulated temperature will appear on the Temp°C display. When the temperature limits are exceeded on the display, the alarm will sound, and the corresponding indicator in the Alarm Status section will light indicating which limit has been exceeded.

The alarm will only sound when a fault occurs. The Alarm button alternately activates and mutes the audible alarm as indicated by the Mute indicator. When the alarm is muted, it will remain muted until the Alarm button is . pressed; the alarm does not reset after a fault condition has been corrected.

Alarm Status

The Alarm Status section indicates the status of the fault monitors. Four amber indicators display the status of the Low Level, High Temp, Low Temp, and Low Flow fault monitors. In the event of a fault, the cause of the fault must be identified and corrected before the unit can be restarted.

The Low Level indicator is connected to a float switch in the reservoir. If a low cooling fluid level condition is detected, the Low Level indicator will light and the Delay indicator will flash. If the condition is not corrected within 30 seconds, the Delay and Normal indicators turn off, the Fault indicator turns on, and the audible alarm will sound. After 50 seconds (total elapsed time), the unit will shut down and a set of relay contacts will open (the status of the relay contacts can be monitored using pins 14 and 15 of the REMOTE . CONT. receptacle on the Interface Access. panel).

The Low Flow indicator is connected to a flow switch in the RETURN line. A low flow fault occurs when the flow rate of the returning cooling fluid drops below 0.5 gallons per minute (1.8 liters per minute). If a low flow condition is detected, the Low Flow indicator will light and the Delay indicator will flash. If the condition is not corrected within 5 seconds, the Delay and Normal .. indicators turn off, the Fault indicator turns on, and the audible alarm will sound. After 30 seconds (total elapsed time), the unit will shut down and the relay contacts will open.

The High/Low Temp indicators are connected to sensors that monitor the temperature of the cooling fluid as it exits the reservoir. The monitors protect the system from exposure to excessively hot or cold cooling fluid. A temperature fault occurs when the cooling fluid temperature exceeds the set temperature limit. In the event of a high or low temperature fault, the unit will shut down, the corresponding indicator will light, the audible alarm will sound, and the set of relay contacts will open.

The Normal indicator (green) indicates no fault is present and the unit is operating normally.

The Delay indicator (amber) indicates an initial condition is out of desired range.

The Delay indicator will flash:

- during the 30 second low fluid level condition delay period.
- during the 5 second low flow condition delay period.
- while the fluid temperature is reaching the high and low temperature conditions following a power up. Once the fluid temperature satisfies the and low limit conditions, the temperature alarm is armed and a fault . will occur if the temperature goes outside of the limits.

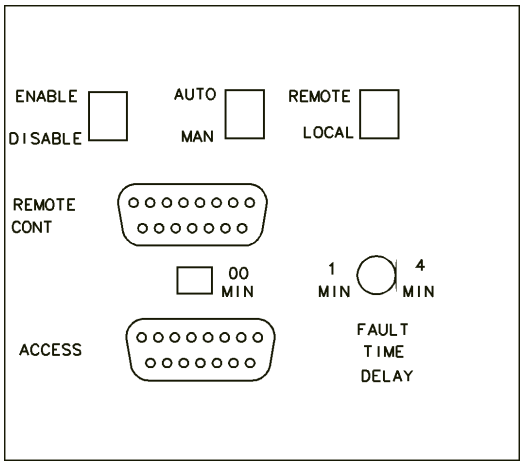
The Delay indicator turns off after these conditions are met.

The Fault indicator (red) indicates a fault has occurred. During a fault, the audible alarm will sound (unless muted), and the status indicator will display the condition(s) causing the fault.

Interface Access. Panel

The Interface Access. panel, located inside the electrical enclosure, allows the Series II temperature controller to be controlled and monitored with various electronic accessories.

The ACCESS. ENABLE/DISABLE switch allows the user to select the source of temperature setpoint adjustment. When the switch is in the ENABLE position, the setpoint is derived from the ACCESS receptacle (pins 6 and 15, 10mV/°C). When the switch is in the Disable position, the setpoint is derived from the Setpoint dial in the Temperature Control section on the front panel.



Interface Access Panel

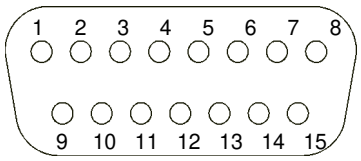
The RESTART AUTO/MAN switch controls the operation of the controller's START switch. If the switch is in the MAN position, the START switch is "open" and the unit must be manually restarted when power is restored following an outage. In the AUTO position, the START switch is "closed" and the unit will automatically restart when power is restored. See ON/OFF/START Logic and AUTO RESTART Switch for more information.

The START/STOP REMOTE/LOCAL switch selects the location where the unit is turned on: from the front panel ON/OFF/START switch or from an external switch. See ON/OFF/START Logic for more information.

The FAULT TIME DELAY potentiometer allows adjustment of the delay period following an initial “out of limits” condition. The time adjustment is in addition to the delays described in the Alarm Status section. For example, if the cooling fluid in the reservoir drops below the operating level, there is a 30 second delay period before a fault occurs. If the FAULT TIME DELAY is adjusted to 1 minute, the delay period for a low level condition would be 1 minute, 30 seconds. See the Alarm Status section for more information.

The D MIN receptacle allows the controller to be configured so the unit will continue to run if a fault occurs. This option is available for customers who are willing to accept the risk of damage to the unit in order to continue to provide all available cooling fluid to the instrument being cooled. Contact our Service Department for more information.

REMOTE CONT. Receptacle



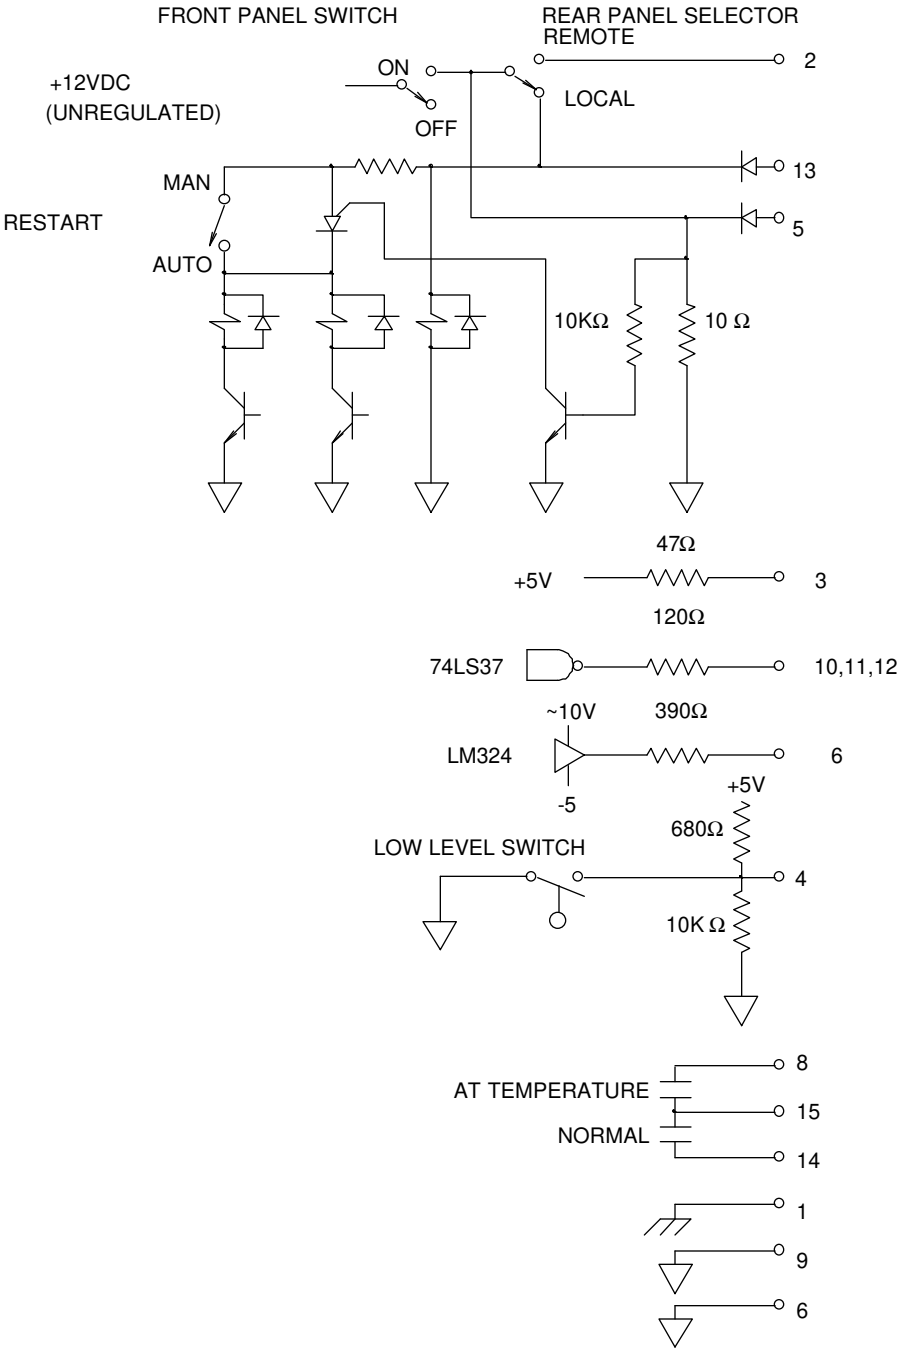
15 pin D-subminiature male

Pin #	Alarm circuitry	Control circuitry
1		Chassis ground.
2		ON/OFF control circuit power (+12VDC, unregulated). See ON/OFF/START Logic.
3	DC for LEDs (+5VDC, current limited through 47 Ω resistor).	
4	Low level switch (+5VDC, current limited through 680 Ω resistor).	
5		START button connection. See ON/OFF/START Logic.
6		Heater ON command, solid state relay drive (+8 to +13 VDC, current limited through 390 Ω resistor). Contact our Sales Department for more information.
7	Reserved.	
8	AT TEMPERATURE contact (24V, 1A maximum. AC and DC). When the fluid temperature is between the high and low temperature limits, this pin is connected to pin 15. See Relay Contact Logic.	
9	Common for DC power supplies, grounded.	

Pin #	Alarm circuitry	Control circuitry
10	FAULT indicator drive (-). Connect LED cathode here, anode to pin 3, for display of FAULT status. See External Status Indicator Logic.	
11	NOT AT TEMPERATURE indicator drive (-). Connect LED cathode here, anode to pin 3, for display indicating when the fluid temperature is not between the high and low temperature limits. See External Status Indicator Logic.	
12	NORMAL indicator drive (-). Connect LED cathode here, anode to pin 3, for display indicating when all status monitors (High Temperature, Low Temperature, Low Level, Low Flow) are normal. See External Status Indicator Logic.	
13		RUN switch connection. See ON/OFF/START Logic.
14	NORMAL contact (+24V, 1A maximum. AC and DC). When all status monitors are normal (see pin 12) this pin is connected to pin 15. See Relay Contact Logic.	
15	Relay contact common connection.	

The exclusion of alarm circuitry is an available option for Series II temperature controllers. The alarm circuitry pin connections are not used on these controllers.

Remote Connector Circuitry Details



ON/OFF/START Logic

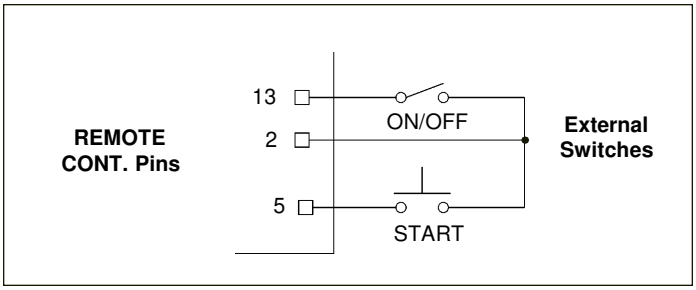
When the START/STOP LOCAL/REMOTE switch is set to LOCAL, the front panel ON/OFF/START switch controls the unit.

When the LOCAL/REMOTE switch is set to REMOTE, the front panel ON/OFF/START must be in the ON position for the unit to operate. An external switch is necessary to complete the circuit and start the unit.

If the front panel ON/OFF/START switch is OFF, then external switches cannot start the unit. This allows an operator or service person at the unit to override the external controls and shut down the unit.

If the front panel ON/OFF/START switch is ON, the external ON/OFF and START switches function just like the front panel switch.

If the rear panel RESTART AUTO/MAN switch is set to AUTO, the START switch is not needed to start the unit. It will start when the external ON/OFF switch is switched to ON or when power is restored after an outage.



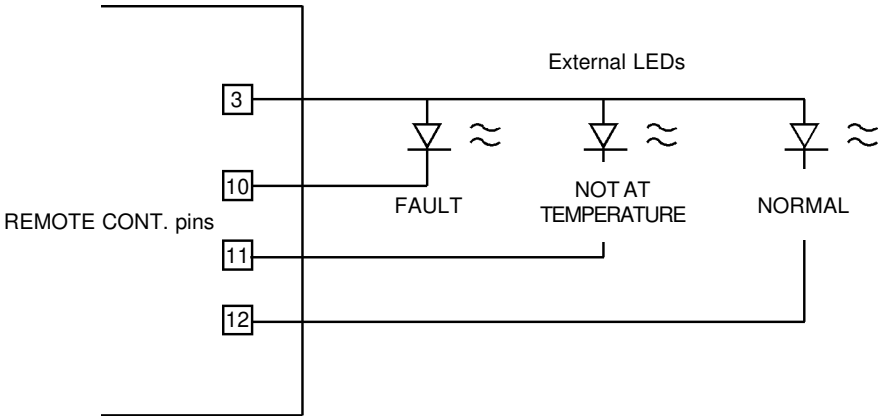
External Status Indicator Logic

The FAULT indicators light if one of the four fault conditions monitored by the alarm circuit (High and Low Temp, Low Level, and Low Flow) has occurred.

To prevent nuisance alarms, this signal does not indicate a FAULT condition when the unit is first turned on and the fluid temperature is outside the alarm limits. This situation will typically occur when the high temperature limit is set to a temperature below ambient. Once the fluid temperature is within the high and low temperature limits, subsequent excursions beyond those limits will produce a FAULT indication.

The NORMAL indicator lights when all four status monitors are normal (no faults). The NORMAL indicator logic is similar to the FAULT indictor logic; a temperature out of limits when the HX is first turned on is considered normal (not a fault).

Relay Contact Logic

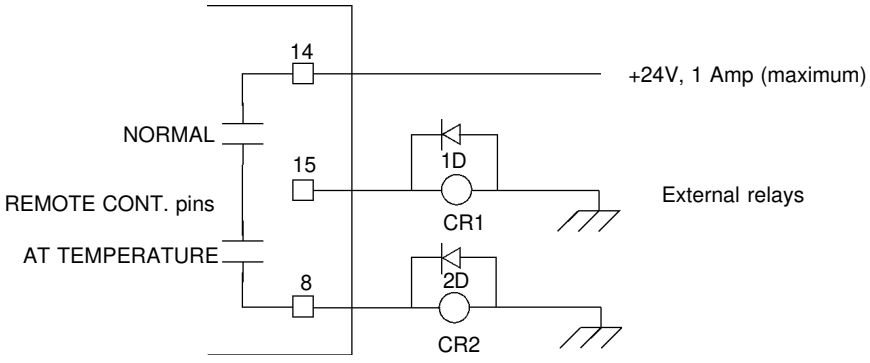


The NORMAL relay contacts are closed if all four status monitors are normal (no faults).

To prevent nuisance alarms, the contacts are closed when the unit is first turned on and the fluid temperature is outside the alarm limits. This situation will typically occur when the high temperature limit is set to a temperature below ambient. Once the fluid temperature is within the high and low temperature limits, subsequent excursions beyond those limits will cause the contacts to open.

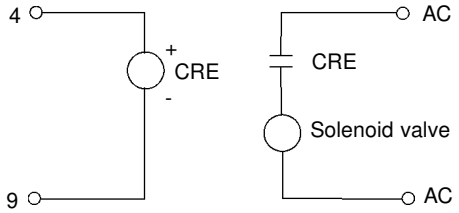
The AT TEMPERATURE contacts are closed if the fluid temperature is between the high and low temperature limits.

In the example circuit shown below, CR1 is energized when the unit is ON and there are no abnormal conditions. CR2 is energized when there are no abnormal conditions **AND** the fluid temperature is within limits. CR1 can serve as an alarm activator, while CR2 can indicate that the unit is ready to provide cooling fluid to the instrument being cooled.

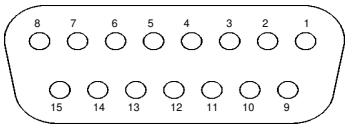


Low Level Switch/Auto Refill

In the example circuit below, when the fluid level in the reservoir drops, DC is applied to the CRE control input to energize the solenoid valve. The valve opens to fill the reservoir. When the fluid level rises, CRE is turned off. If the level does not rise after about 30 seconds, a low level alarm occurs.



ACCESS Receptacle



15 pin D-subminiature female receptacle

Pin #	Function
1	Chassis ground.
2	No connection.
3	Span +. Indicates the maximum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +350mV = +35.0°C).
4	Span -. Indicates the minimum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +50mV = +5.0°C).
5	AT TEMPERATURE indicator solid state relay drive (TTL output. Part of the alarm circuitry in the REMOTE CONT receptacle). Connect solid state relay drive (-) here, (+) to pin 3 on the REMOTE CONT receptacle to energize relay when the fluid temperature is between the high and low temperature limits. Pin reads 0V when fluid temperature is between limits, -5VDC when out of limits. 6	Analog ground. The analog ground is physically separated from the power ground throughout the unit. To prevent offsets that result ground currents, the analog and power ground are only connected at the power supply. Analog ground should only be used as a reference pin when no current is flowing.
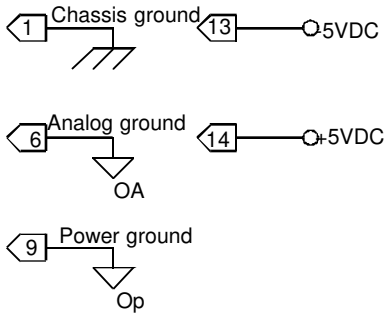
7	Sensor temperature (current limited through 2.7K OHM resistor). The fluid temperature, as measured by the controller's sensor located in the reservoir, can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
8	Setpoint out. The present temperature setpoint can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
9	Power ground. This pin should be used for functions that require the unit to draw input or output current. See pin 6.
10	No connection.
11	No connection.

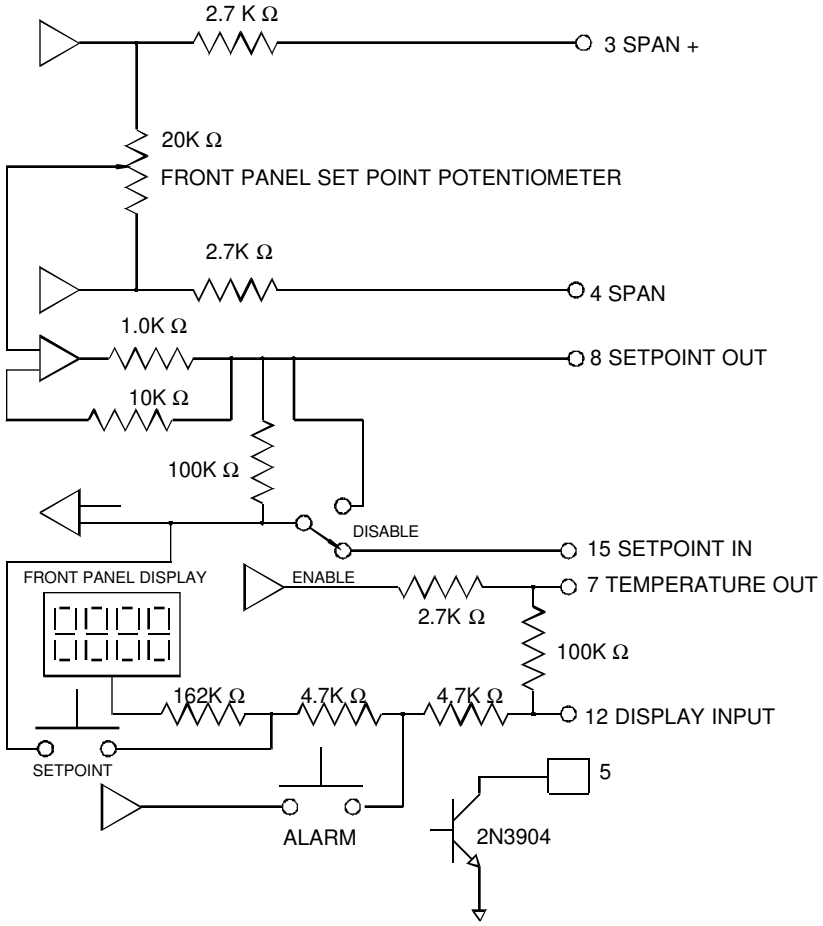
Continued on Next Page

Pin#	Function
12	Digital display (input only). An external voltage can be displayed on the operator panel digital display by applying the voltage to this pin. The display has a low input resistance and a full scale rating of ±1.99VDC. Input is referenced to analog ground, pin 6. The maximum voltage applied to the display should be limited to ±2VDC.
13	-5V. Power supply of -5VDC (15mA maximum).
14	+5V. Power supply of +5VDC (15mA maximum).
15	Setpoint in. The temperature setpoint can be controlled by applying a known voltage to this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +230mV = +23.0°C. The DISABLE/ENABLE switch must be in the ENABLE position to control the setpoint from this pin.

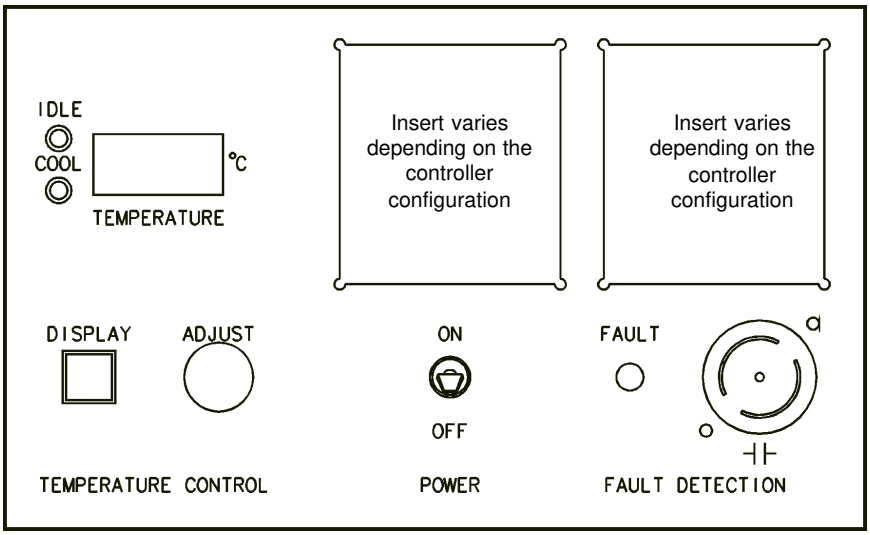
Access Receptacle Equivalent circuits



Access Receptacle Circuitry Details



Digital with Interlock Temperature Controller (Optional)



Digital with Interlock Temperature Controller

Description

The Digital with Interlock temperature controller is a Digital temperature . controller with up to four monitoring options: low temperature, high temperature, low fluid level, and low flow. The controller can be built with any combination of these four monitors.

Temperature Control

The Cool and Idle LEDs indicate the status of the refrigeration system. The Idle indicator is lit when the unit is in the hot gas by-pass mode. The Cool indicator is lit when the refrigeration system is removing heat from the cooling fluid. As the fluid temperature approaches the temperature setpoint, the LEDs cycle on and off to indicate the duty cycle of the system. The unit can be in the Cool or the Idle mode, but never both at the same time. A balance between Cool and Idle controls the temperature.

Start Up

Before starting the unit, check all electrical and plumbing connections and make sure the recirculating system (the HX, the instrument being cooled, and the recirculation lines) has been properly filled with cooling fluid. Also make sure the facility water is turned on and the flow control valve is fully closed (see Section V, Flow Control).

Temperature Adjustment

To display the temperature setpoint, press and hold the DISPLAY button. To adjust the temperature setpoint, press and hold the DISPLAY button and turn the ADJUST dial until the desired temperature setpoint is indicated on the TEMPERATURE °C LED display. Once the setpoint is adjusted, release the DISPLAY button. The TEMPERATURE °C display will indicate the temperature of the fluid in the reservoir.

Inadvertent movement of the ADJUST dial will result in a change in the setpoint. The change will not be immediately reflected on the digital display unless the DISPLAY button is pressed. The display will eventually change as the unit responds to the new setpoint.

When the unit is shut off, wait approximately 5 minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Fault Response

Controllers with a START switch are configured to shut off in the event that a fault occurs. Controllers NOT equipped with a START switch will allow the unit to continue to operate if a fault occurs. This option is available for customers who are willing to accept the risk of damage to the unit in order to continue to provide cooling fluid to the instrument being cooled.

With either controller configuration, the relay contacts connected to the controller receptacle will open and the FAULT indicator will light if a fault occurs. The cause of the fault must be identified and corrected before the unit can be restarted.

START Switch

If the controller is equipped with a START switch, a fault will cause the unit to shut down. Press the START switch to restart the unit after the fault has been corrected. If the fault has not been corrected, the unit will not start and the FAULT indicator will light when the START switch is pressed.

Temperature Monitors

The optional high and low temperature monitors are connected to sensors that monitor the temperature of the cooling fluid as it exits the reservoir. The monitors protect the system from exposure to excessively hot or cold cooling fluid. A temperature fault occurs when the fluid temperature exceeds the set temperature limit.

To adjust either temperature monitor, turn the appropriate calibrated dial to the desired temperature limit.

Low Fluid Level Monitor

The low fluid level monitor is connected to a float switch in the reservoir. If the controller is equipped with a LOW LEVEL indicator, the low level monitor is not connected to the fault circuit. The indicator will light if the reservoir cooling fluid drops below the operating level. The indicator serves only as a warning. A fault will not occur as a result of a low level condition.

If the controller is NOT equipped with a LOW LEVEL indicator, the low level monitor is connected to the fault current. A fault will occur if the reservoir cooling fluid level drops below the operating level.

Low Flow Monitor

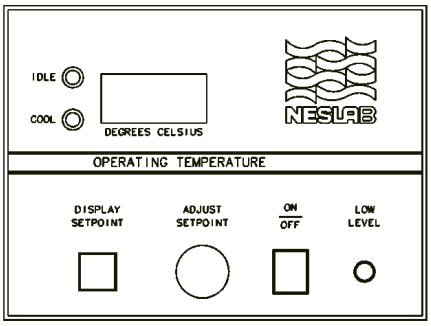
The optional low flow monitor is connected to a flow switch in the RETURN line. A low flow fault occurs when the flow rate of the returning cooling fluid drops below 0.3 gallons per minute (1.0 liters per minute).

When starting a unit with a controller equipped with both a low flow monitor and a START switch, the START switch must be held in the ON position until the flow switch “closes” (2 or 3 seconds). If time is not allowed for the flow switch to close, the unit will stop when the START switch is released.

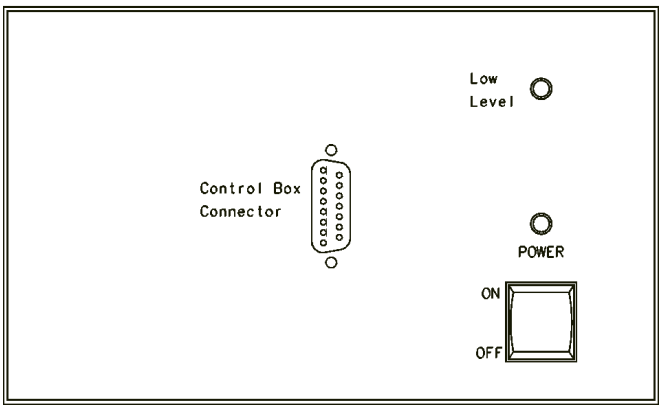
Interlock Relay Contacts

A set of contacts are connected to a receptacle on the operator panel. The contacts are rated 15A, 125V. This is not a power inlet or outlet. The receptacle is isolated from the circuitry. Its ground pin is connected to the chassis. The contacts are normally open: they are closed when the unit is running normally (no faults present), and they are open when the unit is off or when a fault occurs.

Remote Digital Temperature Controller (Optional)



Remote Digital Temperature Controller - Front Panel



Remote Temperature Controller

Installation

Controller dimensions are 4¾" x 7¾" x 3¾" (H x W x D).

Connect the Digital remote box to the unit by securing the connector on the remote box's cable to the Control Box Connector receptacle on the operator panel on the front of the case top.

Temperature Control

The Cool and Idle LEDs indicate the status of the refrigeration system. The Idle indicator is lit when the unit is in the hot gas by-pass mode. The Cool indicator is lit when the refrigeration system is removing heat from the cooling fluid. As the fluid temperature approaches the temperature setpoint, the LEDs cycle on and off to indicate the duty cycle of the system. The unit can be in the Cool or the Idle mode, but never both at the same time. A balance between Cool and Idle controls the temperature.

Start Up

Before starting the unit, check all electrical and plumbing connections and make sure the recirculating system (the HX, the instrument being cooled, and the recirculation lines) has been properly filled with cooling fluid. Also make sure the facility water is turned on and the flow control valve is fully closed (see Section V, Flow Control).

To start the unit, place the ON/OFF switch on the operator panel of the unit in the ON position and press the ON/OFF button on the remote box. The pump and refrigeration system will start, the POWER indicator on the operator panel will light and the DEGREES CELSIUS display on the remote box will indicate the fluid temperature. Either ON/OFF switch will shut the unit off.

Temperature Adjustment

To display the temperature setpoint, press and hold the DISPLAY/ SETPOINT button. To adjust the setpoint, press and hold the DISPLAY/SETPOINT button and turn the ADJUST SETPOINT dial until the desired temperature setpoint is indicated on the DEGREES CELSIUS LED display. Once the setpoint is adjusted, release the DISPLAY/SETPOINT button. The DEGREES CELSIUS LED display will indicate the temperature of the fluid in the reservoir.

Inadvertent movement of the ADJUST SETPOINT dial will result in a change in the setpoint. The change will not be immediately reflected on the digital display unless the DISPLAY/SETPOINT button is pressed. The display will eventually change as the unit responds to the new setpoint.

When the unit is shut off, wait approximately 5 minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Low Level Warning

The LOW LEVEL indicator is connected to a float switch in the reservoir. The indicator warns the user of a low cooling fluid level in the reservoir. A low fluid level condition occurs when the cooling fluid in the reservoir drops below the operating level. The indicator serves only as a warning. The unit will not shut down as a result of a low fluid level condition.

Flow Control

The flow control handle is located on the right side of the unit. The handle is connected to a valve that controls the flow of fluid to your application.

When the handle is in the vertical “+” position, the valve is open and all fluid is supplied to your application. When the handle is in the horizontal “0” position, the valve is closed and no fluid is supplied to your application. When the handle is between these two positions, the flow rate of the fluid is between full flow and no flow. Use a flow meter on the RECIRCULATING FLUID OUTLET to adjust the desired flow rate.

Ensure the flow control handle is in a slightly open position before starting the unit. Once the unit is running, slowly adjust the handle to the desired flow rate. Never start the unit with the handle in the full closed “0” position and never “crank” the valve wide open from the closed or slightly open position.

The pressure gauge next to the flow control valve (labelled RECIRCULATING PRESSURE) indicates the operating pressure of the system.

High and Low Pressure Cutout

High and low pressure cutouts prevent excessively high and low refrigeration pressures that can damage the unit. The cutouts are connected to a pressure gauge that monitors pressure at the suction sideof the compressor.

In the event of a low refrigeration pressure fault, the unit will shut down and must be manually restarted.

In the event of a high refrigeration pressure fault, the unit will shut down. However, the unit will automatically restart once the refrigeration pressure drops below the cutout level.

Pressure Switch

An adjustable pressure switch, located next to the flow switch on the RECIRCULATING FLUID RETURN line, prevents the unit from operating under excessively high recirculating pressure. If the operating pressure exceeds the pre-set limit, the unit will shut down. The fault must be identified and corrected before the unit can be restarted.

If adjustment is required, contact our Service Department for assistance.

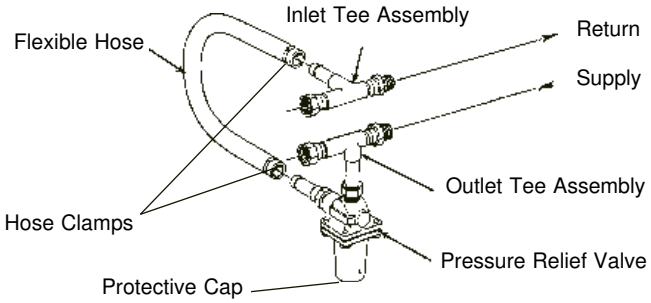
Pump Motor Overload Protector

An overload protector prevents the pump motor from exposure to excessively high current. If an overload condition occurs, due, for example, to a heavy work load, the overload protector shuts the unit down. The overload protector automatically resets after approximately two minutes. The source of the overload must be identified and corrected before the unit will restart.

External Pressure Regulator (Optional)

For applications requiring a maximum pressure less than 55 psi, an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 psi. If the pressure of the fluid leaving the unit exceeds the valve setting the relief valve will bypass the fluid back into the unit to relieve the pressure. The pressure of the system is determined by the back pressure of the connected equipment and the flow rate of the recirculating fluid to your application.

Connect the EPR assembly as shown below. Tighten the hose clamps tight enough to prevent leakage. Do not over-tighten or the clamps will “bite” into the flexible tubbing and can cause excessive wear.



Connect the outlet tee assembly to the inlet of your application. Connect the inlet tee assembly to the outlet of your application.

Adjustment

When adjusting the relief valve some leaking may occur, place a container under the valve during adjustment.

Remove the protective cap and locate a threaded fitting with a slot for a large screwdriver. Hold the threaded fitting in place and loosen the lock nut on the valve body until it is almost flush with the threaded fitting. Unscrew the threaded fitting three to four turns. (If the threaded fitting unscrews completely from the valve housing, screw it back in two to three turns.)

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and your application. Monitor the operating pressure of the HX unit. Turn the threaded fitting until the desired relief pressure is set (the EPR valve cannot be set lower than the total back pressure of your instrument, or flow will not be received).

Tighten the locknut to secure the position of the threaded fitting. Open the hose between the EPR outlet tee assembly and your application.

Section V Maintenance

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal downtime for your unit. For more information, contact our Service Department. Phone numbers and addresses for all our Sales and Service Centers are located in the front of this manual (see Preface, After-sale Support) and on the back cover of this manual.

Cleaning

Periodically inspect the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically when operating at low temperatures. The concentration of water in the cooling fluid will increase over time, leading to a reduction in the cooling capacity.

Before changing the cooling fluid, raise the operating temperature of the unit to de-ice the reservoir. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

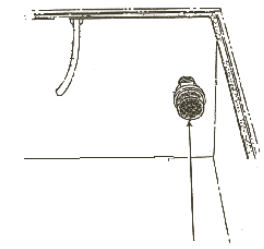
Pump Strainer

A wire mesh pump strainer is located in the reservoir on the pump suction line. If debris is drawn into the reservoir, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

Inspect the strainer whenever the reservoir is checked for cleanliness (see Section V, Cleaning). If the strainer is visibly clogged, cleaning is required.

Disconnect the line cord from the power source and drain the reservoir before cleaning the strainer.

Cover the strainer with a baggie to catch any debris which may become free. Unscrew the strainer and rinse it with water. Replace the strainer. Refer to III, Filling Requirements for instructions on replacing cooling fluid.



Strainer

Section VI Troubleshooting

Checklist

Unit will not start.
Check house circuit breaker.

Ensure power source meets specified voltage, ±10%. Refer to the serial number label on the rear of the unit to identify specific electrical requirements.

Make sure the facility water is connected to the FACILITY WATER INLET.

Unit will not circulate.
Check pump strainer (see Section V, Pump Strainer).

Check for obstructions or kinks in the tubing between the unit and the instrument being cooled.

Check pressure gauge reading. If reading is “0” with flow, the gauge may be faulty. Verify by placing a second gauge in the RECIRCULATING WATER OUTLET line.

Inadequate temperature control.
Check installation of unit for compliance with conditions in Section III.

Make sure instrument being cooled has not overcome the cooling capacity of the unit (see Section II, Specifications).

Service Assistance

If, after these troubleshooting steps, your unit fails to operate properly, contact our Service Department. Phone numbers and addresses for all our Sales and Service Centers are located in the front of this manual (see Preface, After-sale Support) and on the back cover of this manual. Before calling, please obtain the following information:

BOM number
Serial number

Appendix A DeltaTemp Programming Software

DeltaTemp programming software is now available for free download from NESLAB ONLINE BBS (Bulletin Board System) at 603-427-2490.

DeltaTemp software allows you to write custom temperature programs for NESLAB digital units (any unit with a digital temperature readout AND a 10-15 pin INTERFACE port). The menu-driven program provides a table format for entering temperature parameters and a visual graph confirmation of the program you have designed. Program time can range from 0 to 999 minutes with unlimited looping. Choose upper and lower temperature limits and monitor system status with an audible alarm. DeltaTemp can also record your results on a printed graph or file. DeltaTemp is a DOS program, and requires an IBM or 100% compatible computer.

DeltaTemp may require use of a computer interface device, depending on which NESLAB unit is being used. Refer to the setup diagram in the DeltaTemp folder for full details.

To download the software, go to: CONFERENCES / SOFTWARE / DeltaTemp.

The folder also contains the operating manual, setup diagrams, application notes, and directions on making your own interface cable.

NESLAB ONLINE is a FirstClass® system accessible by general terminal software (Windows Terminal accessory, ClarisWorks Communications, Z-Term, Pro-Comm, or similar).

To use the full graphics and features of the BBS we recommend using FirstClass® Client software. FirstClass® Client is available for Macintosh or Windows platforms. It is available from many sources:

NESLAB ONLINE
Mac: Conferences/Software/Macintosh
Windows: Conferences/Software/Windows

AMERICA ONLINE

Appendix B International Quick Reference Guides

HX-540 Kurzbedienungsanleitung

Installation

Stellen Sie das Gerät in einer sauberen Umgebung mit einfachem Zugang zu einem Gebäudewasseranschluß und einem Abfluß auf. Das Gebäudewasser muß den in der Anleitung festgelegten Anforderungen genügen, sonst wird die Leistung des Gerätes herabgesetzt. Unzureichende Wasserzufuhr kann zu einer Überhitzung des Kompressors und so zu einem Ausfall des Gerätes führen.

Vergewissern Sie sich, daß die Spannung Ihrer Stromanschlüsse mit der für das Gerät vorgesehenen Spannung übereinstimmt (±10%).

Die Schlauchanschlüsse des Gerätes befinden sich an der Rückseite und sind mit FACILITY WATER INLET und OUTLET und RECIRCULATING FLUID INLET und OUTLET bezeichnet. Bitte entfernen Sie die Gummiabdichtung von allen Anschlüssen. Schließen Sie den FACILITY WATER INLET-Anschluß an das Gebäudewasser und den FACILITY WATER OUTLET-Anschluß an den Abfluß an. Schließen Sie den RECIRCULATING FLUID INLET-Anschluß an den Ausgang Ihres Instruments und den RECIRCULATING FLUID OUTLET-Anschluß an den Eingang Ihres Instruments an.

Für den Betrieb bei allen Zirkulations- oder Umgebungstemperaturen muß eine nicht gefrierende Flüssigkeit verwendet werden. Die gewählte Flüssigkeit muß eine Viskosität von maximal 50 Centistokes bei der niedrigsten möglichen Betriebstemperatur haben.

Um das Reservoir zu füllen, öffnen Sie die Abdeckplatte in der linken hinteren Ecke der Gehäuseoberseite und entfernen Sie die Reservoirabdeckung, indem Sie die Flügelschrauben lösen. Füllen Sie das Reservoir bis 2 Zoll unterhalb des Randes (dieser Stand sollte erreicht werden, wenn das Gerät die gewünschte Betriebstemperatur erreicht hat). Wenn das zu kühlende Instrument und die Zirkulationsleitungen sehr viel Kühlflüssigkeit aufnehmen können, sollten Sie zusätzliche Kühlflüssigkeit zur Hand haben, um gegebenenfalls nachfüllen zu können.

Inbetriebnahme

Vor Inbetriebnahme des Gerätes vergewissern Sie sich bitte, daß die Montagemuttern des Kompressors gelöst wurden und das Gebäudewasser angestellt ist.Überprüfen Sie, ob die elektrischen Anschlüsse und die Rohr- u. Schlauchanschlüsse sachgemäß installiert sind und daß das gesamte System mit Kühlflüssigkeit gefüllt ist.

Das Gerät muß vor dem Starten mindestens 12 Stunden an die Stromversorgung angeschlossen werden, damit das Öl im Kompressor erwärmt werden kann und sich von der Kühlflüssigkeit abscheiden kann.

Um das Gerät einzuschalten, müssen Sie den Hauptschalter auf „ON“ stellen. Die „COOL“- und „IDLE“-Anzeigen auf der Steuertafel geben den Status des Kühlsystems an. Die COOL-Anzeige leuchtet, wenn das Kühlsystem der Kühlflüssigkeit Wärme entzieht. Die HEAT-Anzeige leuchtet, wenn sich das Gerät im Hot Gas Bypass Modus befindet.Wenn die Temperatur der Kühlflüssigkeit sich der gewünschten Temperatur nähert, blinken die Anzeigen, um den Arbeitszyklus des Systems anzugeben.

Nach dem Ausschalten des Gerätes sollten Sie vor dem Wiedereinschalten ca. 5 Minuten warten, damit das Kühlsystem einen Druckausgleich durchführen kann. Beachtet man diese Wartezeit nicht, kommt es zu kurzen Schaltfrequenzen des Kompressors und eine Kühlung ist nicht möglich.

Um sich den Temperatur-Setpoint anzeigen zu lassen, drücken Sie den SETPOINT/ACTUAL

TEMP-Schalter und halten Sie ihn gedrückt. Um den Temperatur-Setpoint einzustellen, drücken Sie den Setpoint/Actual-Schalter, halten diesen, und drehen gleichzeitig den ADJUST-Schalter so lange, bis die gewünschte Temperatur in der Digitalanzeige angezeigt wird. Wenn die Temperatur eingestellt ist, lassen Sie den Setpoint/ Actual-Schalter los. Die Digitalanzeige zeigt dann die Temperatur der Kühlflüssigkeit im Reservoir an.

Flußsteuerung
Der RECIRCULATION FLOW CONTROL Hebel kontrolliert die Durchflußmenge der Kühlflüssigkeit zu Ihrer Anwendung. In der „+“-Stellung wird die gesamte verfügbare Kühlflüssigkeit an die Anwendung abgegeben, in der „-“-Stellung wird keine Kühlflüssigkeit an die Anwendung abgegeben.

Wartung
Überprüfen Sie regelmäßig die Kühlflüssigkeit im Reservoir. Sollte eine Säuberung notwendig sein, spülen Sie das Reservoir mit einer speziellen Reinigungsflüssigkeit, die mit dem Umlaufsystem und der Kühlflüssigkeit kompatibel ist.

Das Kühlmittel sollten Sie regelmäßig erneuern. Wenn Sie das Gerät bei niedrigen Temperaturen betreiben, erhöht sich mit der Zeit der Wasseranteil in der Kühlflüssigkeit. Dies führt zum Verlust von Kühlkapazität.

Regelmäßiges Absaugen des Kondensor-Heizkörpers ist erforderlich. Die Reinigungshäufigkeit hängt von der Betriebsumgebung ab. Eine monatliche Überprüfung des Kondensors ist empfehlenswert. So werden Sie nach einigen Monaten einen Reinigungsrhythmus gefunden haben.

Das Gerät ist mit einem Pumpenfilter ausgestattet. Der Filter sorgt dafür, daß kleine Teilchen und Schmutzablagerungen nicht in die Pumpe gelangen und so die Pumpflügel beschädigen können.

Nach der Erstinstallation kann es zu einer Blockierung des Filters kommen. Die erste Reinigung sollte daher nach einer Woche erfolgen. Danach empfehlen wir eine monatliche Überprüfung des Filters. So können Sie nach einiger Zeit abschätzen, wie oft der Filter gereinigt werden muß.

Bevor Sie den Filter reinigen, ziehen Sie den Netzstecker aus der Steckdose und leeren Sie das Reservoir.

HX-540 Kvik referance.

Installation:
Opstilles i rene omgivelser.
Steder med meget støv skal undgåes, og periodisk rensning skal udføres, hvis utilsigtet nedbrud skal undgåes. Opbygning af støv vil medføre fald i kølekapasiteten og i værste fald overophedning af systemet.

Check at netspændingen er den nominelle 240V ± max. 10%.

Slangetilgang er på bagsiden mærket „FACILITY WATER INLET“ (ind) og „OUTLET“ (ud), samt Recirkulering „INLET“ og „OUTLET“. Inden tilslutning af fittings fjernes plaststøvkappen fra rørstudsene. „RECIRCULATING FLUID INLET“ tilsluttes den UDGANGEN på det emne, som skal TERMOSTATERES og „RECIRCULATING FLUID OUTLET“ til ind på emnet.

Fyldning af reservoiret foregår ved at fjerne panelet, som er forsynet med fingerskruer, og påfyld egnet rent kølevæske, max 5 cm fra toppen.

Betjening:
Før opstart checkes elektriske forbindelser, slangeforbindelser, væske stand, kompresseor og brugsvand er tilsluttet.
Systemet skal være tændt mindst 12 timer før det sættes igang.
Check hovedkontakten på badet. „Cool“ og „Idle“ LED viser status på badet.

Ønskes den instillede temperatur vist, hold da „Setpoint/Actual Temp“ kontakterne inde. Skal indstillingen ændres, skal der samtidig drejes på justeringsknappen.
Displayet vil skifte tilbage til aktuel temperatur.

Flow kontrol:
Drej på „RECIRCULATING FLOW CONTROL“ + for at åbne og - for at lukke.

Periodisk vedligeholdelse:
Check standen af væske periodisk. Check med mellemrum vakuumet på pumpesiden, rens systemet og check for aflejringer, vækst, utætheder, check vakuumpumpen med kondenser og evt. filtre. Husk åben aldrig instrumentet uden strømmen er afbrudt, og strømkablet er taget ud!

Kortfattad Bruksanvisning för HX-540

Installation
Ställ maskinen i en ren miljö med lätt tillgång till kylningsvatten och ett vattenavlopp. Kylningsvattnet måste möta de krav som är specifierade i instruktionerna annars minskas maskinens prestations förmåga.

Försäkra att spänningen är den samma som den som är given i instruktionerna ± 10%.

Röranslutningarna finns på baksidan av maskinen och är märkta “FACILITY WATER INLET/OUT-LET” och ”RECIRCULATING FLUID INLET/ OUTLET”. Ta bort de skyddande plast bitarna. Anslut “FACILITY WATER INLET” inpassningen till byggnadens kylvatten och “FACILITY WATER OUTLET” inpassningen till avloppet. Anslut “RECIRCULATING FLUID INLET” inpassningen till utsläppet av din anordning och “RECIRCULATING FLUID OUTLET” inpassningen till insläppet av din anordning.

För att fylla tanken, öppna luckan på den bakre vänstra delen av toppen på maskinen och lösgör skruvarna som håller den undre luckan på plats. Fyll tanken tills 2,5 cm återstår. Var beredd att fylla på om din anordning kräver extra vätska.

Vanligt kran vatten är den rekommenderade vätskan vid en temperatur mellan +8°C och +80°C. Under +8°C måste en vätska som inte fryser användas. En blandning av vanligt vatten och etylenglykol (laboratorie kvalitet) föreslås.

Användning
Innan maskinen startas, kontrollera alla elektriska och alla rör anslutningar. Se till att cirkulations systemen har fyllts med vätska.

Var säker på att byggnads vattnet är påsatt.

På alla modeller från HX-200 till HX-750 måste maskinen vara kopplad till energikällan minst 12 timmar innan användning så att oljan tillåts att värmas upp och separera från köldmedlet.

Sätt start knappen på ON för att starta maskinen. COOL och IDLE på framsidan visar statusen på kylningssystemet. Cool lyser när värme tas bort från köldmedlet. Heat är på när “the hot gas bypass mode” används. När temperaturen närmar sig den förbestämda önskade temperaturen kommer de två att växla.

Vänta 5 minuter innan maskinen sätts på igen efter att ha varit avstängd för att låta kylningstrycken att utjämnas. Ingen kylning kommer att utföras om inte trycken tillåts att utjämnas.

Temperatur Ändring
Håll Display knappen intryckt för att visa den önskade temperaturen. Håll Display knappen intryckt och vrid Adjust knappen för att ändra den önskade temperaturen. Släpp Display knappen efter att den önskade temperaturen visas på kontroll panelen. Temperaturen på vätskan i tanken visas nu på kontroll panelen.

Flödeskontroll
“RECIRCULATING FLOW CONTROL” handtaget kontrollerar flödet till din anordning. i “+” positionen får man fullt flöde, “-” positionen innebär inget flöde.

Periodiskt Underhåll
Inspektera vätskan i tanken periodiskt. Om rengöring är nödvändigt, spola tanken med en rengörings vätska som är förenlig med cirkulationssystemet och kylvätskan.

Kylvätskan bör bytas periodvis. När enheten används vid låga temperaturer kommer vätskans koncentration av vatten att öka vilket leder till en minskad kylningskapacitet.

Periodisk rengöring av kondensorn är nödvändig. Hur ofta rengöring är nödvändig beror på miljön. Vi rekommenderar en visuell inspektion av kondensorn varje månad efter installation. Efter flera månader kan det avgöras hur ofta kondensorn måste rengöras i framtiden.

Maskiner med PD och TU pumpar har ett filter. Filtret måste rengöras efter en veckas användning. Efter första rengöringen bör filtret inspekteras varje månad. Efter flera månader kan det avgöras hur ofta filtret måsta rengöras.

Drag ur kontakten och töm tanken innan filtret rengörs.

HX-540, Handleiding voor snelle installatieprocedures

Installatie

Plaats het apparaat in een omgeving waar gebouwenwater en afvoer binnen handbereik zijn. De eisen van de waterfaciliteiten moeten overeenkomen met die gespecificeerd in de handleiding, anders zal het apparaat onvoldoende prestaties leveren.
Onvoldoende watertoevoer kan ertoe leiden dat de compressor oververhit raakt en het apparaat uitgeschakeld wordt.

Let erop dat de netspanning gelijk is aan het aangegeven voltage, ±10%.

De slangaansluitingen zijn bevestigd aan de achterkant van het apparaat en zijn voorzien van de labels FACILITY WATER INLET en OUTLET, en RECIRCULATING FLUID INLET en OUTLET. Verwijder de plastic beschermings-pluggen van alle slangaansluitingen. De FACILITY WATER INLET dient bevestigt te worden aan een watertoevoer en de FACILITY WATER OUTLET dient bevestigt te worden aan een afvoer. Bevestig de RECIRCULATING FLUID INLET aan de uitgang van uw applicatie en de RECIRCULATING FLUID OUTLET aan de ingang van uw applicatie.

Een non-freezing vloeistof wordt in het algemeen aanbevolen, indien u werkt bij omgevingstemperatuur. De gekozen vloeistof moet een viscositeit hebben van 50 Centistokes of minder wanneer circulatie gewenst is bij lage temperaturen..

Om het reservoir te vullen dient men het toegangspaneel aan de linkerachterkant te verwijderen door middel van het losdraaien van de duimschroeven. Vul nu het reservoir tot 2 inches van het maximum wanneer het apparaat de gewenste temperatuur heeft bereikt. Indien de vloeistoflevel van uw toepassingen en de toe-afvoer leidingen voldoende zijn.

Operationeel gebruik

Alvorens het apparaat te starten, dient u ervan verzekerd te zijn dat de schroeven in de compres-sor losgedraaid zijn en dat er gebouwenwater is. Controleer alle elekstricheen slangaansluitingen. Controleer ook of het systeem gevuld is met koelvloeistof.

Het apparaat dient 12 uur aangesloten te zijn aan de netspanning, zodat de olie verhit kan worden en gescheiden kan worden van de koelvloeistof.

Om het apparaat te starten moet men de schakelaar op “ON” zetten. De “Cool” en “Idle LEDs” aan de voorkant van het apparaat duiden de status van het koelsysteem aan. “COOL” is in werking wanneer het apparaat warmte van de koelvloeistof onttrekt, “HEAT” is in werking gesteld wanneer het apparaat in de Hot Gass Bypass stand is gesteld. Als de ingegeven temperatuur bereikt is zal de LED switchen.

Wanneer het apparaat uitgeschakeld is, gelieve 5 minuten te wachten alvorens u het apparaat weer in werking stelt. Deze tijd is nodig om drukken in het koelsysteem gelijk te stellen.
Indien dit niet gebeurt, zal er short-cycle optreden binnen de compressor en er vindt geen koeling plaats.

Om de temperatuur set-point af te kunnen lezen van de display, houdt u de Setpoint/Actual Temp knop ingedrukt. Om de temperatuur set-point aan te passen, houdt u de Setpoint/Actual Temp knop ingedrukt en draait u de Adjust knop net zolang, totdat de gewenste temperatuur set-point op de display af te lezen is.
Als de set-point bereikt is kunt u de Setpoint/Actual knop loslaten. De display zal nu de temperatuur weergeven van het koelvloeistof in het reservoir.

Het apparaat kan uitgerust zijn met een van de meerdere optionele regelaars. Mocht dit het geval zijn, kunt u het beste de gedetailleerde handleiding raadplegen betreffende het gebruik daarvan.

Flow Control
Met de RECIRCULATING FLOW CONTROL kunt u het debiet van uw applicatie regelen. In de “+” positie geeft u een volledig debiet, de “-” positie geeft u geen debiet.

Periodiek Onderhoud
De vloeistof dient regelmatig gecontroleerd te worden. Indien reiniging noodzakelijk is, zal het reservoir gespoeld moeten worden met een vloeistof, welke vergelijkbaar is met het circulatiesysteem en de koelvloeistof.

De koelvloeistof dient regelmatig vervangen te worden. Wanneer u werkt met lage temperaturen zal de concentratie van het water in de koelvloeistof gedurende die tijd toenemen, wat verlies van koelcapaciteit tot gevolg kan hebben.

Periodiek lucht vrijmaken van de condensor is noodzakelijk. Het aantal malen dat dit moet gebeuren hangt af van de omgeving waar het apparaat staat opgesteld en gebruikt wordt. Wij raden een algemene maandelijkse inspektie van de condensor aan na de installatie. Na enkele maanden zal duidelijk zijn hoe vaak men het apparaat moet reinigen.

Het apparaat heeft een pompafvoer. Indien vuil in het systeem aanwezig is, zal de afvoer ervoor zorgen dat het materiaal niet in de pomp terecht komt en daardoor de pomp niet beschadigd.

Nadat het apparaat geinstalleerd is zou de afvoer verstopt kunnen raken. De afvoer zal in de eerste week na de installatie schoongemaakt moeten worden. Nadat dit gebeurt is, is een maandelijkse inspektie aan te raden. Na enkele maanden zal duidelijk zijn hoe vaak men de afvoer moet reinigen.

Alvorens de afvoer te reinigen, gelieve het apparaat uit te schakelen en het reservoir te ledigen.

Kortfattad Bruksanvisning för HX-540

Installation
Ställ maskinen i en ren miljö med lätt tillgång till kylningsvatten och ett vattenavlopp. Kylningsvattnet måste möta de krav som är specifierade i instruktionerna annars minskas maskinens prestations förmåga.

Försäkra att spänningen är den samma som den som är given i instruktionerna ±10%.

Röranslutningarna finns på baksidan av maskinen och är märkta “FACILITY WATER INLET/OUT-LET” och ”RECIRCULATING FLUID INLET/ OUTLET”. Ta bort de skyddande plast bitarna. Anslut “FACILITY WATER INLET” inpassningen till byggnadens kylvatten och “FACILITY WATER OUTLET” inpassningen till avloppet. Anslut “RECIRCULATING FLUID INLET” inpassningen till utsläppet av din anordning och “RECIRCULATING FLUID OUTLET” inpassningen till insläppet av din anordning.

För att fylla tanken, öppna luckan på den bakre vänstra delen av toppen på maskinen och lösgör skruvarna som håller den undre luckan på plats. Fyll tanken tills 2,5 cm återstår. Var beredd att fylla på om din anordning kräver extra vätska.

Vanligt kran vatten är den rekommenderade vätskan vid en temperatur mellan +8°C och +80°C. Under +8°C måste en vätska som inte fryser användas. En blandning av vanligt vatten och etylenglykol (laboratorie kvalitet) föreslås.

Användning
Innan maskinen startas, kontrollera alla elektriska och alla rör anslutningar. Se till att cirkulations systemen har fyllts med vätska.

Var säker på att byggnads vattnet är påsatt.

På alla modeller från HX-200 till HX-750 måste maskinen vara kopplad till energikällan minst 12 timmar innan användning så att oljan tillåts att värmas upp och separera från köldmedlet.

Sätt start knappen på ON för att starta maskinen. COOL och IDLE på framsidan visar statusen på kylningssystemet. Cool lyser när värme tas bort från köldmedlet. Heat är på när “the hot gas bypass mode” används. När temperaturen närmar sig den förbestämda önskade temperaturen kommer de två att växla.

Vänta 5 minuter innan maskinen sätts på igen efter att ha varit avstängd för att låta kylningstrycken att utjämnas. Ingen kylning kommer att utföras om inte trycken tillåts att utjämnas.

Temperatur Ändring
Håll Display knappen intryckt för att visa den önskade temperaturen. Håll Display knappen intryckt och vrid Adjust knappen för att ändra den önskade temperaturen. Släpp Display knappen efter att den önskade temperaturen visas på kontroll panelen. Temperaturen på vätskan i tanken visas nu på kontroll panelen.

Flödeskontroll
“RECIRCULATING FLOW CONTROL” handtaget kontrollerar flödet till din anordning. i “+” positionen får man fullt flöde, “-” positionen innebär inget flöde.

Periodiskt Underhåll
Inspektera vätskan i tanken periodiskt. Om rengöring är nödvändigt, spola tanken med en rengörings vätska som är förenlig med cirkulationssystemet och kylvätskan.

Kylvätskan bör bytas periodvis. När enheten används vid låga temperaturer kommer vätskans koncentration av vatten att öka vilket leder till en minskad kylningskapacitet.

Periodisk rengöring av kondensorn är nödvändig. Hur ofta rengöring är nödvändig beror på miljön. Vi rekommenderar en visuell inspektion av kondensorn varje månad efter installation. Efter flera månader kan det avgöras hur ofta kondensorn måste rengöras i framtiden.

Maskiner med PD och TU pumpar har ett filter. Filtret måste rengöras efter en veckas användning. Efter första rengöringen bör filtret inspekteras varje månad. Efter flera månader kan det avgöras hur ofta filtret måsta rengöras.

Drag ur kontakten och töm tanken innan filtret rengörs.

NOTICE D'UTILISATION

HX 540

INSTALLATION

Installer l'appareil dans un environnement propre avec un accès facile à une arrivée d'eau. Cette source d'eau doit correspondre à ce qui est spécifié dans la notice pour ne pas altérer les performances de l'équipement. Une source non conforme pourrait causer une surchauffe du compresseur et un arrêt de l'appareil.
S'assurer que la tension électrique soit celle requise à ±10 %.
Les connections sont situées à l'arrière et référencées :

" Facility water inlet "
" Facility water outlet "
" Recirculating fluid inlet "
" Recirculating fluid outlet "

Retirer les embouts plastique. Connecter le " Facility water inlet " vers l'arrivée d'eau ; le " Facility water outlet " au robinet; le connecteur " Recirculating fluid inlet " à la sortie de votre application et le " Recirculating fluid outlet " à l'entrée.
Utiliser un fluide antigel dont la viscosité doit être inférieure à 50 centistokes à la température la plus basse.
Pour remplir le réservoir, ouvrir la tape en haut à gauche et retirer le couvercle en dévissant.
Remplir jusqu'à 2 " pouces " du sommet (niveau).
Si le volume total à refroidir est important, il convient d'avoir une réserve de fluide immédiatement disponible sous la main pour ne pas désamorcer la pompe.

MISE EN ROUTE

S'assurer au préalable que les écrous de montage sont desserrés et que l'alimentation en eau est connectée. Vérifier les connections électriques, ainsi que le remplissage des tuyaux de circulation.
Connecter l'appareil à la source électrique 12 heures avant utilisation pour chauffer et séparer l'huile du réfrigérant.
Mettre en route en appuyant sur ON. Les diodes " Cool " et " Idle " renseignent sur le mode de fonctionnement. " Cool " est allumé quand le refroidisseur extrait de la chaleur au fluide; " Heat " est allumé quand il est en mode " By-Pass " gaz chaud. Lorsque la température souhaitée est atteinte, la diode s'éteint et s'allume.
Après avoir éteint l'appareil, attendre environ 5 minutes avant de le rallumer, pour un bon équilibrage des pressions, autrement, le cycle serait trop bref et le refroidissement n'aurait pas lieu.
Pour afficher la température souhaitée, maintenir appuyé l'interrupteur et tourner le bouton de réglage jusqu'à ce que la température souhaitée soit affichée. Relâcher ensuite l'interrupteur.
L'affichage indique alors la température du fluide dans le réservoir.
Votre refroidisseur est peut-être équipé avec d'autres types de contrôleurs de température. Veuillez, dans ce cas, vous référer au manuel d'instructions.

CONTROLEUR DE DEBIT

La poignée " Recirculating flow control " règle le débit de recirculation. En position " + ", votre application reçoit un débit maximum; en position " - ", il n'y a plus de débit.

MAINTENANCE PREVENTIVE

·Vérifier régulièrement le niveau du réservoir,
·Changer de temps à autre le liquide utilisé,
·En cas de nettoyage, rincer avec un produit de lavage compatible,
·Aux basses températures, la concentration en eau a tendance à augmenter ce qui peut générer une perte de puissance de refroidissement,
·Avant de changer de liquide, recirculer à une température plus élevée pour réchauffer le serpentin,
·Nettoyer régulièrement selon les conditions de travail la grille d'aspiration. Nous recommandons d'effectuer la première inspection du condenseur un mois après l'installation,
·Les modèles fonctionnent avec une pompe équipée d'un filtre qui retient les impuretés. Il est recommandé de nettoyer ce filtre après la première semaine et, ensuite, une fois par mois. Ce nettoyage s'effectue après avoir débranché l'appareil et vidangé le réservoir

PROCEDIMIENTOS DE OPERACION DE REFERENCIA RAPIDA PARA EL HX-540

INSTALACION

Sitúe la unidad en un entorno limpio con fácil acceso a la instalación de agua de enfriamiento y un desagüe. Los requerimientos de la instalación de agua deben adaptarse a las especificadas en el manual de instrucciones o el funcionamiento de la unidad se verá mermado. Un suministro de agua inadecuado podría causar que el compresor se sobrecalentara y se apagara la unidad.

Asegúrese de que el voltaje de la fuente de energía sea igual que el voltaje especificado, ±10%.

Las conexiones de tuberías están situadas en la parte trasera de la unidad y están marcadas como FACILITY WATER INLET y OUTLET. Saque los protectores de plástico de todas las conexiones de tuberías. Conecte el adaptador FACILITY WATER INLET a la instalación de agua de enfriamiento y el adaptador FACILITY WATER OUTLET a un desagüe.
Conecte el adaptador RECIRCULATING FLUID INLET a la salida de su aplicación y el adaptador RECIRCULATING FLUID OULET a la entrada de su aplicación.

Se necesita un fluido no congelante para operación a cualquier temperatura de ambiente o de recirculación. El fluido seleccionado debe tener una viscosidad de 50 centistokes o menos a la temperatura de funcionamiento más baja.

Para llenar el reservorio, abra el panel de acceso al reservorio por la esquina trasera izquierda y saque la tapa del reservorio desatornillando los tornillos. Llene el reservorio hasta dos pulgadas del tope cuando la unidad esté a la temperatura de funcionamiento deseada. Si la capacidad de fluido de sus lineas de aplicación y recirculación son significativas, tenga fluido extra a mano.

OPERACION

Antes de poner en marcha la unidad, asegúrese de que las tuercas de montaje del compresor se han aflojado y que la instalación del agua está conectada. Compruebe todas las conexiones eléctricas y de tuberías. Asegúrese de que el sistema circulador se ha llenado con fluido de enfriamiento.

La unidad debe conectarse a la red de energía durante al menos 12 horas para permitir que el aceite se caliente y se separe del refrigerante.

Para poner en marcha la unidad, ponga el interruptor de encendido en posición ON. Los LED Cool y Idle del panel frontal indican la situación del sistema de refrigeración. Cool está en marcha cuando la unidad está eliminando calor del fluido de enfriamiento. Heat está en marcha cuando la unidad está en el modo by-pass gas caliente. A medida que la temperatura de funcionamiento se aproxima al punto fijado, el LED ciclará.

Cuando se apaga la unidad, espere aproximadamente cinco minutos antes de volver a ponerla en marcha para dar tiempo para que las presiones de refrigeración se ecualicen. Si no se permite ecualizarse las presiones, el compresor se cortocicuitará y no enfriará.

Para que el punto de ajuste de temperatura aparezca en pantalla, mantenga presionado el interruptor Setpoint/Actual Temp. Para fijar el punto de ajuste de temperatura, mantenga presionado el interruptor Setpoint/Actual Temp y gire el botón ADJUST hasta que la pantalla digital indique el punto de ajuste de temperatura deseado. Una vez fijado el punto de ajuste, suelte el interruptor Setpoint/Actual Temp. La pantalla indicará la temperatura del fluido en el reservorio.

La unidad puede equiparse con uno de los varios controladores opcionales. En este caso, refiérase al manual de instrucciones para ver más detalles de su operación.

CONTROL DE FLUJO
El mango RECIRCULATING FLOW CONTROL controla la escala de flujo a su aplicación. En la posición + recibirá flujo completo, en la posición - no hay flujo.

MANTENIMIENTO PERIODICO
Inspeccione periódicamente el fluido del reservorio. Si es necesaria una limpieza, rocíe el reservorio con un fluido de limpieza compatible con el sistema de circulación y el fluido refrigerante.

El fluido refrigerante debe sustituirse periódicamente. Cuando se funciona a baja temperatura, la concentración de agua en el fluido refrigerante aumentará con el tiempo, ocasionando una pérdida de capacidad refrigerante.

Es necesario un vaciado periódico de las aletas del condensador. La frecuencia de limpieza depende del entorno en que funciona el aparato. Recomendamos una inspección visual mensual del condensador después de la instalación inicial. Después de varios meses, quedará establecida la frecuencia de limpieza.

La unidad tiene un filtro. Si hay residuos en el sistema, el filtro prevendrá que el material entre en la bomba y dañe las paletas de la bomba.

Después de la instalación inicial, el filtro puede bloquearse. El filtro debe limpiarse después de la primera semana de la instalación. Después de esta primera limpieza, se recomienda una inspección visual mensual. Después de varios meses, se establecerá la frecuencia de limpieza.

Antes de limpiar el filtro, desenchufe el aparato y vacíe el reservorio.

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

WARRANTY

Water-Cooled HX Series Quick Reference Operating Procedures

Installation
Position the unit in a clean environment with easy access to facility cooling water and a drain. The facility water requirements must meet those specified in the instruction or unit performance will be derated.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled TAP WATER, DRAIN, SUPPLY and RETURN. Remove the plastic protective plugs from all the plumbing connections. Connect the TAP WATER fitting to the facility cooling water and the DRAIN fitting to a drain. Connect the SUPPLY fitting to the inlet of your application and the RETURN fitting to the outlet of your application.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within one inch of the top. If the fluid capacity of your application and recirculation lines are significant, have extra fluid on hand.

Tap water is the recommended fluid for operation from +8°C to +80°C. Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Operation
Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

Ensure the facility water is turned on.

On models HX-200 through HX-750, the unit must be connected to the power source for at least 12 hours to allow the oil to be heated and separated from the refrigerant

To start the unit, place the Power Switch to the ON position. The Cool and Idle LEDs on the front panel indicate the status of the refrigeration system. Cool is on when the unit is removing heat from the cooling fluid, Heat is on when the unit is in the hot gas by-pass mode. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Analog Controller Temperature Adjustment
To adjust the temperature setpoint, turn the °C dial on the front of the unit to the desired temperature.

Digital Controller Temperature Adjustment
To display the temperature setpoint, press and hold the DISPLAY switch. To adjust the temperature setpoint, press and hold the DISPLAY switch and turn the ADJUST knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the DISPLAY switch. The display will now indicate the temperature of the fluid in the reservoir.

Flow Control
The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the “+” position you receive full flow, the “-” position is no flow.

Periodic Maintenance
Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend avisual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

For complete information, including troubleshooting procedures, please refer to the instruction manual.

Air-Cooled HX Series Quick Reference Operating Procedures

Installation
Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Avoid excessively dusty areas and institute a periodic cleaning schedule. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled SUPPLY and RETURN. These connections are ¾ inch FPT. Remove the plastic protective plugs from both plumbing connections. Connect the SUPPLY fitting to the inlet of your application. Connect the RETURN fitting to the outlet of your application.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within one inch of the top. If the fluid capacity of your application and recirculation lines are significant, have extra fluid on hand.

Tap water is the recommended fluid for operation from +8°C to +80°C. Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Operation
Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

On models HX-200 through HX-750, the unit must be connected to the power source for at least 12 hours to allow the oil to be heated and separated from the refrigerant

To start the unit, place the Power Switch to the ON position. The Cool and Idle LEDs on the front panel indicate the status of the refrigeration system. Cool is on when the unit is removing heat from the cooling fluid, Heat is on when the unit is in the hot gas by-pass mode. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Analog Controller Temperature Adjustment
To adjust the temperature setpoint, turn the °C dial on the front of the unit to the desired temperature.

Digital Controller Temperature Adjustment
To display the temperature setpoint, press and hold the DISPLAY switch. To adjust the temperature setpoint, press and hold the DISPLAY switch and turn the ADJUST knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the DISPLAY switch. The display will now indicate the temperature of the fluid in the reservoir.

Flow Control
The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the “+” position you receive full flow, the “-” position is no flow.

Periodic Maintenance
Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

For complete information, including troubleshooting procedures, please refer to the instruction manual.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 1000-4-2:1995
	IEC 1000-4-3:1994
	IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition.

On units with a remote control box, the box is packed in a separate carton. Be sure to locate this separate carton; do not dispose of it by mistake.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

The unit has a warranty against defective parts and workmanship for one full year from date of shipment. Refer to the last page of this manual for complete warranty details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label on the rear of the case top to obtain the following information (see Section II, Description for the serial number label location):

- BOM number _____

- Serial number _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department for assistance (see Preface, After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Do not attempt to defeat any of the interlock switches or safety features built into the unit.

Observe all warning labels.

Never remove warning label.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the fluid reservoir.

Make sure the unit is off before connecting or disconnecting the power cord or other cables.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the fluid reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified NESLAB technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

The HX Series Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and volume.

The unit consists of an air-cooled or water-cooled refrigeration system, a fluid reservoir, a fluid recirculation pump, and a temperature controller.

HX units are available with a large number of options. This manual explains how to install, operate, and maintain a “standard” HX unit. This manual also explains some of the available options. Supplemental manuals are supplied with units equipped with options not covered in this manual.

Throughout the manual, you will be asked to consult the unit’s serial number label, or the pump identification label, or both, for specific information. The labels are located on the rear of the case top.

1. For additional dimensions see page 47.
2. HX-750 with a water-cooled refrigeration system has the same dimensions as the HX-500.

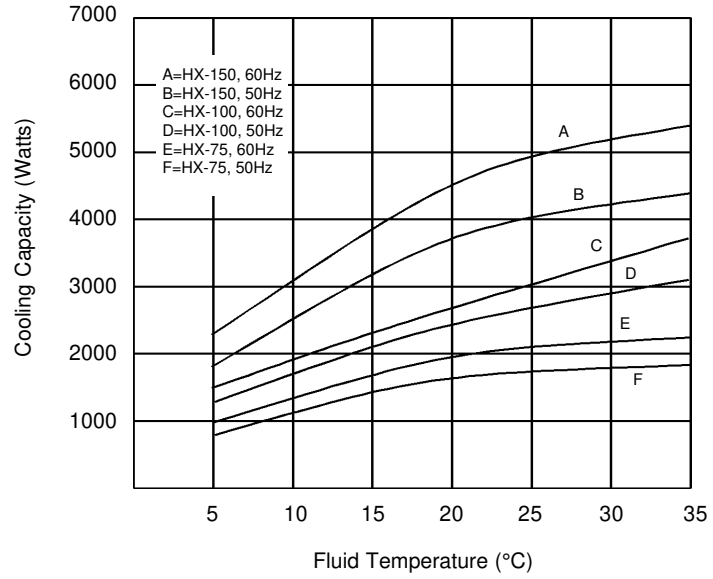
Cooling Capacity

Cooling capacity will vary depending on fluid temperature, ambient temperature, and cooling fluid.

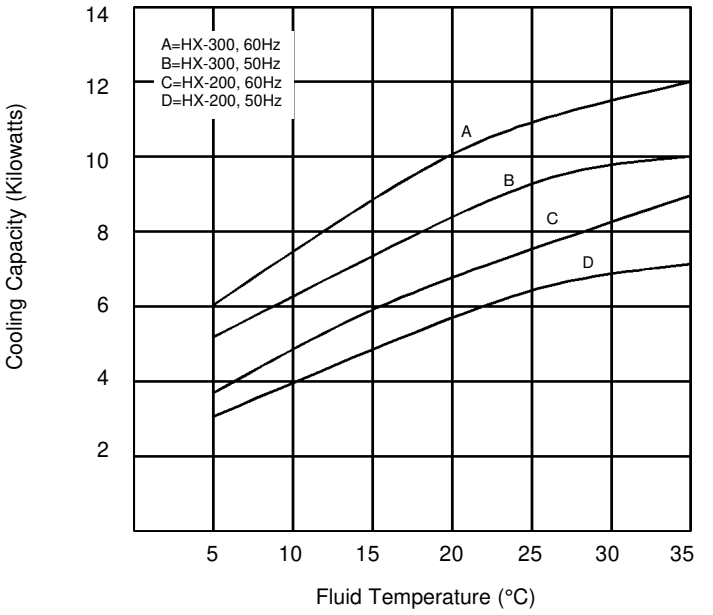
Cooling capacities for models HX-75 through HX-750 were obtained under the following conditions:

1. *air-cooled unit operating at +20°C (+68°F) ambient temperature.*
2. *cooling fluid with specific heat of 1.0 was used for fluid temperatures from +5°C to +35°C.*

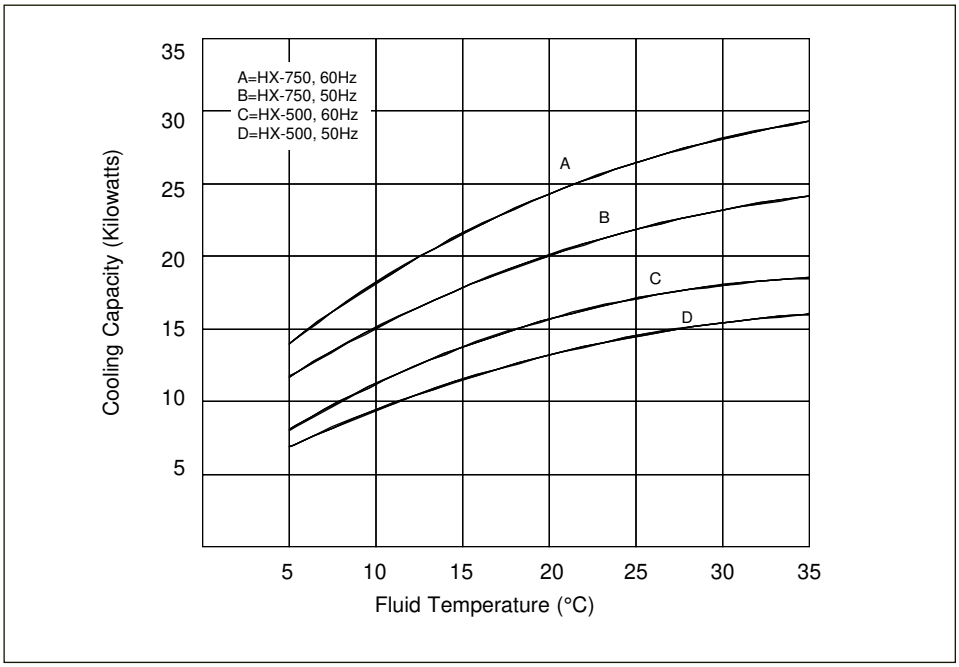
HX-75, 100, & 150



HX-200 & 300



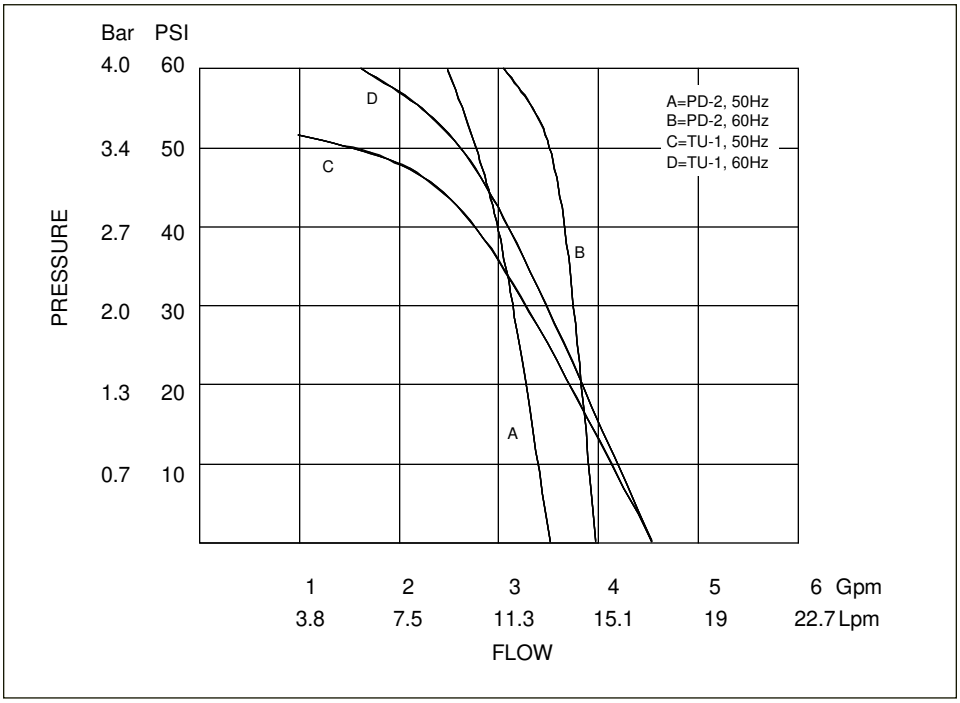
HX-500 & 750



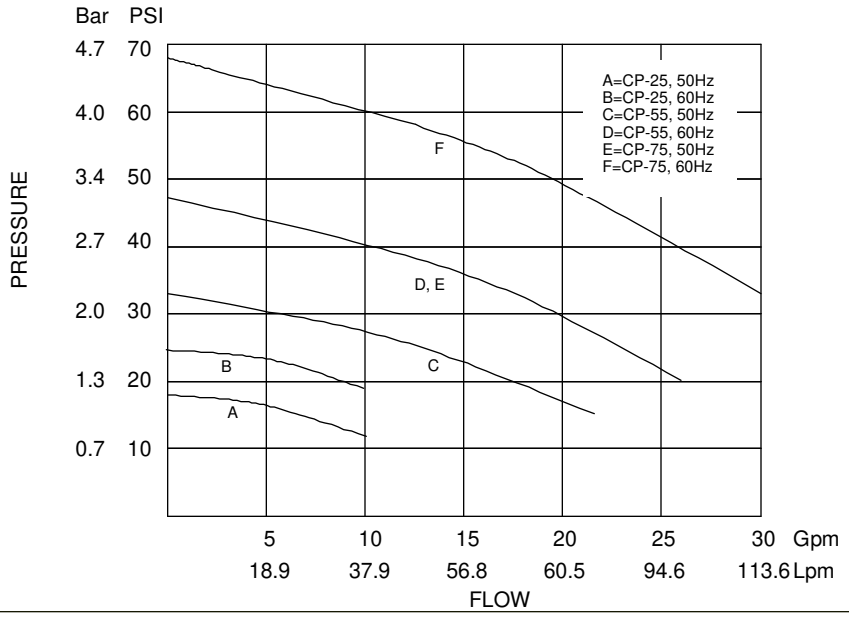
Pump Capacity

HX units are available with one of three standard pump types: positive displacement (PD), centrifugal (CP), and turbine (TU). Refer to the pump identification label on the rear of the case top or rear of analog temperature controller to identify the specific pump in your unit.

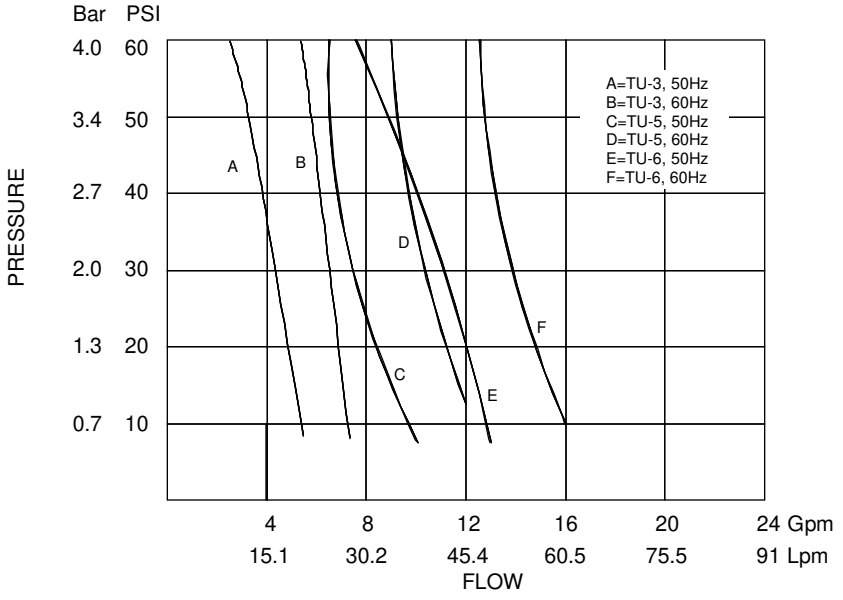
PD2 & TU1



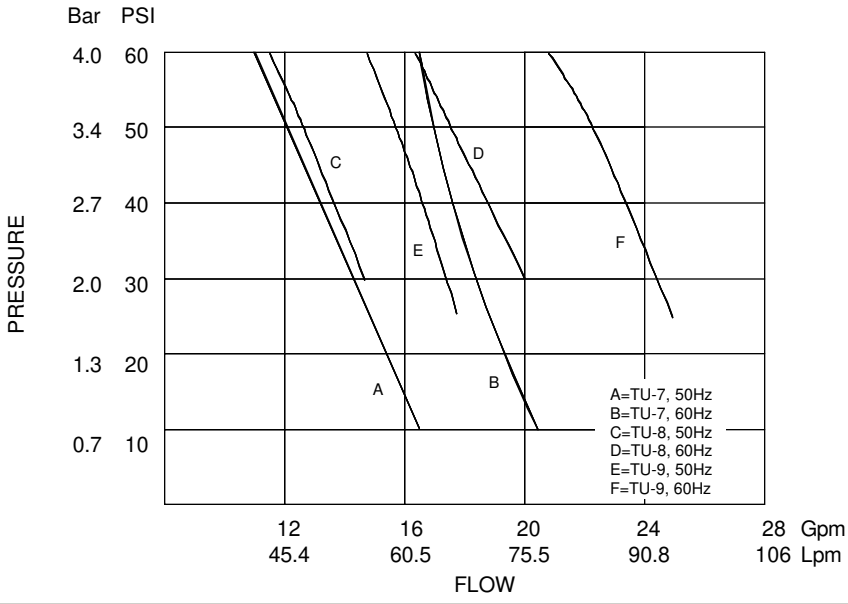
CP



TU-3, 5 & 6



TU-7, 8 & 9



Section III Installation

Site (Air-cooled Units)

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +55°F to +95°F (+13°C to +35°C).

The unit will retain its full rated capacity in ambient temperatures to approximately +75°F (+24°C). Above +75°F, derate the cooling capacity 1% for every 1°F above +75°F, to a maximum ambient temperature of +95°F. In degrees Celsius, derate the cooling capacity 1% for every 0.5°C above +24°C, to a maximum ambient temperature of +35°C.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. It must be positioned so the air intake and discharge are not impeded.

On models HX-75 through HX-150, air is drawn through the left side of the unit and discharged through the right and rear. A minimum clearance of 2 feet (0.6 meter) on these three sides is necessary for adequate ventilation.

On models HX-200 — HX-750, air is drawn through the front of the unit and discharged through the side and rear. A minimum of 5 feet (1.5 meters) on all four sides of the unit is necessary for adequate ventilation.

In some applications where space is at a premium, the minimum ventilation clearance can be compromised. However, consult our Sales Department before positioning the unit in a location with less minimum clearance than listed above. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section VII, Condenser Cleaning).

On digital models HX-100 through HX-750 the stirrer motor is located under the case top. (Models HX-500 and HX-750 have two stirrer motors.) Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation.

NOTE: Units with plate heat exchangers do not have stirrer motors.

Refer to the table below to determine the approximate amount of air intake required for the unit to retain its full rated capacity. If the air intake does not meet these standards, cooling capacity will be derated.

	HX-75	HX-100	HX-150	HX-200
Air Intake				
Cubic feet per minute	600	710	1050	2000
Liters per minute	17000	20100	29730	56640

	HX-300	HX-500	HX-750
Air Intake			
Cubic feet per minute	1900	5000	5600
Liters per minute	53800	141750	158800

Site (Water-cooled units)

The unit should be located in a laboratory or clean industrial environment with easy access to a facility cooling water supply and a drain.

All units are equipped with castors for easy movement. This allows the unit to be placed in a small area, as long as there is ample space for the unit to be moved for access on all four sides. A minimum access clearance of 3 feet (1 meter) on two adjacent sides is recommended.

The facility cooling water supply must meet or exceed the requirements listed in the table shown on the next page for the unit to operate at its full rated capacity. If the facility cooling water does not meet these standards, the cooling capacity will be derated.

As the temperature of the cooling water supply increases, the required flow rate and pressure of the cooling water supply increases.

For example, with a model HX-150, if the temperature of the cooling water supply is +65°F, the flow rate must be at least 1.5 gallons per minute, with a pressure differential of at least 3.5 PSI. However, if the temperature of the cooling water supply is +85°F, the flow rate must be at least 4.0 gallons per minute, with a pressure differential of at least 10 PSI.

If the unit is being used with a building water supply, the back pressure of the drain must be less than the supply pressure.

A water regulating valve, located in the TAP WATER line, regulates the flow rate of the cooling water supply as it enters the unit. The valve regulates the flow rate based on the heat load. Flow through the unit stops automatically when the unit is shut off.

On digital models HX-100 through HX-750 the stirrer motor is located under the case top. (Models HX-500 and HX-750 have two stirrer motors.) Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation. See illustration on previous page.

NOTE: Units with plate heat exchangers do not have stirrer motors.

*Estimated values

Electrical Requirements

Refer to the table below to determine electrical requirements of your unit. Verify the requirements by reviewing the ratings listed on the serial number label on the rear of the case top or rear of analog temperature controller.

	HX-75	HX-100	HX-150
Volts		208/230 220/240	
Hertz		60 50	
Phase		1 1	
Plug		NEMA L6-30P or L6-20P	

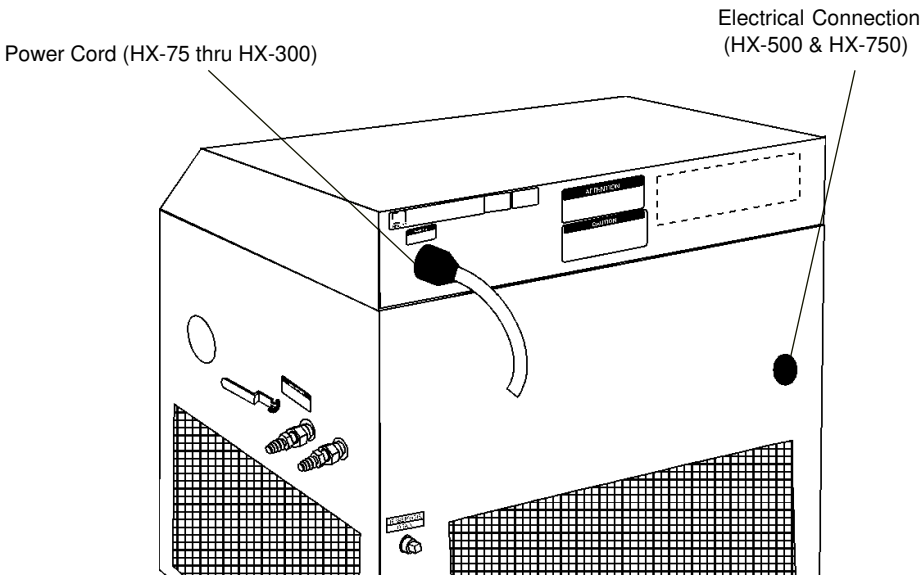
	HX-200	HX-300	Hx-500	HX-750
Volts	208/230 200/220 380/420		208/230	380/420
Hertz	60 50 50		60	50
Phase	3 3 3		3	3
Plug	NEMA L15-30P or L16-20P		N/A	

Make sure the voltage of the power source agrees with the unit's voltage and frequency rating. The unit is designed to tolerate deviations of ±10% from the rated line voltage.

Models HX-75 through HX-300 have an 8 foot (2.4 meter) power cord installed on the unit at the time of shipment.

NOTE: Custom units equipped with heaters may not have a power cord. See Section VI, Special Features.

NOTE: 380V WYE connections are shown in Appendix B.



The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Models HX-500 and HX-750 are not equipped with a power cable. Installation of the cable is the user's responsibility. Wire the unit in conformance to local, state, and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

Models HX-200 through HX-750 are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

Plumbing Requirements

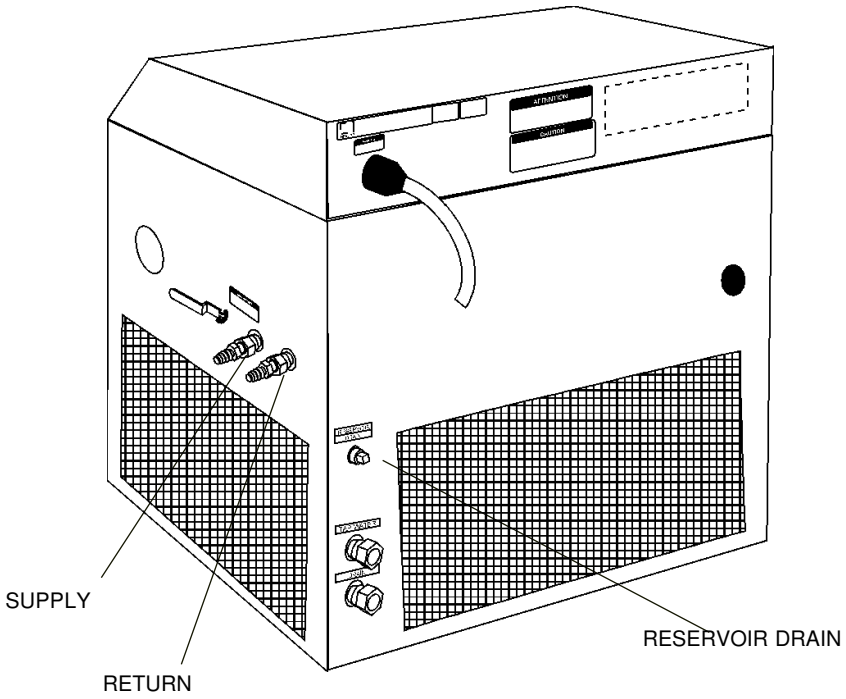
Air-cooled and water-cooled units

Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. Consult the manufacturer of the instrument for a cleaning fluid recommendation.

The plumbing fittings used to connect the HX to the instrument being cooled are located on the right side of the unit (labelled SUPPLY and RETURN). These connections are ¾ inch FPT.

Remove the protective plugs from the SUPPLY and RETURN connections. Connect the SUPPLY fitting to the inlet of the instrument being cooled. Connect the RETURN fitting to the outlet of the instrument being cooled.

The RESERVOIR DRAIN connection on the rear of the unit is a ½ inch FPT fitting connected internally to the unit's fluid reservoir. This fitting provides a means for draining the reservoir. The unit is shipped with a ½ inch MPT plug installed in this fitting. Remove the plug to drain the reservoir.



Two plumbing adapters (¾ inch MPT x 5/8 inch hose) are included with the unit. If the unit is being plumbed to the instrument being cooled using flexible tubing, install the adapters in the SUPPLY and RETURN plumbing ports. To prevent leaking, wrap the threads of the adapters with Teflon® sealing tape before installing them in the plumbing ports. The adapters will accept ½ or 5/8 inch ID flexible tubing.

If the unit is "hard plumbed" to the instrument being cooled or to the cooling water supply, damage can occur if the unit is bumped or jolted from its site. Provisions should be made to prevent the unit from being moved after installation. Once the unit is plumbed, secure the locking castors on the unit's base. If the unit is located in a heavy traffic area where the possibility of collision is imminent, it may be necessary to secure the unit to the site using blocks or mounting brackets.

Flexible tubing, if used, should be heavy wall or reinforced construction. All tubing should be rated to withstand 110 psi at +35°C. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter

reductions must be made, they should be made at the inlet and outlet of the instrument being cooled, not at the HX.

If substantial lengths of connecting tubing are required, they should be pre-filled with cooling fluid before connecting them to the unit.

Water-cooled units
The plumbing connections used to connect the water-cooled condenser in the HX to the facility cooling water supply are located at the rear of the unit (labelled TAP WATER and DRAIN). On models HX-75 through HX-300, these fittings are ½ inch FPT. On models HX-500 and HX-750, these fittings are 1 inch FPT.

Remove the plastic protective plugs from the TAP WATER and DRAIN connections. Connect the TAP WATER fitting to the facility cooling water supply. Connect the DRAIN fitting to a drain.

Fluids

The selected cooling fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

If your unit is equipped with a plate heat exchanger, do not use 100% water as a recirculating fluid. Due to the physical nature of a plate heat exchanger, and its response to temperature changes, using 100% water may cause the plate heat exchanger to rupture.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Tap water is the recommended fluid for operation from +8°C to +35°C.

Below +8°C, a non-freezing solution is required. A 50/50 mixture, by volume, of water and laboratory grade ethylene glycol is suggested.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer's warranty.

For units with extended temperature ranges above +35°C, tap water is the recommended fluid up to +80°C. Above +80°C, the user is responsible for the fluid(s) used.

Water Quality Recommendations

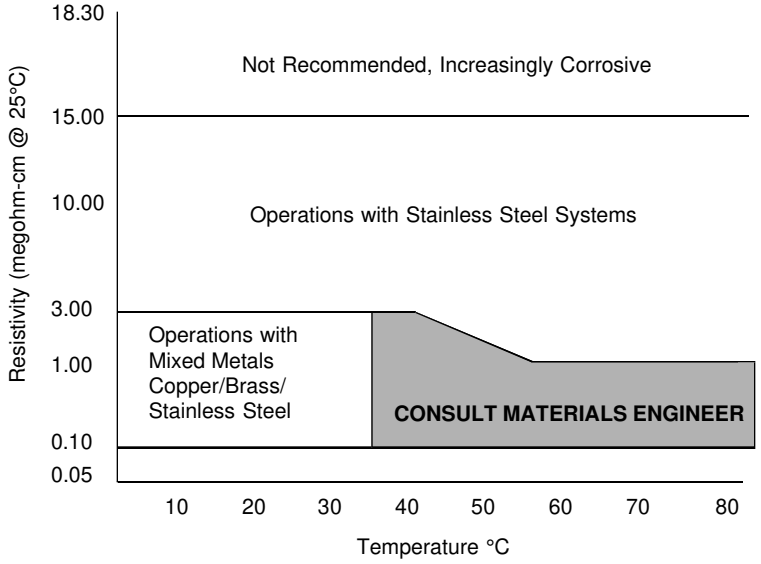
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (as NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (as NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated at 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated at 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated at 25°C).

The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



Water Quality Considerations

Filling Requirements

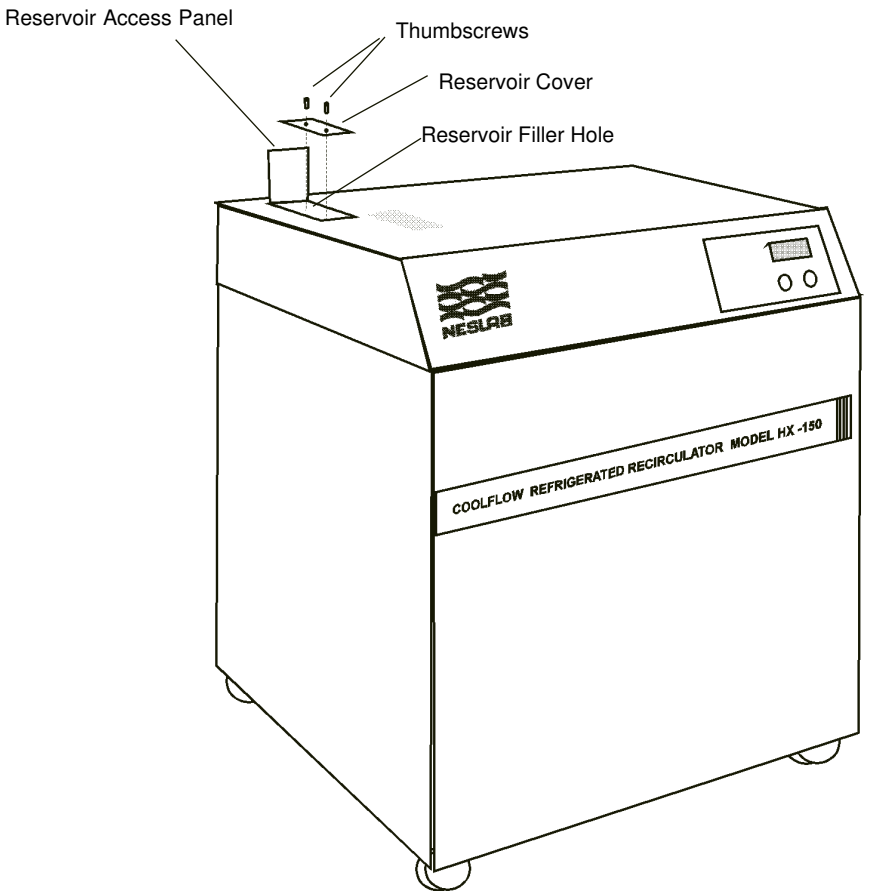
The reservoir access panel is located at the left rear corner of the case top, below an access panel. To open the access panel, slide the latch back (towards the rear of the unit) and lift.

Loosen the thumbscrews and remove the reservoir cover.

Fill the fluid reservoir with cooling fluid to within 1 inch of the top.

The fluid capacity of the instrument being cooled and the recirculation lines may be significant. To prevent the lowering of the fluid level in the reservoir below the operating level, have extra cooling fluid on hand to keep the reservoir filled to within 1 inch of the top.

When the recirculating system is full, replace the reservoir cover. Close the access panel.



Section IV Temperature Controllers

Temperature Controllers

The standard temperature controllers available with HX units are: Digital (Panel mounted or Remote) and Digital with Interlock. This section explains the installation (if applicable) and operation of the controllers.

Refrigeration Control

On “standard” units, the refrigeration compressor runs continuously, unless the fluid temperature exceeds +40°C. However, on some “custom” units equipped with an extended temperature range, the compressor may operate at higher temperatures. A hot gas by-pass system is used to maintain constant temperature in all units.

The Idle and Cool indicators, located on the control panel, indicate the status of the refrigeration system. The Idle indicator is lit when the unit is in the hot gas by-pass mode. The Cool indicator is lit when the refrigeration system is removing heat from the cooling fluid. As the fluid temperature approaches the temperature setpoint, the indicators cycle on and off to indicate the duty cycle of the system. The unit can be in Cool or Idle, but never both at the same time. A balance between Cool and Idle controls the temperature.

Start Up

Before starting, check all electrical and plumbing connections and make sure the recirculating system (the HX, your application, and the recirculation lines) has been properly filled with cooling fluid. Also, make sure the flow control valve is fully closed (see Section V, Flow Control). For CE Mark units ensure the circuit breaker on the right hand side of the unit is on.

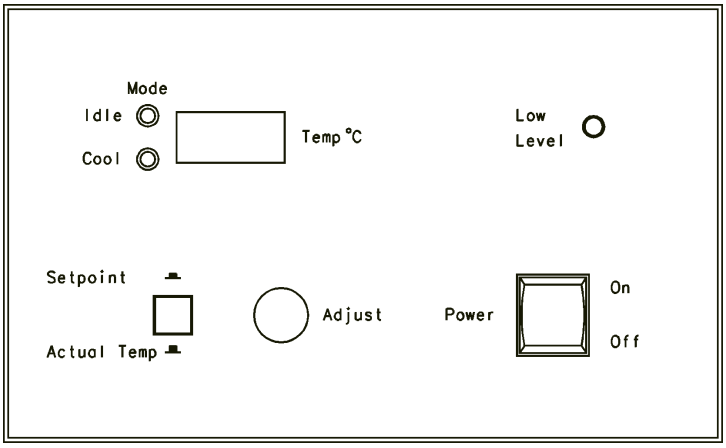
For water-cooled units — ensure that the facilty water is turned on.

Models HX-200 through HX-750 are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

To start the unit, place the Power On/Off switch in the On position. The pump and refrigeration system will start. The Temp°C display will indicate the reservoir fluid temperature. After starting recheck the fluid level, a "top off" may be needed. To shut the unit off, place the Power On/Off switch in the Off position.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Digital
(Panel mounted)

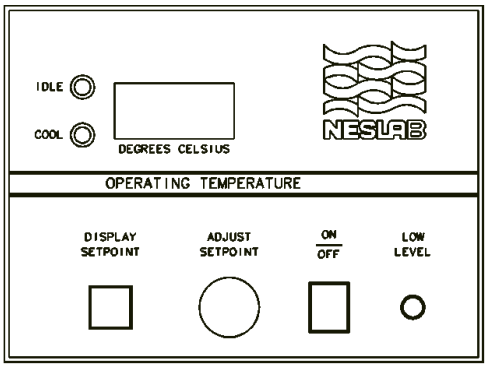


Digital Temperature Controller

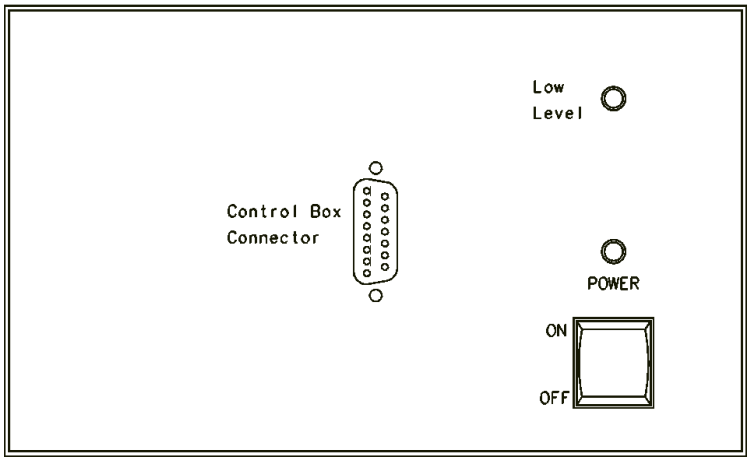
Temperature Adjustment
To display the temperature setpoint, press and hold the Setpoint/Actual Temp button. To adjust the setpoint, press and hold the Setpoint/Actual Temp button and turn the Adjust dial until the desired temperature setpoint is indicated on the Temp°C LED display. Once the setpoint is adjusted, release the Setpoint/Actual Temp button. The Temp°C LED display will indicate the temperature of the fluid in the reservoir.

NOTE: Inadvertent movement of the Adjust dial will result in a change in the setpoint. The change will not be immediately reflected on the Temp°C display unless the Setpoint/Actual Temp button is pressed. The display will eventually change as the unit responds to the new setpoint

Low Level Warning
The Low Level indicator is connected to a float switch in the reservoir. The indicator warns the user of a low cooling fluid level in the reservoir. A low fluid level condition occurs when the cooling fluid in the reservoir drops below the operating level. The indicator serves only as a warning. The unit will not shut down as a result of a low fluid level condition.



Digital Temperature Controller
(remote)



Digital Temperature Controller

Installation

Controller dimensions are 4¾" x 7¾" x 3¾" (H x W x D).

Connect the Digital remote box to the unit by securing the connector on the remote box's cable to the Control Box Connector receptacle on the operator panel on the front of the case top.

Start Up

To start the unit, place the ON/OFF switch on the operator panel of the unit in the ON position and press the ON/OFF button on the remote box. The pump and refrigeration system will start, the POWER indicator on the operator panel will light and the DEGREES CELSIUS display on the remote box will indicate the fluid temperature. Either ON/OFF switch will shut the unit off.

Temperature Adjustment

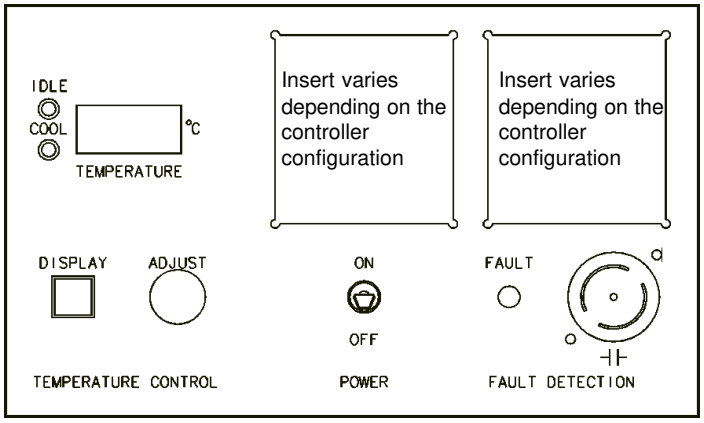
To display the temperature setpoint, press and hold the DISPLAY/SETPOINT button. To adjust the setpoint, press and hold the DISPLAY/SETPOINT button and turn the ADJUST SETPOINT dial until the desired temperature setpoint is indicated on the DEGREES CELSIUS LED display. Once the setpoint is adjusted, release the DISPLAY/SETPOINT button. The DEGREES CELSIUS LED display will indicate the temperature of the fluid in the reservoir.

NOTE: Inadvertent movement of the ADJUST SETPOINT dial will result in a change in the setpoint. The change will not be immediately reflected on the DEGREES CELSIUS display unless the DISPLAY/SETPOINT button is pressed. The display will eventually change as the unit responds to the new setpoint.

Low Level Warning

The LOW LEVEL indicator is connected to a float switch in the reservoir. The indicator warns the user of a low cooling fluid level in the reservoir. A low fluid level condition occurs when the cooling fluid in the reservoir drops below the operating level. The indicator serves only as a warning. The unit will not shut down as a result of a low fluid level condition.

Digital with Interlock



Digital with Interlock Temperature Controller

Description

The Digital with Interlock temperature controller is a Digital temperature controller with up to four monitoring options: low temperature, high temperature, low fluid level, and low flow. The controller can be built with any combination of these four monitors.

Temperature Adjustment
To display the temperature setpoint, press and hold the DISPLAY button. To adjust the temperature setpoint, press and hold the DISPLAY button and turn the ADJUST dial until the desired temperature setpoint is indicated on the TEMPERATURE °C LED display. Once the setpoint is adjusted, release the DISPLAY button. The TEMPERATURE °C display will indicate the temperature of the fluid in the reservoir.

NOTE: Inadvertent movement of the ADJUST dial will result in a change in the setpoint. The change will not be immediately reflected on the TEMPERATURE °C display unless the DISPLAY button is pressed. The display will eventually change as the unit responds to the new setpoint.

Fault Response
Controllers with a START switch are configured to shut off in the event that a fault occurs. Controllers NOT equipped with a START switch will allow the unit to continue to operate if a fault occurs. This option is available for customers who are willing to accept the risk of damage to the unit in order to continue to provide cooling fluid to the instrument being cooled.

With either controller configuration, the relay contacts connected to the controller receptacle will open and the FAULT indicator will light if a fault occurs. The cause of the fault must be identified and corrected before the unit can be restarted.

START Switch
If the controller is equipped with a START switch, a fault will cause the unit to shut down. Press the START switch to restart the unit after the fault has been corrected. If the fault has not been corrected, the unit will not start and the FAULT indicator will light when the START switch is pressed.

Temperature Monitors
The optional high and low temperature monitors are connected to sensors that monitor the temperature of the cooling fluid as it exits the reservoir. The monitors protect the system from exposure to excessively hot or cold cooling fluid. A temperature fault occurs when the fluid temperature exceeds the set temperature limit.

To adjust either temperature monitor, turn the appropriate calibrated dial to the desired temperature limit.

Low Fluid Level Monitor

The low fluid level monitor is connected to a float switch in the reservoir. If the controller is equipped with a LOW LEVEL indicator, the low level monitor is not connected to the fault circuit. The indicator will light if the reservoir cooling fluid drops below the operating level. The indicator serves only as a warning. A fault will not occur as a result of a low level condition.

If the controller is NOT equipped with a LOW LEVEL indicator, the low level monitor is connected to the fault current. A fault will occur if the reservoir cooling fluid level drops below the operating level.

Low Flow Monitor

The optional low flow monitor is connected to a flow switch in the RETURN line. A low flow fault occurs when the flow rate of the returning cooling fluid drops below 0.3 gallons per minute (1.0 liters per minute).

When starting a unit with a controller equipped with both a low flow monitor and a START switch, the START switch must be held in the ON position until the flow switch “closes” (2 or 3 seconds). If time is not allowed for the flow switch to close, the unit will stop when the START switch is released.

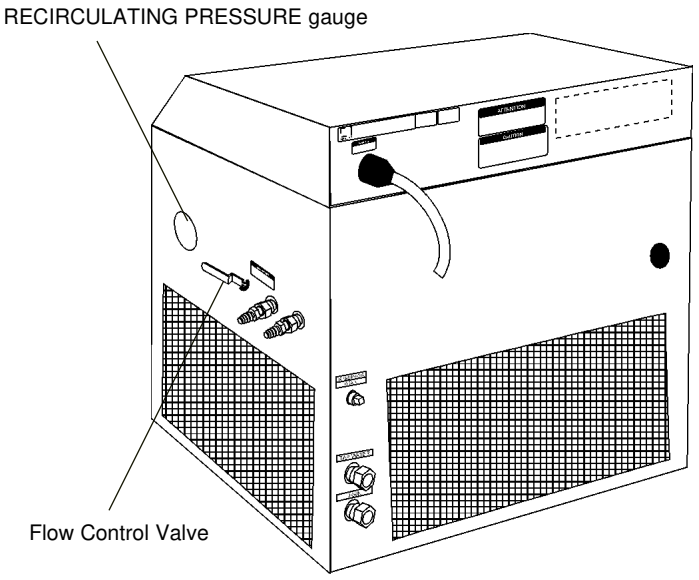
Interlock Relay Contacts

A set of contacts are connected to a receptacle on the operator panel. The contacts are rated 15A, 125V. This is not a power inlet or outlet. The receptacle is isolated from the circuitry. Its ground pin is connected to the chassis. The contacts are normally open: they are closed when the unit is running normally (no faults present), and they are open when the unit is off or when a fault occurs.

Section V Operation

Flow Control

The flow control handle is connected to a valve that controls the flow rate of the cooling fluid to the instrument being cooled. The handle is located on the right side of the unit and is labelled RECIRCULATING FLOW CONTROL.



When the handle is in the “+” position, the valve is open and all possible cooling fluid is supplied to the instrument being cooled. When the handle is in the “-” position, the valve is closed and no cooling fluid is supplied to the instrument being cooled. When the handle is between these two positions, the flow rate of the cooling fluid is between full flow and no flow. Use a flow meter on the SUPPLY line to adjust the desired flow rate.

Make sure the flow control handle is closed before starting the unit. Once the unit is running, use the handle to slowly open the valve until the desired flow rate is adjusted.

On units equipped to detect a low flow condition (Digital with Interlock temperature controllers equipped with a low flow monitor), the flow control valve must be opened slightly to allow fluid to circulate through the flow switch that monitors the flow rate. A flow rate of more than 0.3 gallons per minute (1.0 liters per minute) is necessary. If the flow is completely shut off, or if flow is not adequate, a low flow fault will occur and the unit will not start.

Never “crank” the valve wide open from the closed or slightly open position.

Pressure Gauge

The RECIRCULATING PRESSURE gauge is located next to the flow control handle. The gauge indicates the operating pressure of the system.

Pressure Relief Valve
(PD and TU Pumps Only)

Units with a PD-2 or any TU type pump have an adjustable pressure relief valve. Refer to the pump identification label on the rear of the case top or rear of analog controller to identify the specific pump in your unit.

The pressure relief valve establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The valve does not determine the actual operating pressure; the operating pressure of the system is determined by the back pressure of the connected equipment and the setting of the flow control valve. If adjustment seems necessary, consult our Service Department for assistance.

Before calling, refer to the serial number label on the rear of the case top to obtain the following:

- *unit part number*
- *unit serial number*

High Pressure Cutout
(Water-Cooled Units Only)

Should the unit's refrigeration discharge pressure become too high the high pressure cutout will activate and shut down the unit. High pressures can be caused by a lack of cooling water to the compressor or debris in the refrigeration lines.

Once the cause of the problem has been identified and corrected you must manually reset the cutout. The cutout location depends on the size of your unit. On the HX-75, it is behind the right side panel, on the HX-100 and HX-150 it is behind the left side panel, and on the HX-200 through HX-750 it is behind the rear panel.

Locate the white reset switch on the high pressure cutout. Press in on the switch until a "click" is heard. If the reset does not "click" the cutout was not activated and the unit shut down occurred for another reason.

Section VI Special Features

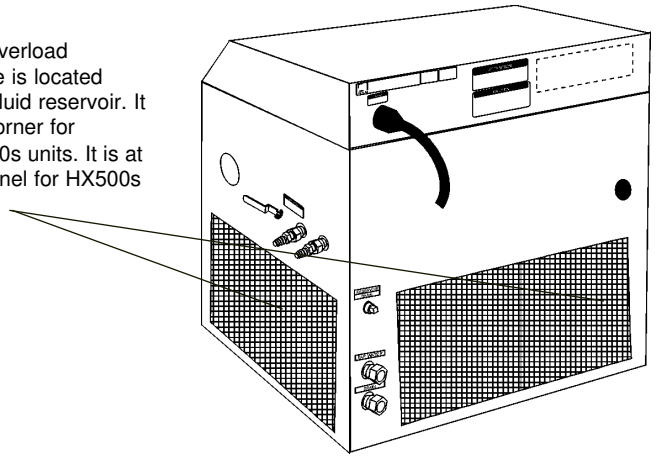
Pump Motor Overload Protector

Refer to the serial number label for the specific electrical requirements of your unit; specifically, identify the phase requirements of your unit.

The pump motor overload protector prevents the pump motor from exposure to excessive current. If an overload fault occurs, due, for example, to excessive pressure or flow, or excessive ambient temperature, the overload protector will shut off the pump motor. The overload protector will automatically reset after approximately one to two minutes.

If a fault occurs, a red lamp on the protector enclosure will light while the pump motor is off. The lamp goes out once the protector resets.

The pump motor overload protector enclosure is located directly under the fluid reservoir. It is at the left rear corner for HX200s and HX300s units. It is at the side access panel for HX500s and HX750s units.



The unit's fault response also varies depending on the unit's configuration.

If the unit has a Digital temperature controller and a single phase pump motor, the unit will continue to run if an overload fault occurs. The pump will restart as soon as the protector resets.

If the unit has a Digital controller and a three phase pump motor, the pump and refrigeration system will both shut down until the protector resets.

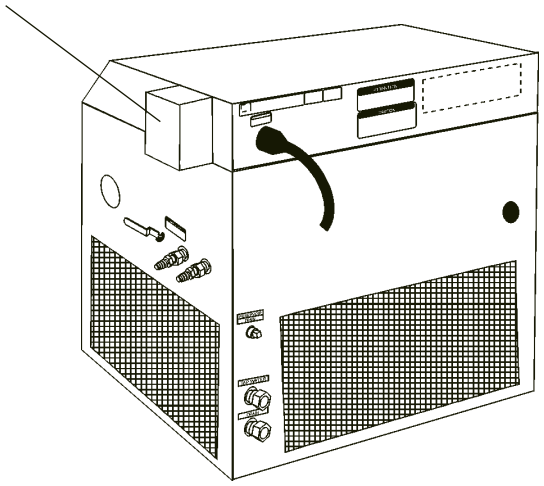
If the unit has a Digital with Interlock temperature controller with a low flow monitor, the unit will shut down due to a low flow fault. The unit must be manually restarted after the protector resets.

The overload protector can be adjusted to require manual resetting after an overload fault. If you are unsure of the phase of the pump motor in your unit, contact our Service Department (see Preface, After-sale Support).

Heater Package (Optional)

The heater package option consists of an immersion heater in the unit's fluid reservoir, a high temperature limit device, a solid state zero-crossing relay, a heater ENABLE/DISABLE switch and a FAULT indicator. The ENABLE/DISABLE switch and the FAULT indicator are located on a small control box appended to the right side of the case top. The FAULT indicator will light if the high temperature limit device is tripped. The high temperature limit device will disconnect power to the heater if the heater surface temperature exceeds a preset limit.

Heater Package Control Box (Typical)



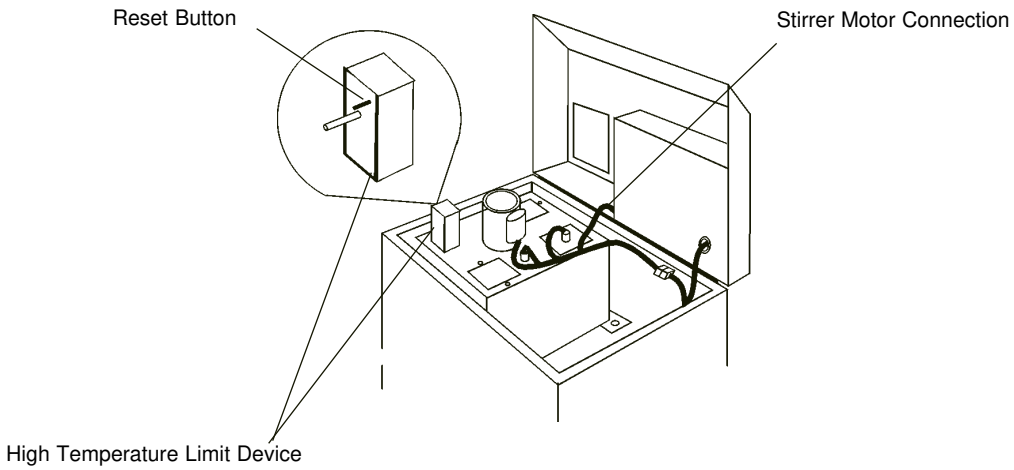
With the ENABLE/DISABLE switch set to ENABLE, the heater will cycle on and off under the control of the temperature controller. With the switch in the DISABLE position, the heater will remain off.

The heater high temperature limit device senses the surface temperature of the heater. If the heater temperature becomes too high, the limit device opens a mechanical relay to remove power from the heater.

The heater surface temperature may operate several degrees higher than the reservoir fluid. The limit device is factory set to a temperature above the upper limit of the temperature controller's range.

For personal safety and equipment reliability, the following procedure must only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

To reset a tripped temperature limit device, lift and open the case top. The case top is secured to the unit base by a hinge between the case top and the base (along the rear of the unit), and by two spring clips located at the front corners, see page 7. To gain access to the temperature limit device, disengage the spring clips with a flat bladed screw driver and lift the front of the case top and tilt it back. A support brace, located on the right side of the inner case, will stop and support the case top.



You must identify and correct the fault before restarting the unit.

The protection device and the heater power connections are located in a small stainless steel box on top of the fluid reservoir. The protection device has a reset button and a temperature limit adjustment shaft. Press the reset button to restore operation.

Some units equipped with heaters do not have a power cable. Installation of the cable is your responsibility. Wire the unit in conformance to local, state and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is your responsibility to assure a proper ground connection is provided. For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician.

To access the power cable connection box and install the cable:

- Lift the unit's bonnet.
- Remove the panel under the right half of the bonnet by removing the screws and the stirrer motor connection. (The stirrer motor connection is located at the lower left corner of the bonnet, see illustration above.)
- Remove the plastic plug on the rear of the bonnet. We recommend that you install an electrical conduit in place of the plastic plug.
- Insert your cable through the conduit.
- Locate the connection box and connect your cable to L1 and L2 (both connections are labeled) and to the ground stud (not labeled).
- Replace the panel and stirrer motor connection.

Remote Condenser (Optional)

Units with the optional remote air-cooled condenser are equipped with high and low refrigeration pressure monitors. The monitors are connected internally to a pressure gauge that monitors refrigeration pressure at the suction side of the compressor. The monitors protect the refrigeration system from operating under excessively high and low refrigeration pressures. A pressure fault occurs when the refrigeration pressure exceeds the set pressure limit.

The status of the monitors is indicated by the COMPRESSOR LOW PRESSURE and COMPRESSOR HIGH PRESSURE indicators located on the operator panel.

In the event of either a low or high refrigeration pressure fault, the unit will shut down. The unit must be manually restarted after the cause of the fault has been identified and corrected. If both indicators are lit simultaneously, an interruption in the main power supply has occurred.

Nitrogen Purge (Optional)

Units equipped with nitrogen purge valves are designed to accept a constant flow of dry nitrogen into the reservoir. The nitrogen blankets the cooling fluid reducing fluid evaporation.

Remove the reservoir cover by removing the screws. Fill the reservoir with fluid. Replace the reservoir cover and screws. Connect the nitrogen line to the valve on the reservoir cover.

A pressure regulator, set to 0.5 psig (0.35 kg/cm^3) or lower, should be used to prevent fluid overflow.

Particulate Filters (Optional)

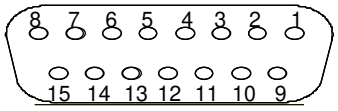
Some custom units are fitted with particulate filter assemblies attached to the supply side of the recirculation water. The frequency for cleaning/changing the filter depends on your usage. Should the unit's performance be degraded, check the filter.

Filters are available from NESLAB, contact our Customer Service Center. Before calling refer to the serial number label on the rear of the unit to obtain the following information:

-unit serial number
-unit part number

15 pin Accessory Connector (Optional)

Units with digital controllers may be modified with a 15 pin accessory connector. To enable the connector slide the LOCAL/REMOTE switch on the temperature controller to the REMOTE position. The pin out information is listed below.



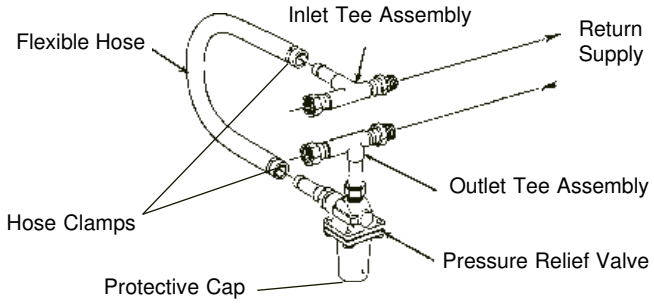
15 pin D-subminiature female receptacle

Pin #	Function
1	Chassis ground.
2	No connection.
3	Span +. Indicates the maximum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +350mV = +35.0°C).
4	Span -. Indicates the minimum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +50mV = +5.0°C).
5	No connection.
6	Analog ground. The analog ground is physically separated from the power ground throughout the unit. To prevent offsets that result from ground currents, the analog and power grounds are only connected at the unit's power supply. Analog ground should only be used as a reference pin .
7	Sensor temperature (current limited through 2.7K OHM resistor). The fluid temperature, as measured by the controller's sensor located in the reservoir, can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
8	Setpoint out. The present temperature setpoint can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
9	Power Ground.
10	Heater output. Will source 3V at 6mA.
11	No connection.
12	Digital display (input only). An external voltage can be displayed on the operator panel digital display by applying the voltage to this pin. The display has a low input resistance and a full scale rating of ±1.99VDC. Input is referenced to analog ground, pin 6. The maximum voltage applied to the display should be limited to ±2VDC.
13	- 5V. Power supply of -5VDC (15mA maximum).
14	+5V. Power supply of +5VDC (15mA maximum).
15	Setpoint in. The temperature setpoint can be controlled by applying a known voltage to this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +230mV = +23.0°C).

External Pressure Regulator (Optional)

For applications requiring a maximum pressure less than 55 psi, an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 psi. If the pressure of the fluid leaving the unit exceeds the valve setting the relief valve will bypass the fluid back into the unit to relieve the pressure. The pressure of the system is determined by the back pressure of the connected equipment and the flow rate of the recirculating fluid to your application.

Connect the EPR assembly as shown below. Tighten the hose clamps tight enough to prevent leakage. Do not over-tighten or the clamps will “bite” into the flexible tubbing and can cause excessive wear.



Connect the outlet tee assembly to the inlet of your application. Connect the inlet tee assembly to the outlet of your application.

Adjustment

When adjusting the relief valve some leaking may occur, place a container under the valve during adjustment.

Remove the protective cap and locate a threaded fitting with a slot for a large screwdriver. Hold the threaded fitting in place and loosen the lock nut on the valve body until it is almost flush with the threaded fitting. Unscrew the threaded fitting three to four turns. (If the threaded fitting unscrews completely from the valve housing, screw it back in two to three turns.)

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and your application. Monitor the operating pressure of the HX unit. Turn the threaded fitting until the desired relief pressure is set (the EPR valve cannot be set lower than the total back pressure of your instrument, or flow will not be received).

Tighten the locknut to secure the position of the threaded fitting. Open the hose between the EPR outlet tee assembly and your application.

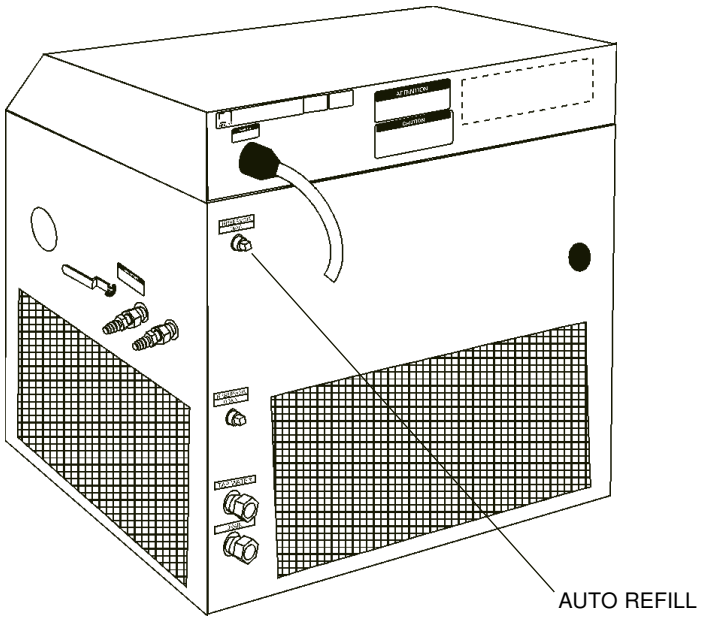
Automatic Refill Device (Optional)

The automatic refill device is designed to maintain the correct level of cooling fluid in the reservoir. The device consists of a float switch in the reservoir and a solenoid valve on top of the reservoir. If the cooling fluid level falls, the float switch will drop, opening the solenoid valve and allowing make-up fluid to fill the reservoir. Once the cooling fluid level reaches the proper level, the float switch will rise and the solenoid valve will close.

The plumbing connection for the refill device is located at the right rear corner of the unit and is labelled AUTO REFILL. This connection is a $^{3}/_{8}$ inch OD stainless steel barbed fitting.

Connect this fitting to a make-up fluid source using $^{5}/_{16}$ or $^{3}/_{8}$ inch ID flexible tubing. Make sure all tubing connections are securely clamped.

Tubing is available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).



Section VII Maintenance

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Condenser Cleaning (Air-cooled units only)

For proper operation, the unit needs to pull substantial amounts of air through a finned condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The frequency of cleaning depends on the operating environment. It is recommended that a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

For "standard" air-cooled units, periodic vacuuming of the fins on the condenser is necessary.

For units with the optional remote air-cooled condenser, remove any debris from around the condenser site. If a visible accumulation of dust or dirt is found on the condenser fins, the condenser should be cleaned with a condenser cleaning solvent and rinsed with water.

Exercise caution not to damage the condenser fins or coil. Condenser fin or coil damage can result in a loss of performance and, in extreme cases, refrigeration system failure.

Hoses

The unit's internal and external hoses and clamps should be inspected and tightened on at least a semiannual basis.

Algae

To restrict the growth of algae in the fluid reservoir, it is recommended that the reservoir cover be kept in place and that all recirculation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, one gram per gallon.

Section VIII Service

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Configuration

Case Top

The unit has a hinged case top to allow service access. The case top is secured to the top of the unit base by a hinge between the case top and base (along the rear of the unit), and by two spring clips located at the front corners, see illustration on page 7. To gain access to the pump assembly or the reservoir area, disengage the spring clips with a flat bladed screw driver and lift the front of the top cover and tilt it back. A support brace, located on the right side of the inner base, will stop and support the case top. Ensure the spring clips engage when the top is lowered back into position.

Reservoir Cover

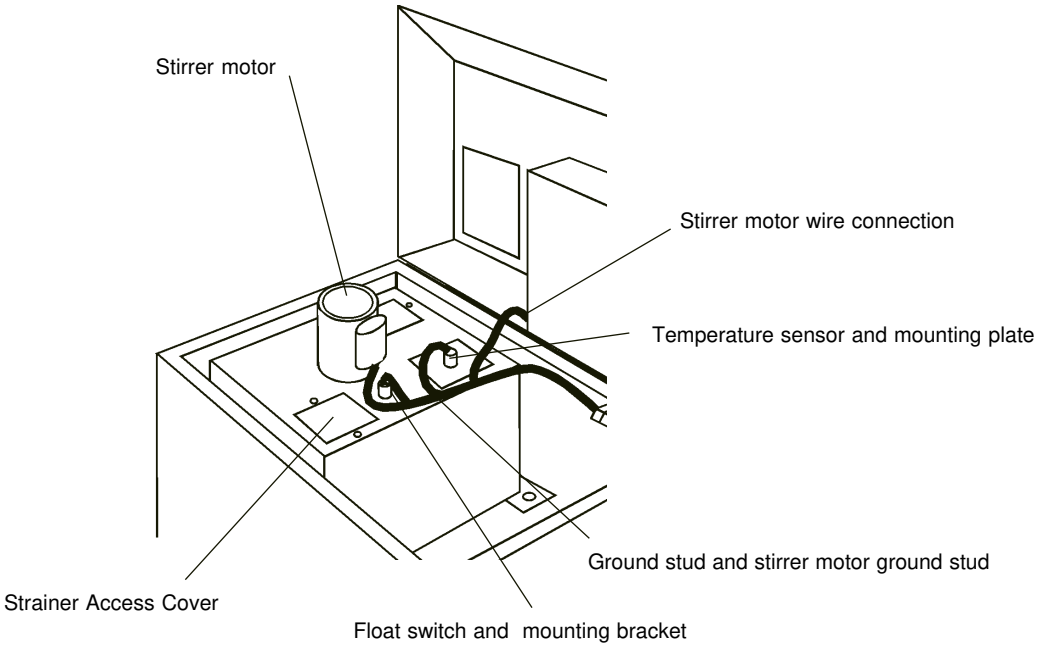
Access to the inside of the fluid reservoir is necessary to clean the reservoir. The figure on the next page illustrates a typical layout of the components mounted on top of the reservoir cover. The component layout varies depending on the unit size. If you are unable to identify the components on your unit's reservoir cover, contact our Service Department for assistance (see Preface, After-sale Support).

Disconnect the unit from its power source before removing the reservoir cover.

Locate the reservoir stirrer motor (units with plate heat exchangers and HX-75s do not have a stirrer motor; HX-500s and HX-750s have two stirrer motors). Disconnect the motor wires at the plug located on the side of the electrical box cover. Also disconnect the green ground wire that connects the ground stud on the reservoir cover to the unit's grounding bar.

Locate the float switch mounting bracket. Remove the two stainless steel screws that secure the bracket to the reservoir cover. Carefully remove the mounting bracket and place the assembly in an area adjacent to the reservoir. Make sure not to strain the connecting wires.

Locate the temperature sensor mounting plate. Remove the two stainless steel screws that secure the bracket to the reservoir. Carefully remove the sensor mounting plate with the sensor(s) attached and place the assembly in a protected area adjacent to the reservoir. Make sure not to damage the sensor(s) or strain the connecting wires.



Remove the stainless steel screws that secure the reservoir cover to the reservoir. Remove the cover and place it to one side in a manner that protects the stirrer motor blades from being bent.

Service Access Panels

Service panels on your unit allow easy access to the pump and refrigeration assemblies. Panel location varies with the size and type of unit. The panels are designed to allow removal without disconnecting the HX from the instrument being cooled.

Disconnect the unit from its power source before removing any of the access panels.

Reservoir Cleaning

Periodic reservoir cleaning is necessary. It is recommended that a visual inspection of the reservoir be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Disconnect the unit from its power source and drain the reservoir before cleaning the reservoir.

Lift the top cover to access the reservoir. Remove the reservoir cover as described in Section VIII, Configuration.

Clean the reservoir with a cleaning fluid compatible with the recirculating system and the cooling fluid.

Do not use steel wool or other abrasive materials. They can scratch the stainless steel surface and initiate rusting.

When the reservoir is clean, re-assemble the cover assembly and close the case top.

Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Pump Strainer
(PD and TU Pumps Only)

If debris is drawn into the recirculating system, the strainer will prevent the material from being sucked into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged with debris and scale. Therefore, the strainer must be cleaned after the first week of use. After this first cleaning, a monthly visual inspection is recommended. After several months, the cleaning frequency will be established.

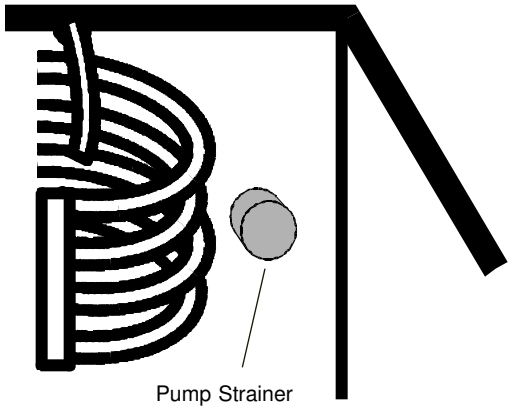
Disconnect the power cord from the power source and drain the fluid reservoir before cleaning the strainer. Do not operate the unit with the strainer removed.

PD-2 and TU Pumps

The wire mesh pump strainer is located in the reservoir on the pump suction line. Remove the strainer access panel located on top of the reservoir cover to access the strainer.

Cover the strainer with a plastic bag to help catch any debris which may become free.

Unscrew the strainer and rinse it with water. Replace the strainer. Refer to Section III, Filling Requirements for instructions on replacing fluid.



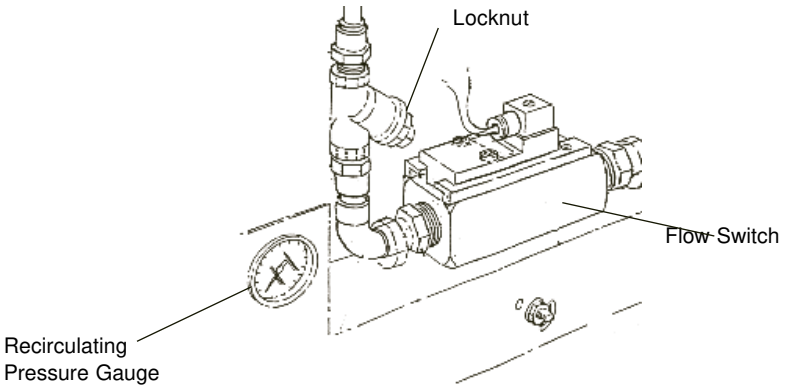
Reservoir cover deleted for clarity

Flow Filter Strainer (Optional)

Unit's equipped with flow switches have flow filter strainers located behind the top right access panel on the inlet side of the flow switch.

Unscrew the locknut and remove the screen. Clean the screen by rinsing it with water.

Replace the strainer and locknut. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.



Phase Rotation

Refer to the serial number label on the rear of the case top or rear of analog controller for the specific electrical requirements of your unit; specifically, identify the phase requirements of your unit.

Three phase units with three phase pump motors have a phase rotation interlock. The interlock prevents the unit from starting if the phase rotation is wrong. If the unit will not start, see Section IX, Checklist. If the options in the checklist are not applicable, the problem may be phase rotation.

Disconnect the unit from its power source, remove the rear panel and the junction box cover (if so equipped). Reverse any two line conductors on the line side of the relay.

Never remove the green ground wire.

Replace the junction box and the rear panel. Reconnect the unit to its power source. If the unit will not start, contact our Service Department.

If you are unsure whether your three phase unit has a three phase pump motor, contact our Service Department (see Preface, After-sale Support).

Pump Lubrication

Units with PD-2 pumps require pump motor lubrication. Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit.

Motors used to drive the pump are manufactured by several companies. These motors use sleeve type bearings with large oil reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil in each fill hole on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years

Suction Discharge Pressure Speed Check

Air-Cooled Standard and High Temperature Units (All Pump Types)[1]

Unit	Suction(psi)	Discharge(psi)	Speed Check(°C/Minute)
HX-75	77 - 84	225 - 250	1.5 - 1.7
HX-100	75 - 83	245 - 265	1.3 - 1.6
HX-150	70 - 73	240 - 270	2.0 - 2.5
HX-200	85 - 105	230 - 255	1.6 - 1.9
HX-300	84 - 105	270 - 305	2.4 - 2.7
HX-500	80 - 90	215 - 235	2.0 - 2.4
HX-750	65 - 75	185 - 215	

Water-Cooled Standard and High Temperature Units (All Pump Types)[2]

Unit	Suction(psi)	Discharge(psi)
HX-75	72	170
HX-100	86 - 92	180
HX-150	65	175
HX-200	85 - 90	180
HX-300	73 - 78	180
HX-500	75 - 82	150
HX-750	50 - 60	180

1. 27°C unit temperature, water in reservoir, access panel removed.
2. 25°C unit temperature, water in reservoir.

NOTE: For low temperature units please call NESLAB.

Section IX Troubleshooting

Checklist

Unit will not start

For CE Mark units, check the position of the circuit breaker on the right side of the unit.

Check power source for correct voltage output. Refer to the serial number label on the rear of the unit or rear of analog temperature controller for the specific electrical requirements of your unit. Power source must be specified voltage, ±10%.

Check house circuit breaker.

On three phase units with three phase pump motors, the phase rotation may be reversed (see Section VIII, Phase Rotation).

On water-cooled units, make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection. Ensure the facility water is turned on.

Check the High Pressure Cutout, it may need to be reset (see Section V, Operation).

Unit will not circulate fluid

Check the tubing between the unit and your application for obstructions.

The pump strainer may require cleaning (PD and TU pumps only). Refer to the pump identification label on the rear of the case top or rear of analog temperature controller to identify the specific pump in your unit. For instructions on cleaning the pump strainer, see Section VIII, Pump Strainer.

On units with CP type pumps, if the back pressure of the instrument being cooled is greater than the maximum pressure of the pump, adequate flow may not be obtained. Check for obstructions in the tubing.

Inadequate temperature control

Make sure the installation of the unit is in compliance with the conditions described in Section III.

Make sure the heat load of the instrument being cooled is not greater than the cooling capacity of the unit.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

- *unit part number*
- *unit serial number*

APPENDIX A INTERNATIONAL QUICK REFERENCE GUIDES

HX - Serie luftgekühlt Kurzbedienungsanleitung

Installation

Das Gerät muß so plaziert werden, daß weder das Ansaugen noch Ausströmen von Luft behindert wird. Bei ungenügender Ventilation wird die Kühlleistung reduziert und kann in extremen Situationen zu einem Ausfall des Kühlsystems (Kompressors) führen.

Aufstellorte mit hoher Staubentwicklung sollten vermieden werden, und es sollte eine regelmäßige Reinigung des Gerätes durchgeführt werden. Um einwandfrei zu funktionieren, muß das Gerät große Luftmengen durch den Kondensor ansaugen. Bei Staub- und Schmutzablagerungen auf dem Kondensorheizkörper kommt es zu einem Verlust von Kühlleistung.

Das Gerät behält seine maximale Kühlleistung bis zu einer Umgebungstemperatur von ca. +24°C.

Vergewissern Sie sich, daß die Spannung Ihrer Stromanschlüsse mit der für das Gerät vorgesehenen Spannung übereinstimmt (±10%).

Die Schlauchanschlüsse (3/4 Zoll FPT) des Gerätes befinden sich an der Rückseite und sind mit SUPPLY und RETURN bezeichnet. Bitte entfernen Sie die Gummiabdichtung von beiden Anschlüssen. Schließen Sie den SUPPLY-Anschluß an den Eingang Ihres Instruments und den RETURN-Anschluß an den Ausgang Ihres Instruments an.

Um das Reservoir zu füllen, öffnen Sie die Abdeckplatte in der linken hinteren Ecke der Gehäuseoberseite und entfernen Sie die Reservoirabdeckung, indem Sie die Flügelschrauben lösen. Füllen Sie das Reservoir bis 1 Zoll unterhalb des Randes mit sauberer Kühlflüssigkeit. Wenn das zu kühlende Instrument und die Zirkulationsleitungen sehr viel Kühlflüssigkeit aufnehmen können, sollten Sie zusätzliche Kühlflüssigkeit zur Hand haben, um gegebenenfalls nachfüllen zu können.

Für den Betrieb im Arbeits-Temperaturbereich von +8°C bis +80°C empfiehlt NESLAB Leitungswasser als Kühlmittel, bei niedrigeren Temperaturen als +8°C muß eine nicht gefrierende Flüssigkeit verwendet werden. Wir empfehlen eine Mischung aus Leitungswasser und Labor Ethylen Glykol.

Inbetriebnahme

Vor Inbetriebnahme des Gerätes vergewissern Sie sich bitte, daß die elektrischen Anschlüsse und die Rohr- u. Schlauchanschlüsse sachgemäß installiert sind und daß das gesamte System mit Kühlflüssigkeit gefüllt ist.

Die Modelle HX-200 bis HX-750 müssen vor dem Starten mindestens 12 Stunden an die Stromversorgung angeschlossen werden, damit das Öl im Kompressor erwärmt werden kann und sich von der Kühlflüssigkeit abscheiden kann.

Um das Gerät einzuschalten, müssen Sie den Hauptschalter auf „ON“ stellen. Die „COOL“- und „IDLE“-Anzeigen auf der Steuertafel geben den Status des Kühlsystems an. Die COOL-Anzeige leuchtet, wenn das Kühlsystem der Kühlflüssigkeit Wärme entzieht. Die HEAT-Anzeige leuchtet, wenn sich das Gerät im Hot Gas Bypass Modus befindet. Wenn die Temperatur der Kühlflüssigkeit sich der gewünschten Temperatur nähert, blinken die Anzeigen, um den Arbeitszyklus des Systems anzugeben.

Nach dem Ausschalten des Gerätes sollten Sie vor dem Wiedereinschalten ca. 5 Minuten warten, damit das Kühlsystem einen Druckausgleich durchführen kann. Beachtet man diese Wartezeit nicht, kommt es zu kurzen Schaltfrequenzen des Kompressors und eine Kühlung ist nicht möglich.

Einstellung der Analog-Temperatursteuerung

Um die Temperatur einzustellen (setpoint), drehen Sie den °C-Schalter an der Vorderseite des Gerätes auf die gewünschte Temperatur.

Einstellung der Digital-Temperatursteuerung

Um sich den Temperatur-Setpoint anzeigen zu lassen, drücken Sie den DISPLAY-Schalter und halten Sie ihn gedrückt. Um den Temperatur-Setpoint einzustellen, drücken Sie den Display-Schalter, halten diesen, und drehen gleichzeitig den ADJUST-Schalter so lange, bis die gewünschte Temperatur in der Digitalanzeige angezeigt wird. Wenn die Temperatur eingestellt ist, lassen Sie den Display-Schalter los. Die Digitalanzeige zeigt dann die Temperatur der Kühlflüssigkeit im Reservoir an.

Flußsteuerung
Der RECIRCULATION FLOW CONTROL Hebel kontrolliert die Durchflußmenge der Kühlflüssigkeit zu Ihrer Anwendung. In der „+“-Stellung wird die gesamte verfügbare Kühlflüssigkeit an die Anwendung abgegeben, in der „-“-Stellung wird keine Kühlflüssigkeit an die Anwendung abgegeben.

WHX - Serie wassergekühlt Kurzbedienungsanleitung**Installation**
Stellen Sie das Gerät in einer sauberen Umgebung mit einfachem Zugang zu einem Gebäudewasseranschluß und einem Abfluß auf. Das Gebäudewasser muß den in der Anleitung festgelegten Anforderungen genügen, sonst wird die Leistung des Gerätes herabgesetzt. Unzureichende Wasserzufuhr kann zu einer Überhitzung des Kompressors und so zu einem Ausfall des Gerätes führen.

Vergewissern Sie sich, daß die Spannung Ihrer Stromanschlüsse mit der für das Gerät vorgesehenen Spannung übereinstimmt (± 10%).

Die Schlauchanschlüsse des Gerätes befinden sich an der Rückseite und sind mit TAP WATER, DRAIN, SUPPLY und RETURN bezeichnet. Bitte entfernen Sie die Gummiabdichtung von allen Anschlüssen. Schließen Sie den TAP WATER-Anschluß an das Gebäudewasser und den DRAIN-Anschluß an den Abfluß an. Schließen Sie den SUPPLY-Anschluß an den Eingang Ihres Instruments und den RETURN-Anschluß an den Ausgang Ihres Instruments an.

Um das Reservoir zu füllen, öffnen Sie die Abdeckplatte in der linken hinteren Ecke der Gehäuseoberseite und entfernen Sie die Reservoirabdeckung, indem Sie die Flügelschrauben lösen. Füllen Sie das Reservoir bis 1 Zoll unterhalb des Randes mit sauberer Kühlflüssigkeit. Wenn das zu kühlende Instrument und die Zirkulationsleitungen sehr viel Kühlflüssigkeit aufnehmen können, sollten Sie zusätzliche Kühlflüssigkeit zur Hand haben, um gegebenenfalls nachfüllen zu können.

Flußsteuerung
Der RECIRCULATION FLOW CONTROL Hebel kontrolliert die Durchflußmenge der Kühlflüssigkeit zu Ihrer Anwendung. In der „+“-Stellung wird die gesamte verfügbare Kühlflüssigkeit an die Anwendung abgegeben, in der „-“-Stellung wird keine Kühlflüssigkeit an die Anwendung abgegeben.

Wartung
Überprüfen Sie regelmäßig die Kühlflüssigkeit im Reservoir. Sollte eine Säuberung notwendig sein, spülen Sie das Reservoir mit einer speziellen Reinigungsflüssigkeit, die mit dem Umlaufsystem und der Kühlflüssigkeit kompatibel ist.

Das Kühlmittel sollten Sie regelmäßig erneuern. Wenn Sie das Gerät bei niedrigen Temperaturen betreiben, erhöht sich mit der Zeit der Wasseranteil in der Kühlflüssigkeit. Dies führt zum Verlust von Kühlkapazität.

Regelmäßiges Absaugen des Kondensor-Heizkörpers ist erforderlich. Die Reinigungshäufigkeit hängt von der Betriebsumgebung ab. Eine monatliche Überprüfung des Kondensors ist empfehlenswert. So werden Sie nach einigen Monaten einen Reinigungsrhythmus gefunden haben.

Geräte mit PD- und TU-Pumpen sind mit einem Pumpenfilter ausgestattet. Der Filter sorgt dafür, daß kleine Teilchen und Schmutzablagerungen nicht in die Pumpe gelangen und so die Pumpflügel beschädigen können.

Nach der Erstinstallation kann es zu einer Blockierung des Filters kommen. Die erste Reinigung sollte daher nach einer Woche erfolgen. Danach empfehlen wir eine monatliche Überprüfung des Filters. So können Sie nach einiger Zeit abschätzen, wie oft der Filter gereinigt werden muß.

Bevor Sie den Filter reinigen, ziehen Sie den Netzstecker aus der Steckdose und leeren Sie das Reservoir.

Luftkølet HX-serie Kvik referance.

Installation:
Opstilles i rene omgivelser.

Steder med meget støv skal undgåes, og periodisk rensning skal udføres, hvis utilsigtet nedbrud skal undgåes. Opbygning af støv vil medføre fald i kølekapasiteten og i værste fald overophedning af systemet.

Check at netspændingen er den nominelle 240V ± max. 10%.

Slangetilgang er på bagsiden mærket „Supply“ til indgang på dit emne og „Return“ på udgangen.

Ledningsvand (ionbyttet) kan anvendes mellem +8 til 80^0 C, under $+8^0$ C skal væsken blandes op med ethylenglycol.

Fyldning af reservoiret foregår ved at fjerne panelet, som er forsynet med fingerskruer, og påfyld egnet rent kølevæske, max 5 cm fra toppen

Betjening:
Før opstart checkes elektriske forbindelser, slangeforbindelser, væske stand og brugsvand er tilsluttet.

Analog temperatur kontrol:
Drej på knappen mærket C til den rigtige temperatur.

Digital temperatur kontrol:
Setpunktet vises ved at holde „Display“ tasten inde, skal temperaturen ændres drejes herefter på „Adjust“ knappen. Slip „Display“ knappen og aktuel temperatur vises.

Flow kontrol:
Drej på „RECIRCULATING FLOW CONTROL“ + for at åbne og - for at lukke.

Periodisk vedligeholdelse:
Check standen af væske periodisk. Check med mellemrum vakuumet på pumpesiden, rens systemet og check for aflejringer, vækst, utætheder, check vakuumpumpen med kondenser og evt. filtre. Husk åben aldrig instrumentet uden strømmen er afbrudt, og strømkablet er taget ud!

Vandkølet HX-serie Kvik referance.

Installation:
Opstilles i rene omgivelser

Steder med meget støv skal undgås og periodisk rensning skal udføres, hvis utilsigtet nedbrud skal undgås. Opbygning af støv vil medføre fald i kølekapasiteten og i værdste fald overophedning af systemet.

Check at netspændingen er den nominelle 240V ± max. 10%.

Slangetilgang er på bagsiden mærket „TAP WATER“ (hanevand) og „DRAIN“ (ud), samt „Supply“ og „Return“. Inden tilslutning af fittings fjernes plaststøvkappen fra rørstudsene. „TAP WATER“ tilsluttes ledningsvand og „DRAIN“ til afløb. Tilslut dernæst „Supply“ til indgang på dit emne og „Return“ på udgangen.

Ledningsvand (ionbyttet) kan anvendes mellem +8 til 80 deg. C, under +8 deg C skal væsken blandes op med ethylenglycol.

Fyldning af reservoiret foregård ved at fjerne panelet, som er forsynet med fingerskruer og påfyld egnet rent kølevæske, max 5 cm fra toppen

Periodisk vedligeholdelse:
Check standen af væske periodisk. Check med mellemrum vacuummet på pumpesiden, rens systemet og check for aflejringer, vækst, utætheder, check vacuumpumpen med kondenser og evt. filtre. Husk åbn aldrig instrumentet uden strømmen er afbrudt og strømkablet er taget ud!

Watergekoelde HX Series, Handleiding voor snelle installatie-procedures

Installatie
Plaats het apparaat in een ruimte waar gebouwenwater en de mogelijkheid tot afvoer daarvan binnen handbereik zijn. De eisen van de waterfaciliteiten moeten overeenkomen met die gespecificeerd in de handleiding, anders zal het apparaat onvoldoende prestaties leveren. Onvoldoende watertoevoer kan ertoe leiden dat de compressor oververhit raakt en het apparaat uitgeschakeld wordt.

Let erop dat de netspanning gelijk is aan ht aangegeven voltage, ±10%.

De slangaansluitingen zijn bevestigd aan de achterkant van het apparaat en zijn voorzien van de labels TAPWATER, DRAIN, SUPPLY en RETURN. Verwijder de plastic beschermingspluggen van alle slangaansluitingen. De TAPWATER plug dient aangesloten te worden aan de watertoevoer en de DRAIN plug dient te worden aangesloten aan de afvoer. Bevestig de SUPPLY plug aan de ingang van uw applicatie en bevestig de RETURN plug aan de uitgang van uw applicatie.

Om het reservoir te vullen dient men het toegangspaneel aan de linkerachterkant te openen en het reservoir door middel van het losdraaien van de duimschroeven te verwijderen. Vul nu het reservoir tot maximaal 1 inch aan de bovenkant.Indien de vloeistof level van uw toepassingen en de toe- en afvoer leidingen voldoende zijn, dient u altijd extra vloeistof achter de hand te houden.

Kraanwater is aan te bevelen bij een arbeidsproces van 8C. tot +80C. Beneden de +8°C. dient men een non-freezing vloeistof te gebruiken. Een combinatie van kraanwater en laboratorium gerichte ehtylene glycol wordt in het algemeen aanbevolen.

Operationeel gebruik
Alvorens het apparaat te starten, dient men de elektrische- en slangaansluitingen te controleren. Controleer tevens of het systeem gevuld is met koelvloeistof.

De modellen HX-200 tot HX-750 dienen 12 uur aangesloten te zijn aan de netspanning, zodat de olie verhit kan worden en gescheiden kan worden van de koelvloeistof.

Om het apparaat te starten moet men de schakelaar op “ON” zetten. De “Cool” en “Idle LEDs” aan de voorkant van het apparaat geven de status van het koelsysteem weer. “Cool” is in werking wanneer het apparaat warmte van de koelvloeistof onttrekt, “Heat” is in werking wanneer het apparaat in de Hot Gas Bypass stand is gesteld. Indien de ingegeven temperatuur bereikt is, zal de LED switchen.

Wanneer het apparaat uitgeschakeld is, gelieve 5 minuten te wachten alvorens u het apparaat weer in werking stelt. Deze tijd is nodig voor de drukken in het koelsysteem. Indien dit niet gebeurt, zal er short-cycle optreden binnen de compressor en er vindt geen koeling plaats.

Analog ControllerTemperature Adjustment
Om de temperatuur set-point aan te passen, gelieve de Gr.C. knop aan de voorkant van het apparaat te draaien naar de gewenste temperatuur.

Digital ControllerTemperature Adjustment
Om de temperatuur set-point aan te duiden, houdt u de “DISPLAY” knop ingedrukt. Om de temperatuur set-point aan te passen, houdt u de “DISPLAY” knop ingedrukt en draait u de “ADJUST” knop totdat de gewenste temperatuur set-point af te lezen is van de display. Als de set-point is aangepast, kunt u de “DISPLAY” knop loslaten. De display zal nu de temperatuur weergeven van de vloeistof in het reservoir.

Flow Control
Met de RECIRCULATING FLOW CONTROL kunt u het debiet van uw applicatie regelen. De “+” positie geeft u een volledig debiet weergegeven, de “-” positie geeft geen debiet.

Periodiek Onderhoud
De vloeistof in het reservoir dient regelmatig gecontroleerd te worden. Indien reiniging noodzakelijk is, zal het reservoir schoongespoeld moeten worden met een vloeistof welke gelijk is aan het circulatiesysteem en de koelvloeistof..

De koelvloeistof dient periodiek vervangen te worden. Wanneer u werkt met lage temperaturen, zal de concentratie van het water in de koelvloeistof gedurende die tijd toenemen, wat verlies van koelcapaciteit tot gevolg kan hebben.

Het periodiek luchtvrij maken van de condensor is noodzakelijk. Het aantal malen dat dit moet gebeuren hangt af van de omgeving waar het apparaat staat opgesteld en tevens gebruikt wordt. Wij raden een algemene maandelijkse inspektie van de condensor aan na de installatie. Na enkele maanden zal duidelijk zij hoe vaak men de condensor moet reinigen.

Apparaten met PD en TU pompen hebben een afvoer. Indien vuil aanwezig is in het systeem, zal de afvoer ervoor zorgen dat het materiaal niet in de pomp terecht komt en daardoor de pompleidingen niet beschadigd.

Nadat het apparaat geinstalleerd is, zou de afvoer verstopt kunnen raken. De afvoer zal in de eerste week na de installatie schoongemaakt moeten worden. Nadien is een maandelijkse inspektie aan te raden. Na enkele maanden zal duidelijk zijn hoe vaak men de afvoer moet reinigen.

Alvorens de afvoer te reinigen, gelieve het apparaat uit te schakelen en het reservoir te ledigen.

Luchtgekoelde HX Series, Handleiding voor snelle installatie-procedures

Installatie
Plaats het apparaat op een dusdanige manier dat luchttoevoer en afvoer niet wordt belemmerd. Inadequate ventilatie kan leiden tot afname van koelcapaciteit en, in extreme gevallen, tot het niet functioneren van de compressor.

Het is aan te raden stoffige ruimtes te vermijden en de condensor regelmatig schoon te houden.

Voor een juiste werking moet het apparaat een voldoende hoeveelheid lucht aanzuigen door middel van een condensor. Een opeenhoping van stof en vuil op de condensor kan leiden tot een verlies van koelcapaciteit.

Het apparaat behoudt haar integrale capaciteit bij een omgevingstemperatuur tot ongeveer +24°C.

Let erop dat de netspanning gelijk is aan het aangegeven voltage, ±10%.

De slangaansluitingen zijn bevestigd aan de achterkant van het apparaat en zijn voorzien van het label SUPPLY en RETURN. Deze aansluitingen zijn 3/4 inch FPT. Verwijder de plastic beschermingspluggen van beide slangaansluitingen. Bevestig de SUPPLY plug met de ingang van het apparaat welke gekoeld wordt. Bevestig de RETURN plug aan de uitgang van van uw applicatie.

Om het reservoir te vullen, gelieve het toegangspaneel te verwijderen door middel van het losdraaien van de duimschroeven. Vul nu het reservoir tot 2 inches van het maximum wanneer het apparaat de gewenste temperatuur heeft bereikt. Indien het vloeistof level van uw toepassingen de toe-afvoer leidingen voldoende zijn.

Kraanwater wordt in het algemeen aanbevolen, indien men werkt met temperaturen van +8°C tot +80°C.

Beneden de +8°C. moet een non-freezing vloeistof gebruikt worden. Een combinatie van kraanwater en ethylene glycol wordt aanbevolen.

Operationeel gebruik
Alvorens het apparaat in gebruik te nemen, gelieve eerst alle elektrische- en slangaansluitingen te controleren. Controleer ook of het systeem gevuld is met koelvloeistof.

De modellen HX-200 tot HX-750 dienen 12 uur aangesloten te zijn aan de netspanning, zodat de olie verhit en gescheiden kan worden van de koelvloeistof.

Om het apparaat te starten moet men de schakelaar op “ON” zetten. De “Cool” en “Idle LEDs” aan de voorkant van het apparaat duiden de status van het koelsysteem aan. “Cool” is in werking wanneer het apparaat warmte van de koelvloeistof ontlucht, “Heat” is in werking wanneer het apparaat in de Hot Gass Bypass stand is gesteld. Indien de ingegeven temperatuur bereikt is, zal de LED switchen.

Wanneer het apparaat uitgeschakeld is, gelieve 5 minuten te wachten alvorens u het apparaat weer in werking stelt. Deze tijd is nodig om de drukken in het koelsysteem. Indien dit niet gebeurt, zal er short-cycle binnen de compressor optreden en er vindt geen koeling plaats.

Analog Controller Temperature Adjustment
Om de temperatuur set-point aan te passen, gelieve de Gr.C. knop aan de voorkant van het apparaat te draaien naar de gewenste temperatuur.

Digital Controller Temperature Adjustment
Om de temperatuur set-point aan te duiden, houdt u de “DISPLAY” knop ingedrukt. Om de temperatuur set-point aan te passen, houdt u de “DISPLAY” knop ingedrukt en draait u de “AD-JUST” knop totdat de gewenste temperatuur set-point af te lezen is van de display. Als de set-point is aangepast, kunt u de “DISPLAY” knop loslaten. De display zal nu de temperatuur weergeven van de vloeistof in het reservoir.

Flow Control
Met de RECIRCULATING FLOW CONTROL kunt u het debiet van uw applicatie regelen. De “+” positie geeft u een volledig debiet, de “-” positie geeft geen debiet.

Periodiek Onderhoud
De vloeistof in het reservoir dient regelmatig gecontroleerd te worden. Indien reiniging noodzakelijk is, zal het reservoir schoongespoeld moeten worden met een vloeistof, welke gelijk is aan het circulatiesysteem en de koelvloeistof.

De koelvloeistof dient perdiodiek vervangen te worden. Wanneer u werkt met lage temperaturen, zal de concentratie van het water in de koelvloeistof gedurende die tijd toenemen, wat verlies van koelcapaciteit tot gevolg kan hebben.

Periodiek luchtvrij maken van de condensor is noodzakelijk. Het aantal malen dat dit moet gebeuren hangt af van de omgeving waar het apparaat staat opgesteld en gebruikt wordt. Wij raden een algemene maandelijkse inspektie van de condensor na de installatie aan. Na enkele maanden zal duidelijk zijn hoe vaak men het apparaat moet reinigen.

Apparaten met PD en TU pompen hebben een afvoer. Indien vuil aanwezig is in het systeem, zal de afvoer ervoor zorgen dat het materiaal niet in de pomp terecht komt en daardoor de pompleidingen niet beschadigd.

Nadat het apparaat geinstalleerd is, zou de afvoer verstopt kunnen raken. De afvoer zal in de eerste week na de installatie schoongemaakt moeten worden. Nadat dit gebeurd is, is een maandelijkse inspektie aan te raden. Na enkele maanden zal duidelijk zijn hoe vaak men de afvoer moet reinigen.

Alvorens de afvoer te reinigen, gelieve het apparaat uit te schakelen en het reservoir te ledigen.

Kortfattad Bruksanvisning för Vattenkyld HX-serie

Installation
Ställ maskinen i en ren miljö med lätt tillgång till kylningsvatten och ett vattenavlopp. Kylningsvattnet måste möta de krav som är specifierade i instruktionerna annars minskas maskinens prestations förmåga.

Försäkra att spänningen är den samma som den som är given i instruktionerna ±10%.

Röranslutningarna finns på baksidan av maskinen och är märkta “TAP WATER, DRAIN SUPPLY/ RETURN”. Ta bort de skyddande plast bitarna. Anslut “TAP WATER” inpassningen till byggnads vattnet och “DRAIN” inpassningen till avloppet. Anslut “SUPPLY” inpassningen till insläppet av din anordning och “RETURN” inpassningen till utsläppet av din anordning.

För att fylla tanken, öppna luckan på den bakre vänstra delen av toppen på maskinen och lösgör skruvarna som håller den undre luckan på plats. Fyll tanken tills 2,5 cm återstår. Var beredd att fylla på om din anordning kräver extra vätska.

Vanligt kran vatten är den rekommenderade vätskan vid en temperatur mellan +8°C och +80°C. Under +8°C måste en vätska som inte fryser användas. En blandning av vanligt vatten och etylenglykol (laboratorie kvalitet) föreslås.

Användning
Innan maskinen startas, kontrollera alla elektriska och alla rör anslutningar. Se till att cirkulations systemen har fyllts med vätska.

Var säker på att byggnads vattnet är påsatt.

På alla modeller från HX-200 till HX-750 måste maskinen vara kopplad till energikällan minst 12 timmar innan användning så att oljan tillåts att värmas upp och separera från köldmedlet.

Sätt start knappen på ON för att starta maskinen. COOL och IDLE på framsidan visar statusen på kylningssystemet. Cool lyser när värme tas bort från köldmedlet. Heat är på när “the hot gas bypass mode” används. När temperaturen närmar sig den förbestämda önskade temperaturen kommer de två att växla.

Vänta 5 minuter innan maskinen sätts på igen efter att ha varit avstängd för att låta kylningstrycken att utjämnas. Ingen kylning kommer att utföras om inte trycken tillåts att utjämnas.

Analog Kontroll, Temperatur Ändring
För att ändra den önskade förbestämda temperaturen, vrid °C knappen på framsidan av maskinen tills den önskade temperaturen är nådd.

Digital Kontroll, Temperatur Ändring
Håll Display knappen intryckt för att visa den önskade temperaturen. Håll Display knappen intryckt och vrid Adjust knappen för att ändra den önskade temperaturen. Släpp Display knappen efter att den önskade temperaturen visas på kontroll panelen. Temperaturen på vätskan i tanken visas nu på kontroll panelen.

Flödeskontroll
“RECIRCULATING FLOW CONTROL” handtaget kontrollerar flödet till din anordning. i “+” positionen får man fullt flöde, “-” positionen innebär inget flöde.

Periodiskt Underhåll
Inspektera vätskan i tanken periodiskt. Om rengöring är nödvändigt, spola tanken med en rengörings vätska som är förenlig med cirkulationssystemet och kylvätskan.

Kylvätskan bör bytas periodvis. När enheten används vid låga temperaturer kommer vätskans koncentration av vatten att öka vilket leder till en minskad kylningskapacitet.

Periodisk rengöring av kondensorn är nödvändig. Hur ofta rengöring är nödvändig beror på miljön. Vi rekommenderar en visuell inspektion av kondensorn varje månad efter installation. Efter flera månader kan det avgöras hur ofta kondensorn måste rengöras i framtiden.

Maskiner med PD och TU pumpar har ett filter. Filtret måste rengöras efter en veckas användning. Efter första rengöringen bör filtret inspekteras varje månad. Efter flera månader kan det avgöras hur ofta filtret måsta rengöras.

Drag ur kontakten och töm tanken innan filtret rengörs.

Kortfattad Bruksanvisning för Luft Kyld HX-serie

Installation
Ställ maskinen så att luft intaget och uttaget inte är blockerade. Otillräcklig ventilation leder till minskad kylningskapacitet och vid vissa tillfällen kan kompressorn gå sönder.

Undvik dammiga områden och rengör maskinen periodvis. För att fungera ordentligt måste mycket luft passera genom kondensorn. Damm och smuts i kondensorn leder till minskad kylnings kapacitet.

Maskinen har full kylningskapacitet upp till en temperatur av +75°F (24°C).

Försäkra att spänningen är den samma som den som är given i instruktionerna ±10%.

För att fylla tanken, öppna luckan på den bakre vänstra delen av toppen på maskinen och lösgör skruvarna som håller den undre luckan på plats. Fyll tanken tills 2,5 cm återstår. Var beredd att fylla på om din anordning kräver extra vätska.

Innan maskinen startas, kontrollera alla elektriska och alla rör anslutningar. Se till att cirkulations systemen har fyllts med vätska.

Användning
Innan maskinen startas, kontrollera alla elektriska och alla rör anslutningar. Se till att cirkulations systemen har fyllts med vätska.

Var säker på att byggnads vattnet är påsatt.

På alla modeller från HX-200 till HX-750 måste maskinen vara kopplad till energikällan minst 12 timmar innan användning så att oljan tillåts att värmas upp och separera från köldmedlet.

Sätt start knappen på ON för att starta maskinen. COOL och IDLE på framsidan visar statusen på kylningssystemet. Cool lyser när värme tas bort från köldmedlet. Heat är på när “the hot gas bypass mode” används. När temperaturen närmar sig den förbestämda temperaturen kommer de två att växla.

Vänta 5 minuter after att maskinen stängts av innan den sätts på igen för att låta kylningstrycken att utjämnas. Ingen kylning kommer att utföras om inte trycken tillåts att utjämnas.

Analog Kontroll, Temperatur Ändring
För att ändra den önskade förbestämda temperaturen, vrid °C knappen på framsidan av maskinen tills den önskade temperaturen är nådd.

Digital Kontroll, Temperatur Ändring
Håll Display knappen intryckt för att visa den önskade temperaturen. Håll Display knappen intryckt och vrid Adjust knappen för att ändra den önskade temperaturen. Släpp Display knappen efter att den önskade temperaturen visas på kontroll panelen. Temperaturen på vätskan i tanken visas nu på kontroll panelen.

Flödeskontroll
“RECIRCULATING FLOW CONTROL” handtaget kontrollerar flödet till din anordning. i “+” positionen får man fullt flöde, “-” positionen innebär inget flöde.

Periodiskt Underhåll
Inspektera vätskan i tanken periodiskt. Om rengöring är nödvändigt, spola tanken med en rengörings vätska som är förenlig med cirkulationssystemet och kylvätskan.

Kylvätskan bör bytas periodvis. När enheten används vid låga temperaturer kommer vätskans koncentration av vatten att öka vilket leder till en minskad kylningskapacitet.

Periodisk rengöring av kondensorn är nödvändig. Hur ofta rengöring är nödvändig beror på miljön. Vi rekommenderar en visuell inspektion av kondensorn varje månad efter installation. Efter flera månader kan det avgöras hur ofta kondensorn måste rengöras i framtiden.

Maskiner med PD och TU pumpar har ett filter. Filtret måste rengöras efter en veckas användning. Efter första rengöringen bör filtret inspekteras varje månad. Efter flera månader kan det avgöras hur ofta filtret måsta rengöras.

Innan filtret rengörs, drag ur kontakten och töm tanken.

NOTICE D'UTILISATION
REFROIDISSEURS TYPE HX VERSION *AIR*

NINSTALLATION
Ces appareils ont un système de réfrigération refroidi par air. L'air est aspiré sur le devant et rejeté à l'arrière et sur les côtés

Positionner l'appareil afin que l'admission et l'émission ne soient pas obstruées. Une ventilation insuffisante serait la cause d'une réduction de la capacité de refroidissement, voire, d'une défaillance du compresseur.

Dans une zone excessivement poussièreuse, le nettoyage périodique est recommandé. En mode de fonctionnement, l'appareil aspire de l'air à travers le condenseur. De la poussière et des particules sur la grille atténueraient sa capacité de refroidissement.

L'appareil conserve sa pleine puissance de refroidissement sur une plage de température allant de l'ambiante à + 24°C.

S'assurer que l'alimentation électrique soit celle requise à ±10%.

Les connections, d'un diamètre 0.75 pouce FPT, sont situées à l'arrière de l'appareil et sont référencées " SUPPLY " et " RETURN ".. Retirer les embouts plastiques. Connecter le tuyau enfiché sur " SUPPLY " vers l'entrée de l'équipement et celui sur " RETURN " vers la sortie.

Pour remplir le réservoir, ôter la tape à l'aide des deux vis. Dévisser le bouchon et remplir le réservoir avec un liquide approprié. L'eau du robinet est recommandée pour un fonctionnement entre + 8 °C et + 30°C; à une température inférieure, mieux vaut rajouter du glycol-éthylène.

MISE EN ROUTE
Vérifier les connections électriques, les tuyaux d'eau et le niveau de remplissage du liquide. Sur les modèles HX 200 à HX 750, il faut alimenter l'appareil 12 heures avant pour chauffer et séparer l'huile du refrigérant.

Mettre en route en appuyant sur " ON ". Un voyant s'allume qui indique que l'appareil est en fonctionnement. Pour l'éteindre, appuyer sur " OFF ".

Les voyants LED " Cool " et " IDLE " indiquent le mode de fonctionnement du système de réfrigération. " Cool " est allumé quand l'appareil évacue la chaleur du fluide, " HEAT " est allumé quand l'appareil est en mode de " By-pass ". Quand la température obtenue approche de la température souhaitée, le voyant s'allume et s'éteint.

Après avoir éteint l'appareil, attendre environ cinq minutes avant de le rallumer, pour un bon équilibrage des pressions.Autrement, le cycle au niveau du compresseur serait trop bref et le refroidissement n'aurait pas lieu.

REGLAGE DU CONTROLEUR DE TEMPERATURE ANALOGIQUE
Tourner le potentiomètre situé à l'avant jusqu'à ce que la température désirée coïncide avec la graduation.

REGLAGE DU CONTROLEUR DE TEMPERATURE NUMERIQUE
Pour afficher la température souhaitée, maintenir appuyé l'interrupteur et tourner le bouton de réglage jusqu'à ce que la température souhaitée soit affichée. Relâcher ensuite l'interrupteur. L'affichage indique alors la température du fluide dans le réservoir.

CONTROLEUR DE DEBIT
La poignée " Recirculating Flow conrol " règle le débit de recirculation. En position " + ", votre application reçoit un débit maximum; en position " - ", il n'y a plus de débit.

MAINTENANCE PREVENTIVE
Vérifier régulièrement le niveau du réservoir,

Changer de temps à autre le liquide utilisé,

En cas de nettoyage, rincer avec un produit de lavage compatible,

Aux basses températures, la concentration en eau a tendance à augmenter ce qui peut générer une perte de puissance de refroidissement,

Avant de changer de liquide, recirculer à une température plus élevée pour réchauffer le serpentin,

Nettoyer régulièrement selon les conditions de travail la grille d'aspiration. Nous recommandons d'effectuer la première inspection du condenseur un mois après l'installation,

Les modèles fonctionnant avec des pompes type PD ou TU sont équipés d'un filtre qui retient les impuretés. Il est recommandé de nettoyer ce filtre après la première semaine et, ensuite, une fois par mois. Ce nettoyage s'effectue après avoir débranché l'appareil et vidangé le réservoir

NOTICE D'UTILISATION
REFROIDISSEURS TYPE HX VERSION EAU

INSTALLATION
Installer l'appareil dans un environnement propre avec un accès facile à une arrivée d'eau. Cette source d'eau doit correspondre à ce qui est spécifié dans la notice pour ne pas altérer les performances de l'équipement. Une source non conforme pourrait causer une surchauffe du compresseur et un arrêt de l'appareil.

S'assurer que la tension électrique soit celle requise à ±10 %.

Les connections sont situées à l'arrière et référencées :
" TAP WATER "
" DRAIN "
" SUPPLY "
" RETURN "

Retirer les embouts plastique. Connecter le " Tap water " vers l'arrivée d'eau ; le " Drain " au robinet; " Supply " vers l'entrée de votre application et le " Return " à la sortie.

Utiliser un fluide antigel dont la viscosité doit être inférieure à 50 centistokes à la température la plus basse.

Pour remplir le réservoir, ouvrir la tape en haut à gauche et retirer le couvercle en dévissant. Remplir jusqu'à 1 " pouce " du sommet (niveau). Si le volume total à refroidir est important, il convient d'avoir une réserve de fluide immédiatement disponible sous la main pour ne pas désamorcer la pompe.

MISE EN ROUTE
Vérifier les connections électriques, les tuyaux d'eau et le niveau de remplissage du liquide. Sur les modèles HX 200 à HX 750, il faut alimenter l'appareil 12 heures avant pour chauffer et séparer l'huile du refrigérant.

Mettre en route en appuyant sur " ON ". Un voyant s'allume qui indique que l'appareil est en fonctionnement. Pour l'éteindre, appuyer sur " OFF ".

Les voyants LED " Cool " et " IDLE " indiquent le mode de fonctionnement du système de réfrigération. " Cool " est allumé quand l'appareil évacue la chaleur du fluide, " HEAT " est allumé quand l'appareil est en mode de " By-pass ". Quand la température obtenue approche de la température souhaitée, le voyant s'allume et s'éteint.

Après avoir éteint l'appareil, attendre environ cinq minutes avant de le rallumer, pour un bon équilibrage des pressions.Autrement, le cycle au niveau du compresseur serait trop bref et le refroidissement n'aurait pas lieu.

REGLAGE DU CONTROLEUR DE TEMPERATURE ANALOGIQUE
Tourner le potentiomètre situé à l'avant jusqu'à ce que la température désirée coïncide avec la graduation.

REGLAGE DU CONTROLEUR DE TEMPERATURE NUMERIQUE
Pour afficher la température souhaitée, maintenir appuyé l'interrupteur et tourner le bouton de réglage jusqu'à ce que la température souhaitée soit affichée. Relâcher ensuite l'interrupteur. L'affichage indique alors la température du fluide dans le réservoir.

CONTROLEUR DE DEBIT
La poignée " Recirculating flow control " règle le débit de recirculation. En position " + ", votre application reçoit un débit maximum; en position " - ", il n'y a plus de débit.

MAINTENANCE PREVENTIVE
Changer de temps à autre le liquide utilisé,

Aux basses températures, la concentration en eau a tendance à augmenter ce qui peut générer une perte de puissance de refroidissement,

Avant de changer de liquide, recirculer à une température plus élevée pour réchauffer le serpentin,

Nettoyer régulièrement selon les conditions de travail la grille d'aspiration. Nous recommandons d'effectuer la première inspection du condenseur un mois après l'installation,

Les modèles fonctionnant avec des pompes type PD ou TU sont équipés d'un filtre qui retient les impuretés. Il est recommandé de nettoyer ce filtre après la première semaine et, ensuite, une fois par mois. Ce nettoyage s'effectue après avoir débranché l'appareil et vidangé le réservoir

PROCEDIMIENTOS DE OPERACION DE REFERENCIA RAPIDA PARA LA SERIE HX REFRIGERADA POR AGUA

INSTALACION
Sitúe la unidad en un entorno limpio con fácil acceso a la instalación de agua de enfriamiento y un desagüe. Los requerimientos de la instalación de agua deben adaptarse a las especificadas en el manual de instrucciones o el funcionamiento de la unidad se verá mermado. Un suministro de agua inadecuado podría causar que el compresor se sobrecalentara y se apagara la unidad.

Asegúrese de que el voltaje de la fuente de energía sea igual que el voltaje especificado, ±10%.

Las conexiones de tuberías están situadas en la parte trasera de la unidad y están marcadas como TAP WATER, DRAIN, SUPPLY y RETURN. Saque los protectores de plástico de todas las conexiones de tuberías. Conecte el adaptador TAP WATER a la instalación de agua de enfriamiento y el adaptador DRAIN a un desagüe. Conecte el adaptador SUPPLY a la entrada de su aplicación y el adaptador RETURN a la salida de su aplicación.

Para llenar el reservorio, abra el panel de acceso situado en la esquina trasera izquierda del tope de la caja y saque la tapa del reservorio desatornillando los tornillos. Llene el reservorio hasta una pulgada del tope. Si la capacidad de fluido de su aplicación y las lineas de recirculación son significativas, tenga fluido extra a mano.

Se recomienda el agua corriente como fluido para operar desde +8 ºC hasta +80 ºC. Por debajo de +8 ºC, debe utilizarse un fluido no congelador. Sugerimos una mezcla de agua corriente y etileno glicol de grado laboratorio.

OPERACION
Antes de poner en marcha la unidad, compruebe todas las conexiones eléctricas y de tuberías. Asegúrese de que el sistema circulador se ha llenado con fluido refrigerante.

En los modelos HX-200 hasta HX-750, la unidad debe conectarse a la red de energía durante al menos 12 horas para permitir que el aceite se caliente y se separe del refrigerante.

Para poner en marcha la unidad, ponga el interruptor de encendido en posición ON. Los LED Cool y Idle del panel frontal indican la situación del sistema de refrigeración. Cool está en marcha cuando la unidad está eliminando calor del fluido de enfriamiento. Heat está en marcha cuando la unidad está en el modo by-pass gas caliente. A medida que la temperatura de funcionamiento se aproxima al punto fijado, el LED ciclará.

Cuando se apaga la unidad, espere aproximadamente cinco minutos antes de volver a ponerla en marcha para permitir que las presiones de refrigeración se ecualicen. Si no se permite ecualizarse las presiones, el compresor se cortocicuitará y no enfriará.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR ANALOGICO
Para fijar el punto de ajuste de la temperatura, gire el dial ºC situado en el frontal de la unidad hasta la temperatura deseada.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR DIGITAL
Para que el punto de ajuste de temperatura aparezca en pantalla, mantenga presionado el interruptor DISPLAY. Para fijar el punto de ajuste de temperatura, mantenga presionado el interruptor DISPLAY y gire el botón ADJUST hasta que la pantalla digital indique el punto de ajuste de temperatura deseado. Una vez fijado el punto de ajuste, suelte el interruptor DISPLAY. La pantalla indicará la temperatura del fluido en el reservorio.

CONTROL DE FLUJO
El mango RECIRCULATING FLOW CONTROL controla la escala de flujo a su aplicación. En la posición + recibirá flujo completo, en la posición - no hay flujo.

MANTENIMIENTO PERIODICO

Inspeccione periódicamente el fluido del reservorio. Si es necesaria una limpieza, rocíe el reservorio con un fluido de limpieza compatible con el sistema de circulación y el fluido refrigerante.

El fluido refrigerante debe sustituirse periódicamente. Cuando se funciona a baja temperatura, la concentración de agua en el fluido refrigerante aumentará con el tiempo, ocasionando una pérdida de capacidad refrigerante.

Es necesario un vaciado periódico de las aletas del condensador. La frecuencia de limpieza depende del entorno en que funciona el aparato. Recomendamos una inspección visual mensual del condensador después de la instalación inicial. Después de varios meses, quedará establecida la frecuencia de limpieza.

Las unidades con bombas PD y TU tienen un filtro. Si hay residuos en el sistema, el filtro prevendrá que el material entre en la bomba y dañe las paletas de la bomba.

Después de la instalación inicial, el filtro puede bloquearse. El filtro debe limpiarse después de la primera semana de la instalación. Después de esta primera limpieza, se recomienda una inspección visual mensual. Después de varios meses, se establecerá la frecuencia de limpieza.

Antes de limpiar el filtro, desenchufe el aparato y vacíe el reservorio.

PROCEDIMIENTOS DE OPERACION DE REFERENCIA RAPIDA PARA LA SERIE HX REFRIGERADA POR AIRE

INSTALACION
Sitúe la unidad para no impedir la entrada y descarga. Una ventilación inadecuada causará una reducción en la capacidad de enfriamiento y, en casos extremos, un fallo en el compresor.

Deben evitarse las zonas excesivamente polvorientas y debe instituirse un calendario de limpiezas periódicas. Para un funcionamiento adecuado, la unidad necesita empujar una cantidad sustancial de aire a través de un condensador. Un cúmulo de polvo o residuos en las aletas del condensador ocasionaría una pérdida de capacidad de enfriamiento.

La unidad retendrá su capacidad completa en temperaturas ambiente de hasta aproximadamente + 75 ºF.

Asegúrese de que el voltaje de la fuente de energía sea igual que el voltaje especificado, ±10%.

Las conexiones de tuberías están situadas en la parte trasera de la unidad y están marcadas como SUPPLY y RETURN. Estas conexiones son 3/4" FPT. Saque los protectores de plástico de ambas conexiones de tuberías. Conecte el adaptador SUPPLY en la entrada de su aplicación. Conecte el adaptador RETURN a la salida de su aplicación.

Para llenar el reservorio, abra el panel de acceso situado en la esquina trasera izquierda del tope de la caja y saque la tapa del reservorio desatornillando los tornillos. Llene el reservorio hasta una pulgada del tope. Si la capacidad de fluido de su aplicación y las lineas de recirculación son significativas, tenga fluido extra a mano.

Se recomienda el agua corriente como fluido para operar desde +8 ºC hasta +80 ºC. Por debajo de +8 ºC, debe utilizarse un fluido no congelador. Sugerimos una mezcla de agua corriente y etileno glicol de grado laboratorio.

OPERACION
Antes de poner en marcha la unidad, compruebe todas las conexiones eléctricas y de tuberías. Asegúrese de que el sistema circulador se ha llenado con fluido refrigerante.

En los modelos HX-200 hasta HX-750, la unidad debe conectarse a la red de energía durante al menos 12 horas para permitir que el aceite se caliente y se separe del refrigerante.

Para poner en marcha la unidad, ponga el interruptor de encendido en posición ON. Los LED Cool y Idle del panel frontal indican la situación del sistema de refrigeración. Cool está en marcha cuando la unidad está eliminando calor del fluido de enfriamiento. Heat está en marcha cuando la unidad está en el modo by-pass gas caliente. A medida que la temperatura de funcionamiento se aproxima al punto fijado, el LED ciclará.

Cuando se apaga la unidad, espere aproximadamente cinco minutos antes de volver a ponerla en marcha para permitir que las presiones de refrigeración se ecualicen. Si no se permite ecualizarse las presiones, el compresor se cortocicuitará y no enfriará.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR ANALOGICO
Para fijar el punto de ajuste de la temperatura, gire el dial ºC situado en el frontal de la unidad hasta la temperatura deseada.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR DIGITAL
Para que el punto de ajuste de temperatura aparezca en pantalla, mantenga presionado el interruptor DISPLAY. Para fijar el punto de ajuste de temperatura, mantenga presionado el interruptor DISPLAY y gire el botón ADJUST hasta que la pantalla digital indique el punto de ajuste de temperatura deseado. Una vez fijado el punto de ajuste, suelte el interruptor DISPLAY. La pantalla indicará la temperatura del fluido en el reservorio.

CONTROL DE FLUJO
El mango RECIRCULATING FLOW CONTROL controla la escala de flujo a su aplicación. En la posición + recibirá flujo completo, en la posición - no hay flujo.

MANTENIMIENTO PERIODICO
Inspeccione periódicamente el fluido del reservorio. Si es necesaria una limpieza, rocíe el reservorio con un fluido de limpieza compatible con el sistema de circulación y el fluido refrigerante.

El fluido refrigerante debe sustituirse periódicamente. Cuando se funciona a baja temperatura, la concentración de agua en el fluido refrigerante aumentará con el tiempo, ocasionando una pérdida de capacidad refrigerante.

Es necesario un vaciado periódico de las aletas del condensador. La frecuencia de limpieza depende del entorno en que funciona el aparato. Recomendamos una inspección visual mensual del condensador después de la instalación inicial. Después de varios meses, quedará establecida la frecuencia de limpieza.

Las unidades con bombas PD y TU tienen un filtro. Si hay residuos en el sistema, el filtro prevendrá que el material entre en la bomba y dañe las paletas de la bomba.

APPENDIX B 380V WYE MODIFICATION.

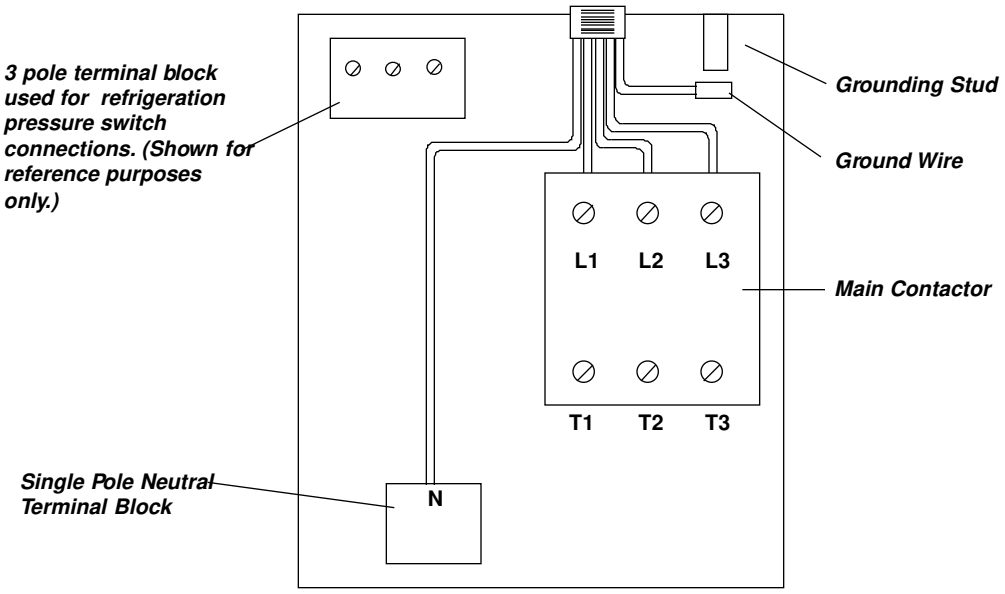
Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit.

For personal safety and equipment reliability, the following procedure should only be performed by a qualified service technician familiar with the safety precautions required for working inside an energized disconnect box.

Electrical connections are made in the electrical enclosure at the rear of the unit. Remove one of the “knock-outs” from the wall of the enclosure and install a conduit connector. Connect the line cord to the main contactor terminals labelled L1, L2, and L3. Connect the neutral wire (N) to the single pole terminal block labelled N. Connect the ground wire (G) to the grounding stud.

NOTE: Not all units require a neutral connector. Refer to the unit's serial number label on the rear of the unit and to your facility power source availability. Units not requiring a neutral connector use the same connection procedures except there will be no neutral wire or single pole terminal block.

NOTE: The HX-750 380/480V model contains a three phase condenser fan motor. It is possible to misconnect the main power and have the motor turn in the wrong direction resulting in incorrect airflow over the condenser. Proper airflow is achieved by exchanging any two main power connectors.



WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

PREFACE
Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. This label indicates testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, or the information in this manual, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label on the rear of the control box to obtain the following information (see Section II, Description):

-unit part number _____

-unit serial number _____

Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department (see After-sale Support).

Installation, operation, or maintenance of the unit other than described in this manual may result in a hazardous situation.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Do not attempt to defeat any of the interlock switches or safety features built into the unit.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the reservoir.

Make sure the unit is off before connecting or disconnecting the power cord or other cables.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Empty the reservoir before moving the unit.

Never operate any of your equipment with damaged power cords.

Refer all service and repairs of your unit to a qualified technician.

In addition to these safety warnings, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

General Information

Description

The HX Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and volume.

The unit consists of a water-cooled or air-cooled refrigeration system, a fluid reservoir, a fluid recirculation pump, and a temperature controller.

Throughout the manual, you will be asked to consult the unit's serial number label, or the pump identification label, or both, for specific information. Both labels are located on the rear of the unit.

Specifications

Temperature Range	+5°C to +35°C
Temperature Stability	±1.0°C
Cooling Capacity[1]	38,000 Watts
Pumping Capacity	35 gpm @ 45 psi
Air-Cooled Unit Dimensions	
(H x W x D)	
Inches	63¾ x 46 x 29
Centimeters	162.0 x 116.8 x 73.6
Water-Cooled Unit Dimensions	
(H x W x D)	
Inches	50⅝ x 46 x 28¾
Centimeters	128.3 x 116.8 x 73.0
Reservoir Volume	
Gallons	15.0
Liters	57.0
Weight	
Pounds	1250
Kilograms	567

1. Circulating water at 25°C, at 20°C ambient. 31,500 watts for 50HZ units.

Cooling Capacity

The unit will retain its full rated capacity in ambient temperatures to approximately +75°F (+24°C). Above +75°F, reduce the cooling capacity 1% for every 1°F above +75°F, to a maximum ambient temperature of +95°F. In degrees Celsius, reduce the cooling capacity 1% for every 0.5°C above +24°C, to a maximum ambient of +35°C.

Cooling capacity varies depending on fluid temperature, ambient temperature, and cooling fluid.

Installation

Site (Air-cooled Units)

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +55°F to +95°F (+13°C to +35°C).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

Positioned the unit so the air intake and discharge is not impeded.

Air is drawn through the front of the unit and discharged through the sides and rear. A minimum clearance of 2 feet (0.6 meter) on these three sides is necessary for adequate ventilation.

The minimum air flow requirement is 5600 cubic feet per minute.

In some applications where space is at a premium, the minimum ventilation clearance can be compromised. However, consult our Sales Department before positioning the unit in a location with less minimum clearance than listed above. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section VII, Condenser Cleaning).

Site (Water-Cooled Units)

The unit should be located in a laboratory or clean industrial environment with easy access to a facility cooling water supply and a drain.

All units are equipped with casters for easy movement. This allows the unit to be placed in a small area, as long as there is ample space for the unit to be moved for access on all four sides. A minimum clearance of 3 feet (1 meter) on two adjacent sides is recommended.

The facility cooling water supply must meet or exceed the flow rate requirements listed in the following table for the unit to operate at its full rated capacity. If the facility cooling water does not meet these standards, the cooling capacity will be reduced.

Temp	**13°C**	**18°C**	**24°C**	**29°C**
Flow Rate				
GPM	11	15	23.5	32

If the unit is being used with a building water supply, the back pressure of the drain must be less than the supply pressure.

A water regulating valve, located in the TAP WATER line, regulates the flow rate of the cooling water supply as it enters the unit. The valve regulates the flow rate based on the heat load. Flow through the unit stops automatically when the unit is shut off.

Electrical Requirements

The construction of this unit provides protection against the risk of electric shock by grounding appropriate metal parts. The protection may not function unless the power cord is connected to a properly grounded outlet. A proper ground connection must be provided.

Make sure the voltage of the power source agrees with the unit's voltage and frequency rating. The unit is designed to tolerate deviations of ±10% from the rated line voltage.

Volts	208	380/420
Hertz	60	50
Phase	3	3

Plumbing Requirements

Before installing the unit to an instrument that previously used tap water as a fluid, flush the instrument several times to remove any rust or scale that has built up.

The plumbing fittings used to connect your HX to your application are located on the right side of the unit (labelled SUPPLY and RETURN). These connections are one inch FPT.

Remove the plastic protective plugs from the SUPPLY and RETURN connections. Connect the SUPPLY fitting to the inlet of your application. Connect the RETURN fitting to the outlet of your application.

The RESERVOIR DRAIN connection, located on the rear of the unit, is a 1/2 inch FPT fitting connected internally to the unit reservoir. This fitting provides a means for draining the reservoir. The unit is shipped with a plug installed in this fitting. To drain the reservoir remove the plug and place the drain valve to the vertical position.

If the unit is “hard plumbed” to your application or, for water-cooled units, to the cooling water supply, damage can occur if the unit is bumped or jolted from its site. Provisions should be made to prevent the unit from being moved after installation. Once the unit is plumbed, secure the locking castors on the unit’s base. If the unit is located in a heavy traffic area where there is a possibility of collision, it may be necessary to secure the unit to the site using blocks or mounting brackets.

Flexible tubing, if used, should be of heavy wall or reinforced construction. All tubing should be rated to withstand 110 psi at +100°C. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, they should be made at the inlet and outlet of your application, not at the HX water chiller.

If substantial lengths of cooling lines are required, they should be pre-filled with fluid before connecting them to the unit.

For water-cooled units, the plumbing connections used to connect the condenser in the HX to the facility cooling water supply are located at the rear of the unit (labelled TAP WATER and DRAIN). These fittings are one inch FPT.

Remove the plastic protective plugs from the TAP WATER and DRAIN connections. Connect the TAP WATER fitting to the facility cooling water supply. Connect the DRAIN fitting to a drain.

Fluids

The selected cooling fluid must have a viscosity of 50 centistokes or less at the lowest operating temperatures.

Your unit is equipped with plate heat exchangers, do not use 100% pure water as a recirculating fluid. Due to the physical nature of a plate heat exchanger, and its response to temperature changes, using 100% water may cause the plate exchanger to rupture.

Never use flammable or corrosive fluids with the unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting the unit to prolonged exposure to distilled or deionized water.

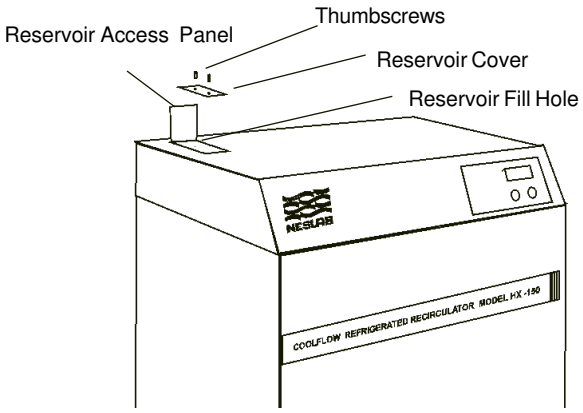
Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seal. Use of automobile anti-freeze will void the manufacturer's warranty.

Filling Requirements

Open the reservoir access panel on the top of the unit. Loosen the thumbscrews and remove the reservoir cover.

Fill the reservoir with fluid to within 1inch of the top.

The fluid capacity of the hose connections and the application may be significant. To prevent lowering of the fluid level in the reservoir below the operating level, have extra fluid on hand to keep the reservoir filled to within 1 inch of the top.



Automatic Refill Device (Optional)

The automatic refill device is designed to maintain the correct level of cooling fluid in the reservoir. The device consists of a float switch in the reservoir and a solenoid valve on top of the reservoir. If the cooling fluid level falls, the float switch will drop, opening the solenoid valve and allowing make-up fluid to fill the reservoir. Once the cooling fluid level reaches the proper level, the float switch will rise and the solenoid valve will close.

The plumbing connection for the refill device is located at the rear corner of the unit and is labelled AUTO REFILL. This connection is a $^{3}/_{8}$ inch OD stainless steel barbed fitting.

Connect this fitting to a make-up fluid source using $^{5}/_{16}$ or $^{3}/_{8}$ inch ID flexible tubing. Make sure all tubing connections are securely clamped.

Tubing is available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

A 50/50 mixture of ethylene glycol and water is required to prevent damage to the plate heat exchanger. When using the refill device, ensure the proper mixture is maintained.

Operation

Temperature Controller

Start Up

The unit has a compressor crankcase heater which warms the oil in the compessor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

Before starting the unit, double check all electrical and plumbing connections and make sure the circulating system (the HX, the instrument being cooled, and the circulating lines) has been properly filled with cooling fluid.

For water-cooled units ensure that the facility water is turned on.

To start the unit place the ON/OFF POWER switch to the ON position and press the START switch. (Some units are not equipped with START switches, see Interlocks—Fault Response paragraph on this page.)

To stop the unit place the ON/OFF switch to the OFF position.

When the unit is shut off, wait approximately 5 minutes before restarting.This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Temperature Adjustment

The COOL and IDLE indicators, located on the control panel, indicate the status of the refrigeration system. The IDLE indicator is lit when the unit is in the hot gas by-pass mode. The COOL indicator is lit when the refrigeration system is removing heat from the cooling fluid. As the fluid temperature approaches the temperature setpoint, the indicators cycle on and off to indicate the duty cycle of the system. The unit can be in the COOL or the IDLE mode, but never both at the same time. A balance between COOL and IDLE is needed to control temperature.

To display the temperature setpoint, press and hold the Setpoint/Actual Temp button. To adjust the setpoint, press and hold the Setpoint/Actual Temp button and turn the Adjust dial until the desired temperature setpoint is indicated on the Temp°C LED display. Once the setpoint is adjusted, release the Setpoint/Actual Temp button. The Temp°C LED display will indicate the temperature of the fluid in the reservoir.

NOTE: Inadvertent movement of the Adjust dial will result in a change in the setpoint. The change will not be immediately reflected on the Temp°C display unless the Setpoint/Actual Temp button is pressed. The display will eventually change as the unit responds to the new setpoint

Interlocks (Optional)

Options

The temperature controller has up to four monitoring options: low temperature, high temperature, low fluid level, and low flow. The controller can be built with any combination of these four monitors.

Fault Response

Controllers with a START switch are configured to shut off in the event that a fault occurs. Controllers NOT equipped with a START switch will allow the unit to continue to operate if a fault occurs. This option is available for customers who are willing to accept the risk of damage to the unit in order to continue to provide cooling fluid to the instrument being cooled.

With either controller configuration, the relay contacts connected to the controller receptacle will open and the FAULT indicator will light if a fault occurs. The cause of the fault must be identified and corrected before the unit can be restarted.

Temperature Monitors

The optional high and low temperature monitors are connected to sensors that monitor the temperature of the cooling fluid as it exits the reservoir. The monitors protect the system from exposure to excessively hot or cold cooling fluid. A temperature fault occurs when the fluid temperature exceeds the set temperature limit.

To adjust either temperature monitor, turn the appropriate calibrated dial tothe desired temperature limit.

Low Fluid Level Monitor

The low fluid level monitor is connected to a float switch in the reservoir. If the controller is equipped with a LOW LEVEL indicator, the low level monitor is not connected to the fault circuit. The indicator will light if the reservoir cooling fluid drops below the operating level. The indicator serves only as a warning. A fault will not occur as a result of a low level condition.

If the controller is NOT equipped with a LOW LEVEL indicator, the low level monitor is connected to the fault current. A fault will occur if the reservoir cooling fluid level drops below the operating level.

Low Flow Monitor

The optional low flow monitor is connected to a flow switch in the RETURN line. A low flow fault occurs when the flow rate of the returning cooling fluid drops below 0.3 gallons per minute (1.0 liters per minute).

When starting a unit with a controller equipped with both a low flow monitor and a START switch, the START switch must be held in the ON position until the flow switch “closes” (2 or 3 seconds). If time is not allowed for the flow switch to close, the unit will stop when the START switch is released.

Interlock Relay Contacts

A set of contacts are connected to a receptacle on the operator panel. The contacts are rated 15A, 125V. This is not a power inlet or outlet. The receptacle is isolated from the circuitry. Its ground pin is connected to the chassis. The contacts are normally open: they are closed when the unit is running normally (no faults present), and they are open when the unit is off or when a fault occurs.

Flow Control

The flow control handle is connected to a valve that controls the flow of the cooling fluid to your application. The handle is on the right side of the unit.

When the handle is in the OPEN position, the valve is open and all possible fluid is supplied to your application. When the handle is in the CLOSED position, the valve is closed and no fluid is supplied to your application. When the handle is between these two positions, the flow rate of the fluid is between full flow and no flow.

Never "crank" the valve wide open from the closed position.

Pressure Gauge

The RECIRCULATING PRESSURE gauge indicate the operating pressure of the system

Remote Condenser (Optional)

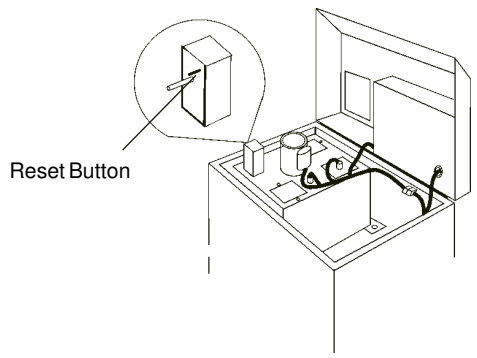
Units with the optional remote air-cooled condenser are equipped with high and low refrigeration pressure monitors. The monitors are connected internally to a pressure gauge that monitors refrigeration pressure at the suction side of the compressor. The monitors protect the refrigeration system from operating under excessively high and low refrigeration pressures. A pressure fault occurs when the refrigeration pressure exceeds the set pressure limit.

The status of the monitors is indicated by the COMPRESSOR LOW PRESSURE and COMPRESSOR HIGH PRESSURE indicators located on the operator panel.

In the event of either a low or high refrigeration pressure fault, the unit will shut down. The unit must be manually restarted after the cause of the fault has been identified and corrected. If both indicators are lit simultaneously, an interruption in the main power supply has occurred.

Heater Package (Optional)

The heater package option consists of an immersion heater in the unit's fluid reservoir, a high temperature limit device, a solid state zero-crossing relay, a heater ENABLE/DISABLE switch and a FAULT indicator. The ENABLE/DISABLE switch and the FAULT indicator are located on a small control box appended to the right side of the case top. The FAULT indicator will light if the high temperature limit device is tripped. The high temperature limit device will disconnect power to the heater if the heater surface temperature exceeds a preset limit.



High Temperature Limit Device

With the ENABLE/DISABLE switch set to ENABLE, the heater will cycle on and off under the control of the temperature controller. With the switch in the DISABLE position, the heater will remain off.

The heater high temperature limit device senses the surface temperature of the heater. If the heater temperature becomes too high, the limit device opens a mechanical relay to remove power from the heater.

The heater surface temperature may operate several degrees higher than the reservoir fluid. The limit device is factory set to a temperature above the upper limit of the temperature controller's range.

For personal safety and equipment reliability, the following procedure must only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

To reset a tripped temperature limit device, lift and open the case top. The case top is secured to the unit base by a hinge between the case top and the base (along the rear of the unit), and by two spring clips located at the front corners. To gain access to the temperature limit device, disengage the spring clips with a flat bladed screw driver and lift the front of the case top and tilt it back. A support brace, located on the right side of the inner case, will stop and support the case top.

You must identify and correct the fault before restarting the unit.

The protection device and the heater power connections are located in a small stainless steel box on top of the fluid reservoir. The protection device has a reset button and a temperature limit adjustment shaft. Press the reset button to restore operation. **NOTE:** On units without a reset button cycle the power switch.

Pump Motor Overload Protector

The overload protector prevents the pump motor from exposure to excessive current. If an overload fault occurs, due, for example, to excessive pressure or flow, or excessive ambient temperature, the overload protector will shut off the motor.

The overload protector automatically resets when the condition clears

Depending on your electrical configuation, the unit may continue to run if an overload fault occurs. To start the pump after the protector resets press the START switch on the controller.

High Pressure Cutout

For water-cooled units, should the refrigeration discharge pressure become too high the high pressure cutout will activate and shut down the unit. High pressures can be caused by a lack of cooling water to the compressor or debris in the refrigeration lines.

Locate the reset switch. Press in on the switch until a "click" is heard. If the reset does not "click" the cutout was not activated and the unit shut down occurred for another reason.

Maintenance & Service

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Condenser Cleaning (Air-cooled units only)

For proper operation, the unit needs to pull substantial amounts of air through a finned condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The frequency of cleaning depends on the operating environment. We recommend that a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Periodic vacuuming of the fins on the condenser is necessary.

Exercise caution not to damage the condenser fins or coil. Condenser fin or coil damage can result in a loss of performance and, in extreme cases, refrigeration system failure.

Algae

To restrict the growth of algae in the reservoir we recommend the reservoir cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, 1 gram per 3.5 liters.

Configuration

Case Top

The unit has a hinged case top to allow service access. The case top is secured to the top of the unit base by a hinge between the case top and base (along the rear of the unit), and by two spring clips located at the front corners. To gain access to the pump assembly or the reservoir area, disengage the spring clips with a flat bladed screw driver and lift the front of the top cover and tilt it back. A support brace, located on the right side of the inner base, will stop and support the case top. Ensure the spring clips engage when the top is lowered back into position.

Reservoir Cover

Access to the inside of the fluid reservoir is necessary to clean the reservoir.

Disconnect the unit from its power source before removing the reservoir cover.

Remove the stainless steel screws that secure the reservoir cover to the reservoir. Lift the cover high enough to ensure the sensors underneath it will clear and then carefully place the cover to the side.

Service Access Panels

Service panels on your unit allow easy access to the pump and refrigeration assemblies. The panels are designed to allow removal without disconnecting the HX from the instrument being cooled.

Disconnect the unit from its power source before removing any of the access panels.

Reservoir Cleaning

Periodic reservoir cleaning is necessary. It is recommended that a visual inspection of the reservoir be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Disconnect the unit from its power source and drain the reservoir before cleaning the reservoir.

Lift the top cover to access the reservoir. Remove the reservoir cover as described earlier in this section.

Clean the reservoir with a cleaning fluid compatible with the recirculating system and the cooling fluid.

Do not use steel wool or other abrasive materials. They can scratch the stainless steel surface and initiate rusting.

When the reservoir is clean, re-assemble the cover assembly and close the case top.

Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Pressure Relief Valve Adjustment

To adjust the operating pressure of your unit close the flow control handle. Locate the set screw above the pump motor. Turning the screw clockwise raises the pressure, turning it counter clockwise lowers the pressure.

Hoses

The unit's hoses should be inspected and tightened on a semi-annual basis.

Troubleshooting

Checklist

Unit will not start

Check power source for correct voltage output. Refer to the serial number label on the rear of the unit or rear of analog temperature controller for the specific electrical requirements of your unit. Power source must be specified voltage, ±10%.

Check house circuit breaker.

On water-cooled units, make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection. *Ensure the facility water is turned on.*

Also on water-cooled units, check the High Pressure Cutout, it may need to be reset (see Section V, Operation).

Unit will not circulate fluid

Check the tubing between the unit and your application for obstructions.

Inadequate temperature control

Make sure the installation of the unit is in compliance with the conditions described in Section III.

Make sure the heat load of the instrument being cooled is not greater than the cooling capacity of the unit.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Customer Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

- *unit part number*
- *unit serial number*
- *voltage of unit*
- *voltage of power source*

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

Recirculating Chillers

NESLAB chillers are world-renowned for their quality and reliability. For over 35 years, NESLAB has been the industry leader in innovation and dependability making our equipment the preferred chiller for the majority of companies world-wide. The use of hot gas bypass temperature control in a chiller, today's industry standard, was developed by NESLAB. Forward thinking concepts like this, along with superior performance, make NESLAB chillers the number one choice to cool your valuable equipment, improve your processes, and save on costly tap water usage.

Recirculating *Chillers*

Using a chiller for your water cooled equipment is a wise decision for many reasons. Your valuable equipment needs to operate at its maximum level of performance. Cooling with tap water, tower water, and building chilled water can prove unreliable or cause problems. Fluctuations in temperature, pressure, and flow, as well as minerals and particulates, can produce unreliable results and damage to your equipment. A NESLAB chiller will eliminate all of these problems and save you money. Running tap water through your equipment or process is very expensive. You pay twice for the use of water. Running 4 gallons of water, 24 hours per day, 7 days a week, 52 weeks per year can potentially send 2,000,000 gallons of water down the drain per year. As you can see, by recirculating, a NESLAB chiller can pay for itself in a very short time.

Deciding on which NESLAB chiller to use is simple. Use our easy to read charts on the following pages to determine which model best suits your needs. What is your heat load requirement? What temperature do you need to circulate? What is your flow and pressure need? Do you need a simple workhorse chiller or a highly sophisticated chiller? If you are not sure of your equipment's water cooling requirements or need advice on how to best utilize our chiller, call our Applications Engineers. We have extensive cross reference information on most equipment and the experience to advise you on which NESLAB chiller will meet your needs exactly.

NESLAB is the industry leader in chiller design and innovation. We were the first to use the hot gas bypass method of temperature control in a chiller. It is now considered the industry standard. Hot gas bypass works by routing the hot, uncondensed refrigerant back through the reservoir coil when heating is needed. This eliminates on/off cycling of compressors and the addition of energy-wasting heater. You get better temperature control, greater energy efficiency, and increased compressor life.

NESLAB also introduced the industry's first completely CFC-free portable chiller in our CFT Series. We feel a responsibility to use the most environmentally friendly refrigerants available. Our HX Series uses an HCFC refrigerant which is universally accepted as an environmentally friendly alternative to CFC's.

Which chiller series should you use?

CFT Series

Heat removal capabilities from 580 watts to 11,000 watts. Basic, simple, a dependable performer.

(Pages 33-34)

HX Series

Heat removal capabilities from 2000 watts to 75,000 watts. Many pumps, controllers, and hundreds of options available.

(Pages 35-42)

System Series

Complete, packaged, Water to Water Heat Exchangers with built-in pump and temperature controller.

(Pages 45-48)

Recirculating Chillers - CFT Series

As the original designer of the small portable chiller, NESLAB ntroduced the CFT Series to cool precise analytical equipment. t now cools virtually every water cooled application including lab- ratory, medical, semiconductor, industrial, and laser industries. This tried and true design has made the CFT Series the number one hoice among equipment manufacturers. The heart of the CFT Series is the CFC-free refrigeration system which provides long ife, maintenance free operation. All CFT Series chillers also fea- ure a rugged, sealed PVC reservoir. The sealed design minimizes luid evaporation and eliminates maintenance allowing you to focus n your work instead of the chiller. The sealed reservoir also llows circulation to an open container; something not possible with an unsealed reservoir, adding to the versatility of your CFT. n addition, the CFT Series incorporates a built-in fluid bypass system to protect the chiller in the event of an external line blockage. The standard digital microprocessor controller shows the recirculating temperature and the setpoint to a resolution of 1°C, and maintains the recirculating temperature to ±0.5°C of the setpoint. Should you be concerned about protecting your equipment or your CFT, we have included a user adjustable high and low temperature limit safety, displaying the error should the chiller reach one of these limits. If you have special cooling water requirements for your application, chances are we can meet your needs with one of the many options available. High and low temperature ranges, condenser air filter packages, deionized water packages and convenient accessories such as tubing and fluids make the CFT Series the perfect choice for your liquid temperature control needs.

Microprocessor Controller
Provides a readout and setpoint resolution of 1°C and maintains a stability of ±0.5°C

Compact Design
Maximizes use of limited floor space

Removable Condenser Vent
Quick, easy access to the condenser for routine cleaning. Also simplifies installation of our accessory air filter package

APPLICATIONS

- Condenser Cooling
- Diffusion Pumps
- Turbo-Molecular Pumps
- Vacuum Systems
- GC/MS
- Lasers
- Electron Microscopes
- ICP
- FTIR
- Plasma Etch Equipment
- Sputtering Systems
- AA Graphite Furnace
- Resistance Welders

Recirculating Chillers - HX Series

The HX Series of chillers are NESLAB's versatile, highly configrable chiller series that can go from a simple workhorse to a highly ophisticated chiller via the many options available. This makes it erfectly suitable for use in laboratory, laser, industrial, semiconuctor, or medical applications. Since its introduction in the late ixties, the HX Series has undergone continuous design enhancements and improvements. But, some things haven't changed for ver 35 years; dependable performance, use of the highest quality materials, and a design that will be trouble free for many years.

Your HX chiller is a solid investment to protect and maximize the performance of your valuable equipment. The HX Series comes in a variety of standard configurations. To meet your needs exactly, we offer choices of controllers, pumps, temperature ranges, and condenser designs. If you're not sure which version would be the most suitable for your application, contact one of our Applications Engineers. They have the expertise necessary to make the perfect recommendation.

Easy Access
Hinged top opens for easy access to internal components

Digital Temperature Controller
An LED readout displays recirculating temperature and setpoint, both with a resolution of 1°C. A low liquid level indicator guards against fluid evaporation or circulating leaks. Idle and Cool lights are essential for diagnostics and operating status.

TC-400 Temperature Controller
A fully programmable, self-diagnostic microprocessor controller featuring:

- Recirculating fluid and setpoint temperature to a 1°C resolution
- Process flow rate readout
- Low level, high temperature, low temperature, and low flow fault with alarm
- User adjustable alarm limits
- Analog interface
- Remote sensor interface (remote sensor purchased separately)

Options include:

- Remote sensor
- Remote controller
- Resistivity display for deionized water applications
- RS-232 or RS-485 serial communications interface
- 0.1°C temperature resolution

Smart Design
Stainless steel reservoir and heat exchanger ensures fluid compatibility

Reservoir drain for quick fluid changes

- User adjustable alarm limits
- Analog interface
- Remote sensor interface (remote sensor purchased separately)

Recirculating Chillers

HX Series - Indoor/Outdoor

NESLAB's HX-1000 and HX-2000 are high capacity chillers esigned for indoor or outdoor installation. The largest of our recir- ulating chiller family, these heavy duty, industrial units are ideal or replacing building water cooling of multiple systems, or for andling the heavy heat loads of high capacity lasers, medical maging equipment, and industrial processing equipment. In addi- ion to these applications, the HX-1000 and HX-2000 are ideal for aboratory or hospital/clinic settings when it is necessary to dis- harge heat outside.

A large industrial grade pump provides strong pressure for circulat- ing at distances, and excellent fluid agitation for temperature uniformity. A digital control box remotes by cable to a convenient internal location. It provides all of the features of our TC-400 including high temperature, low temperature, low flow, and low level safeties. The refrigeration system is controlled by our hot gas bypass, which eliminates compressor cycling on and off and greatly enhances compressor life.

Air Cooled Refrigeration
Two large condensing fans are mounted at the top of the units. They draw air through the system and discharge it at the top, and are completely self-contained and designed to withstand rain and harsh weather

Electrical Enclosure
The electrical components are designed to NEMA 4 Code for operational safety. All electronics are encased in a durable, locking enclosure for protection from tampering and outdoor conditions

Recirculating Chiller Specifications

Recirculating Chillers

HX Series - Low Temperature

The HX -540 low temperature chiller is ideal for applications equiring high heat removal at low temperatures. Typically, a low emperature/high heat removal chiller would require a large case to accommodate the special components needed. NESLAB's years of experience in chiller technology has enabled us to offer this chiller n an extremely compact size. Feel free to compare to the compe- ition. Standard features include a stainless steel reservoir, plate style heat exchanger, NEMA 4 electrical enclosure, and hot gas bypass temperature control. The sophisticated TC400 micro- processor controller monitors all chiller functions as well as provid- ing fluid safeties such as low reservoir liquid level, high and low temperature overshoot, and low flow. The TC400 even provides a recirculating flow readout in gallons or liter per minute, you choose. The HX-540 is perfect for use in a variety of applications. Reaction vessels in the chemical and pharmaceutical industries, quenching of cables in the fiber optics industry, and many chip manufacturing and testing processes in the semiconductor industry are just a few of the many applications where the HX-540 has become useful.

Compact Design
Maximizes use of limited floor space

Safety Certifications
NEMA 4 electrical enclosure for safety and reliability

Recirculating Chillers

Custom Configurations

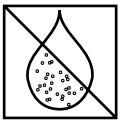
Many customization options are available on the HX and CFT Series Chillers. Below are just a few. If you do not see what you need, contact one of our Applications Engineers. Chances are we have the option available to suit your application.

Extended Temperature Range

Feature will allow you to set a circulating temperature outside of the range of the standard model.

Stainless Steel/Plastic Unit

Recirculating Chiller features stainless steel and plastic components to provide fluid compatibility for your sensitive circulating applications.



Deionization Package

We will install a purification system for standard ultra pure circulating requirements.

Custom Electrical

Recirculating Chiller can be wired for a variety of AC power sources.

Safety Interlocks

Recirculating Chiller warns of situations outside of your set specifications. Monitor flow, liquid level or low/high temperature.

Safety Certifications

Units can be customized with certified components and electrical designs to meet the safety requirements set by the following internationally recognized standards.

CSA

We have been granted the Category Certification Program for the Canadian Standards Association, complying to CSA 1010.1 for all products.

CE

All units destined for Europe are tested for compliance to the EMC and LVD directives. NESLAB's in-house EMC lab is assessed by Interference Technologies International, Ltd., as a supplier of EMC testing services.

IEC

Many of our Recirculating Chiller designs meet the rigorous European safety standards of IEC 1010 or IEC 10601, and are certified through the TUV Testing Agency.

UL

NESLAB has been granted the Client Test Data Program for the Underwriters Laboratories, and is certified to provide UL testing in-house for Commercial Processing Chiller UL 471, Medical Electrical Equipment Component UL 2601-1, and Laboratory Electrical Equipment UL 3101-1.

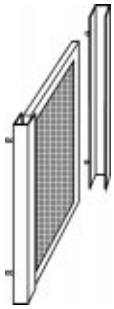
IBM Safety Specification

NESLAB has been designing units which conform to the IBM safety spec on recirculating chillers since 1972. This option includes NEMA 12 enclosure and emergency off.

Semi S2-93

Our semiconductor chillers are designed and tested to comply with Semi S2-93 safety guidelines for semiconductor manufacturing equipment. These guidelines apply to equipment used in the manufacturing, metrology, assembly, and testing of semiconductor products.

Recirculating Chillers *Accessories*



Air Filter Package

Snap on air filter protects chillers with air cooled condensers from damage and prevents loss of performance in dusty or unclean environments.

For Models

All CFT Series chillers and HX-75 through HX-750 Series chillers with air cooled condensers

Tubing Package

Tygon and silicon tubing available for air or water lines, fluids handling, and drainage procedures. Tygon tubing is a durable choice for applications requiring near ambient temperature ranges. Silicon tubing is available for dependable circulation at very low temperature ranges.

For Models

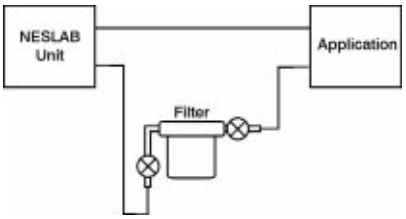
All CFT and HX Series chillers System Series water to water heat exchangers
All Bath/Circulators

Algicide

Chloramin-T Algicide eliminates the growth of algae in water baths, circulators, chillers, and other laboratory apparatus. The 250 gram bottle contains enough algicide to treat 1000 liters of water.

For Models

All CFT and HX Series chillers System Series water to water heat exchangers
All Bath/Circulators

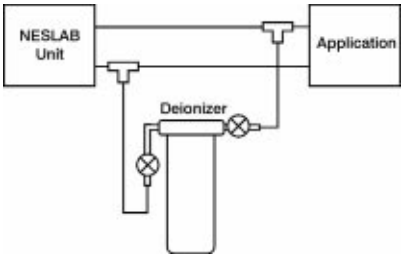


Particulate Filter Package

Can be used on the process side or on the facility side in our water cooled condenser models to protect your equipment and chiller from harmful particulates. Available in 5, 10, 25, or 40 micron sizes, partial or full flow

For Models

All CFT and HX Series chillers System Series water to water heat exchangers



Deionized Water Package

Partial flow system maintains resistivity levels between 1 and 3 meg-ohm/cm. Available with a cartridge change indicator light. Also compatible with NESLAB's optional resistivity readout.

For Models

All CFT and HX Series chillers System Series water to water heat exchangers

Recirculating Chillers

NESLAB chillers are world-renowned for their quality and reliability. For over 35 years, NESLAB has been the industry leader in innovation and dependability making our equipment the preferred chiller for the majority of companies world-wide. The use of hot gas bypass temperature control in a chiller, today's industry standard, was developed by NESLAB. Forward thinking concepts like this, along with superior performance, make NESLAB chillers the number one choice to cool your valuable equipment, improve your processes, and save on costly tap water usage.

Recirculating *Chillers*

Using a chiller for your water cooled equipment is a wise decision for many reasons. Your valuable equipment needs to operate at its maximum level of performance. Cooling with tap water, tower water, and building chilled water can prove unreliable or cause problems. Fluctuations in temperature, pressure, and flow, as well as minerals and particulates, can produce unreliable results and damage to your equipment. A NESLAB chiller will eliminate all of these problems and save you money. Running tap water through your equipment or process is very expensive. You pay twice for the use of water. Running 4 gallons of water, 24 hours per day, 7 days a week, 52 weeks per year can potentially send 2,000,000 gallons of water down the drain per year. As you can see, by recirculating, a NESLAB chiller can pay for itself in a very short time.

Deciding on which NESLAB chiller to use is simple. Use our easy to read charts on the following pages to determine which model best suits your needs. What is your heat load requirement? What temperature do you need to circulate? What is your flow and pressure need? Do you need a simple workhorse chiller or a highly sophisticated chiller? If you are not sure of your equipment's water cooling requirements or need advice on how to best utilize our chiller, call our Applications Engineers. We have extensive cross reference information on most equipment and the experience to advise you on which NESLAB chiller will meet your needs exactly.

NESLAB is the industry leader in chiller design and innovation. We were the first to use the hot gas bypass method of temperature control in a chiller. It is now considered the industry standard. Hot gas bypass works by routing the hot, uncondensed refrigerant back through the reservoir coil when heating is needed. This eliminates on/off cycling of compressors and the addition of energy-wasting heater. You get better temperature control, greater energy efficiency, and increased compressor life.

NESLAB also introduced the industry's first completely CFC-free portable chiller in our CFT Series. We feel a responsibility to use the most environmentally friendly refrigerants available. Our HX Series uses an HCFC refrigerant which is universally accepted as an environmentally friendly alternative to CFC's.

Which chiller series should you use?

CFT Series

Heat removal capabilities from 580 watts to 11,000 watts. Basic, simple, a dependable performer.

(Pages 33-34)

HX Series

Heat removal capabilities from 2000 watts to 75,000 watts. Many pumps, controllers, and hundreds of options available.

(Pages 35-42)

System Series

Complete, packaged, Water to Water Heat Exchangers with built-in pump and temperature controller.

(Pages 45-48)

Recirculating Chillers - CFT Series

As the original designer of the small portable chiller, NESLAB ntroduced the CFT Series to cool precise analytical equipment. t now cools virtually every water cooled application including lab- ratory, medical, semiconductor, industrial, and laser industries. This tried and true design has made the CFT Series the number one hoice among equipment manufacturers. The heart of the CFT Series is the CFC-free refrigeration system which provides long ife, maintenance free operation. All CFT Series chillers also fea- ure a rugged, sealed PVC reservoir. The sealed design minimizes luid evaporation and eliminates maintenance allowing you to focus n your work instead of the chiller. The sealed reservoir also llows circulation to an open container; something not possible with an unsealed reservoir, adding to the versatility of your CFT. n addition, the CFT Series incorporates a built-in fluid bypass system to protect the chiller in the event of an external line blockage. The standard digital microprocessor controller shows the recirculating temperature and the setpoint to a resolution of 1°C, and maintains the recirculating temperature to ±0.5°C of the setpoint. Should you be concerned about protecting your equipment or your CFT, we have included a user adjustable high and low temperature limit safety, displaying the error should the chiller reach one of these limits. If you have special cooling water requirements for your application, chances are we can meet your needs with one of the many options available. High and low temperature ranges, condenser air filter packages, deionized water packages and convenient accessories such as tubing and fluids make the CFT Series the perfect choice for your liquid temperature control needs.

Microprocessor Controller
Provides a readout and setpoint resolution of 1°C and maintains a stability of ±0.5°C

Compact Design
Maximizes use of limited floor space

Removable Condenser Vent
Quick, easy access to the condenser for routine cleaning. Also simplifies installation of our accessory air filter package

APPLICATIONS

- Condenser Cooling
- Diffusion Pumps
- Turbo-Molecular Pumps
- Vacuum Systems
- GC/MS
- Lasers
- Electron Microscopes
- ICP
- FTIR
- Plasma Etch Equipment
- Sputtering Systems
- AA Graphite Furnace
- Resistance Welders

Recirculating Chillers - HX Series

The HX Series of chillers are NESLAB's versatile, highly configrable chiller series that can go from a simple workhorse to a highly ophisticated chiller via the many options available. This makes it erfectly suitable for use in laboratory, laser, industrial, semiconuctor, or medical applications. Since its introduction in the late ixties, the HX Series has undergone continuous design enhancements and improvements. But, some things haven't changed for ver 35 years; dependable performance, use of the highest quality materials, and a design that will be trouble free for many years.

Your HX chiller is a solid investment to protect and maximize the performance of your valuable equipment. The HX Series comes in a variety of standard configurations. To meet your needs exactly, we offer choices of controllers, pumps, temperature ranges, and condenser designs. If you're not sure which version would be the most suitable for your application, contact one of our Applications Engineers. They have the expertise necessary to make the perfect recommendation.

Easy Access
Hinged top opens for easy access to internal components

Digital Temperature Controller
An LED readout displays recirculating temperature and setpoint, both with a resolution of 1°C. A low liquid level indicator guards against fluid evaporation or circulating leaks. Idle and Cool lights are essential for diagnostics and operating status.

TC-400 Temperature Controller
A fully programmable, self-diagnostic microprocessor controller featuring:

- Recirculating fluid and setpoint temperature to a 1°C resolution
- Process flow rate readout
- Low level, high temperature, low temperature, and low flow fault with alarm
- User adjustable alarm limits
- Analog interface
- Remote sensor interface (remote sensor purchased separately)

Options include:

- Remote sensor
- Remote controller
- Resistivity display for deionized water applications
- RS-232 or RS-485 serial communications interface
- 0.1°C temperature resolution

Smart Design
Stainless steel reservoir and heat exchanger ensures fluid compatibility

Reservoir drain for quick fluid changes

TC-400 Temperature Controller

A fully programmable, self-diagnostic microprocessor controller featuring:

- Recirculating fluid and setpoint temperature to a 1°C resolution
- Process flow rate readout
- Low level, high temperature, low temperature, and low flow fault with alarm
- User adjustable alarm limits
- Analog interface
- Remote sensor interface (remote sensor purchased separately)

Recirculating Chillers

HX Series - Indoor/Outdoor

NESLAB's HX-1000 and HX-2000 are high capacity chillers esigned for indoor or outdoor installation. The largest of our recir- ulating chiller family, these heavy duty, industrial units are ideal or replacing building water cooling of multiple systems, or for andling the heavy heat loads of high capacity lasers, medical maging equipment, and industrial processing equipment. In addi- ion to these applications, the HX-1000 and HX-2000 are ideal for aboratory or hospital/clinic settings when it is necessary to dis- harge heat outside.

A large industrial grade pump provides strong pressure for circulat- ing at distances, and excellent fluid agitation for temperature uniformity. A digital control box remotes by cable to a convenient internal location. It provides all of the features of our TC-400 including high temperature, low temperature, low flow, and low level safeties. The refrigeration system is controlled by our hot gas bypass, which eliminates compressor cycling on and off and greatly enhances compressor life.

Air Cooled Refrigeration
Two large condensing fans are mounted at the top of the units. They draw air through the system and discharge it at the top, and are completely self-contained and designed to withstand rain and harsh weather

Electrical Enclosure
The electrical components are designed to NEMA 4 Code for operational safety. All electronics are encased in a durable, locking enclosure for protection from tampering and outdoor conditions

Recirculating Chillers

HX Series - Low Temperature

The HX -540 low temperature chiller is ideal for applications equiring high heat removal at low temperatures. Typically, a low emperature/high heat removal chiller would require a large case to accommodate the special components needed. NESLAB's years of experience in chiller technology has enabled us to offer this chiller n an extremely compact size. Feel free to compare to the compe- ition. Standard features include a stainless steel reservoir, plate style heat exchanger, NEMA 4 electrical enclosure, and hot gas bypass temperature control. The sophisticated TC400 micro- processor controller monitors all chiller functions as well as provid- ing fluid safeties such as low reservoir liquid level, high and low temperature overshoot, and low flow. The TC400 even provides a recirculating flow readout in gallons or liter per minute, you choose. The HX-540 is perfect for use in a variety of applications. Reaction vessels in the chemical and pharmaceutical industries, quenching of cables in the fiber optics industry, and many chip manufacturing and testing processes in the semiconductor industry are just a few of the many applications where the HX-540 has become useful.

Compact Design
Maximizes use of limited floor space

Safety Certifications
NEMA 4 electrical enclosure for safety and reliability

SHIPPING WEIGHT	915 Lbs/415 Kgs

Specifications listed for units circulating 60% Ethylene Glycol, 20% water, and fluid with specific heat of .6. Specifications will be affected by changes in temperature, ambient or fluids. Specifications subject to change.

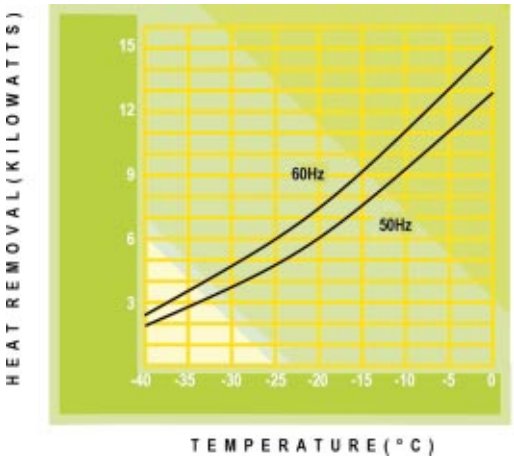
FEATURES

- High cooling capacity at low temperatures
- Semi-hermetic compressor
- High pressure circulating pump
- Designed for 24 hour, continuous duty
- Hot gas bypass system
- Water cooled condenser

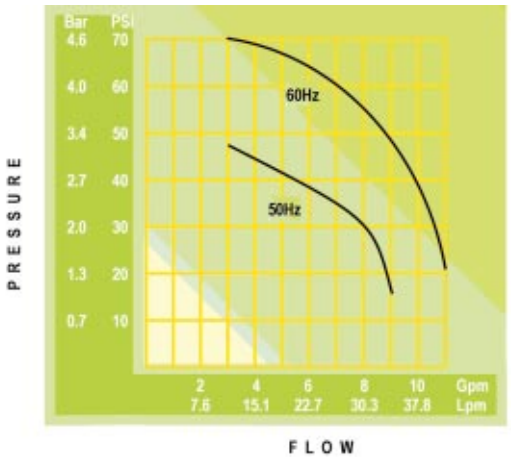
APPLICATIONS

- Plasma Etch Chamber
- Quenching Fiber Optics Cables
- Chemical and Organic Reactions
- Gallium Arsenide Crystal Growth
- Molecular Beam Epitaxy

Cooling Capacity



Pumping Capacity



Recirculating Chillers

Custom Configurations

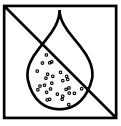
Many customization options are available on the HX and CFT Series Chillers. Below are just a few. If you do not see what you need, contact one of our Applications Engineers. Chances are we have the option available to suit your application.

Extended Temperature Range

Feature will allow you to set a circulating temperature outside of the range of the standard model.

Stainless Steel/Plastic Unit

Recirculating Chiller features stainless steel and plastic components to provide fluid compatibility for your sensitive circulating applications.



Deionization Package

We will install a purification system for standard ultra pure circulating requirements.

Custom Electrical

Recirculating Chiller can be wired for a variety of AC power sources.

Safety Interlocks

Recirculating Chiller warns of situations outside of your set specifications. Monitor flow, liquid level or low/high temperature.

Safety Certifications

Units can be customized with certified components and electrical designs to meet the safety requirements set by the following internationally recognized standards.

CSA

We have been granted the Category Certification Program for the Canadian Standards Association, complying to CSA 1010.1 for all products.

CE

All units destined for Europe are tested for compliance to the EMC and LVD directives. NESLAB's in-house EMC lab is assessed by Interference Technologies International, Ltd., as a supplier of EMC testing services.

IEC

Many of our Recirculating Chiller designs meet the rigorous European safety standards of IEC 1010 or IEC 10601, and are certified through the TUV Testing Agency.

UL

NESLAB has been granted the Client Test Data Program for the Underwriters Laboratories, and is certified to provide UL testing in-house for Commercial Processing Chiller UL 471, Medical Electrical Equipment Component UL 2601-1, and Laboratory Electrical Equipment UL 3101-1.

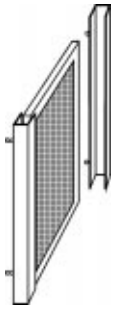
IBM Safety Specification

NESLAB has been designing units which conform to the IBM safety spec on recirculating chillers since 1972. This option includes NEMA 12 enclosure and emergency off.

Semi S2-93

Our semiconductor chillers are designed and tested to comply with Semi S2-93 safety guidelines for semiconductor manufacturing equipment. These guidelines apply to equipment used in the manufacturing, metrology, assembly, and testing of semiconductor products.

Recirculating Chillers *Accessories*



Air Filter Package

Snap on air filter protects chillers with air cooled condensers from damage and prevents loss of performance in dusty or unclean environments.

For Models

All CFT Series chillers and HX-75 through HX-750 Series chillers with air cooled condensers

Tubing Package

Tygon and silicon tubing available for air or water lines, fluids handling, and drainage procedures. Tygon tubing is a durable choice for applications requiring near ambient temperature ranges. Silicon tubing is available for dependable circulation at very low temperature ranges.

For Models

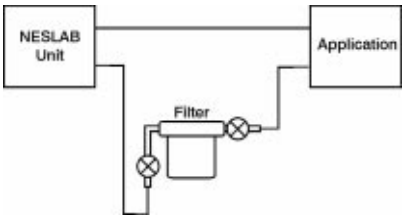
All CFT and HX Series chillers System Series water to water heat exchangers
All Bath/Circulators

Algicide

Chloramin-T Algicide eliminates the growth of algae in water baths, circulators, chillers, and other laboratory apparatus. The 250 gram bottle contains enough algicide to treat 1000 liters of water.

For Models

All CFT and HX Series chillers System Series water to water heat exchangers
All Bath/Circulators

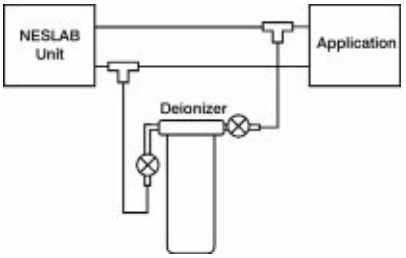


Particulate Filter Package

Can be used on the process side or on the facility side in our water cooled condenser models to protect your equipment and chiller from harmful particulates. Available in 5, 10, 25, or 40 micron sizes, partial or full flow

For Models

All CFT and HX Series chillers System Series water to water heat exchangers



Deionized Water Package

Partial flow system maintains resistivity levels between 1 and 3 meg-ohm/cm. Available with a cartridge change indicator light. Also compatible with NESLAB's optional resistivity readout.

For Models

All CFT and HX Series chillers System Series water to water heat exchangers

SECTION XI

Warranty

Installation
Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Avoid excessively dusty areas and institute a periodic cleaning schedule. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled SUPPLY and RETURN. These connections are ¾ inch FPT. Remove the plastic protective plugs from both plumbing connections. Connect the SUPPLY fitting to the inlet of your application. Connect the RETURN fitting to the outlet of your application.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within one inch of the top. If the fluid capacity of your application and recirculation lines are significant, have extra fluid on hand.

Tap water is the recommended fluid for operation from +8°C to +80°C. Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Operation
Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

On models HX-200 through HX-750, the unit must be connected to the power source for at least 12 hours to allow the oil to be heated and separated from the refrigerant

To start the unit, place the Power Switch to the ON position. The Cool and Idle LEDs on the front panel indicate the status of the refrigeration system. Cool is on when the unit is removing heat from the cooling fluid, Heat is on when the unit is in the hot gas by-pass mode. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Temperature Adjustment
To display the temperature setpoint, press and hold the Setpoint switch. To adjust the temperature setpoint, press and hold the Setpoint switch and turn the adjust knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the Setpoint switch. The display will now indicate the temperature of the fluid in the reservoir.

Flow Control
The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the “+” position you receive full flow, the “-” position is no flow.

Periodic Maintenance
Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Installation
Position the unit in a clean environment with easy access to facility cooling water and a drain. The facility water requirements must meet those specified in the instruction or unit performance will be derated.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled TAP WATER, DRAIN, SUPPLY and RETURN. Remove the plastic protective plugs from all the plumbing connections. Connect the TAP WATER fitting to the facility cooling water and the DRAIN fitting to a drain. Connect the SUPPLY fitting to the inlet of your application and the RETURN fitting to the outlet of your application.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within one inch of the top. If the fluid capacity of your application and recirculation lines are significant, have extra fluid on hand.

Tap water is the recommended fluid for operation from +8°C to +80°C. Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Operation
Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

Ensure the facility water is turned on.

On models HX-200 through HX-750, the unit must be connected to the power source for at least 12 hours to allow the oil to be heated and separated from the refrigerant

To start the unit, place the Power Switch to the ON position. The Cool and Idle LEDs on the front panel indicate the status of the refrigeration system. Cool is on when the unit is removing heat from the cooling fluid, Heat is on when the unit is in the hot gas by-pass mode. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Temperature Adjustment
To display the temperature setpoint, press and hold the Setpoint switch. To adjust the temperature setpoint, press and hold the Setpoint switch and turn the adjust knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the Setpoint switch. The display will now indicate the temperature of the fluid in the reservoir.

Flow Control
The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the “+” position you receive full flow, the “-” position is no flow.

Periodic Maintenance
Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition.

On units with a remote control box, the box is packed in a separate carton. Be sure to locate this separate carton; do not dispose of it by mistake.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

The unit has a warranty against defective parts and workmanship for one full year from date of shipment. Refer to the last page of this manual for complete warranty details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label on the rear of the case top to obtain the following information (see Section II, Description for the serial number label location):

*- BOM number*_____

- Serial number _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department for assistance (see Preface, After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Do not attempt to defeat any of the interlock switches or safety features built into the unit.

Observe all warning labels.

Never remove warning label.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the fluid reservoir.

Make sure the unit is off before connecting or disconnecting the power cord or other cables.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the fluid reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified NESLAB technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

The HX Series II Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and volume.

The unit consists of an air-cooled or water-cooled refrigeration system, a fluid reservoir, a fluid recirculation pump, and a temperature controller.

HX units are available with a large number of options. This manual explains how to install, operate, and maintain a “standard” HX unit. This manual also explains some of the available options. Supplemental manuals are supplied with units equipped with options not covered in this manual.

Throughout the manual, you will be asked to consult the unit’s serial number label, or the pump identification label, or both, for specific information. Both labels are located on the rear of the case top.

1. The model HX-750 with a water-cooled refrigeration system has the same dimensions as the HX-500. For additional dimensions see page 46.

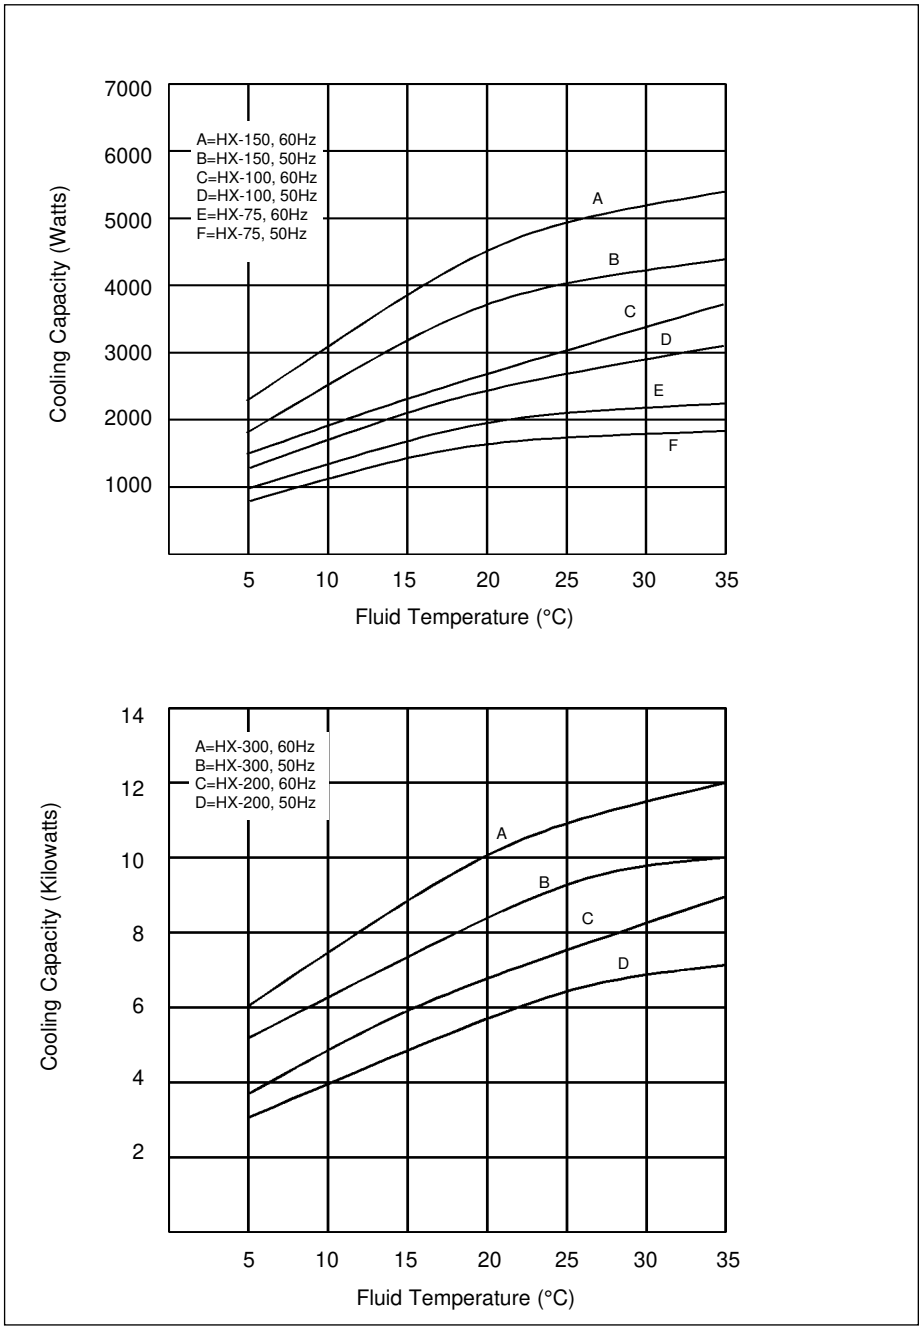
Cooling Capacity

Cooling capacity will vary depending on fluid temperature, ambient temperature, and cooling fluid.

Cooling capacities for models HX-75 through HX-750 were obtained under the following conditions:

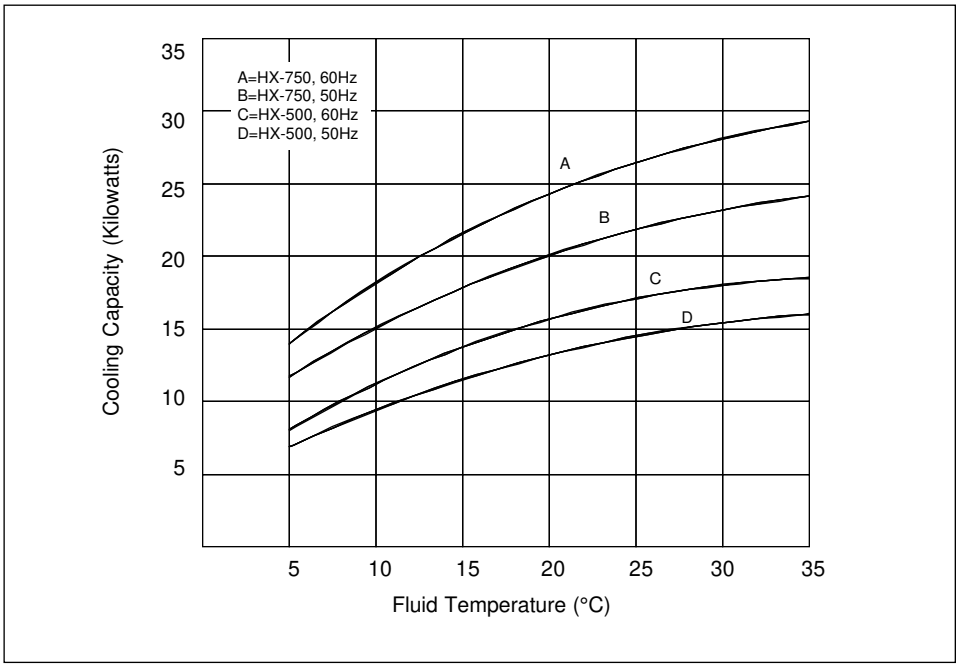
1. *air-cooled unit operating at +20°C (+68°F) ambient temperature.*
2. *cooling fluid with specific heat of 1.0 was used for fluid temperatures from +5°C to +35°C.*

HX-75, 100, & 150



HX-200 & 300

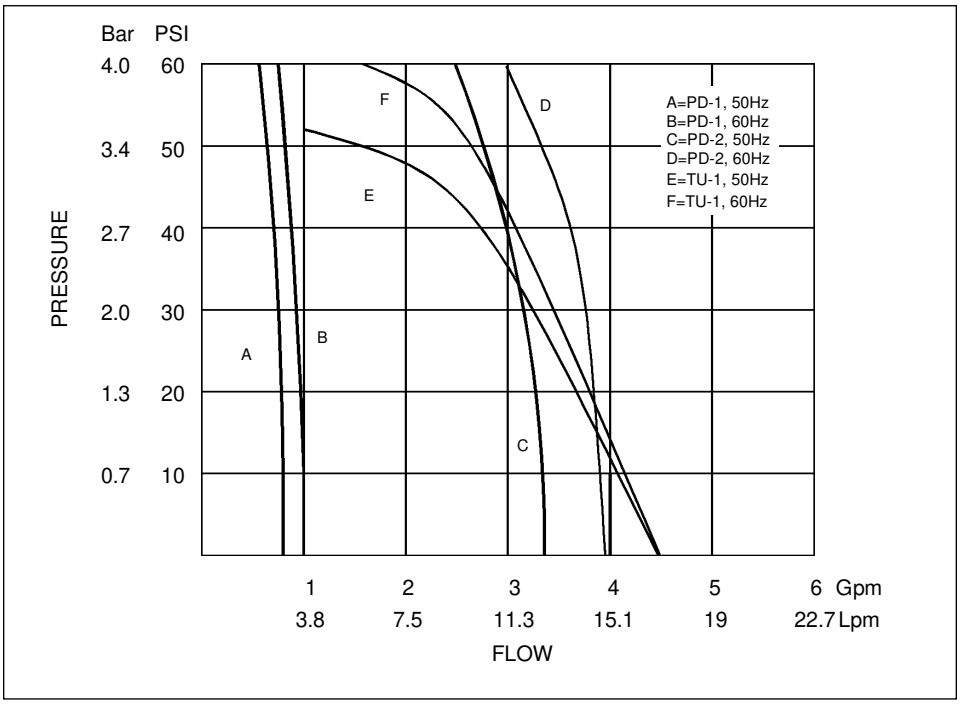
HX-500 & 750



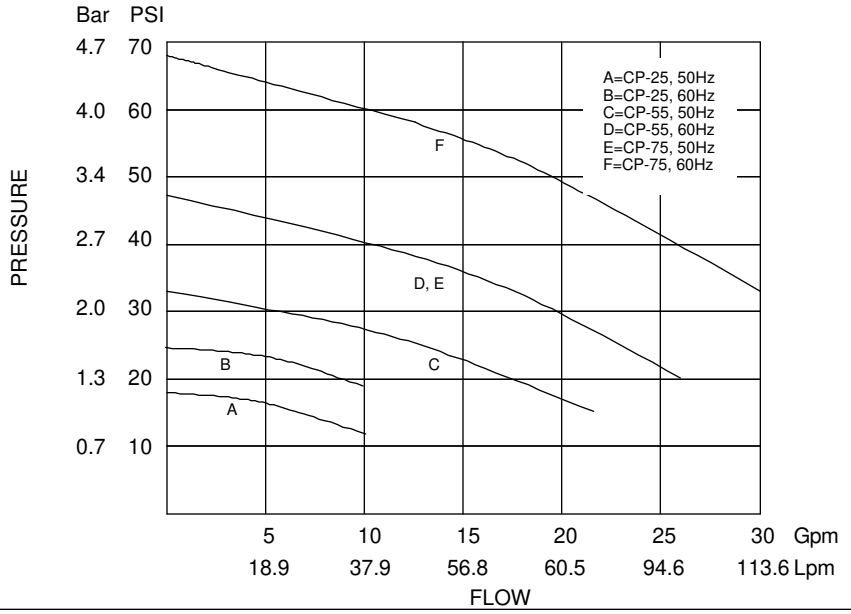
Pump Capacity

HX units are available with one of three standard pump types: positive displacement (PD), centrifugal (CP), and turbine (TU). Refer to the pump identification label on the rear of the case top or rear of analog temperature controller to identify the specific pump in your unit.

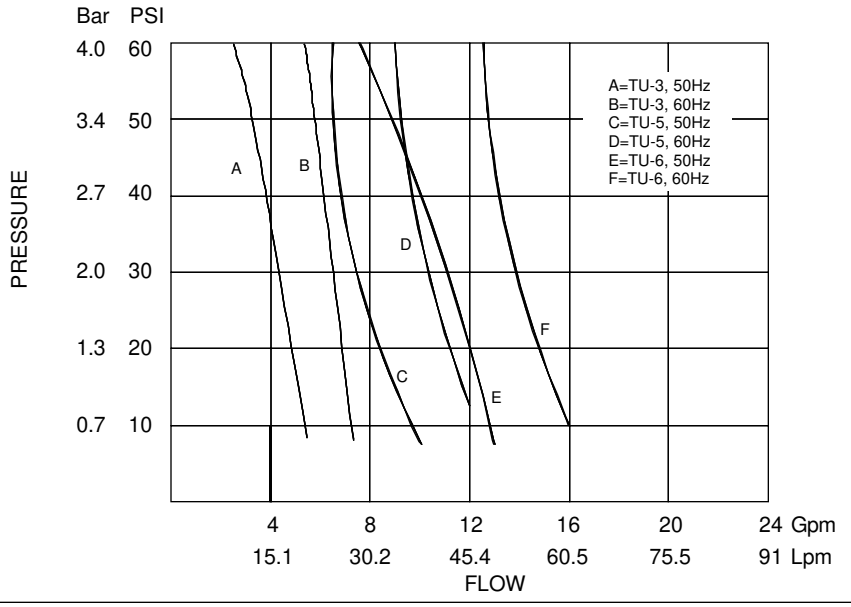
PD1, PD2 & TU1



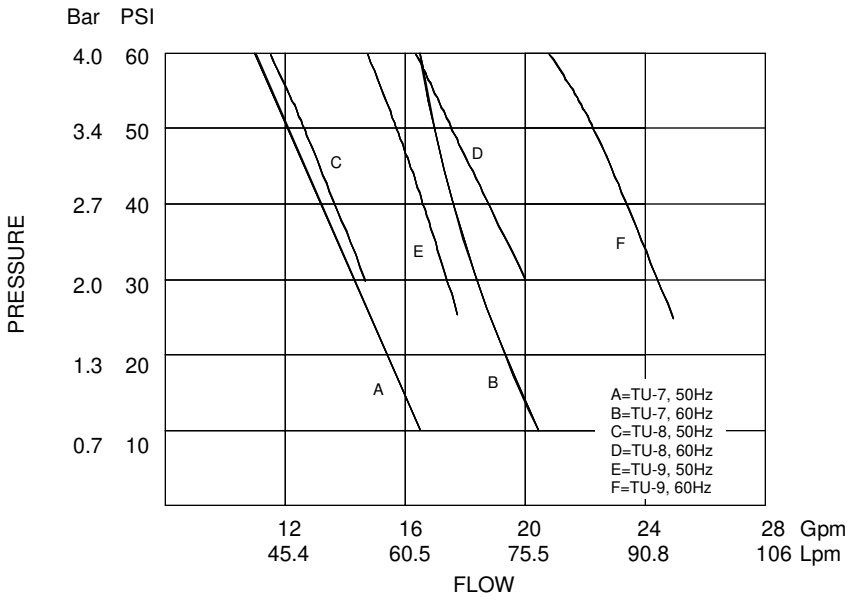
CP



TU-3, 5 & 6



TU-7, 8 & 9



Section III Installation

Site (Air-cooled Units)

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +55°F to +95°F (+13°C to +35°C).

The unit will retain its full rated capacity in ambient temperatures to approximately +75°F (+24°C). Above +75°F, derate the cooling capacity 1% for every 1°F above +75°F, to a maximum ambient temperature of +95°F. In degrees Celsius, derate the cooling capacity 1% for every 0.5°C above +24°C, to a maximum ambient temperature of +35°C.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. It must be positioned so the air intake and discharge are not impeded.

On models HX-75 through HX-150, air is drawn through the left side of the unit and discharged through the right and rear. A minimum clearance of 2 feet (0.6 meter) on these three sides is necessary for adequate ventilation.

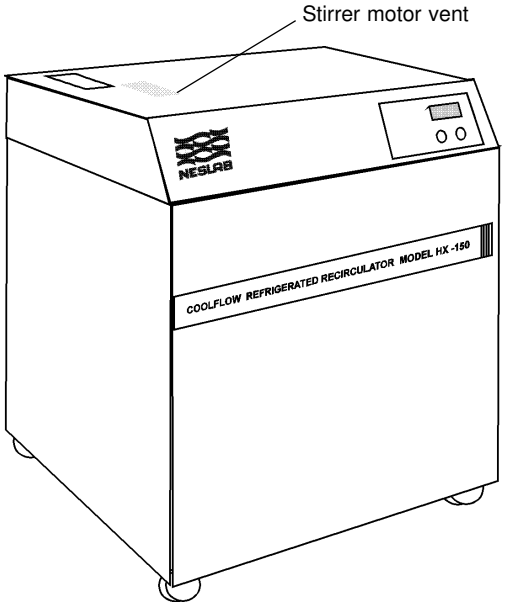
On models HX-200 through HX-750, air is drawn through the front of the unit and discharged through the side and rear panels. A minimum of 5 feet (1.5 meters) on all four sides of the unit is necessary for ventilation.

In some applications where space is at a premium, the minimum ventilation clearance can be compromised. However, consult our Sales Department before positioning the unit in a location with less minimum clearance than listed above. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section VII, Condenser Cleaning).

On models HX-100 through HX-750 the stirrer motor is located under the case top. (Models HX-500 and HX-750 have two stirrer motors.) Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation. See illustration on page 7.

NOTE: Units with plate heat exchangers do not have stirrer motors.



NOTE: The HX-750 380/480V model contains a three phase condenser fan motor. It is possible to misconnect the main power and have the motor turn in the wrong direction resulting in incorrect airflow over the condenser. Proper airflow is achieved by exchanging any two main power connectors.

Refer to the table below to determine the approximate amount of air intake required for the unit to retain its full rated capacity. If the air intake does not meet these standards, cooling capacity will be derated.

	HX-75	HX-100	HX-150	HX-200
Air Intake				
Cubic feet per minute	600	710	1050	2000
Liters per minute	17000	20100	29730	56640

	HX-300	HX-500	HX-750
Air Intake			
Cubic feet per minute	1900	5000	5600
Liters per minute	53800	141750	158800

Site (Water-cooled units)

The unit should be located in a laboratory or clean industrial environment with easy access to a facility cooling water supply and a drain.

All units are equipped with castors for easy movement. This allows the unit to be placed in a small area, as long as there is ample space for the unit to be moved for access on all four sides. A minimum access clearance of 3 feet (1 meter) on two adjacent sides is recommended.

The facility cooling water supply must meet or exceed the requirements listed in the table shown on the next page for the unit to operate at its full rated capacity. If the facility cooling water does not meet these standards, the cooling capacity will be derated.

As the temperature of the cooling water supply increases, the required flow rate and pressure of the cooling water supply increases.

For example, with a model HX-150, if the temperature of the cooling water supply is +65°F, the flow rate must be at least 1.5 gallons per minute, with a pressure differential of at least 3.5 PSI. However, if the temperature of the cooling water supply is +85°F, the flow rate must be at least 4.0 gallons per minute, with a pressure differential of at least 10 PSI.

If the unit is being used with a building water supply, the back pressure of the drain must be less than the supply pressure.

A water regulating valve, located in the TAP WATER line, regulates the flow rate of the cooling water supply as it enters the unit. The valve regulates the flow rate based on the heat load. Flow through the unit stops automatically when the unit is shut off.

On models HX-100 through HX-750 the stirrer motor is located under the case top. (Models HX-500 and HX-750 have two stirrer motors.) Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation. See illustration on page 7.

NOTE: Units with plate heat exchangers do not have stirrer motors.

*Estimater Value

Electrical Requirements

Refer to the table below to determine the unit's electrical requirements. Verify the requirements by reviewing the ratings listed on the serial number label on the rear of the case top or rear of analog temperature controller.

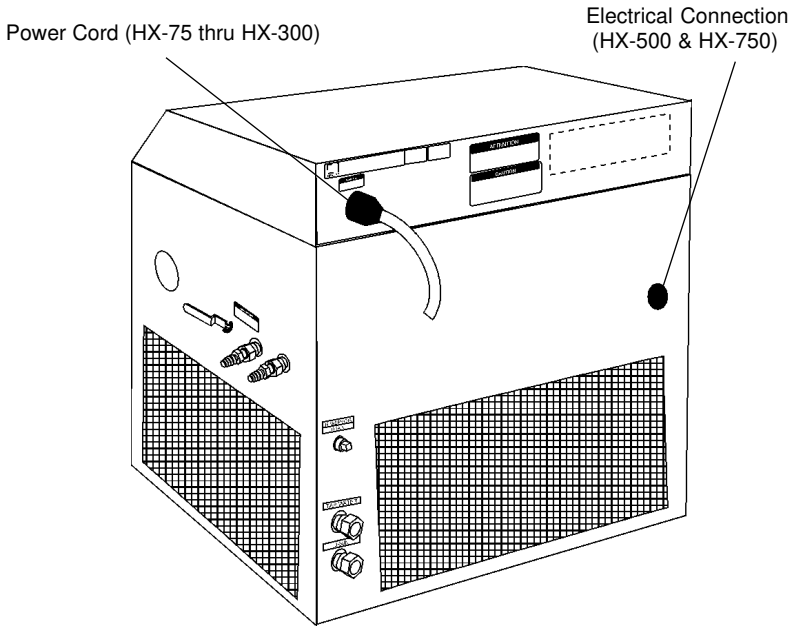
	HX-75	HX-100	HX-150
Volts	208/230 220/240		
Hertz	60 50		
Phase	1 1		
Plug	NEMA L6-30P or L6-20P		

	HX-200	HX-300	HX-500	HX-750
Volts	208/230 200/220	380/420	208/230	380/420
Hertz	60 50	50	60	50
Phase	3 3	3	3	3
Plug	NEMA L15-30P or L16-20P		N/A	

Make sure the voltage of the power source agrees with the unit's voltage and frequency rating. The unit is designed to tolerate deviations of ±10% from the rated line voltage.

Models HX-75 through HX-300 have an 8 foot (2.4 meter) power cord installed on the unit at the time of shipment.

NOTE: Custom units equipped with heaters may not have a power cord. See Section VI, Special Features.



The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Models HX-500 and HX-750 are not equipped with a power cable. Installation of the cable is the user's responsibility. Wire the unit in conformance to local, state, and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

Models HX-200 through HX-750 are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

Plumbing Requirements

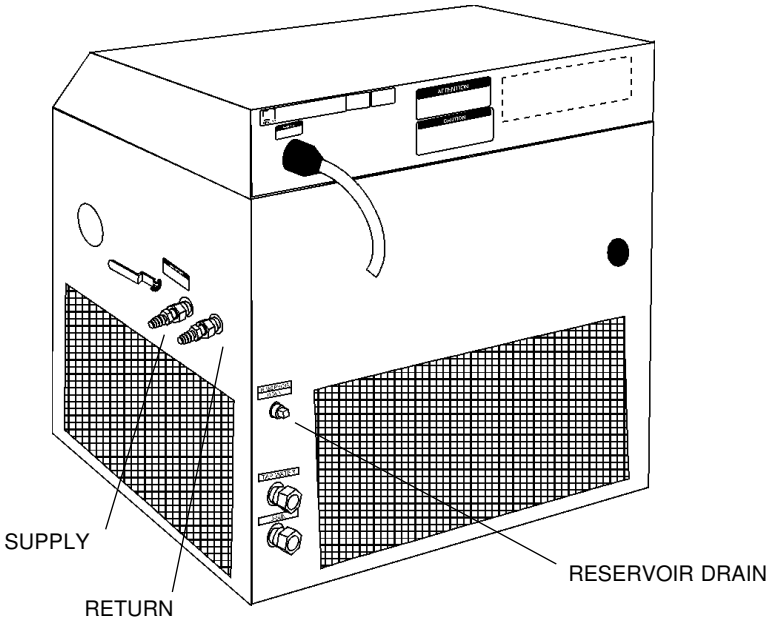
Air-cooled and water-cooled units

Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. Consult the manufacturer of the instrument for a cleaning fluid recommendation.

The plumbing fittings used to connect the HX to the instrument being cooled are located on the right side of the unit (labelled SUPPLY and RETURN). These connections are ¾ inch FPT.

Remove the protective plugs from the SUPPLY and RETURN connections. Connect the SUPPLY fitting to the inlet of the instrument being cooled. Connect the RETURN fitting to the outlet of the instrument being cooled.

The RESERVOIR DRAIN connection, located on the rear of the unit, is a ½ inch FPT fitting connected internally to the unit's fluid reservoir. This fitting is for draining the reservoir. The unit is shipped with a ½ inch MPT plug installed in this fitting. Remove the plug to drain the reservoir.



Two plumbing adapters (¾ inch MPT x 5/8 inch hose) are included with the unit. If the unit is being plumbed to the instrument being cooled using flexible tubing, install the adapters in the SUPPLY and RETURN plumbing ports. To prevent leaking, wrap the threads of the adapters with Teflon® sealing tape before installing them in the plumbing ports. The adapters will accept ½ or 5/8 inch ID flexible tubing.

If the unit is "hard plumbed" to the instrument being cooled or to the cooling water supply, damage can occur if the unit is bumped or jolted from its site. Provisions should be made to prevent the unit from being moved after installation. Once the unit is plumbed, secure the locking castors on the unit's base. If the unit is located in a heavy traffic area where the possibility of collision is imminent, it may be necessary to secure the unit to the site using blocks or mounting brackets.

Flexible tubing, if used, should be heavy wall or reinforced construction. All tubing should be rated to withstand 110 psi at +35°C. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter

reductions must be made, they should be made at the inlet and outlet of the instrument being cooled, not at the HX.

If substantial lengths of connecting tubing are required, they should be pre-filled with cooling fluid before connecting them to the unit.

Water-cooled units
The plumbing connections used to connect the water-cooled condenser in the HX to the facility cooling water supply are located at the rear of the unit (labelled TAP WATER and DRAIN). On models HX-75 through HX-300, these fittings are ½ inch FPT. On models HX-500 and HX-750, these fittings are 1 inch FPT.

Remove the plastic protective plugs from the TAP WATER and DRAIN connections. Connect the TAP WATER fitting to the facility cooling water supply. Connect the DRAIN fitting to a drain.

Fluids

The selected cooling fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

If your unit is equipped with a plate heat exchanger, do not use 100% water as a recirculating fluid. Due to the physical nature of a plate heat exchanger, and its response to temperature changes, using 100% water may cause the plate heat exchanger to rupture.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Tap water is the recommended fluid for operation from +8°C to +35°C.

Below +8°C, a non-freezing solution is required. A 50/50 mixture, by volume, of water and laboratory grade ethylene glycol is suggested.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer's warranty.

For units with extended temperature ranges above +35°C, tap water is the recommended fluid up to +80°C. Above +80°C, the user is responsible for the fluid(s) used.

Water Quality Recommendations

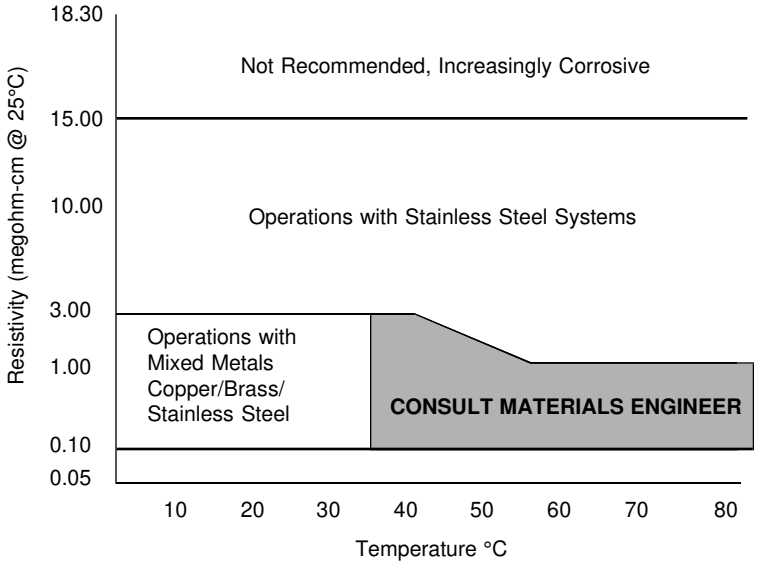
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (as NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (as NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated at 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated at 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated at 25°C).

The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



Water Quality Considerations

Filling Requirements

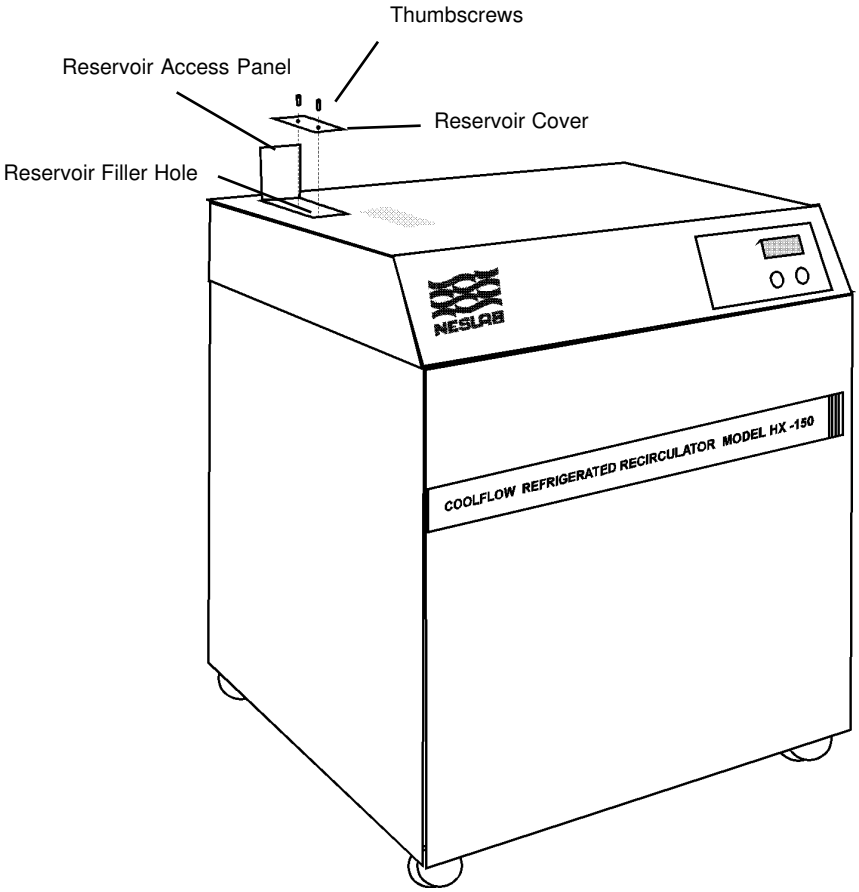
The reservoir access panel is located at the left rear corner of the case top. To open the access panel, slide the latch back (towards the rear of the unit) and lift.

The reservoir cover is located below the access panel. Loosen the thumbscrews and remove the reservoir cover.

Fill the fluid reservoir with cooling fluid to within 1 inch of the top.

The fluid capacity of the instrument being cooled and the recirculation lines may be significant. To prevent the lowering of the fluid level in the reservoir below the operating level, have extra cooling fluid on hand to keep the reservoir filled to within 1 inch of the top.

When the recirculating system is full, replace the reservoir cover and the access panel.



Section IV Temperature Controllers

Temperature Controllers

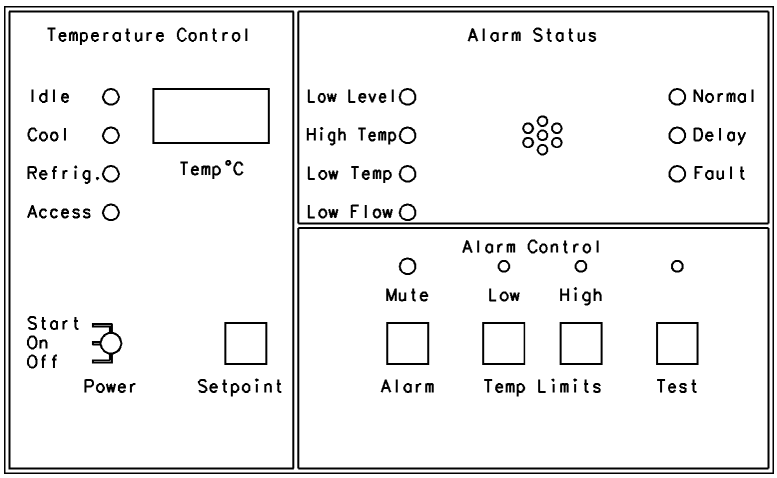
The temperature controller supplied with your unit is the Series II. This section explains the operation of the controller.

Refrigeration Control

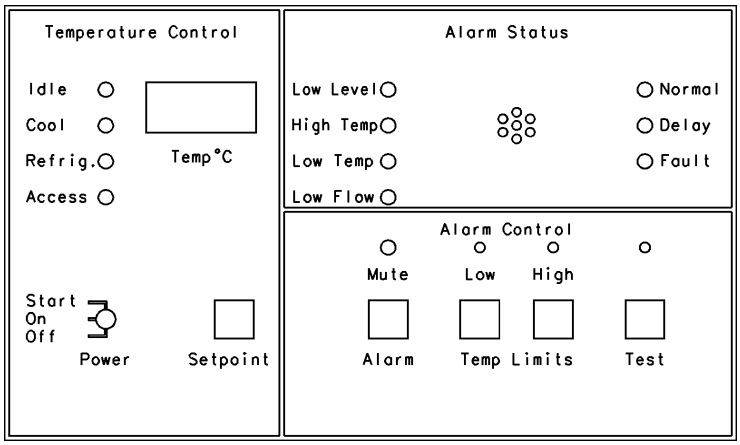
On “standard” units, the refrigeration compressor runs continuously, unless the fluid temperature exceeds +40°C. However, on some “custom” units equipped with an extended temperature range, the compressor may operate at higher temperatures. A hot gas by-pass system, designed to eliminate compressor cycling and premature wear, is used to maintain constant temperature in all units.

The Cool and Idle indicators, located on the control panel, indicate the status of the refrigeration system. The Idle indicator is lit when the unit is in the hot gas by-pass mode. The Cool indicator is lit when the refrigeration system is removing heat from the cooling fluid. As the fluid temperature approaches the temperature setpoint, the indicators cycle on and off to indicate the duty cycle of the system. The unit can be in the Cool or the Idle mode, but never both at the same time. A balance between Cool and Idle is needed to control temperature.

When the unit is shut off, wait approximately 5 minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.



Series II Temperature Controller



Series II Temperature Controller

Series II

Description

The Series II temperature controller features are divided into four sections. Three are mounted on the operator panel on the front of the case top: Temperature Control, Alarm Control, and Alarm Status. The fourth section, the Interface Access. panel is mounted on the rear of the case top and is covered with a removable protective metal plate.

The four controller sections all work together, but for ease of explanation, are described separately.

The Series II temperature controller is also available without the alarm circuitry installed. Controllers with this option are equipped with only two of the four Series II sections: Temperature Control and the Interface Access. panel.

Temperature Control

This section of the temperature controller turns the unit on and off, adjusts and displays the fluid and setpoint temperatures, and indicates general refrigeration status.

Before starting the unit, double check all electrical and plumbing connections and make sure the recirculating system (the HX, the instrument being cooled, and the tubing that connects them) has been properly filled with cooling fluid. Open the flow control valve to allow slightly more than 0.3 gallons per minute (1.0 liters per minute) of flow through the recirculation lines (see Section V, Flow Control).

NOTE: For water-cooled units ensure the facility water is turned on.

A three position toggle switch controls the Off/On/Start functions. To start the unit, momentarily hold the Off/On/Start switch in the Start position. Normal running position is On. To shut the unit off, place the Off/On/Start switch in the Off position.

To display the temperature setpoint, press and hold the Setpoint button. To adjust the temperature setpoint, press and hold the Setpoint button and turn the dial located directly above the Setpoint button until the desired temperature setpoint is indicated on the Temp°C LED display. Once the setpoint is adjusted, release the Setpoint button. The Temp°C LED display will indicate the fluid temperature.

Inadvertent movement of the Setpoint dial will result in a change in the setpoint. The change will not be immediately reflected on the Temp°C LED display unless the Setpoint button is pressed. The display will eventually change as the unit responds to the new setpoint.

The Temperature Control section is equipped with four indicators: Idle, Cool, Refrig. (refrigeration), and Access. (accessory). The Idle and Cool indicators are explained in Section IV, Refrigeration Control.

The Refrig. indicator displays the status of the refrigeration compressor. The indicator is lit when the compressor is running.

The Access. indicator displays the status of the ACCESS. ENABLE/DISABLE switch on the Interface Access. panel. The indicator is lit when the switch is in the ENABLE position. See Interface Access. panel for more information.

Alarm Control

The Alarm Control section adjusts the high and low temperature limits of the alarm, tests the alarm, and activates/de-activates the audible alarm.

To display the high or low temperature limit, press the corresponding button. When the button is pressed, the limit is indicated on the Temp°C display.

To adjust either temperature limit, press the corresponding button and turn the slotted potentiometer located directly above the button (a small screwdriver is required). The high and low values must be at least 4°C apart for the unit to operate.

The Test button simulates high and low temperature conditions to test the temperature limits.

To test the temperature limits, press the Test button and turn the dial located directly above the button. The simulated temperature will appear on the Temp°C display. When the temperature limits are exceeded on the display, the alarm will sound, and the corresponding indicator in the Alarm Status section will light indicating which limit has been exceeded.

The alarm will only sound when a fault occurs. The Alarm button alternately activates and mutes the audible alarm as indicated by the Mute indicator. When the alarm is muted, it will remain muted until the Alarm button is pressed; the alarm does not reset after a fault condition has been corrected.

Alarm Status

Alarm Status section indicates the status of the fault monitors. Four amber indicators display the status of the Low Level, High Temperature, Low Temperature, and Low Flow fault monitors. In the event of a fault, the cause of the fault must be identified and corrected before the unit can be restarted.

The Low Level indicator is connected to a float switch in the reservoir. If a low cooling fluid level condition is detected, the Low Level indicator will light and the Delay indicator will flash. If the condition is not corrected within 30 seconds, the Delay and Normal indicators turn off, the Fault indicator turns on, and the audible alarm will sound. After 50 seconds (total elapsed time), the unit will shut down and a set of relay contacts will open (the status of the relay contacts can be monitored using pins 14 and 15 of the REMOTE CONT. receptacle on the Interface Access. panel).

The Low Flow indicator is connected to a flow switch in the RETURN line. A low flow fault occurs when the flow rate of the returning cooling fluid drops below 0.3 gallons per minute (1.0 liters per minute). If a low flow condition is detected, the Low Flow indicator will light and the Delay indicator will flash. If the condition is not corrected within 5 seconds, the Delay and Normal indicators turn off, the Fault indicator turns on, and the audible alarm will sound. After 30 seconds (total elapsed time), the unit will shut down and the relay contacts will open.

The High/Low Temp indicators are connected to sensors that monitor the temperature of the cooling fluid as it exits the reservoir. The monitors protect the system from exposure to excessively hot or cold cooling fluid. A temperature fault occurs when the cooling fluid temperature exceeds the set temperature limit. In the event of a high or low temperature fault, the unit will shut down, the corresponding indicator will light, the audible alarm will sound, and the set of relay contacts will open.

The Normal, Delay, and Fault indicators, also mounted in the Alarm Status section, monitor the status of a fault.

Normal (green) indicates that no fault is present and the unit is operating normally.

Delay (amber) indicates an initial condition out of desired range.

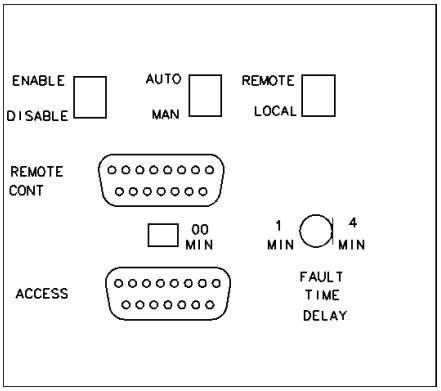
The Delay indicator will flash:

1. *during the 30 second low fluid level condition delay period.*
2. *during the 5 second low flow condition delay period.*
3. *while the fluid temperature is reaching the high and low temperature conditions following a power up. Once the fluid temperature satisfies the high and low limit conditions, the temperature alarm is armed and a fault will occur if the temperature goes outside of the limits.*

The Delay indicator turns off after these conditions are met.

The Fault indicator (red) indicates a fault has occurred. During a fault, the audible alarm will sound (unless muted), and the status indicator will displaythe cndition(s) causing the fault.

Interface Access. Panel



Interface Access panel (rear of case top)

The Interface Access. panel allows the Series II temperature controller to be controlled and monitored with various electronic accessories.

The ACCESS. ENABLE/DISABLE switch allows the user to select the source of temperature setpoint adjustment. When the switch is in the ENABLE position, the setpoint is derived from the ACCESS receptacle (pins 6 and 15, 10mV/°C). When the switch is in the Disable position, the setpoint is derived from the Setpoint dial in the Temperature Control section on the operator panel.

The RESTART AUTO/MAN switch controls the operation of the controller's START switch. If the switch is in the MAN position, the START switch is "open" and the unit must be manually restarted when power is restored following an outage. In the AUTO position, the START switch is "closed" and the unit will automatically restart when power is restored following an outage. See ON/OFF/START Logic for more information.

The START/STOP REMOTE/LOCAL switch selects the location where the unit is turned on: from the operator panel ON/OFF/START switch or from an external switch. See ON/OFF/START Logic for more information.

The FAULT TIME DELAY potentiometer allows adjustment of the delay period following an initial "out of limits" condition. The time adjustment is in addition to the delays described in the Alarm Status section. For example, if the cooling fluid in the reservoir drops below the operating level, there is a 30 second delay period before a fault occurs. If the FAULT TIME DELAY is adjusted to 1 minute, the delay period for a low level condition would be 1 minute, 30 seconds. See the Alarm Status section for more information.

The oo MIN receptacle allows the controller to be configured so the unit will continue to run if a fault occurs. This option is available for customers who are willing to accept the risk of damage to the unit in order to continue to provide all available cooling fluid to the instrument being cooled. Contact our Service Department for more information.

The power receptacle located next to the Interface Access. panel is a NEMA 5-15R receptacle rated for 125V, 0.25A maximum. It is typically used to power a deionizer LED.

Section V Operation

Flow Control

The RECIRCULATING FLOW CONTROL handle, located on the right-hand side of your unit, is connected to a valve that controls the flow rate of the cooling fluid to the instrument being cooled.

When the handle is in the “+” position, the valve is open and all possible cooling fluid is supplied to the instrument being cooled. When the handle is in the “-” position, the valve is closed and no cooling fluid is supplied to the instrument being cooled. When the handle is between these two positions, the flow rate of the cooling fluid is between full flow and no flow. Use a flow meter on the SUPPLY line to adjust the desired flow rate.

The flow control valve must be opened slightly to allow fluid to circulate through the flow switch that monitors the flow rate. A flow rate of more than 0.3 gallons per minute (1.0 liters per minute) is necessary. If the flow is completely shut off, or if the flow is not adequate, a low flow fault will occur and the unit will not start.

Never “crank” the valve wide open from the closed or slightly open position.

Start Up

For CE Mark units check the circuit breaker setting on the side of the bonnet.

Models HX-200 through HX-750 are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

On water-cooled units, ensure the facility water is on and make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection.

A three position toggle switch controls the Off/On/Start functions. To start the unit, momentarily hold the Off/On/Start switch in the Start position. Normal running position is On. To shut the unit off, place the Off/On/Start switch in the Off position.

When the unit is shut off, wait approximately 5 minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Pressure Gauge

The RECIRCULATING PRESSURE gauge is located next to the flow control handle. The gauge indicates the operating pressure of the system.

Pressure Relief Valve
(PD and TU Pumps Only)

Units with a PD-1, PD-2, or any TU type pump have an adjustable pressure relief valve. Refer to the pump identification label on the rear of the case top or rear of analog controller to identify the specific pump in your unit.

The pressure relief valve establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The valve does not determine the actual operating pressure; the operating pressure of the system is determined by the back pressure of the connected equipment and the setting of the flow control valve. If adjustment seems necessary, consult our Service Department for assistance.

Before calling, refer to the serial number label on the rear of the case top to obtain the following:

- *BOM number*
- *Serial number*

High Pressure Cutout
(Water-Cooled Units Only)

Should the unit's refrigeration discharge pressure become too high the high pressure cutout will activate and shut down the unit. High pressures can be caused by a lack of cooling water to the compressor or debris in the refrigeration lines.

Once the cause of the problem has been identified and corrected you must manually reset the cutout. The cutout location depends on the size of your unit. On the HX-75, it is behind the right side panel, on the HX-100 and HX-150 it is behind the left side panel, and on the HX-200 through HX-750 it is behind the rear panel.

Locate the white reset switch on the high pressure cutout. Press in on the switch until a "click" is heard. If the reset does not "click" the cutout was not activated and the unit shut down occurred for another reason.

Section VI Special Features

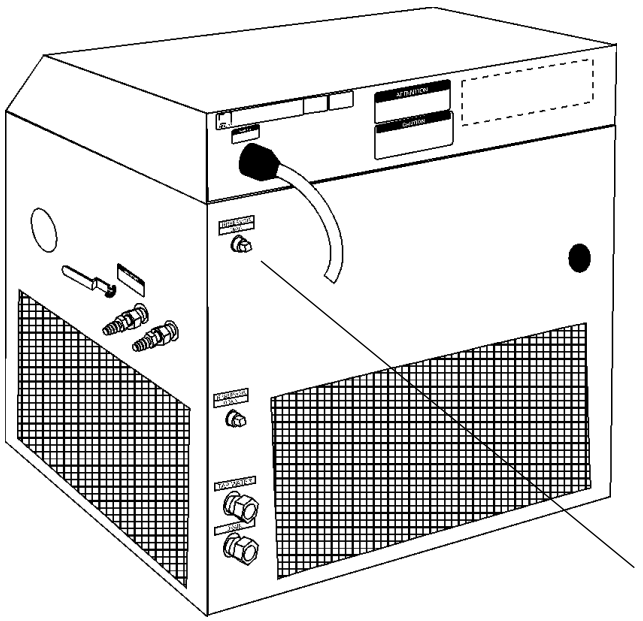
Automatic Refill Device (Optional)

The automatic refill device is designed to maintain the correct level of cooling fluid in the reservoir. The device consists of a float switch in the reservoir and a solenoid valve on top of the reservoir. If the cooling fluid level falls, the float switch will drop, opening the solenoid valve and allowing make-up fluid to fill the reservoir. Once the cooling fluid level reaches the proper level, the float switch will rise and the solenoid valve will close.

The plumbing connection for the refill device is located at the right rear corner of the unit and is labelled AUTO REFILL. This connection is a $^{3}/_{8}$ inch OD stainless steel barbed fitting.

Connect this fitting to a make-up fluid source using $^{5}/_{16}$ or $^{3}/_{8}$ inch ID flexible tubing. Make sure all tubing connections are securely clamped.

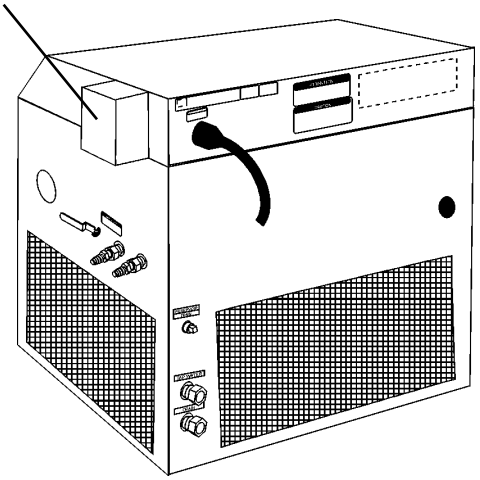
Tubing is available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).



Heater Package (Optional)

The heater package option consists of an immersion heater in the unit's fluid reservoir, a high temperature limit device, a solid state zero-crossing relay, a heater ENABLE/DISABLE switch and a FAULT indicator. The ENABLE/DISABLE switch and the FAULT indicator are located on a small control box appended to the right side of the case top. The FAULT indicator will light if the high temperature limit device is tripped. The high temperature limit device will disconnect power to the heater if the heater surface temperature exceeds a preset limit.

Heater Package Control Box (Typical)



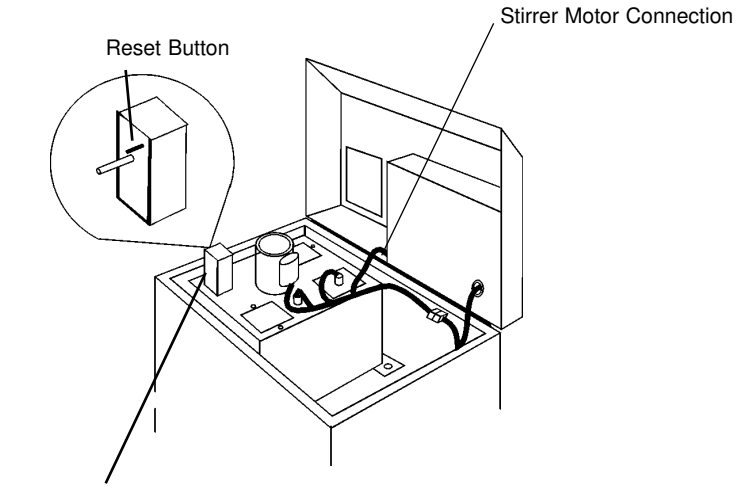
With the ENABLE/DISABLE switch set to ENABLE, the heater will cycle on and off under the control of the temperature controller. With the switch in the DISABLE position, the heater will remain off.

The heater high temperature limit device senses the surface temperature of the heater. If the heater temperature becomes too high, the limit device opens a mechanical relay to remove power from the heater.

The heater surface temperature may operate several degrees higher than the reservoir fluid. The limit device is factory set to a temperature above the upper limit of the temperature controller's range.

For personal safety and equipment reliability, the following procedure must only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

To reset a tripped temperature limit device, lift and open the case top. The case top is secured to the unit base by a hinge between the case top and the base (along the rear of the unit), and by two spring clips located at the front corners. To gain access to the temperature limit device, disengage the spring clips with a flat bladed screw driver and lift the front of the case top and tilt it back. A support brace, located on the right side of the inner case, will stop and support the case top.



You must identify and correct the fault before restarting the unit.

The protection device and the heater power connections are located in a small stainless steel box on top of the fluid reservoir. The protection device has a reset button and a temperature limit adjustment shaft. Press the reset button to restore operation.

Some units equipped with heaters do not have a power cable. Installation of the cable is your responsibility. Wire the unit in conformance to local, state and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is your responsibility to assure a proper ground connection is provided. For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician.

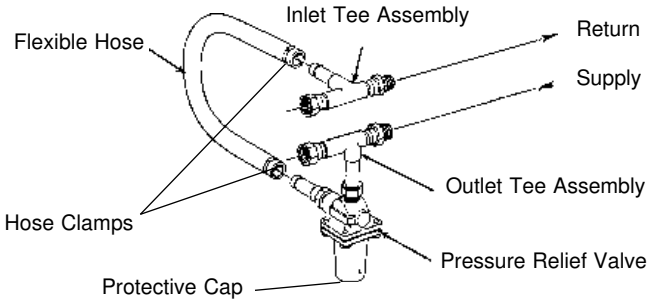
To access the power cable connection box and install the cable:

- Lift the unit's bonnet.
- Remove the panel under the right half of the bonnet by removing the screws and the stirrer motor connection. (The stirrer motor connection is located at the lower left corner of the bonnet, see illustration above.)
- Remove the plastic plug on the rear of the bonnet. We recommend that you install an electrical conduit in place of the plastic plug.
- Insert your cable through the conduit.
- Locate the connection box and connect your cable to L1 and L2 (both connections are labeled) and to the ground stud (not labeled).
- Replace the panel and stirrer motor connection.

External Pressure Regulator (Optional)

For applications requiring a maximum pressure less than 55 psi, an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 psi. If the pressure of the fluid leaving the unit exceeds the valve setting the relief valve will bypass the fluid back into the unit to relieve the pressure. The pressure of the system is determined by the back pressure of the connected equipment and the flow rate of the recirculating fluid to your application.

Connect the EPR assembly as shown below. Tighten the hose clamps tight enough to prevent leakage. Do not over-tighten or the clamps will “bite” into the flexible tubbing and can cause excessive wear.



Connect the outlet tee assembly to the inlet of your application. Connect the inlet tee assembly to the outlet of your application.

Adjustment

When adjusting the relief valve some leaking may occur, place a container under the valve during adjustment.

Remove the protective cap and locate a threaded fitting with a slot for a large screwdriver. Hold the threaded fitting in place and loosen the lock nut on the valve body until it is almost flush with the threaded fitting. Unscrew the threaded fitting three to four turns. (If the threaded fitting unscrews completely from the valve housing, screw it back in two to three turns.)

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and your application. Monitor the operating pressure of the HX unit. Turn the threaded fitting until the desired relief pressure is set (the EPR valve cannot be set lower than the total back pressure of your instrument, or flow will not be received).

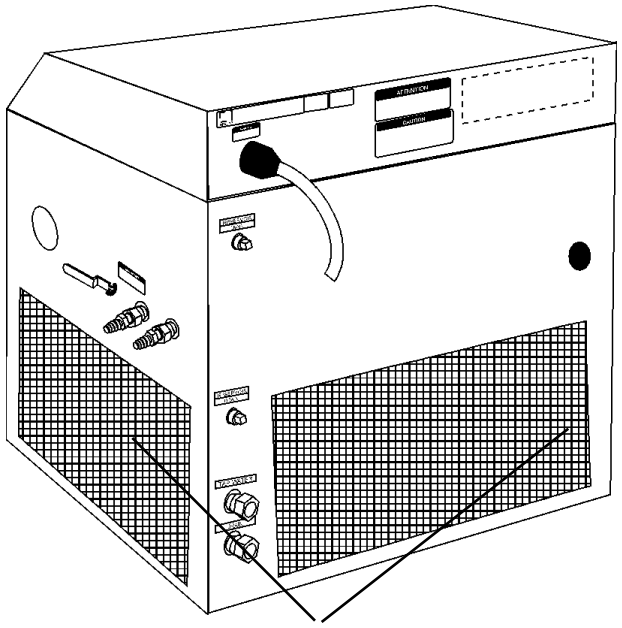
Tighten the locknut to secure the position of the threaded fitting. Open the hose between the EPR outlet tee assembly and your application.

Pump Motor Overload Protector

Refer to the serial number label on the rear of the case top for the unit's specific electrical requirements; specifically, identify the phase requirements.

The overload protector prevents the pump motor from exposure to excessive current. If an overload fault occurs, due, for example, to excessive pressure or flow, or excessive ambient temperature, the overload protector will shut off the pump motor. The overload protector will automatically reset after approximately one to two minutes.

If a fault occurs, a red lamp on the protector enclosure will light while the pump motor is off. The lamp goes out once the protector resets.



The pump motor overload protector is located directly under the fluid reservoir. It is in the left rear corner for HX200s and HX300s units. It is at the side access panel for HX500s and HX750s units.

The overload protector can be adjusted to require manual resetting after an overload fault. Contact our Service Department for adjustment instructions (see Preface, After-sale Support).

The unit will shut down in the event of a low flow fault. Manually restart the unit after the protector resets (if the RESTART switch on the Interface Access. panel is in the AUTO position, the unit will restart automatically).

If you are unsure of the phase of the pump motor in your unit, contact our Service Department (see Preface, After-sale Support).

Remote Condenser (Optional)

Units with the optional remote air-cooled condenser are equipped with high and low refrigeration pressure monitors. The monitors are connected internally to a pressure gauge that monitors refrigeration pressure at the suction side of the compressor. The monitors protect the refrigeration system from operating under excessively high and low refrigeration pressures. A pressure fault occurs when the refrigeration pressure exceeds the set pressure limit.

The status of the monitors is indicated by the COMPRESSOR LOW PRESSURE and COMPRESSOR HIGH PRESSURE indicators located on the operator panel.

In the event of either a low or high refrigeration pressure fault, the unit will shut down. The unit must be manually restarted after the cause of the fault has been identified and corrected. If both indicators are lit simultaneously, an interruption in the main power supply has occurred.

Nitrogen Purge (Optional)

Units equipped with nitrogen purge valves are designed to accept a constant flow of dry nitrogen into the reservoir. The nitrogen blankets the cooling fluid reducing fluid evaporation.

Remove the reservoir cover by removing the screws. Fill the reservoir with fluid. Replace the reservoir cover and screws. Connect the nitrogen line to the valve on the reservoir cover.

A pressure regulator, set to 0.5 psig (0.35 kg/cm^3) or lower, should be used to prevent fluid overflow.

Particulate Filters (Optional)

Some custom units are fitted with particulate filter assemblies attached to the supply side of the recirculation water. The frequency for cleaning/changing the filter depends on your usage. Should the unit's performance be degraded, check the filter.

Filters are available from NESLAB, contact our Customer Service Center. Before calling refer to the serial number label on the rear of the unit to obtain the following information:

-BOM number
-Serial number

Section VII Maintenance

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Condenser Cleaning (Air-cooled units only)

For proper operation, the unit needs to pull substantial amounts of air through a finned condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The frequency of cleaning depends on the operating environment. It is recommended that a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

For "standard" air-cooled units, periodic vacuuming of the fins on the condenser is necessary.

For units with the optional remote air-cooled condenser, remove any debris from around the condenser site. If a visible accumulation of dust or dirt is found on the condenser fins, the condenser should be cleaned with a condenser cleaning solvent and rinsed with water.

Exercise caution not to damage the condenser fins or coil. Condenser fin or coil damage can result in a loss of performance and, in extreme cases, refrigeration system failure.

Algae

To restrict the growth of algae in the fluid reservoir, it is recommended that the reservoir cover be kept in place and that all recirculation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, one gram per gallon.

Section VIII Service

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

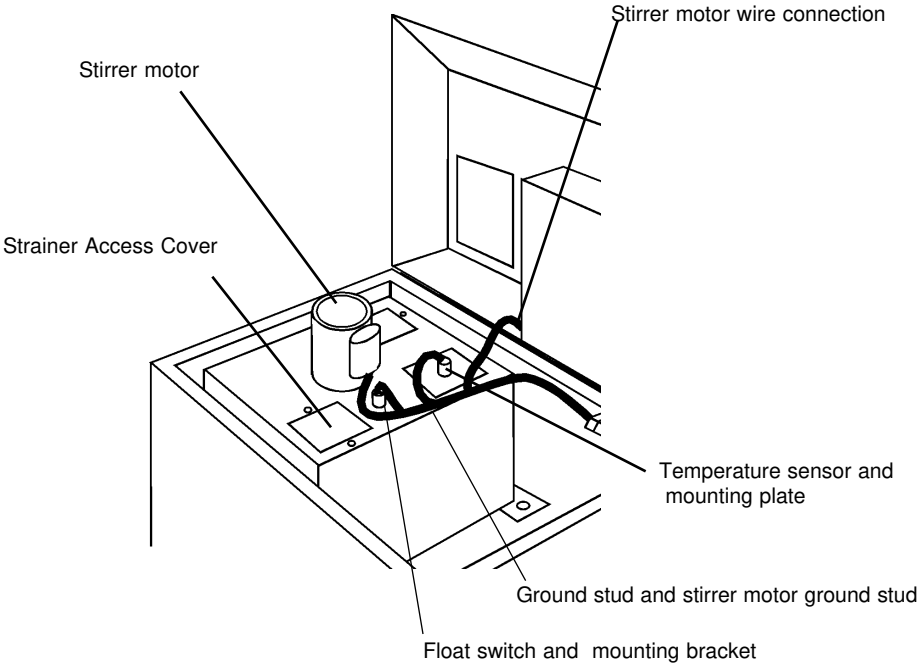
Configuration

Case Top

The unit has a hinged case top to allow service access. The case top is secured to the top of the unit base by a hinge between the case top and base (along the rear of the unit), and by two spring clips located at the front corners, see illustration on page 3. To gain access to the pump assembly or the reservoir area, disengage the spring clips with a flat bladed screw driver and lift the front of the top cover and tilt it back. A support brace, located on the right side of the inner base, will stop and support the case top. Ensure the spring clips engage when the top is lowered back into position.

Reservoir Cover

Access to the inside of the fluid reservoir is necessary to clean the reservoir. The figure below illustrates a typical layout of the components mounted on top of the reservoir cover. The component layout varies depending on the unit size. If you are unable to identify the components on your unit's reservoir cover, contact our Customer Service Department for assistance (see Preface, After-sale Support).



Disconnect the unit from its power source before removing the reservoir cover.

Locate the reservoir stirrer motor (units with plate heat exchangers and HX-75s do not have a stirrer motor; HX-500s and HX-750s have two stirrer motors). Disconnect the motor wires at the plug located on the side of the electrical box cover. Also disconnect the green ground wire that connects the ground stud on the reservoir cover to the unit's grounding bar.

Locate the float switch mounting bracket. Remove the two stainless steel screws that secure the bracket to the reservoir cover. Carefully remove the mounting bracket and place the assembly in an area adjacent to the reservoir. Make sure not to strain the connecting wires.

Locate the temperature sensor mounting plate. Remove the two stainless screws that secure the bracket to the reservoir. Carefully remove the sensor mounting plate with the sensor(s) attached and place the assembly in a protected area adjacent to the reservoir. Make sure not to damage the sensor(s) or strain the connecting wires.

Remove the stainless steel screws that secure the reservoir cover to the reservoir. Remove the cover and place it to one side in a manner that protects the stirrer motor blades from being bent.

Service Access Panels
Service access panels on your unit allow easy access to the pump and refrigeration assemblies. Panel location varies with the size and type of unit. The panels are designed to allow removal without disconnecting the HX from the instrument being cooled.

Disconnect the unit from its power source before removing any of the access panels.

Reservoir Cleaning

Periodic reservoir cleaning is necessary. We recommend that a visual inspection of the reservoir be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Disconnect the unit from its power source and drain the reservoir before cleaning the reservoir.

Lift the top cover to access the reservoir. Remove the reservoir cover as described in Section VIII, Configuration. Clean the reservoir with a cleaning fluid compatible with the recirculating system and the cooling fluid.

Do not use steel wool or other abrasive materials. They can scratch the stainless steel surface and initiate rusting.

When the reservoir is clean, re-assemble the cover assembly and close the case top. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Pump and Flow Switch Strainers

The pump and flow switch strainers require cleaning. If debris is drawn into the recirculating system, the pump strainer will prevent the material from being drawn into the pump and damaging the pump vanes and the filter strainer will prevent material from clogging the flow switch.

After initial installation, the strainers may become clogged with debris and scale. Clean the strainer after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

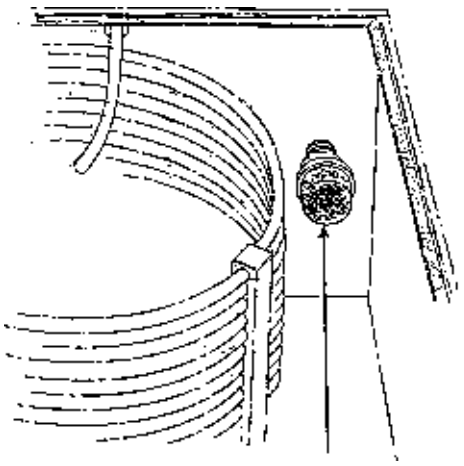
Disconnect the power cord from the power source and drain the fluid reservoir before cleaning the strainer. Do not operate the unit with any strainer removed.

PD-2 and TU Pumps

The wire mesh pump strainer is located in the reservoir on the pump suction line. Remove the strainer access panel located on top of the reservoir cover to access the strainer.

Cover the strainer with a plastic bag to help catch any debris which may become free.

Unscrew the strainer and rinse it with water. Replace the strainer. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.



Pump Strainer

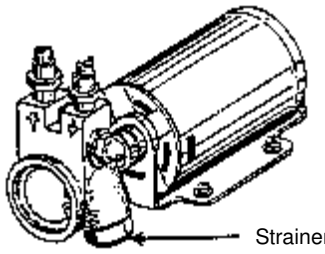
PD-1 Pumps

The wire mesh pump strainer is located on the inlet (suction) side in the pump head.

Lift the case top and remove the top right access panel to access the pump area. Unscrew the larger of the two acorn nuts on the pump head and remove the screen. Clean the screen by rinsing it with water.

When the screen is clean, replace it in the pump head and tighten the acorn nut. Replace the access panel and close the case top.

Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

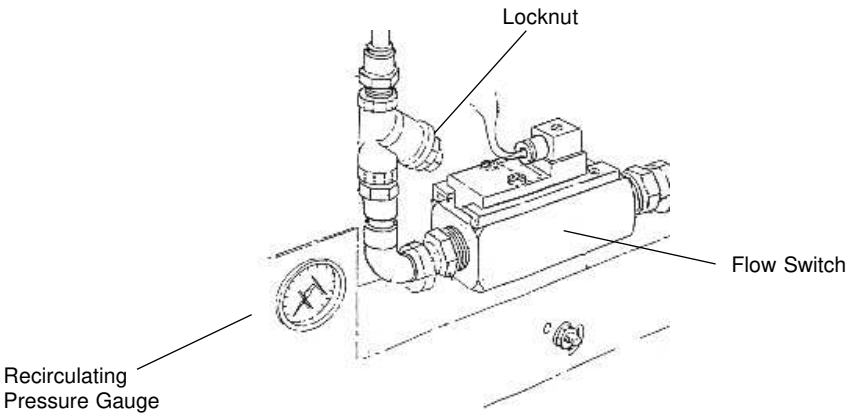


Flow Filter Strainer

The flow filter strainer is located behind the top right access panel on the inlet side of the flow switch.

Unscrew the locknut and remove the screen. Clean the screen by rinsing it with water.

Replace the strainer and locknut. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

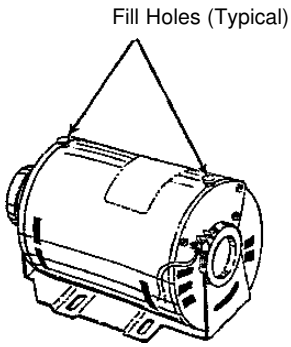


Pump Motor Lubrication

Units with PD-1 and PD-2 pumps require pump motor lubrication. Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit.

Motors used to drive the pump are manufactured by several companies. These motors use sleeve type bearings with large oil reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil in each fill hole on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



Phase Rotation

Three phase units with three phase pump motors are equipped with a phase rotation interlock. Refer to the serial number label on the rear of the case top for the specific electrical requirements of your unit. The interlock prevents the unit from starting if the phase rotation is wrong. If the unit will not start, see Section IX, Checklist. If the options in the checklist are not applicable, the problem may be phase rotation.

Disconnect the unit from its power source, remove the rear panel and the junction box cover (if so equipped). Reverse any two line conductors on the line side of the relay.

Never remove the green ground wire.

Replace the junction box and the rear panel. Reconnect the unit to its power source. If the unit will not start, contact our Customer Service Department.

Suction Discharge Pressue Speed Check (R-22)

Air-Cooled Standard and High Temperature Units (All Pump Types)[1]

Unit	Suction(psi)	Discharge(psi)	Speed Check(°C/Minute)
HX-75	77 - 84	225 - 250	1.5 - 1.7
HX-100	75 - 83	245 - 265	1.3 - 1.6
HX-150	70 - 73	240 - 270	2.0 - 2.5
HX-200	85 - 105	230 - 255	1.6 - 1.9
HX-300	84 - 105	270 - 305	2.4 - 2.7
HX-500	80 - 90	215 - 235	2.0 - 2.4
HX-750	65 - 75	185 - 215	

Water-Cooled Standard and High Temperature Units (All Pump Types)[2]

Unit	Suction(psi)	Discharge(psi)
HX-75	72	170
HX-100	86 - 92	180
HX-150	65	175
HX-200	85 - 90	180
HX-300	73 - 78	180
HX-500	75 - 82	150
HX-750	50 - 60	180

1. 27°C unit temperature, water in reservoir, access panel removed.
2. 25°C unit temperature, water in reservoir.

NOTE: Refrigerant R-22. For low temperature units please call NESLAB.

Section IX Troubleshooting

Checklist

Unit will not start

For CE Mark units, ckeck the circuit breaker setting on the side of the bonnet.

Check power source for correct voltage output. Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit. Power source must be specified voltage, ±10%.

Check house circuit breaker.

On three phase units with three phase pump motors, the phase rotation may be reversed (see Section VIII, Phase Rotation).

On water-cooled units, ensure the facility water is on and make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection. Check the High Pressure Cutout, it may need to be reset (see Section V, Operation).

Unit will not circulate fluid

Check the tubing, flow switch strainer, and any optional filters/cartridges between the unit and your application for obstructions or for cleaning/ replacement.

Units with PD and TU type pumps may require pump strainer cleaning. Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit. For instructions on cleaning the pump strainer, see Section VIII, Pump Strainer.

On units with CP type pumps, if the back pressure of the instrument being cooled is greater than the maximum pressure of the pump, adequate flow may not be obtained. Check for obstructions in the tubing.

Inadequate temperature control

Make sure the installation of the unit is in compliance with the conditions described in Section III.

Make sure the heat load of the instrument being cooled is not greater than the cooling capacity of the unit.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

- BOM number
- Serial number

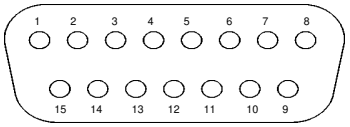
* HX-750 air-cooled units. HX-750 water-cooled are the same size as the HX-500 units.

1. Dimensions are given in inches, ±1/8 inch.
2. Model HX-750 with a water-cooled condenser has the same dimensions as an HX-500.
4. Dimension A is the distance from the floor to the center of the SUPPLY and RETURN connections.
5. Dimension B is the distance from the floor to the center of the DRAIN connection.
6. Dimension C is the distance from the floor to the center of the tap water outlet connection.
7. Dimension D is the distance from the center of the SUPPLY connection to the rear of the unit case.
8. Dimension E is the distance between the SUPPLY and RETURN connections
9. Dimension F is the distance between the center of the TAP WATER connections (upper inlet and lower outlet).
10. Dimension G is the distance from the edge of the unit case to the center of the three plumbing connections.
11. Dimension H is the distance from the floor to the bottom of the case, height of the castors (not shown).
12. Dimension I is the depth of the unit with the case top open (not shown).
13. Dimension J is the height of the unit with the case top open (not shown).

AppendixA Additional Electrical Information

REMOTE CONT. Receptacle

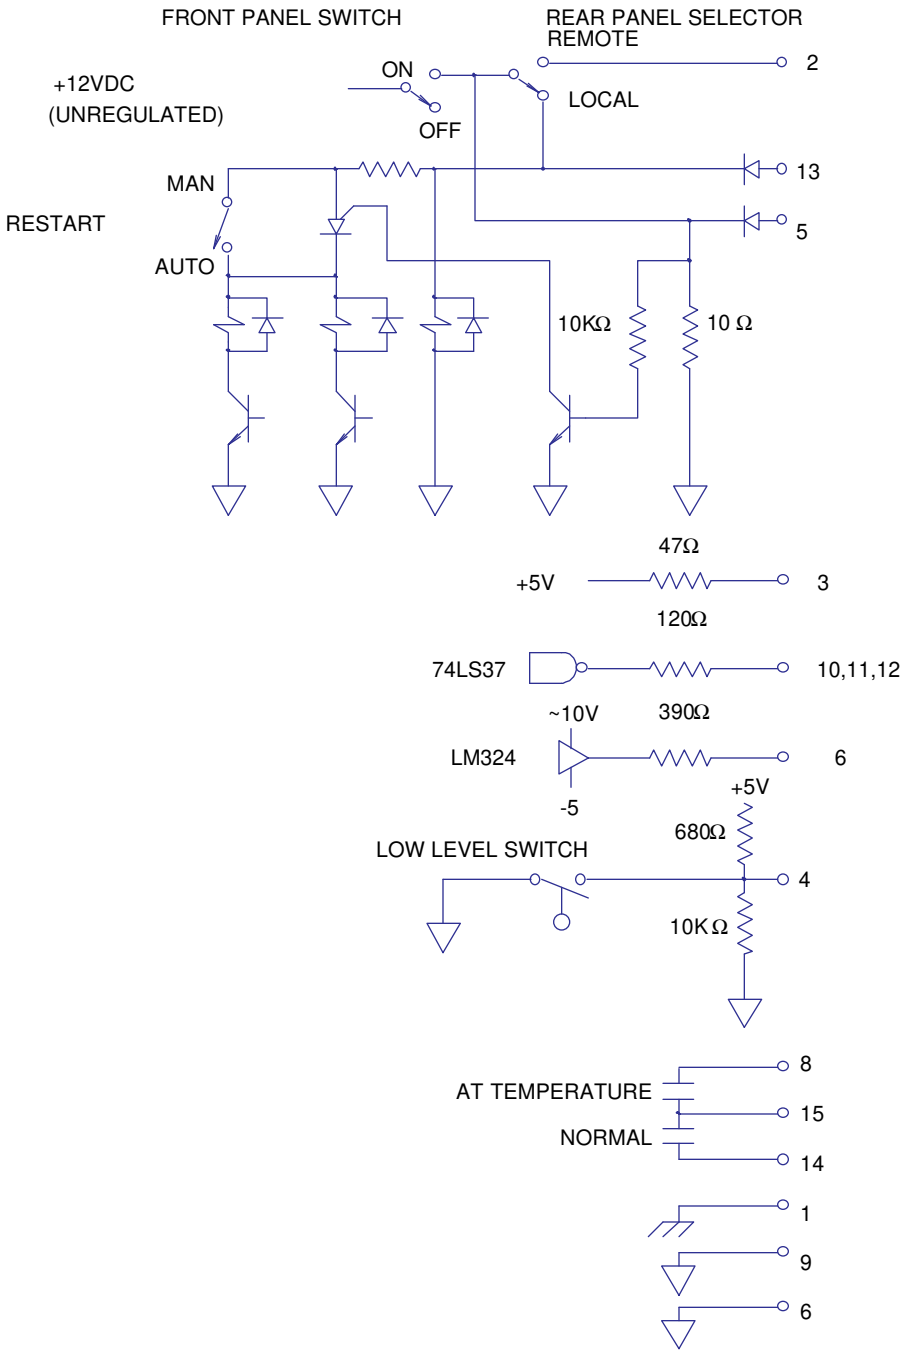


15 pin D-subminiature male receptacle

Pin #	Alarm circuitry	Control circuitry
1		Chassis ground.
2		ON/OFF control circuit power (+12VDC, unregulated). See ON/OFF/START Logic.
3	DC for LED indicators (+5VDC, current limited through 47Ω resistor).	
4	Low level switch (+5VDC, current limited through 680Ω resistor).	
5		START button connection. See ON/OFF/ START Logic.
6		Heater ON command, solid state relay drive (+8 to +13 VDC, current limited through 390Ω resistor). Contact our Sales Department for more information.
7	Reserved.	
8	AT TEMPERATURE contact (24V, 1A maximum. AC and DC). When the fluid temperature is between the high and low temperature limits, this pin is connected to pin 15. See Relay Contact Logic.	
9	Common for DC power supplies, grounded.	
10	FAULT indicator drive (-). Connect LED cathode here, anode to pin 3, for display of FAULT status. See External Status Indicator Logic.	
11	NOT AT TEMPERATURE indicator drive (-). Connect LED cathode here, anode to pin 3, for display indicating when the fluid temperature is not between the high and low temperature limits. See External Status Indicator Logic.	
12	NORMAL indicator drive (-). Connect LED cathode here, anode to pin 3, for display indicating when all status monitors (High Temperature, Low Temperature, Low Level, Low Flow) are normal. See External Status Indicator Logic.	
13		RUN switch connection. See ON/OFF/ START Logic.
14	NORMAL contact (+24V, 1A maximum. AC and DC). When all status monitors are normal (see pin 12) this pin is connected to pin 15. See Relay Contact Logic.	
15	Relay contact common connection.	

The exclusion of alarm circuitry is an available option for Series II temperature controllers. The alarm circuitry pin connections are not used on these controllers.

Remote Connector Circuitry



ON/OFF/START Logic

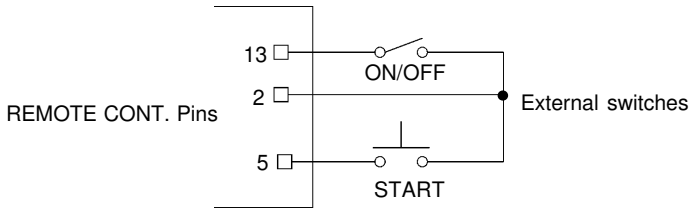
When the START/STOP LOCAL/REMOTE switch is set to LOCAL, the operator panel ON/OFF/START switch controls the unit.

When the LOCAL/REMOTE switch is set to REMOTE, the operator panel ON/OFF/START must be in the ON position for the unit to operate. An external switch is necessary to complete the circuit and start the unit.

If the operator panel ON/OFF/START switch is OFF, then external switches cannot start the unit. This allows an operator or service person at the unit to override the external controls and shut down the unit.

If the operator panel ON/OFF/START switch is ON, the external ON/OFF and START switches function just like the operator panel switch.

If the Interface Access. panel RESTART AUTO/MAN switch is set to AUTO, the START switch is not needed to start the unit. It will start when the external ON/OFF switch is switched to ON or when power is restored after an outage.



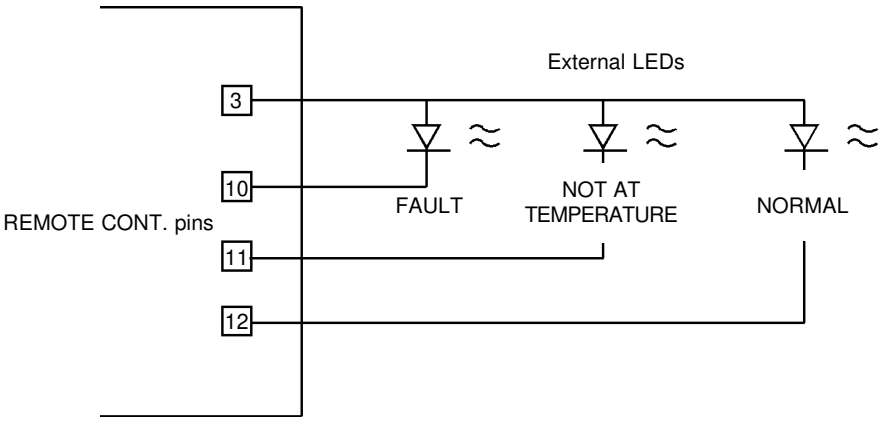
External Status Indicator Logic

The FAULT indicators light if one of the conditions monitored by the alarm circuit (High and Low Temperature, Low Level, and Low Flow) has occurred.

To prevent nuisance alarms, this signal does not indicate a FAULT condition when the unit is first turned on and the fluid temperature is outside the alarm limits. This situation will typically occur when the high temperature limit is set to a temperature below ambient. Once the fluid temperature is within the high and low temperature limits, subsequent excursions beyond those limits will produce a FAULT indication.

The NOT AT TEMPERATURE indicator lights when the operating temperature is not between the high and low temperature limits.

The NORMAL indicator lights when all four status monitors are normal (no faults). The NORMAL indicator logic is similar to the FAULT indictor logic; a temperature out of limits when the HX is first turned on is considered normal (not a fault).



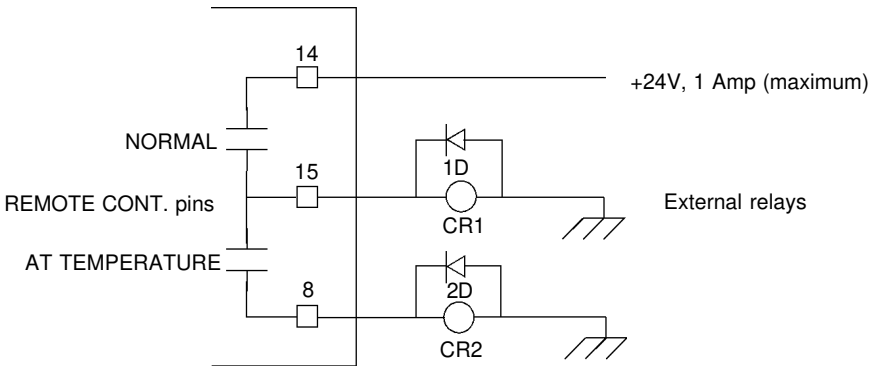
Relay Contact Logic

The NORMAL relay contacts are closed if all four status monitors are normal (no faults).

To prevent nuisance alarms, the contacts are closed when the unit is first turned on and the fluid temperature is outside the alarm limits. This situation will typically occur when the high temperature limit is set to a temperature below ambient. Once the fluid temperature is within the high and low temperature limits, subsequent excursions beyond those limits will cause the contacts to open.

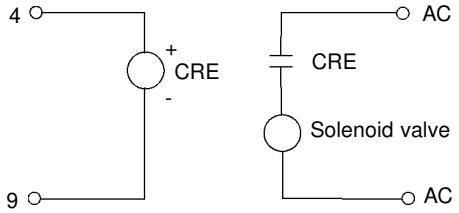
The AT TEMPERATURE contacts are closed if the fluid temperature is between the high and low temperature limits.

In the example circuit shown below, CR1 is energized when the unit is ON and there are on abnormal conditions. CR2 is energized when there are no abnormal conditions AND the fluid temperature is within limits. CR1 can serve as an alarm activator, while CR2 can indicate that the unit is ready to provide cooling fluid to the instrument being cooled.

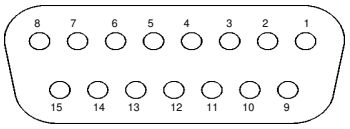


Low Level Switch/Auto Refill

In the example circuit below, when the fluid level in the reservoir drops, DC is applied to the CRE control input to energize the solenoid valve. The valve opens to fill the reservoir. When the fluid level rises, CRE is turned off. If the level does not rise after about 30 seconds, a low level alarm occurs.



ACCESS Receptacle



15 pin D-subminiature female receptacle

Pin #	Function
1	Chassis ground.
2	No connection.
3	Span +. Indicates the maximum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +350mV =+35.0°C).
4	Span -. Indicates the minimum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +50mV = +5.0°C).
5	AT TEMPERATURE indicator solid state relay drive (TTL output. Part of the alarm circuitry in the REMOTE CONT receptacle). Connect solid state relay drive (-) here, (+) to pin 3 on the REMOTE CONT receptacle to energize relay when the fluid temperature is between the high and low temperature limits. Pin reads 0V when fluid temperature is between limits, -5VDC when out of limits. 6	Analog ground. The analog ground is physically separated from the power ground throughout the unit. To prevent offsets that result ground currents, the analog and power ground are only connected at the power supply. Analog ground should only be used as a reference pin when no current is flowing.
7	Sensor temperature (current limited through 2.7K OHM resistor). The fluid temperature, as measured by the controller's sensor located in the reservoir, can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
8	Setpoint out. The present temperature setpoint can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
9	Power ground. This pin should be used for functions that require the unit to draw input or output current. See pin 6.
10	No connection.
11	No connection.

Pin#	Function
12	Digital display (input only). An external voltage can be displayed on the operator panel digital display by applying the voltage to this pin. The display has a low input resistance and a full scale rating of ±1.99VDC. Input is referenced to analog ground, pin 6. The maximum voltage applied to the display should be limited to ±2VDC.
13	-5V. Power supply of -5VDC (15mA maximum).
14	+5V. Power supply of +5VDC (15mA maximum).
15	Setpoint in. The temperature setpoint can be controlled by applying a known voltage to this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +230mV = +23.0°C. The DISABLE/ENABLE switch must be in the ENABLE position to control the setpoint from this pin.

Appendix B DeltaTemp Programming Software

DeltaTemp programming software is now available for free download from NESLAB ONLINE BBS (Bulletin Board System) at 603-427-2490.

DeltaTemp software allows you to write custom temperature programs for NESLAB digital units (any unit with a digital temperature readout AND a 10-15 pin INTERFACE port). The menu-driven program provides a table format for entering temperature parameters and a visual graph confirmation of the program you have designed. Program time can range from 0 to 999 minutes with unlimited looping. Choose upper and lower temperature limits and monitor system status with an audible alarm. DeltaTemp can also record your results on a printed graph or file. DeltaTemp is a DOS program, and requires an IBM or 100% compatible computer.

DeltaTemp may require use of a computer interface device, depending on which NESLAB unit is being used. Refer to the setup diagram in the DeltaTemp folder for full details.

To download the software, go to: CONFERENCES / SOFTWARE / DeltaTemp.

The folder also contains the operating manual, setup diagrams, application notes, and directions on making your own interface cable.

NESLAB ONLINE is a FirstClass® system accessible by general terminal software (Windows Terminal accessory, ClarisWorks Communications, Z-Term, Pro-Comm, or similar).

To use the full graphics and features of the BBS we recommend using FirstClass® Client software. FirstClass® Client is available for Macintosh or Windows platforms. It is available from many sources:

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

WARRANTY

Quick Start Procedures Air-Cooled Models

Installation

Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Avoid excessively dusty areas and institute a periodic cleaning schedule. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the right side of the unit and are labelled SUPPLY and RETURN. These connections are ¾ inch FPT. Remove the plastic protective plugs from both plumbing connections. Connect the SUPPLY fitting to the inlet of your application. Connect the RETURN fitting to the outlet of your application.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within one inch of the top. If the fluid capacity of your application and recirculation lines is significant, have extra fluid on hand.

NESLAB recommends using distilled/deionized water with a 0.05 to 0.1 megohm-cm reading. If you do not have access to distilled/deionized water we recommend using filtered tap water.

Operation

Before starting the unit, double-check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

On models HX-300 through HX-750, the unit must be connected to the power source for at least 12 hours to allow the compressor oil to heat and separated from the refrigerant.

To start the unit first connect it to main power. On units equipped with a circuit breaker, place it to the on position. The MAIN POWER LED will illuminate. Place the ON/OFF switch to the ON position. The COOL and HEAT LEDs on the front panel indicate the status of the refrigeration system. COOL is on when the unit is removing heat from the cooling fluid, HEAT is on when heat is being added to the fluid reservoir. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Temperature Adjustment

To display the temperature setpoint, while displaying the reservoir temperature press the NEXT key. To adjust the temperature setpoint use the YES/NO keys as described in this manual.

Flow Control

The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the full vertical position you receive full flow, the full horizontal position is no flow.

Periodic Maintenance

Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend making a monthly visual inspection of the condenser after initial installation. After several months, the cleaning frequency will be established.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual ins-pection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Quick Start Procedures Water-Cooled Models

Installation

Position the unit in a clean environment with easy access to facility cooling water and a drain. The facility water requirements must meet those specified in the instruction or unit performance will be reduced.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear and right side of the unit and are labelled TAP WATER, DRAIN, SUPPLY and RETURN. Remove the plastic protective plugs from all the plumbing connections. Connect the TAP WATER fitting to the facility cooling water and the DRAIN fitting to a drain. Connect the SUPPLY fitting to the inlet of your application and the RETURN fitting to the outlet of your application.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within one inch of the top. If the fluid capacity of your application and recirculation lines is significant, have extra fluid on hand.

NESLAB recommends using distilled/deionized water with a 0.05 to 0.1 megohm-cm reading. If you do not have access to distilled/deionized water we recommend using filtered tap water.

Operation

Before starting the unit, double-check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

Ensure the facility water is turned on.

On models HX-300 through HX-750, the unit must be connected to the power source for at least 12 hours to allow the compressor oil to heat and separated from the refrigerant.

To start the unit first connect it to main power. On units equipped with a circuit breaker, place it to the on position. The MAIN POWER LED will illuminate. Place the ON/OFF switch to the ON position. The COOL and HEAT LEDs on the front panel indicate the status of the refrigeration system. COOL is on when the unit is removing heat from the cooling fluid, HEAT is on when heat is being added to the fluid reservoir. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Temperature Adjustment

To display the temperature setpoint, while displaying the reservoir temperture press the NEXT key. To adjust the temperature setpoint use the YES/NO keys as described in this manual.

Flow Control

The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the full vertical position you receive full flow, the full horizontal position is no flow.

Periodic Maintenance

Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition.

On units with a remote control box, the box is packed in a separate carton. Be sure to locate this separate carton; do not dispose of it by mistake.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

The unit has a warranty against defective parts and workmanship for one full year from date of shipment. Refer to the last page of this manual for complete warranty details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label on the rear of the case top to obtain the following information (see Section II, Description for the serial number label location):

- BOM number _____

- Serial number _____

- Software version (see page 46) _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department for assistance (see Preface, After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Do not attempt to defeat any of the interlock switches or safety features built into the unit.

Observe all warning labels.

Never remove warning label.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the fluid reservoir.

Make sure the unit is off before connecting or disconnecting the power cord or other cables.

Always turn off the unit and, if applicable, disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the fluid reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified NESLAB technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

The HX Series Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and volume.

The unit consists of an air-cooled or water-cooled refrigeration system, a fluid reservoir, a fluid recirculation pump, and a temperature controller. Optional remote temperature controllers and remote probes are also available.

HX units are available with a large number of options. This manual explains how to install, operate, and maintain a “standard” HX unit. This manual also explains some of the available options. Supplemental manuals are supplied with units equipped with options not covered in this manual.

Throughout the manual, you will be asked to consult the unit’s serial number label, or the pump identification label, or both, for specific information. Both labels are located on the rear of the case top.

Kilograms	338	440

1. For safety reasons, the unit is designed to shut down if the reservoir fluid temperature exceeds 7°C of either temperature limit.
2. Modified temperature ranges from -15°C to +90°C are available.
3. Model HX-750 with a water-cooled refrigeration system has the same dimensions as the HX-500. For additional dimensions see page 50.

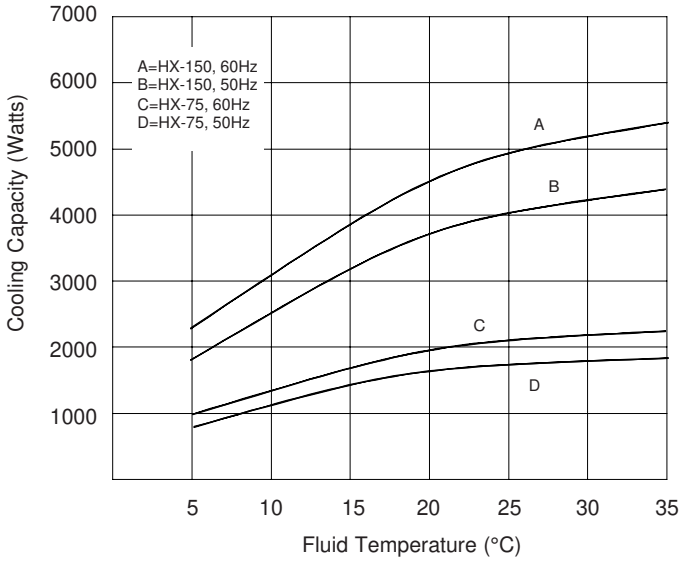
Cooling Capacity

Cooling capacity will vary depending on fluid temperature, ambient temperature, and cooling fluid.

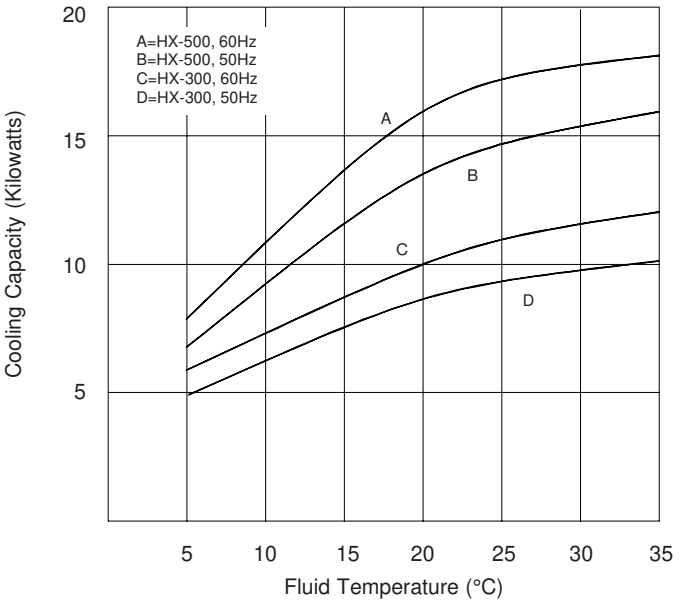
Cooling capacities were obtained under the following conditions:

1. *air-cooled unit operating at +20°C (+68°F) ambient temperature.*
2. *cooling fluid with specific heat of 1.0 was used for fluid temperatures from +5°C to +35°C.*

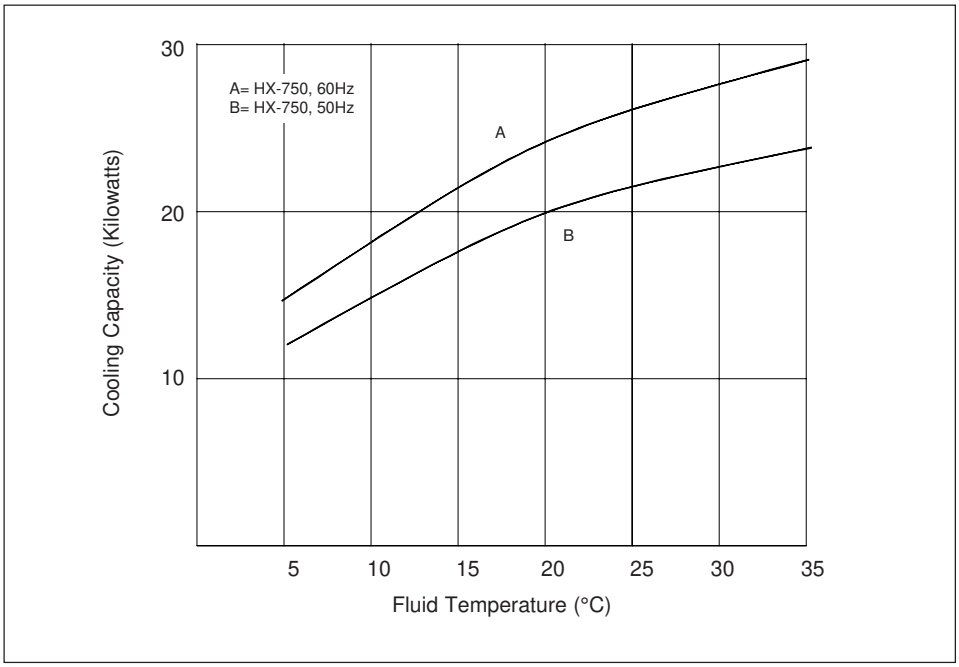
HX-75 & HX-150



HX-300 & HX-500



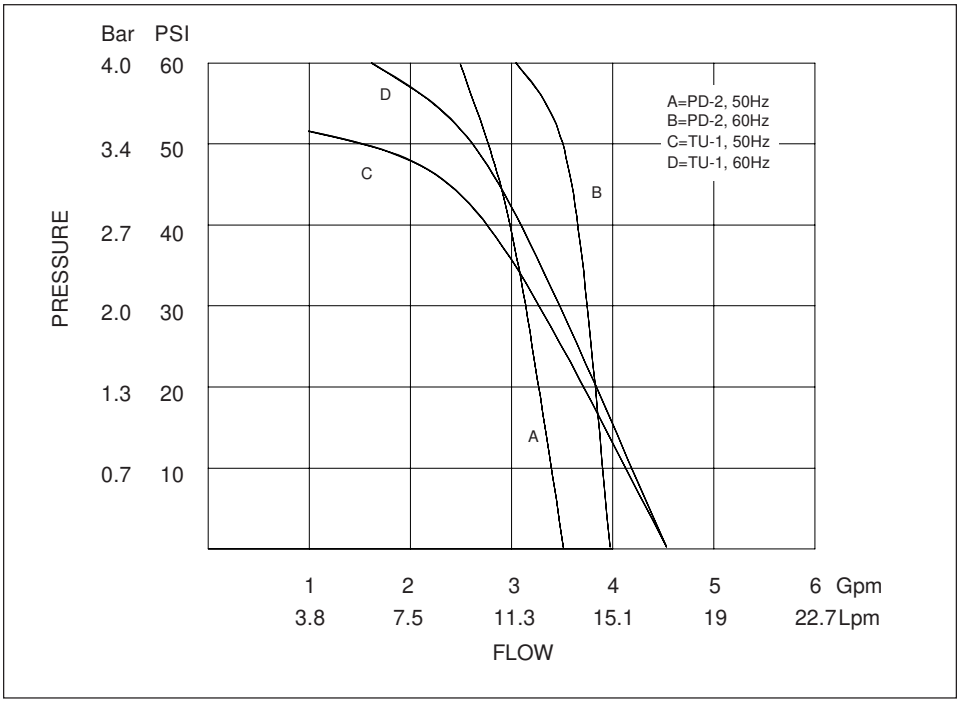
HX-750



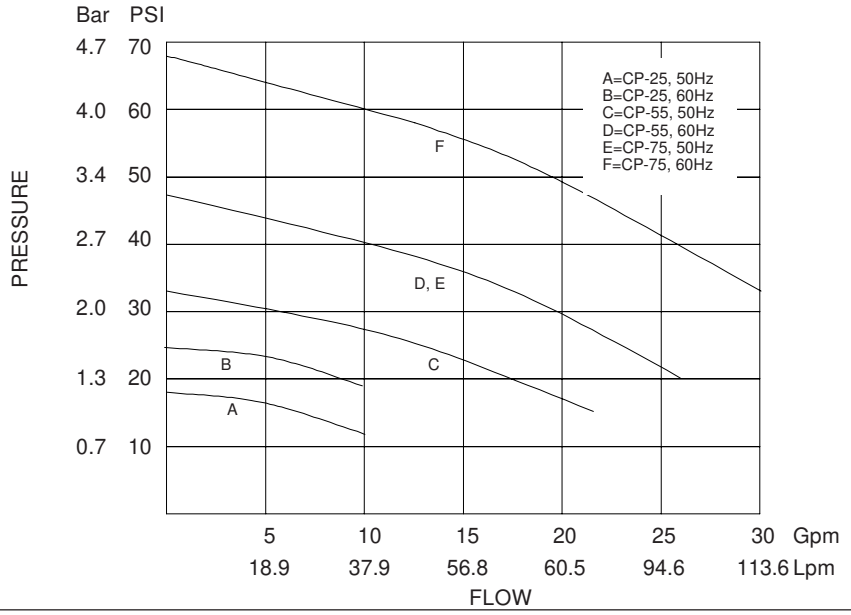
Pump Capacity

HX units are available with one of three standard pump types: positive displacement (PD), centrifugal (CP), and turbine (TU). Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit.

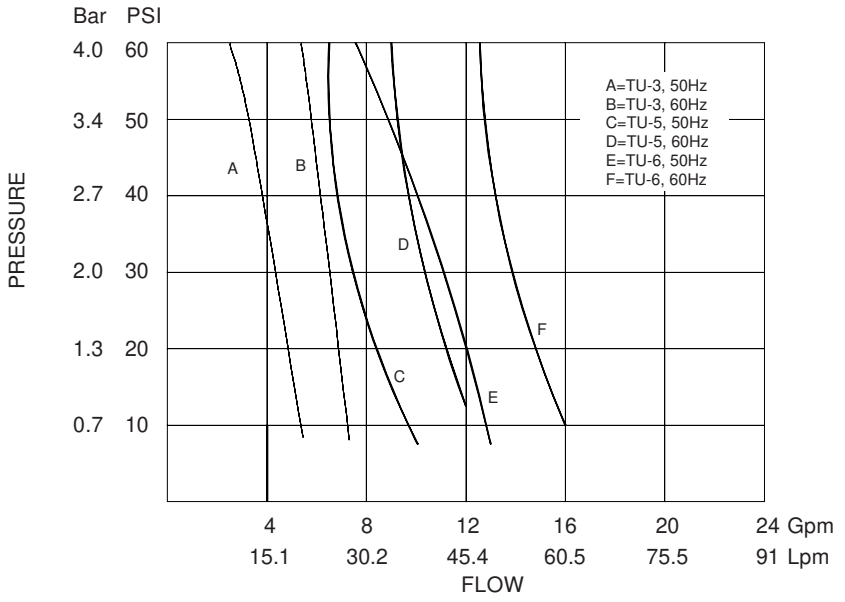
PD2 & TU1



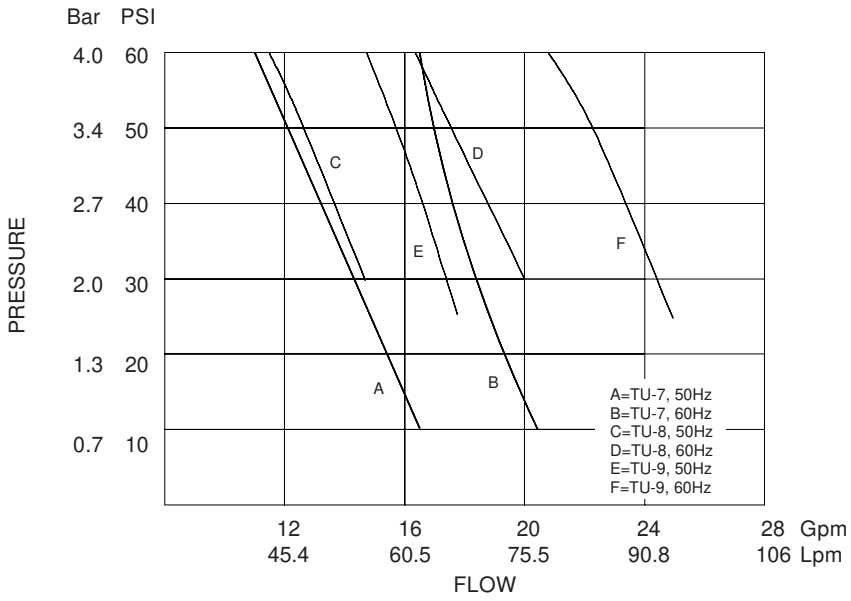
CP



TU-3, 5 & 6



TU-7, 8 & 9



Section III Installation

Site (Air-cooled Units)

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +55°F to +95°F (+13°C to +35°C).

The unit will retain its full rated capacity in ambient temperatures to approximately +75°F (+24°C). Above +75°F, reduce the cooling capacity 1% for every 1°F above +75°F, to a maximum ambient temperature of +95°F. In degrees Celsius, reduce the cooling capacity 1% for every 0.5°C above +24°C, to a maximum ambient temperature of +35°C.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. It must be positioned so the air intake and discharge are not impeded.

On models HX-75 and HX-150, air is drawn through the left side of the unit and discharged through the right and rear. A minimum clearance of 2 feet (0.6 meter) on these three sides is necessary for adequate ventilation.

On models HX-300 through HX-750, air is drawn through the front of the unit and discharged through the side and rear panels. A minimum of 5 feet (1.5 meters) on all four sides of the unit is necessary for ventilation.

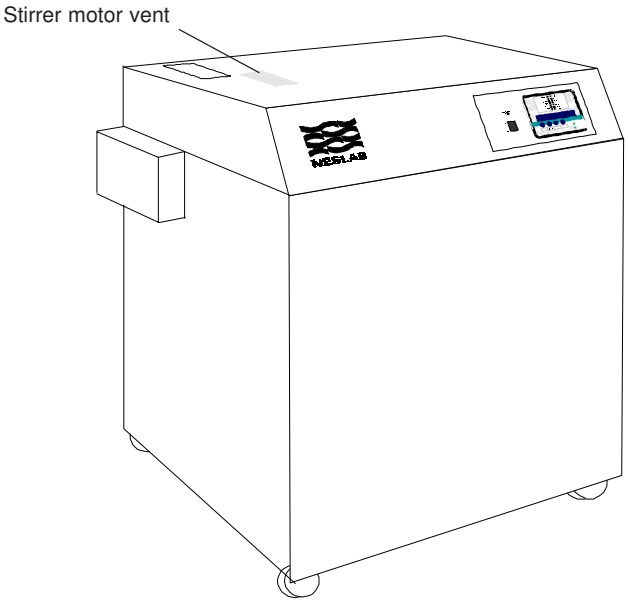
On models with a three-phase condenser fan motor, it is possible to connect the main power and have the motor turn in the wrong direction resulting in incorrect airflow over the condenser. Proper airflow is achieved by exchanging any two main power connectors so air is drawn into the fan. See page 35.

In some applications where space is at a premium, the minimum ventilation clearance can be compromised. However, consult our Sales Department before positioning the unit in a location with less minimum clearance than listed above. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Avoid excessively dusty areas and institute a periodic cleaning schedule (see Section VII, Condenser Cleaning). If the compressor is allowed to overheat the unit's High Pressure Cutout (HPC) will cycle the unit on and off until cleaning is done and proper airflow is restored. This cycling will eventually damage the unit's compressor.

On models HX-150 through HX-750 a stirrer motor is located under the case top. (Models HX-500 and HX-750 have two stirrer motors.) Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation.

NOTE: HX-75s and units with plate heat exchangers do not have stirrer motors.



Refer to the table below to determine the approximate amount of air intake required for the unit to retain its full rated capacity. If the air intake does not meet these standards, cooling capacity will be reduced.

	HX-75	HX-150	HX-300
Air Intake			
Cubic feet per minute	600	1050	1900
Liters per minute	17000	29730	53800

	HX-500	HX-750
Air Intake		
Cubic feet per minute	5000	5600
Liters per minute	141750	158800

Site (Water-cooled units)

The unit should be located in a laboratory or clean industrial environment with easy access to a facility cooling water supply and a drain.

All units are equipped with castors for easy movement. This allows the unit to be placed in a small area, as long as there is ample space for the unit to be moved for access on all four sides. A minimum access clearance of 3 feet (1 meter) on two adjacent sides is recommended.

The facility cooling water supply must meet or exceed the requirements listed in the table shown on the next page for the unit to operate at its full rated capacity. If the facility cooling water does not meet these standards, the cooling capacity will be reduced.

As the temperature of the cooling water supply increases, the required flow rate and pressure of the cooling water supply increases.

For example, with a model HX-150, if the temperature of the cooling water supply is +65°F, the flow rate must be at least 1.5 gallons per minute, with a pressure differential of at least 3.5 PSI. However, if the temperature of the cooling water supply is +85°F, the flow rate must be at least 4.0 gallons per minute, with a pressure differential of at least 10 PSI.

If the unit is being used with a building water supply, the back pressure of the drain must be less than the supply pressure.

A water-regulating valve, located in the TAP WATER line, regulates the flow rate of the cooling water supply as it enters the unit. The valve regulates the flow rate based on the heat load. Flow through the unit stops automatically when the unit is shut off.

On models HX-150 through HX-750 a stirrer motor is located under the case top. (Models HX-500 and HX-750 have two stirrer motors.) Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation. See illustration on page 13.

NOTE: HX-75s and units with plate heat exchangers do not have stirrer motors.

	Temperature of cooling water supply

Electrical Requirements

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is your responsibility to assure a proper ground connection is provided.

Refer to the table below to determine the unit's electrical requirements. Verify the requirements by reviewing the ratings listed on the serial number label on the rear of the case top.

	HX-75 & HX-150		HX-300		
Volts	208-230	220-240	208-230	200-220	380-420
Hertz	60	50	60	50	50
Phase	1	1	3	3	3
Plug	NEMA L6-30P or L6-20P		NEMA L15-30P or L16-20P		

	HX-500 & HX-750	
Volts	208-230	380-420
Hertz	60	50
Phase	3	3

Make sure the voltage of the power source agrees with the unit's voltage and frequency rating. The unit is designed to tolerate deviations of ±10% from the rated line voltage.

Models HX-75 through HX-300 rated 24 Amps or less have an 8 foot (2.4 meter) power cord installed on the unit at the time of shipment.

HX-500s and HX-750s and some units equipped with heaters do not have a power cable. Installation of the cable is your responsibility. Wire the unit in conformance to local, state and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

For personal safety and equipment reliability, only a qualified technician should perform the following procedure.

To access the connections open the pullbox.

- Insert your cable through the conduit.
- Locate 3TB and 4TB and connect your cable. See the illustration on page 34.
- Close the pullbox.

Plumbing Requirements

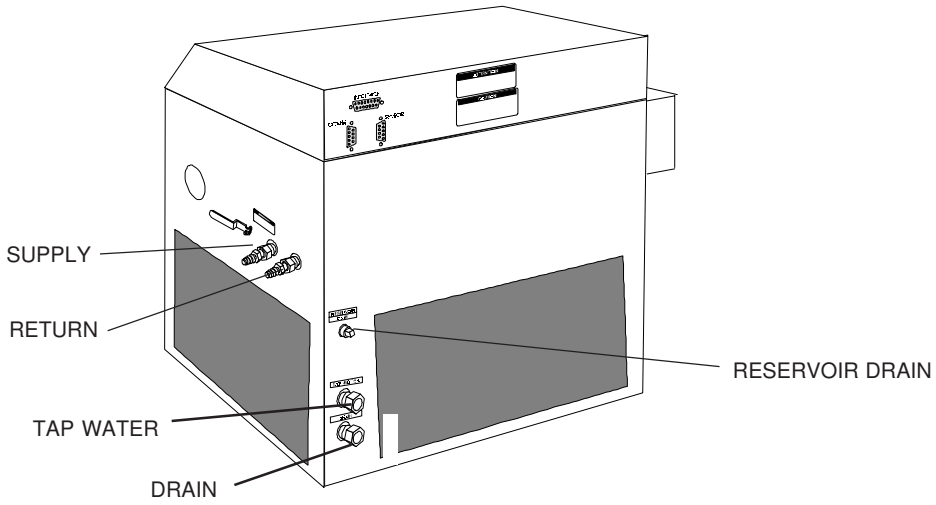
Air-cooled and water-cooled units

Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. Consult the manufacturer of the instrument for a cleaning fluid recommendation.

The plumbing fittings used to connect the HX to the instrument being cooled are located on the right side of the unit (labelled SUPPLY and RETURN). These connections are ¾ inch NPT, unless otherwise specified.

Remove the protective plugs from the SUPPLY and RETURN connections. Connect the SUPPLY fitting to the inlet of your application. Connect the RETURN fitting to the outlet of your application.

The RESERVOIR DRAIN connection, located on the rear of the unit, is a ½ inch FPT fitting connected internally to the unit's fluid reservoir. This fitting is for draining the reservoir. The unit is shipped with a ½ inch MPT plug installed in this fitting. Remove the plug to drain the reservoir.



Two plumbing adapters (¾ inch MPT x 5/8 inch hose) are included with the unit. If the unit is being plumbed to the instrument being cooled using flexible tubing, install the adapters in the SUPPLY and RETURN plumbing ports. To prevent leaking, wrap the threads of the adapters with Teflon® sealing tape before installing them in the plumbing ports. The adapters will accept ½ or 5/8 inch ID flexible tubing.

Flexible tubing, if used, should be heavy wall or reinforced construction. All tubing should be rated to withstand 110 psi at the unit's highest possible operating temperature. Make sure all tubing connections are securely

clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

If the unit is "hard plumbed" to the instrument being cooled or to the cooling water supply, damage can occur if the unit is bumped or jolted from its site. Provisions should be made to prevent the unit from being moved after installation. Once the unit is plumbed, secure the locking castors on the unit's base. If the unit is located in a heavy traffic area where the possibility of collision is imminent, it may be necessary to secure the unit to the site using blocks or mounting brackets.

It is important to keep the distance between the unit and your application as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, they should be made at the inlet and outlet of your application, not at the HX.

If substantial lengths of connecting tubing are required, they should be pre-filled with cooling fluid before connecting them to the unit.

Water-cooled units

The plumbing connections used to connect the water-cooled condenser in the HX to the facility cooling water supply are located at the rear of the unit (labelled TAP WATER and DRAIN). On HX-75s through HX-300s, these fittings are ½ inch FPT. On HX-500s and HX-750s, these fittings are 1 inch FPT.

Remove the plastic protective plugs from the TAP WATER and DRAIN connections. Connect the TAP WATER fitting to the facility cooling water supply. Connect the DRAIN fitting to a drain.

Fluids

Never use flammable or corrosive fluids with this unit. Do not use automotive antifreeze. Commercial antifreeze contains silicates that can damage the pump seals. Use of automotive antifreeze will void the manufacturer's warranty.

NESLAB recommends using distilled/deionized water with a 0.05 to 0.1 megohm-cm reading.

Highly distilled/deionized water, above the 3 megohm-cm region, may become aggressive and is not recommended for use with units with wetted parts other than stainless steel. Distilled/deionized water in the 15 megohm-cm region is definitely aggressive and should not be used. Units operating in these regions should be closely monitored. See Water Quality Standards and Recommendations in this section.

If you do not have access to distilled/deionized water we recommend using filtered tap water. NESLAB cannot recommend any custom fluids, these fluids are too dependent on your particular application.

If your unit is equipped with a plate heat exchanger do not use 100% water as a recirculating fluid. Due to the physical nature of a plate heat exchanger, and its response to temperature changes, using 100% water may cause the plate heat exchanger to rupture.

Below +8°C, a non-freezing solution is required. A 50/50 mixture, by volume, of distilled/deionized water and laboratory grade ethylene glycol is suggested. The selected cooling fluid must have a viscosity of 50 centistokes or less.

For units with extended temperature ranges above +35°C, we recommend distilled/deionized water up to +80°C. Above +80°C, you are responsible for the fluid(s) used.

NOTE: When using the remote sensor for low-temperature operation the unit itself may, depending on your application and setup, have to maintain an even lower temperature. Should the unit's fluid reservoir temperature exceed the low-end temperature range by 7°C, the unit will shut down.

Water Quality Standards and Recommendations

	Permissible (PPM)	Desirable (PPM)

Other Parameters		
pH	6.5-8.5	7-8
Resistivity	0.01*	0.05-0.1*

* Megohm-Cm (Compensated to 25°C)

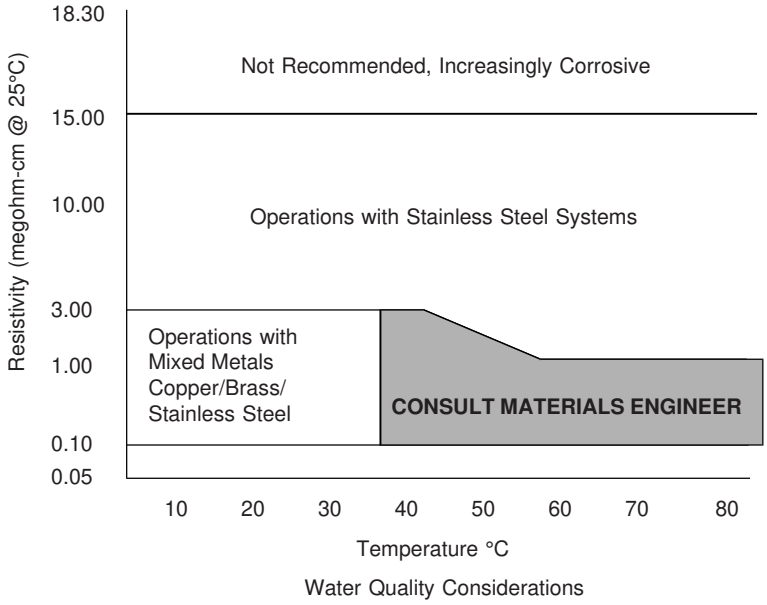
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (of NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (of NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water, as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated to 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated to 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated to 25°C).

These two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



Filling Requirements

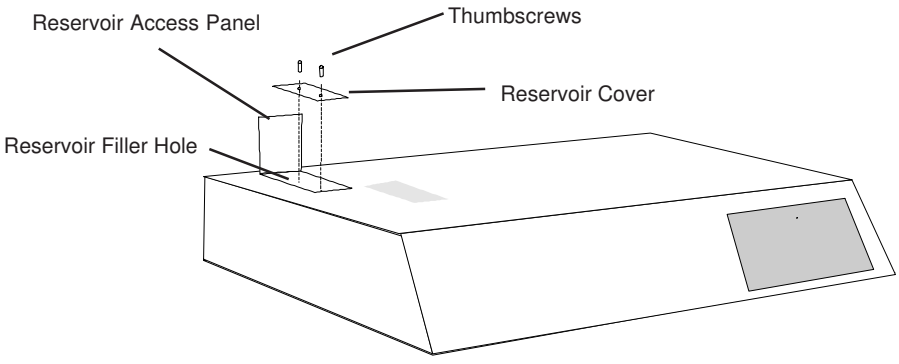
The reservoir access panel is located at the left rear corner of the case top. To open the access panel, slide the latch back (towards the rear of the unit) and lift.

The reservoir cover is located below the access panel. Loosen the thumbscrews and remove the reservoir cover.

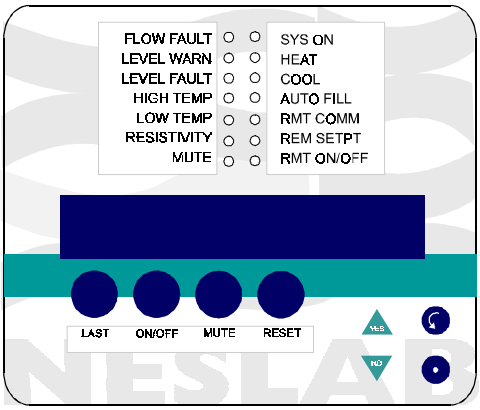
Fill the fluid reservoir with cooling fluid to within 1 inch of the top.

The fluid capacity of the instrument being cooled and the recirculation lines may be significant. To prevent the lowering of the fluid level in the reservoir below the operating level, have extra cooling fluid on hand to keep the reservoir filled to within 1 inch of the top.

When the recirculating system is full, replace the reservoir cover and the access panel.



Section IV Temperature Controller



Controller Keypad

The front panel mounted unit/temperature controller allows the operator to start, control and monitor many features of the unit.

LAST
Scrolls backward through the menus.

ON/OFF
Starts/stops the unit.

MUTE
Toggles audible alarm silence function for the current alarm. When alarm is silenced, the MUTE LED lights.

RESET
Clears alarm indications after fault condition has been corrected. Alarm LEDs will remain lit after problem is eliminated to provide indication of problem cause for operator. RESET clears these indicators.

YES

Answers yes to Y/N questions, increments numerical values for setting numeric values.

NO

Answers no to Y/N questions, decrements numerical values for setting numeric values.

NEXT

Scrolls forward through the menus.

ENTER

Confirms entry of numeric values.

NOTE: If next is pressed while the value still flashes, the new value will not be accepted. The display will stop flashing and the original value will be displayed. In this case next can be used to abort data entry. The display will not sequence unless next is depressed again.

For large values, you can change the display by manipulating the individual digits. Press YES and NO at the same time, the most significant digit will flash. YES increments and the NO decrements the digit. Press enter to accept the digit and to move to the next most significant digit. Repeat until all digits are entered. Pressing next before all digits are entered will abort the procedure and return the display to the original value.

The controller will not allow you to enter a value above the maximum or below the minimum value, or any illegal value. If you try to enter an illegal value the display will revert to its original value when the last digit is entered.

Status Indicators

Units are configured in one of two ways. They are configured either to shut down in the case of a fault, Cutout Option (CUTOUT), or, for those customers willing to take the risk of damage to their unit in order to continue providing all available cooling to their application, a Switch Option (WARN). See Setup Loop on page 27. Contact our Service Department for more information.

If the Switch Option is chosen, LEVEL FAULT, HTC FAULT, SYS FAULT, and FLOW FAULT ***do not*** shut down the unit but they are serious conditions and require immediate attention. Once the cause of the fault is identified and corrected, push the controller's RESET button to clear the flashing SYS FAULT or the FLOW FAULT indication. Cycle the MASTER POWER ON OFF switch to clear the flashing HTC FAULT indication, see page 33.

Status indicators are provided to show the state of the various functions.

FLOW FAULT indicates the unit flow is below the low-flow setpoint. The unit will shut down in the Cutout Option, but will continue to operate in the Switch Option. **NOTE:** You can disable the low-flow monitor by setting the low-flow setpoint to 0, see page 27. The indicator flashes if the setpoint is set to 0.

LEVEL WARN indicator flashes if the reservoir level is below the top float switch mounted in the reservoir. The unit will continue to run.

LEVEL FAULT indicates the reservoir level is below the bottom float switch and is too low for safe operation. The unit will shut down.

HIGH TEMP indicates that the reservoir temperature is above the high temperature limit setpoint.

If the reservoir temperature is started above the high limit setpoint the unit will

continue to run and the HIGH TEMP indicator will continue to flash until the reservoir temperature is below the high limit setpoint. Should the reservoir temperature go above the high limit setpoint the unit continues to run in the Switch Option, but shuts down in the Cutout Option.

LOW TEMP indicates that the reservoir temperature is below the low temperature limit setpoint.

If a unit is started with the reservoir temperature below the temperature limit setpoint, the unit will run and the LOW TEMP status indicator will continue to flash until the reservoir temperature is above the low limit setpoint. Should the reservoir temperature subsequently go below the low limit setpoint the unit continues to run in the Switch Option, but shuts down in the Cutout Option.

RESISTIVITY (optional) indicator flashes if the measured resistivity is below the resistivity setpoint.

MUTE indicates the buzzer has been turned off.

SYS ON indicates unit is running.

HEAT indicates heat is being added to the reservoir system to maintain constant temperature. The indicator flashes when the optional heater is inside the proportional band.

COOL indicates the refrigeration system is removing heat from the reservoir system to maintain constant temperature.

As the fluid temperature approaches the temperature setpoint, the COOL indicator cycles on and off to indicate the duty cycle of the system. The unit can be in COOL or HEAT mode, but never both at the same time. A balance between COOL and HEAT controls the temperature.

AUTO FILL (optional) indicates the reservoir fluid level is below the top float switch and the auto refill device is activated, see page 32.

RMT COMM (optional) indicates the unit is configured to receive communication via an optional COMM connector located on the rear of the unit, see page 35.

REM SETPT indicates the temperature setpoint is being remotely controlled by the analog input (pin 15) on the INTERFACE on the rear of the unit, see page 31.

RMT ON/OFF indicates the unit is configured to receive a remote on/off input signal from pin 14 on the INTERFACE on the rear of the unit, see page 31.

Changing a Value

The **YES** key increments the value. The **NO** key decrements the value.

The display will flash as soon as either key is depressed, and will continue to flash until the **ENTER** key is pressed to accept the new value. The new value will not be used by the controller until the **ENTER** key is depressed and the display stops flashing.

If the **NEXT** key is pressed while the value is flashing, the new value will not be accepted. The display will stop flashing and the original value will be displayed. In this case the **NEXT** key can be used to abort data entry. The display will not sequence unless the **NEXT** key is depressed again.

For large values you can change the display by manipulating the individual digits. Press the **YES** key and the **NO** key at the same time. The most significant digit will start to flash. The **YES** key increments or the **NO** key decrements the digit. Press the **ENTER** key to accept the digit and to move to the next most significant digit. Repeat until all digits are entered. Pressing the **NEXT** key before all digits are entered will abort the procedure and return the display to the original value.

The controller will not allow you to enter a value below the minimum or above the maximum (typically +5°C and +35°C, these values change for units with extended temperature ranges). If you try to enter an illegal value outside the operating range, the display will revert to its original value.

Controller Displays

An alphanumeric display presents numeric readings of various operating conditions within the chiller. Display function is selected by pressing the appropriate keys to move through a menu of available information.

An Operator's Loop and a Setup Loop allow you to display and/or alter different parameters of the controller. The Setup Loop can be accessed from the Operator's Loop temperature display by pressing and holding the key combinations shown on Figure 1 on the next page.

When the controller is first powered up it goes through a short self-test and then enters the Operator's Loop, displaying the reservoir fluid temperature. Use the key combination shown in Figure 2 on the next page to scroll through the loop.

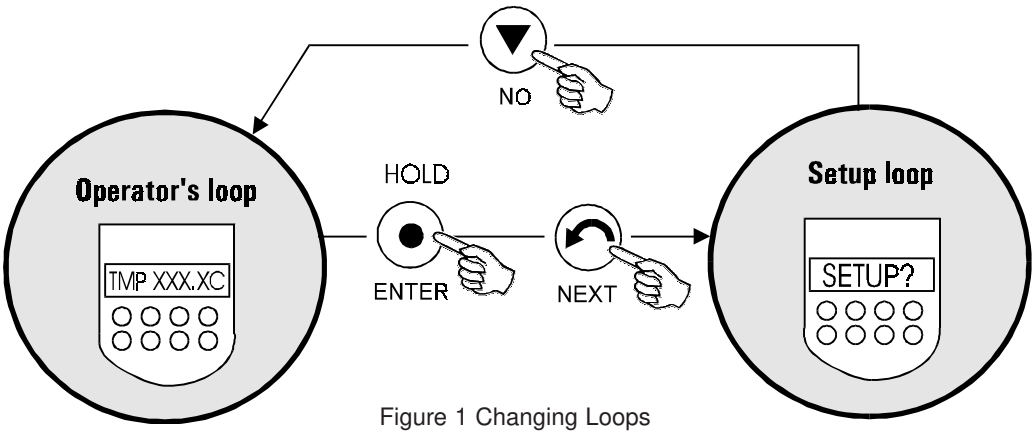


Figure 1 Changing Loops

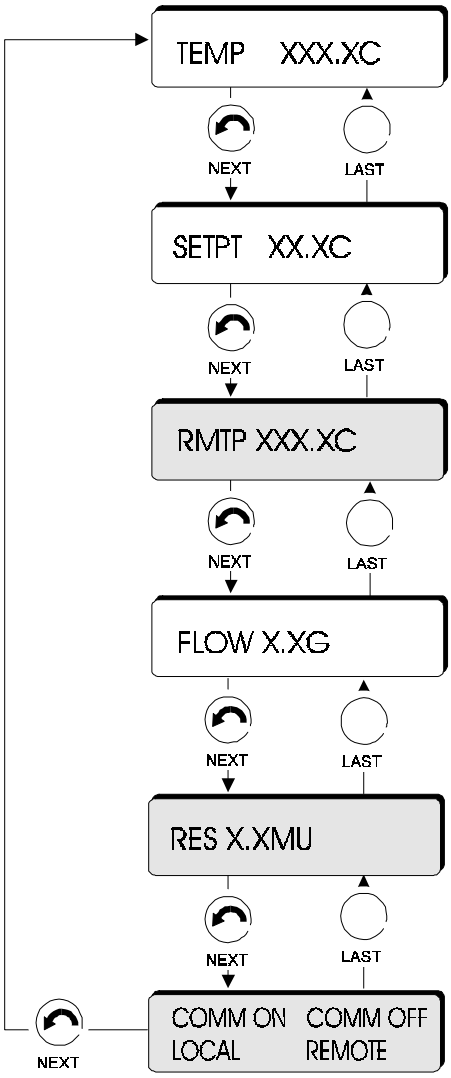

TEMPERATURE xxx.xC
This displays the temperature of coolant leaving the chiller.

SETPT xx.xC
This displays the setpoint for temperature control. The chiller's temperature controller causes the fluid temperature to equal this temperature. If needed, use the YES/NO keys to change the value then press ENTER to accept the new value.

RMTP xxx.xC*
For units using the optional remote probe, this feature displays the probe's sensed temperature. The probe's temperature control cannot exceed the unit's operational temperature range ±7°C or the unit will shut down. Ensure the probe is connected to the unit . See SENSOR on page 35.

FLOW x.xG
This displays the flow rate at the RETURN port in gallons or liters per minute.

RES x.xM*
This displays the uncompensated fluid resistivity.

COMM ON COMM OFF LOCAL REMOTE*
This displays one of the four possible communication configurations created in the Setup Loop. See pages 27 - 28.

* These displays are optional. They show only if the unit is factory configured.

Figure 2 Operator's Loop

Setup Loop

The Setup Loop allows the operator to change limits; to configure how the unit will react to faults (CUTOUT/WARN); to display the flow rate in GPM or LPM; and to include or exclude the optional remote probe display. It is also used to include or exclude the optional beeper; to change the temperature controller's tuning constants; to utilize the optional remote box; and to select optional external communication. Optional displays are highlighted.

NOTE: If the unit is configured for the remote operation option, the temperature limits are for the remote probe. For safety reasons, if the unit's fluid reservoir temperature exceeds 7°C of either end of the unit's temperature range, **the unit will shut down.**

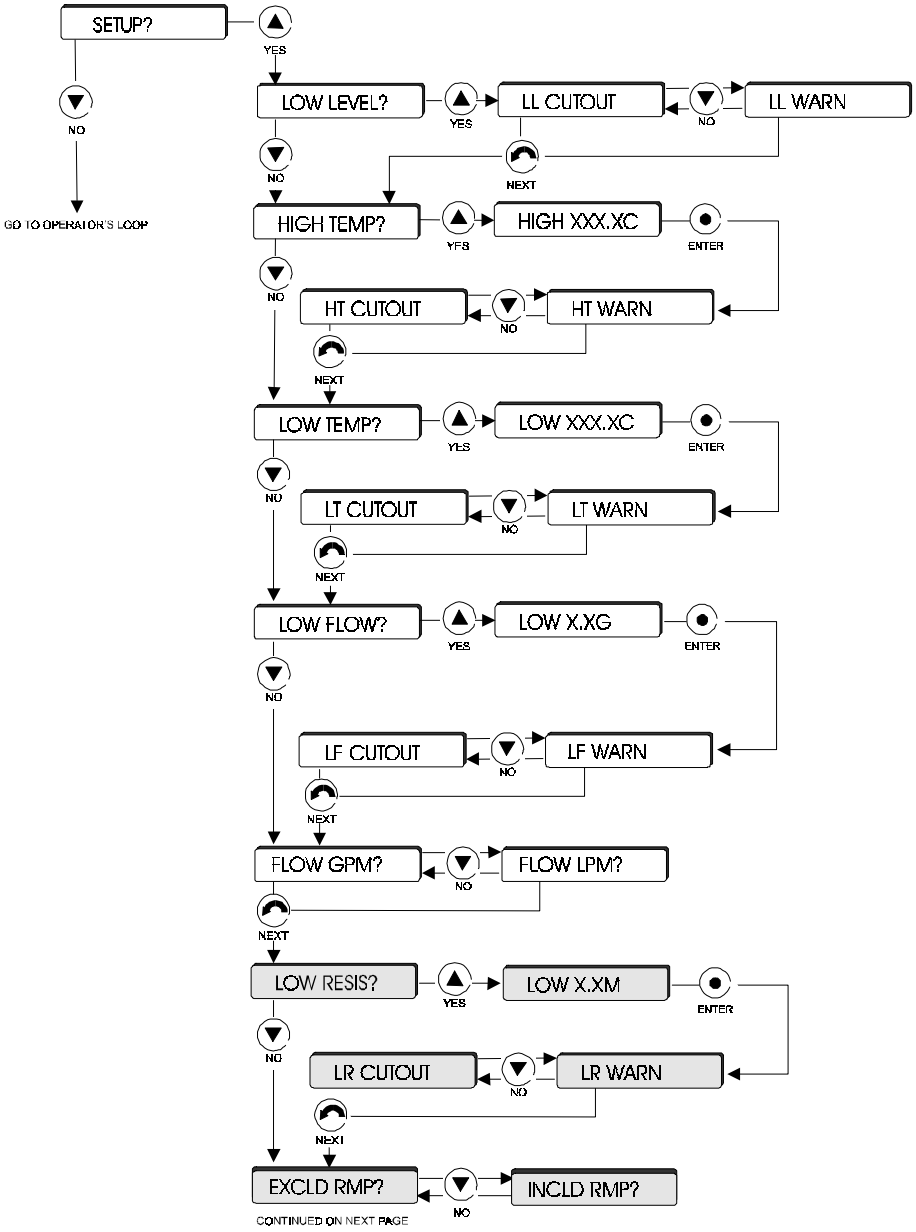

Figure 3 Setup Loop (1 of 2)

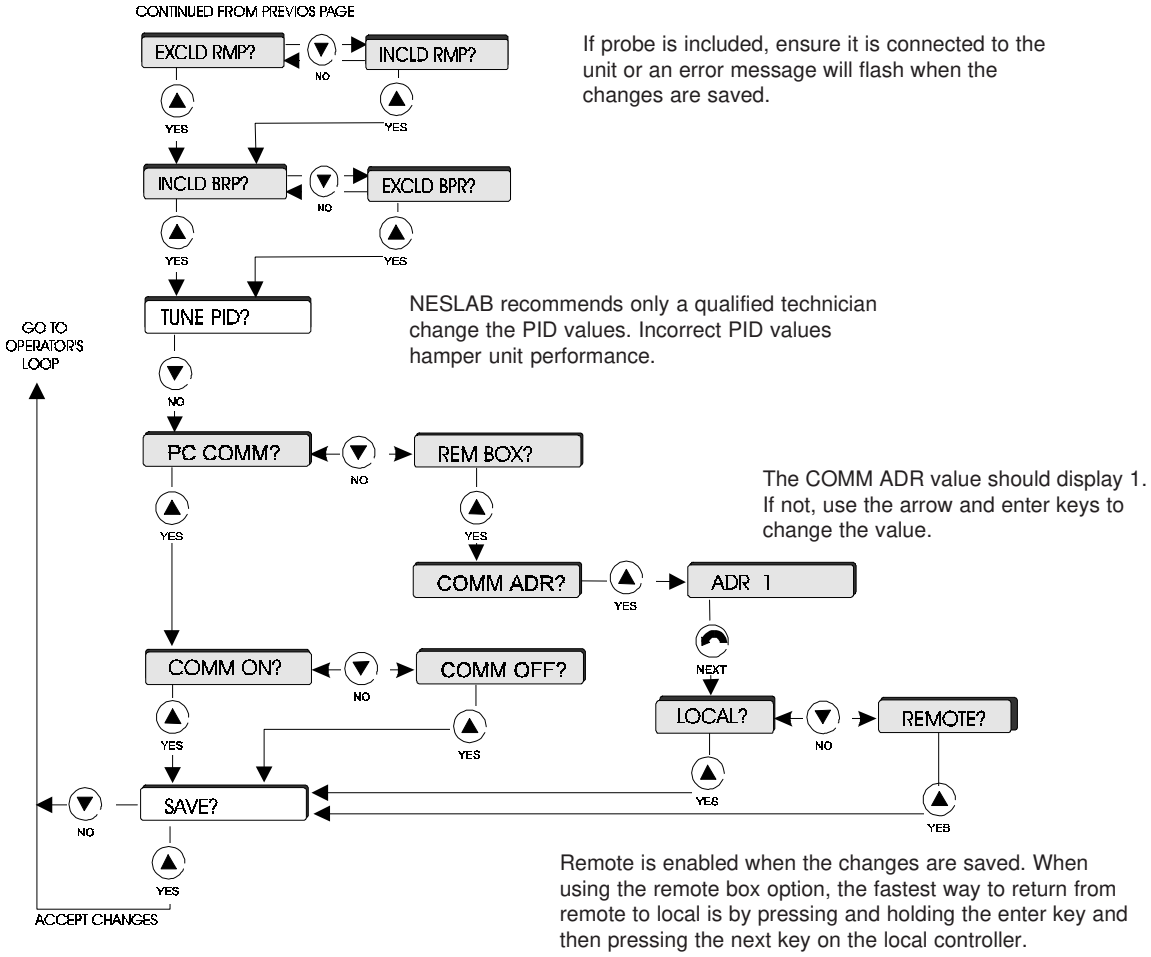

Figure 3 Setup Loop (2 of 2)

NOTE: Should you desire to return to the temperature display and abort *all* changes, keep pressing next until the display reads **SAVE?** Press **NO.**

Section V Operation

Flow Control

The RECIRCULATING FLOW CONTROL handle, located on the right-hand side of your unit, is connected to a valve that controls the flow rate of the cooling fluid to your application.

When the handle is in the full vertical position, the valve is open and all possible cooling fluid is supplied to your application. When the handle is in the full horizontal position, the valve is closed and no cooling fluid is supplied to your application. When the handle is between these two positions, the flow rate of the cooling fluid is between full flow and no flow. Use a flow meter on the SUPPLY line to adjust the desired flow rate.

The flow control valve must be opened slightly to allow fluid to circulate through the flow switch that monitors the flow rate. For small pumps, a flow rate of more than 0.3 gpm (1.0 lpm) is necessary. For large pumps, a 1.0 gpm (3.8 lpm) is needed. Pump flow for normal operation is pump dependent and is factory preset

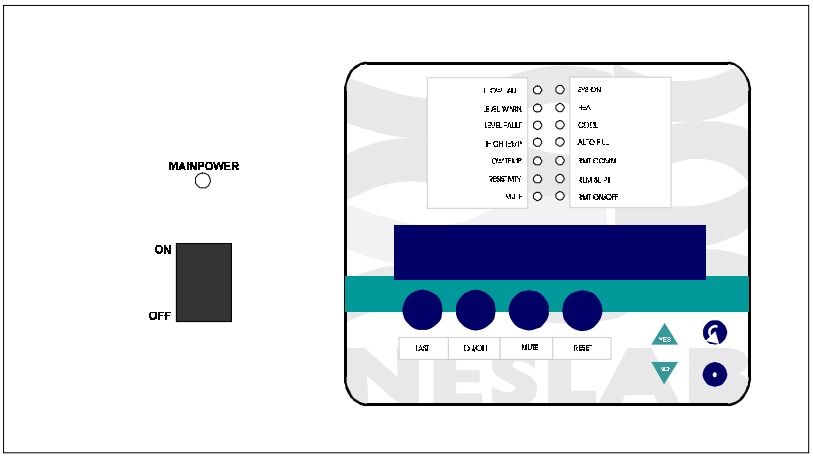
Never “crank” the valve wide open from the closed or slightly open position.

Start Up

On water-cooled units, ensure the facility water is on and make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection.

Apply power to the unit. For CE Mark units, place the circuit breaker on the bonnet to the on position. The MAINPOWER indicator will illuminate.

Models HX-300 through HX-750 are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, connect the unit to its power source for at least 12 hours. This allows time for the oil to heat and separate from the refrigerant.



Place the MAIN POWER ON OFF switch ON. The controller will go through a short self-test and then display the reservoir fluid temperature.

LOCAL Start Up

Depress the ON/OFF key on the temperature controller. The unit will start and the SYS ON LED will illuminate.

To stop the unit, depress the ON/OFF key on the temperature controller.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

REMOTE Start Up

Locate the J100 INTERFACE on the rear of the unit. Connect pin 1 to pin 12. The RMT ON/OFF indicator will illuminate. Connect pin 1 to pin 14 and the unit will start. See page 31 for additional information.

To stop the unit, disconnect pin 1 from pin 14.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Pressure Gauge

The RECIRCULATING PRESSURE gauge is located next to the flow control handle. The gauge indicates the operating pressure of the system.

INTERFACE Connector 15-pin Dsub Female

PIN	NAME	NOTES	DEFINITION
1	12VDC COMMON		Common for digital inputs (pins 13 and 14)
2	RESISTIVITY OUT		0-10VDC Analog Voltage Output: Reference to pin 6. This voltage output is proportional to the resistivity of the reservoir fluid: 0.5VDC / M-cm. (Ex 9.0V = 18Mohm-cm) (Max Load @ 10V = 5mA)
3	LOW LEVEL	Note 1	Dry Relay Contact: Reference to pin 11. Closes if either level switch is in the "low" position for more than 1 second.
4	TEMP/SENSOR	Note 1	Dry Relay Contact: Reference to pin 11. Closes immediately when any of the following occur: 1. High Temp Fault, 2. High Temp Warn, 3. Low Temp Fault, 4. Low Temp Warn, 5. RTD1 Fault/Warn, 6. RTD2 Fault/Warn, or 7. Resistivity Warn.
5	PUMP ON	Note 1	Dry Relay Contact: Reference to pin 11. Closes immediately when pump is turned on. Opens immediately when pump is turned off.
6	ANALOG GROUND		Common for analog signals (pins 2, 7 and 15)
7	RESERVOIR TEMP OUT		0-10VDC Analog Voltage Output: Reference to pin 6. This voltage output is proportional to the reservoir fluid temperature: Scale = 10mV / ^{O}C. (Ex 200mV = 20°C) (Max Load @ 10V = 5mA) * Optional Range = 0 – 10V (where: 0V = Low Temp Span, 10V = Hi Temp Span). Contact Factory for details.
8	LOW FLOW	Note 1	Dry Relay Contact: Reference to pin 11. Closes immediately when a low flow occurs while the pump is on. Note: To allow the pump to get up to speed at startup, the pump is allowed to run for 3 seconds before the low flow sensor is read.
9	FAULT NO	Note 1	Dry Relay Contact: Reference to pin 11. Closes after power up and no-faults present. Opens immediately when any of the following faults occur: 1. Low Flow, 2. Low Level, 3. Temp/Sensor, 4. High Pressure Fault, or 5. Heater High Temp Cutout.
10	FAULT NC	Note 1	Dry Relay Contact: Reference to pin 11. Compliment of pin 9 (open when pin 9 is closed).
11	RELAY COMMON		Common for all relay contacts (pins 3, 4, 5, 8, 9, 10).
12	REMOTE ON/OFF ENABLE		Digital Input: Reference to pin 1. Connect to pin 1 to allow unit to be remotely turned on/off through pin 14 REMOTE ON/OFF.
13	REMOTE SETPOINT ENABLE		Digital Input: Reference to pin 1. Connect to pin 1 to allow the setpoint to be changed remotely through pin 15 REMOTE SETPOINT IN.
14	REMOTE ON/OFF		Digital Input: Reference to pin 1. Connect to pin 1 to turn unit on. Disconnect to turn unit off. Note: Pins 1 and 12 must be connected to allow operation from this pin.
15	REMOTE SETPOINT IN		Analog Voltage Input: Reference to pin 6. Apply a DC voltage to this pin to adjust the unit's setpoint: Range = 10mV/ ^{O}C. (Ex 200mV = 20°C) (Max Input Voltage = 10VDC, Input Impedance > 600K). * Optional Range = 0 – 10V (where: 0V = Low Temp Span, 10V = Hi Temp Span) Contact Factory for details.

Note 1:
All relay contacts (except for Pin 10) are normally OPEN when power is off. Pin 10 contacts are normally CLOSED when power is off. All relay contacts are rated: 250V/3A, <= .08 Ohm.

Section VI Optional Features

Automatic Refill Device

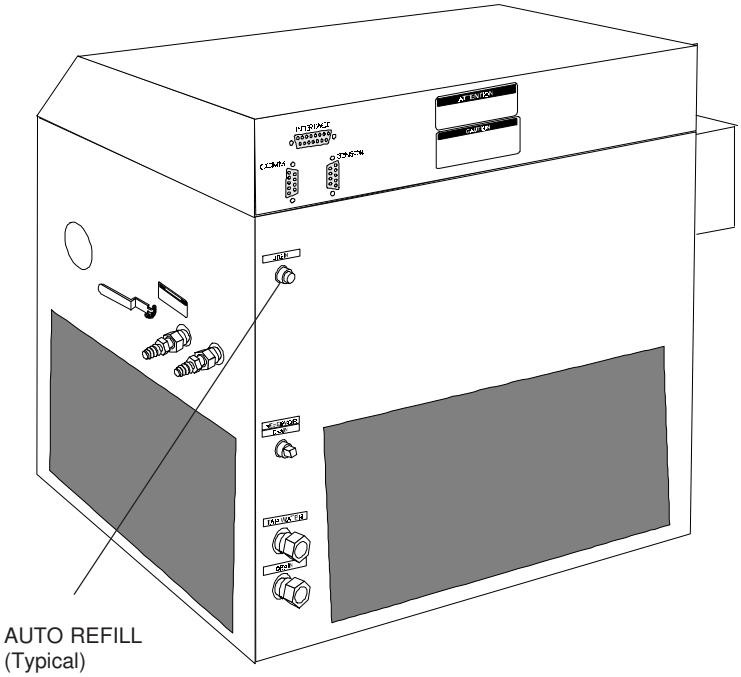
The automatic refill device is designed to maintain the correct level of cooling fluid in the reservoir. The device consists of a solenoid valve and a reservoir float switch. If the cooling fluid level falls, the float switch drops, opening the solenoid valve and allows makeup fluid to fill the reservoir. Once the cooling fluid level reaches the proper level, the float switch rises and the solenoid valve closes.

NOTE: Refill times depends on the facility water pressure.

The plumbing connection for the refill device is located at the right rear corner of the unit and is labelled AUTO REFILL. This connection is a $^{3}/_{8}$ inch OD stainless steel barbed fitting.

Connect this fitting to a makeup fluid source using $^{5}/_{16}$ or $^{3}/_{8}$ inch ID flexible tubing. Make sure all tubing connections are securely clamped.

Tubing is available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).



AUTO REFILL
(Typical)

Heater Package

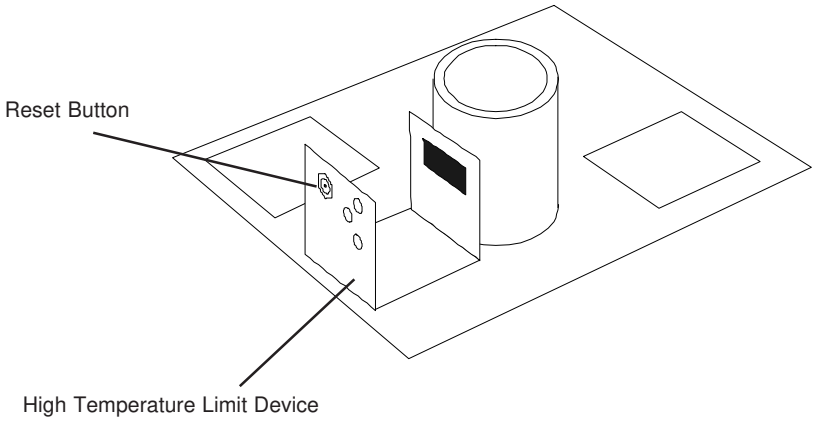
The heater package option consists of an immersion heater in the unit's fluid reservoir, a high temperature limit device, a low-level switch, and a solid state zero-crossing relay. A HTC FAULT message on the controller will light if the high temperature limit device is tripped. The low-level switch will disconnect power to the heater if the heater surface is exposed to air.

The heater surface temperature may operate several degrees higher than the reservoir fluid. The limit device is factory set to a temperature above the upper limit of the temperature controller's range.

For personal safety and equipment reliability, only a qualified technician should perform the following procedure. Contact our Service Department for assistance (see Preface, After-sale Support).

To reset a tripped temperature limit device, lift and open the case top. The case top is secured to the unit base by a hinge between the case top and the base (along the rear of the unit), and by two spring clips located at the front corners, see illustration on page 7. To gain access to the temperature limit device, disengage the spring clips with a flat bladed screw driver and lift the front of the case top and tilt it back. A support brace, located on the right side of the inner case, will stop and support the case top.

You must identify and correct the fault before restarting the unit. The protection device and the heater power connections are located on top of the fluid reservoir. The protection device has a small, black reset button. Press the reset button to restore heater operation and clear the HTC fault. Cycle the MASTER POWER ON OFF switch to clear the flashing HTC FAULT indication.



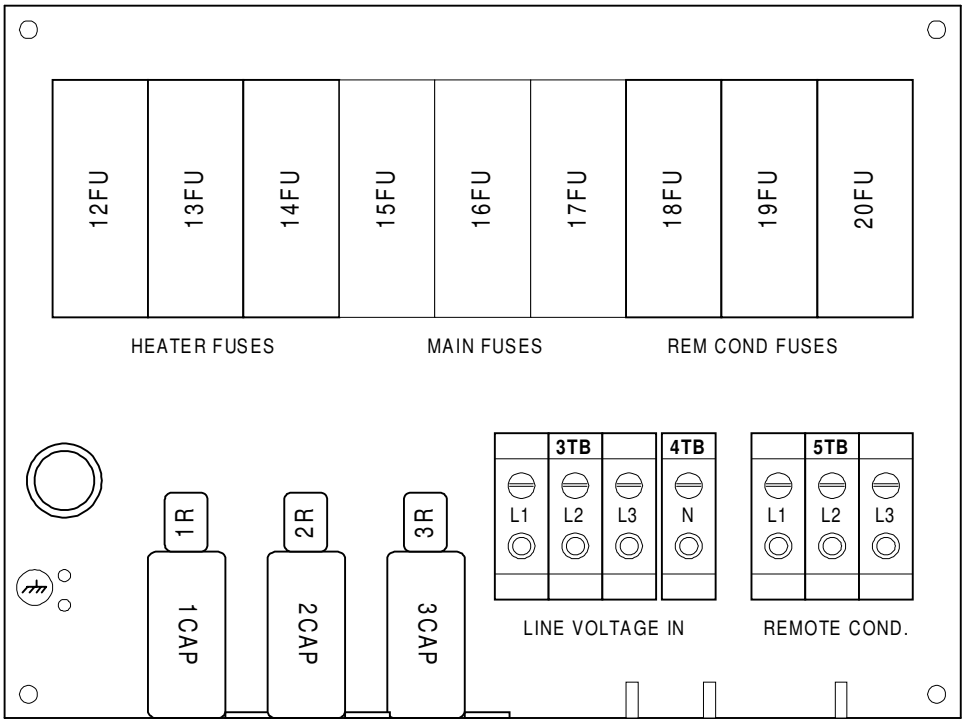
Some units equipped with heaters do not have a power cable. Installation of the cable is your responsibility. Wire the unit in conformance to local, state and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

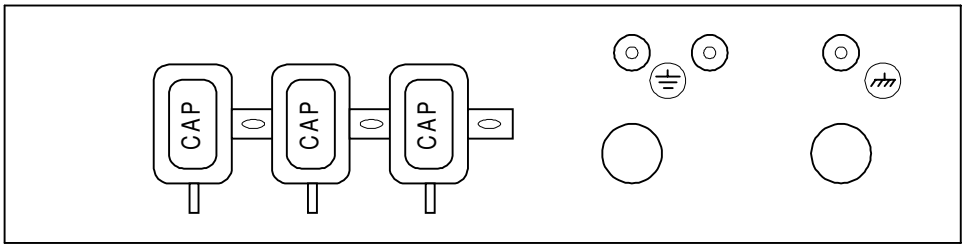
The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is your responsibility to assure a proper ground connection is provided. For personal safety and equipment reliability, only a qualified technician should perform the following procedure.

To access the connections open the pullbox.

- Insert your cable through the conduit.
- Locate 3TB and 4TB and connect your cable.
- Close the pullbox.

Note: Pullbox shown with heater and remote condenser options.



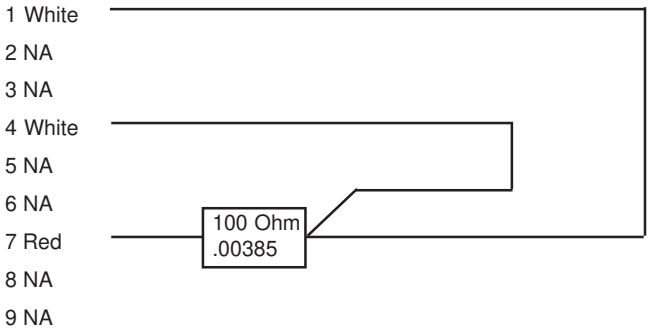


SENSOR Connector

The unit can be configured to have its temperature controlled from a remote location. Temperature is read on the controller's RTMP display. In the Operator's Loop, RTMP is the sensed temperature, TEMP indicates the HX's tank temperature. See page 26.

The remote probe is connected to a 9-pin male "D-sub" located on the rear of the unit. Ensure your remote application does not cause the HX to exceed its temperature range. For safety reasons the HX will shut down if either limit is exceeded by 7°C.

This is a 3-wire RTD probe. It must be calibrated before initial use, see Appendix A.



COMM Connector

COMM is a 9-pin female "D-sub" located on the rear of the unit used for remote operation. The unit can be configured to operate from a PC comm or remote box option. See pages 27 to 28. For NEScom software information, see Appendix B. For serial communications protocol see Appendix C.

When using the remote box option, the fastest way to return from remote to local is by pressing and holding the enter key and then pressing the next key on the local controller.

Going from local to remote is not available at the remote box.

The pin out information for either configuration is:

RS-232 (NEScom)		**RS-485 (Remote Box)**	
1	Not used	1	Ground
2	TX	2 -7	Not used
3	RX	8	T+
4	Not used	9	T-
5	Ground		
6-9	Not used		

Remote Box

The remote box mirrors the unit's controller. The remote box operates by sending and receiving RS485 serial communication. The remote box is attached to the unit by an RS485 cable with 9-pin D subminature connectors, see page 35 for pin out information.

Connect the cable to the 9-pin connector on the rear of the remote box and the 9-pin COMM port on the unit. The cable is available in 25, 50, 75, 100 and 200 foot lenghts.

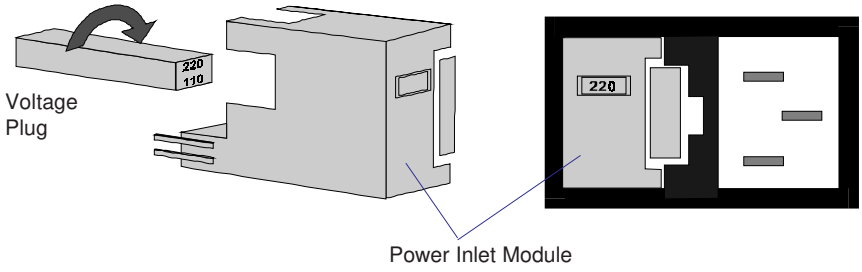
Power up the local unit and the remote box. For safety reasons, the unit cannot be put in the remote mode by the remote box. The unit is put in remote mode by entering the local unit's Setup Loop and enabling the RS485 mode, see pages 27 - 28.

The remote box will momentarily display CONNECTING and then the display will show the current reservoir temperature. CONNECTING indicates that communication is not yet established between the local unit and the remote box. If the CONNECTING display does not extinguish check the connections and then toggle the power to the unit. Run the Operator's Loop, it should display REMOTE. If not, rerun the Setup Loop and ensure changes are saved. Check to see that the unit is in RS485 mode by observing that the REMOTE ENABLE light on the remote controller is lit.

While in the remote mode, the local controller only mirrors the remote controller's display. However, you do use the local controller to return to the local mode. Press and hold the local controller's enter key and then press the next key. The REMOTE light will turn off.

The remote box also has a 15-pin connector for standard 10mV/°C temperature output (between pin 7 and referenced to pin 6). It can be used for a chart recorder or other recording device. An optional 0 - 10VDC signal is available.

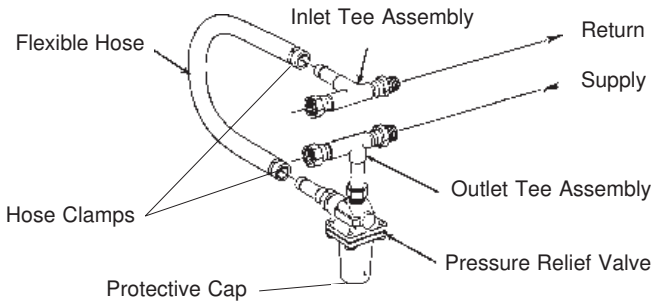
The remote box can be configured for 110V or 220V operation. The voltage is displayed on the power inlet module located on the rear of the remote box. To change the voltage pry the module out from the power connection. Remove the voltage plug from the module and rotate it 180°. Reinstall the plug. The desired voltage should be displayed. Reinstall the inlet module.



External Pressure Regulator

For applications requiring a maximum pressure less than 55 psi, an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 psi. If the pressure of the fluid leaving the unit exceeds the valve setting the relief valve will bypass the fluid back into the unit to relieve the pressure. The back pressure of the connected equipment and the flow rate of the recirculating fluid to your application determine the pressure of the system.

Connect the EPR assembly as shown below. Tighten the hose clamps tight enough to prevent leakage. Do not overtighten or the clamps will “bite” into the flexible tubing and can cause excessive wear.



Connect the outlet tee assembly to the inlet of your application. Connect the inlet tee assembly to the outlet of your application.

Adjustment

When adjusting the relief valve some leaking may occur, place a container under the valve during adjustment.

Remove the protective cap and locate a threaded fitting with a slot for a large screwdriver. Hold the threaded fitting in place and loosen the lock nut on the valve body until it is almost flush with the threaded fitting. Unscrew the threaded fitting three to four turns. (If the threaded fitting unscrews completely from the valve housing, screw it back in two to three turns.)

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and your application. Monitor the operating pressure of the HX unit. Turn the threaded fitting until the desired relief pressure is set (the EPR valve cannot be set lower than the total back pressure of your instrument, or flow will not be received).

Tighten the locknut to secure the position of the threaded fitting. Open the hose between the EPR outlet tee assembly and your application.

Nitrogen Purge

Units equipped with nitrogen purge valves are designed to accept a constant flow of dry nitrogen into the reservoir. The nitrogen blankets the cooling fluid reducing fluid evaporation.

Remove the reservoir cover by removing the screws. Fill the reservoir with fluid. Replace the reservoir cover and screws. Connect the nitrogen line to the valve on the reservoir cover.

A pressure regulator, set to 0.5 psig (0.35 kg/cm^3) or lower, should be used to prevent fluid overflow.

Particulate Filters

Particulate filter assemblies attach to the supply side of the recirculation water. Refer to the separate manual attached to the filter assembly.

The frequency for cleaning/changing the filter depends on your usage. Should the unit's performance be degraded, check the filter.

Filters are available from NESLAB, contact our Customer Service Center. Before calling refer to the serial number label on the rear of the unit to obtain the following information:

-BOM number
-Serial number

Section VII Maintenance

Service Contracts

NESLAB offers on-site Service Contracts designed to provide extended life and minimal downtime for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Condenser Cleaning (Air-cooled units only)

For proper operation, the unit needs to pull substantial amounts of air through a finned condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

Eventually the compressor will overheat and the High-Pressure Cutout (HPC) will activate and temporarily shut down the unit. The HPC will cycle the unit on and off until the condenser is cleaned. After a period of time, this cycling will damage the unit's compressor.

The frequency of cleaning depends on the operating environment. We recommend making a monthly visual inspection of the condenser after initial installation. After several months, the frequency of cleaning will be established.

For "standard" air-cooled units, periodic vacuuming of the fins on the condenser is necessary. For units with the optional remote air-cooled condenser, remove any debris from around the condenser site. If a visible accumulation of dust or dirt is found on the condenser fins, the condenser should be cleaned with a condenser cleaning solvent and rinsed with water.

Exercise caution not to damage the condenser fins or coil. Condenser fin or coil damage can result in a loss of performance and, in extreme cases, refrigeration system failure.

Hoses

The unit's internal and external hoses and clamps should be inspected and tightened on at least a semiannual basis.

Algae

To restrict the growth of algae in the fluid reservoir, we recommend the reservoir cover be kept in place and that all recirculation lines be opaque. This will eliminate the entrance of light, which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, 1 gram per 3.5 liters. Other algicides can be harmful to the unit's internal components. Contact NESLAB for additional information.

Section VIII Service

For personal safety and equipment reliability, only a qualified technician should perform the following procedure. Contact our Service Department for assistance (see Preface, After-sale Support).

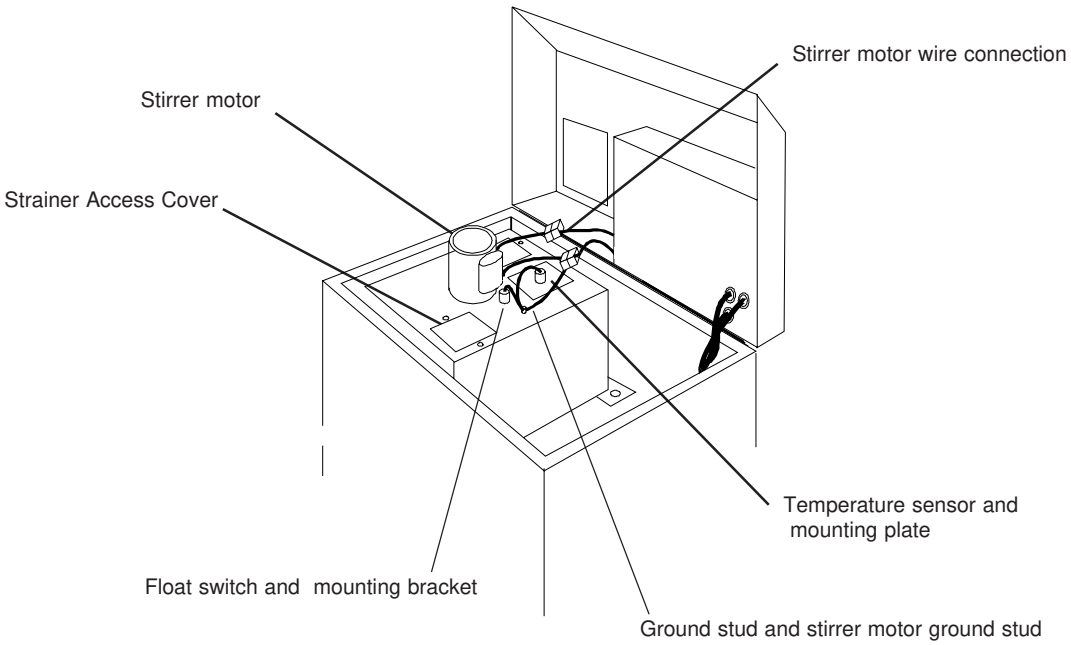
Configuration

Case Top

The unit has a hinged case top to allow service access. The case top is secured to the top of the unit base by a hinge between the case top and base (along the rear of the unit), and by two spring clips located at the front corners, see illustration on page 7. To gain access to the pump assembly or the reservoir area, disengage the spring clips with a flat bladed screw driver and lift the front of the top cover and tilt it back. A support brace, located on the right side of the inner base, will stop and support the case top. Ensure the spring clips engage when the top is lowered back into position.

Reservoir Cover

Access to the inside of the fluid reservoir is necessary to clean the reservoir. The figure below illustrates a typical layout of the components mounted on top of the reservoir cover. The component layout varies depending on the unit size. If you are unable to identify the components on your unit's reservoir cover, contact our Customer Service Department for assistance (see Preface, After-sale Support).



Disconnect the unit from its power source before removing the reservoir cover.

Locate the reservoir stirrer motor (units with plate heat exchangers and HX-75s do not have a stirrer motor; HX-500s and HX-750s have two stirrer motors). Disconnect the motor wires at the plug located on the side of the electrical box cover. Also disconnect the green ground wire that connects the ground stud on the reservoir cover to the unit's grounding bar.

Locate the float switch mounting bracket. Remove the two stainless steel screws that secure the bracket to the reservoir cover. Carefully remove the mounting bracket and place the assembly in an area adjacent to the reservoir. Make sure not to strain the connecting wires.

Locate the temperature sensor mounting plate. Remove the two stainless screws that secure the bracket to the reservoir. Carefully remove the sensor mounting plate with the sensor(s) attached and place the assembly in a protected area adjacent to the reservoir. Make sure not to damage the sensor(s) or strain the connecting wires.

Remove the stainless steel screws that secure the reservoir cover to the reservoir. Remove the cover and place it to one side in a manner that protects the stirrer motor blades from being bent.

Service Access Panels
Service access panels on your unit allow easy access to the pump and refrigeration assemblies. Panel location varies with the size and type of unit. The panels are designed to allow removal without disconnecting the HX from the instrument being cooled.

Disconnect the unit from its power source before removing any of the access panels.

Reservoir Cleaning

Periodic reservoir cleaning is necessary. We recommend making a monthly visual inspection of the reservoir after initial installation. After several months, the frequency of cleaning will be established.

Disconnect the unit from its power source and drain the reservoir before cleaning the reservoir.

Lift the top cover to access the reservoir. Remove the reservoir cover as described in Section VIII, Configuration. Clean the reservoir with a cleaning fluid compatible with the recirculating system and the cooling fluid.

Do not use steel wool or other abrasive materials. They can scratch the stainless steel surface and initiate rusting.

When the reservoir is clean, reassemble the cover assembly and close the case top. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Pump Strainer

Units with PD and TU pumps have pump strainers that require cleaning. If debris is drawn into the recirculating system, the pump strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

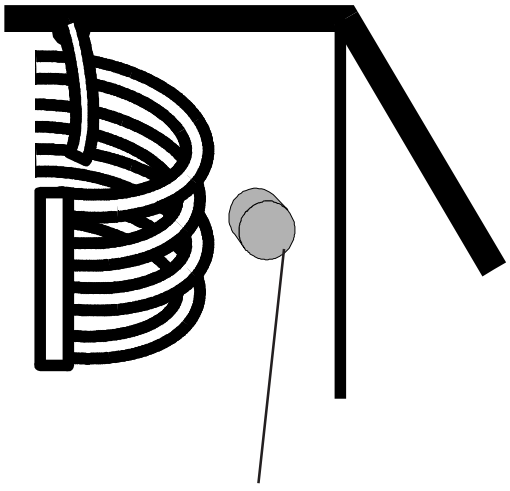
After initial installation, the strainer may become clogged with debris and scale. Clean the strainer after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Disconnect the power cord from the power source and drain the fluid reservoir before cleaning the strainer. Do not operate the unit with any strainer removed.

The wire mesh pump strainer is located in the reservoir on the pump suction line. Remove the strainer access panel located on top of the reservoir cover to access the strainer, see illustration on page 41.

Cover the strainer with a plastic bag to help catch any debris that may become dislodged during removal.

Unscrew the strainer and rinse it with water. Replace the strainer. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.



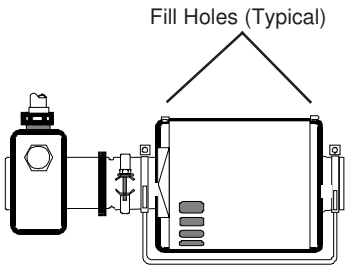
Pump Strainer

Pump Motor Lubrication

Units with PD pumps require pump motor lubrication. Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit.

Several companies manufacture motors used to drive the pump. These motors use sleeve type bearings with large oil reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil in each fill hole on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



Phase Rotation

Three-phase units with three-phase pump motors are equipped with a phase rotation interlock. Refer to the serial number label on the rear of the case top for the specific electrical requirements of your unit. The interlock prevents the unit from starting if the phase rotation is wrong and causes a system fault. If the unit will not start, see Section IX, Checklist. If the options in the checklist are not applicable, the problem may be phase rotation.

If phase rotation is the problem, disconnect the unit from its power source, remove the pullbox cover. Reverse any two line conductors on the line side of the relay. See page 35.

Never remove the green ground wire.

Replace the pullbox cover. Reconnect the unit to its power source. If the unit will not start, contact our Customer Service Department.

High/Low Pressure Cutouts

Should the unit's refrigeration discharge pressure become too high the high-pressure cutout will activate and shut down the compressor. High pressures can be caused by a lack of cooling water to the compressor or debris in the refrigeration lines.

Should the unit's refrigeration discharge pressure become too low the low-pressure cutout will activate and shut down the compressor. Low pressures can be caused by a leak in the refrigeration lines.

If a fault occurs, the controller displays a SYS FAULT message and the compressor will shut down. Once the cause of the problem has been identified and corrected you must manually reset the cutout.

Units have a yellow sticker indentifying the cutout location. Locate the white reset switch on the cutout. Press in on the switch until a "click" is heard. If the reset does not "click" the cutout was not activated and the unit shut down occurred for another reason.

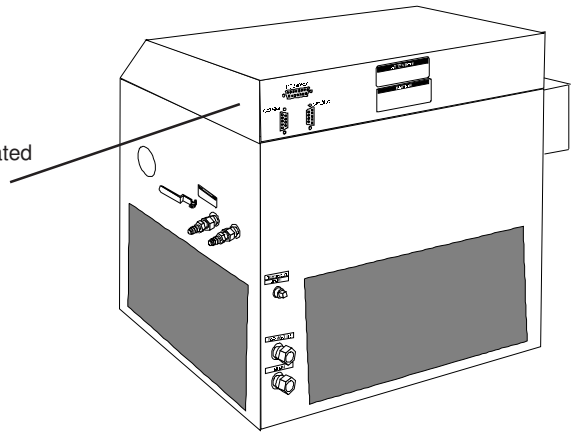
Pump Motor Overload Protector (3Ø Pumps Only)

The overload protector prevents the pump motor from exposure to excessive current. If an overload fault occurs, due, for example, to excessive pressure or flow, or excessive ambient temperature, the overload protector will shut off the pump motor. The overload protector will automatically reset after approximately one to two minutes.

If a fault occurs, the controller displays a SYS FAULT message and the pump will shut down. Once the cause of the fault is identified and corrected, press the controller's RESET button to restart the pump.

The overload protector can be adjusted to require manual resetting after an overload fault. Contact our Service Department for adjustment instructions (see Preface, After-sale Support).

The pump motor overload protector is located under the bonnet inside the electrical enclosure.



Pressure Relief Valve
(PD and TU Pumps Only)

Units with a PD or TU pump have an adjustable pressure relief valve. Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit.

The pressure relief valve establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The valve does not determine the actual operating pressure; the back pressure of the connected equipment and the setting of the flow control valve determine the operating pressure of the system. If adjustment seems necessary, consult our Service Department for assistance.

Before calling, refer to the serial number label on the rear of the case top to obtain the following:

- *BOM number*
- *Serial number*

Suction Discharge Pressure Speed Check (R-22)

Air-Cooled Standard and High Temperature Units (All Pump Types)[1]

Unit	Suction (psi)	Discharge (psi)	Speed Check (°C/Minute)
HX-75	77 - 84	225 - 250	1.5 - 1.7
HX-150	70 - 73	240 - 270	2.0 - 2.5
HX-300	84 - 105	270 - 305	2.4 - 2.7
HX-500	80 - 90	215 - 235	2.0 - 2.4
HX-750	65 - 75	185 - 215	

Water-Cooled Standard and High Temperature Units (All Pump Types)[2]

Unit	Suction(psi)	Discharge(psi)
HX-75	72	170
HX-150	65	175
HX-300	73 - 78	180
HX-500	75 - 82	150
HX-750	50 - 60	180

1. 27°C unit temperature, water in reservoir, access panel removed.
2. 25°C unit temperature, water in reservoir.

NOTE: Refrigerant R-22. For low-temperature units please call NESLAB.

Section IX Troubleshooting

Displaying Software Version

To display the software version ensure the controller is in the Operator's Loop and displaying the reservoir fluid temperature. Depress and hold the enter key . Press the YES NO YES keys and the display will indicate CALIBRATE? While continuing to hold the enter key press the YES NO YES keys again. The display will now indicate the software version, for example 000550.36h. Press NO to return to the reservoir fluid temperature display.

Checklist

Unit will not start or cycles on and off

HX-300s through HX-750s are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

For CE Mark units, check the circuit breaker setting on the bonnet.

For units equipped with an optional EMO button, check its position.

Check for a fault condition.

Check the INTERFACE connections on the rear of the unit.

Check power source for correct voltage output. Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit. Power source must be specified voltage, ±10%.

Check house circuit breaker.

On three phase units with three phase pump motors, the phase rotation may be reversed (see Section VIII, Phase Rotation).

On water-cooled units, ensure the facility water is on and make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection. Check the High Pressure Cutout, it may need to be reset (see Section VIII, High/Low Pressure Cutouts).

On air-cooled units, ensure the condenser fins are clean and that proper airflow is not restricted.

Unit will not circulate fluid

Check the tubing, strainer, and any optional filters/cartridges between the unit and your application for obstructions or for cleaning/replacement.

Units with PD and TU type pumps may require pump strainer cleaning. Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit. For instructions on cleaning the pump strainer (see Section VIII, Pump Strainer).

On units with CP type pumps, if the back pressure of the instrument being cooled is greater than the maximum pressure of the pump, adequate flow may not be obtained. Check for obstructions in the tubing.

Inadequate temperature control
Check/adjust the setpoint in the Operator's Loop.

Make sure the installation of the unit is in compliance with the conditions described in Section III.

Make sure the heat load of the instrument being cooled is not greater than the cooling capacity of the unit.

Ensure the unit is not configured for optional remote probe operation.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

The controller circuit board may be defective.

No serial communications
All units are tested for serial communications before they leave the factory. Ensure the RMT COMM indicator on the controller is illuminated.

Check all communications commands, they *must be exact*. See Appendix C.

Check communications settings. The protocol uses an RS-232 serial interface with the parameters: 9600 baud, 8 data bits, 1 stop bit and no parity.

Check all wiring for proper connections or possible shorts.

Software to verify serial communication is available from NESLAB.

Returning to local mode
When operating using the remote box, the quickest way to return to the local mode is to press the NEXT and ENTER keys on the local controller.

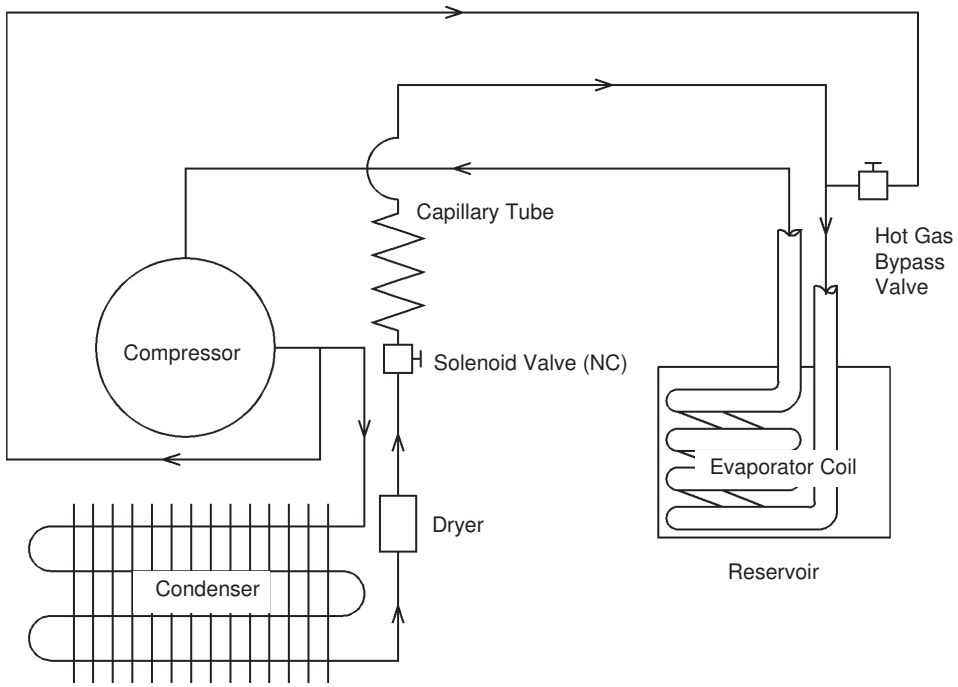
Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface). Before calling, please obtain the following information:

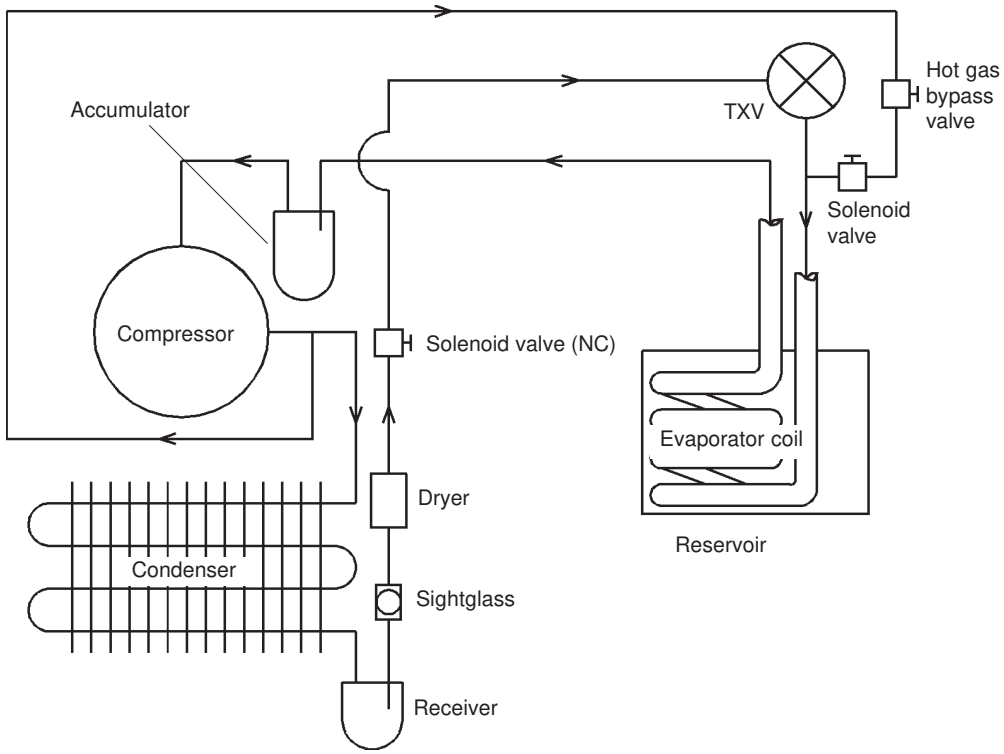
BOM number
Serial number
Voltage of unit
Voltage of power source
Temperature of facility water
Software version

Section X Diagrams

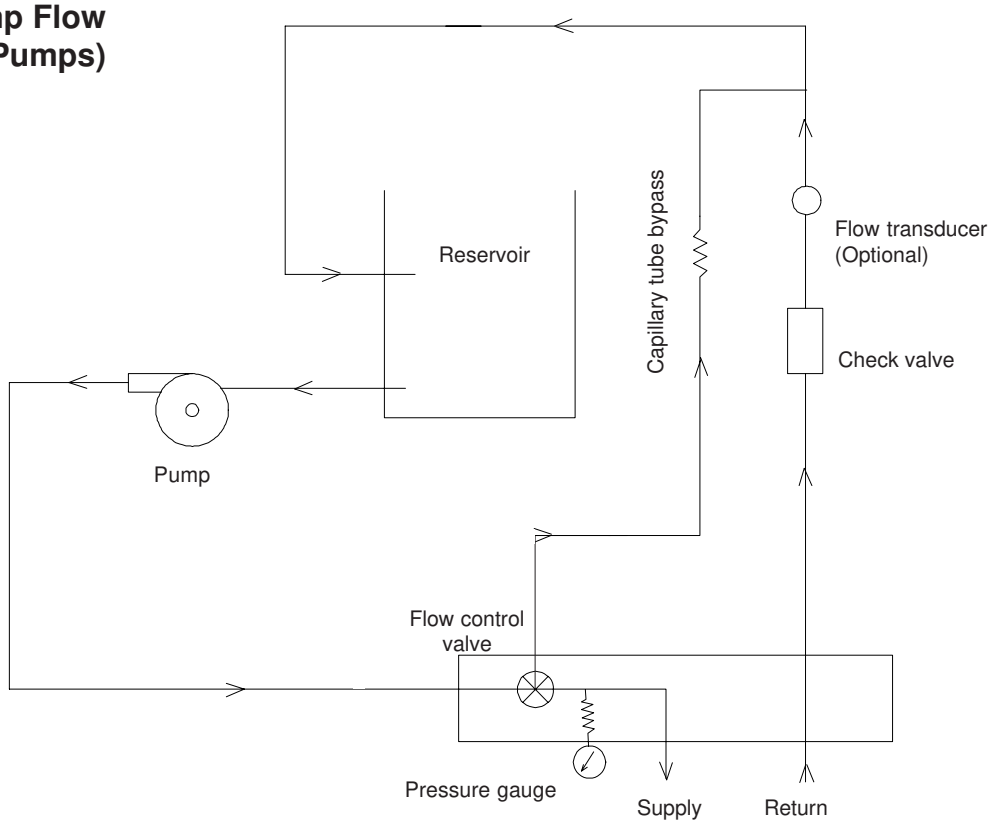
Refrigeration Flow Diagram
(HX-75 and HX-150)



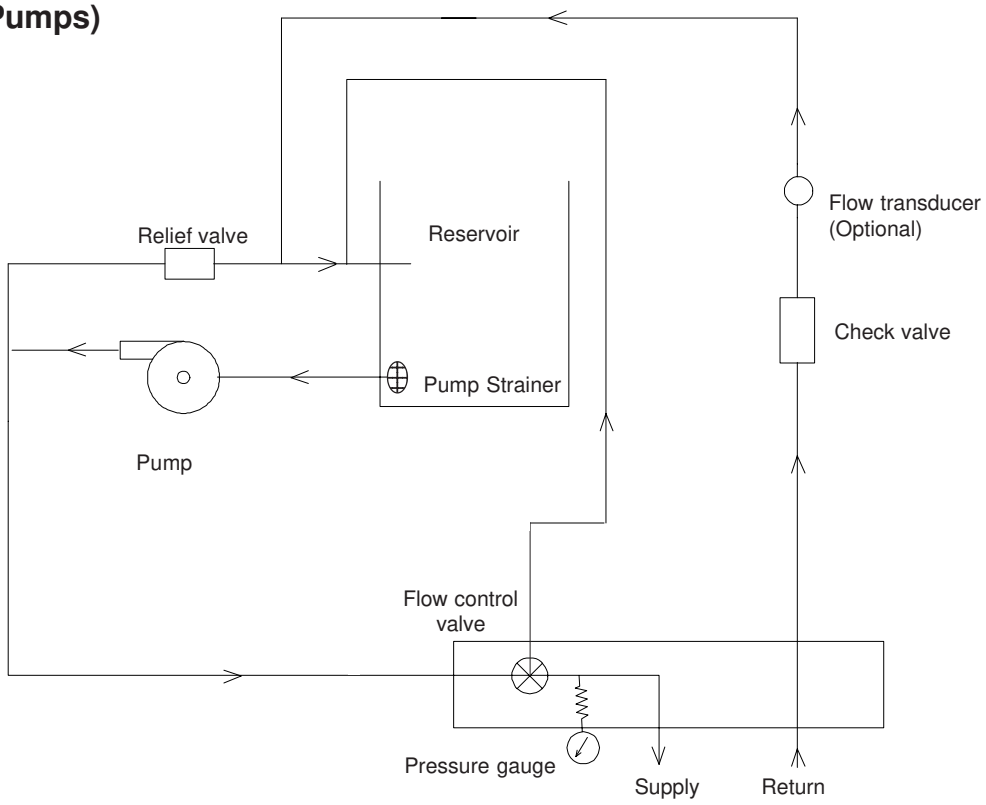
Refrigeration Flow Diagram
(HX-300 through HX-750)



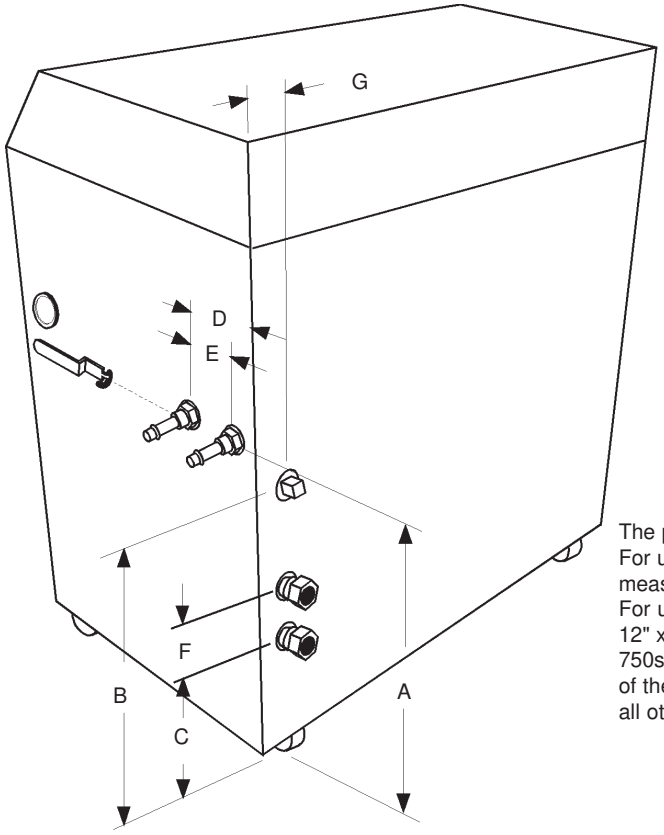
Pump Flow Diagram (CP Pumps)



Pump Flow Diagram (PD and TU Pumps)



Dimensions



The pullbox comes in two sizes. For units without heaters the box measures 6" x 6" x 4" (H x W x D). For units with heaters it measures 12" x 16" x 4" (H x W x D). On HX-750s the box is located on the rear of the unit, it is on the left side for all other units.

Unit Dimensions	HX75	HX150	HX300	HX500	HX750AC*
Dimension A	16	20	25 3/8	25 1/4	41
Dimension B	15 1/4	19 1/4	23 1/2	21 1/8	33 3/4
Dimension C	8 1/4	9 1/4	8 3/8	5 1/2	NA
Dimension D	7 1/4	7 1/4	7 1/2	9 1/2	9 1/2
Dimension E	3	3	3	3	3
Dimension F	3	3	3	5 1/2	NA
Dimension G	1 3/8	1 3/8	1 1/2	2 1/4	NA
Dimension H	2 1/2	2 1/2	2 3/8	2 1/4	2 1/4
Dimension I	25 7/8	28 1/2	32 1/2	36 1/8	36
Dimension J	48 1/2	54	64 7/8	73 1/2	86 1/4
Crate Dimensions (H x W x D)	46x30x27	49x33x29	55x40x33	61x54x36	74x54x36

* Air-cooled units. Water-cooled units are the same size as the HX-500 units.

1. Dimensions are given in inches, ±1/8 inch.
2. Model HX-750 with a water-cooled condenser has the same dimensions as an HX-500.
3. Dimension A is the distance from the floor to the center of the SUPPLY and RETURN connections.
4. Dimension B is the distance from the floor to the center of the DRAIN connection.
5. Dimension C is the distance from the floor to the center of the tap water outlet connection.
6. Dimension D is the distance from the center of the SUPPLY connection to the rear of the unit case.
7 Dimension E is the distance between the SUPPLY and RETURN connections
8. Dimension F is the distance between the center of the TAP WATER connections (upper inlet and lower outlet).
9. Dimension G is the distance from the edge of the unit case to the center of the three plumbing connections.
10. Dimension H is the distance from the floor to the bottom of the case, height of the castors (not shown).
11. Dimension I is the depth of the unit with the case top open (not shown).
12. Dimension J is the height of the unit with the case top open (not shown).

Appendix A Remote Probe Calibration

Before using the optional remote probe it must be calibrated. To do this you run the unit to its temperature extremes and use the controller's Operator's and Calibration Loops.

Install the remote probe into the SENSOR 9-pin "D-sub" located on the rear of the unit.

Use the Operator's Loop to run the unit to its high-end temperature limit. When the setpoint is reached press and hold the ENTER key and then press YES-NO-YES to display CALIBRATE? Press YES.

Press NEXT until RMT RTD? is displayed. Press YES to display HI CAL? HI xxx.xC will be displayed, use the YES/NO keys to reach the desired temperature and the press ENTER. Press the NEXT key until SAVE? is displayed, press YES to return to the Operator's Loop.

Use the Operator's Loop to run the unit to its low-end temperature limit. When the setpoint is reached press and hold the ENTER key and then press YES-NO-YES to display CALIBRATE? Press YES.

Press NEXT until RMT RTD? is displayed. Press YES to display HI CAL? Press NO and LOW CAL? is displayed. Press YES and LOWxxx.xC will be displayed, use the YES/NO keys to reach the desired temperature and the press ENTER. Press the NEXT key until SAVE? is displayed, press YES to return to the Operator's Loop.

The probe is now calibrated. Re-calibrate as necessary or if the probe is replaced.

Appendix B Programming Software

The NESLAB Communications Software is a user-friendly software that allows you to automate your temperature control process. The software includes a 3½" disk, comprehensive operator's manual and a toll-free number to a trained technical staff.

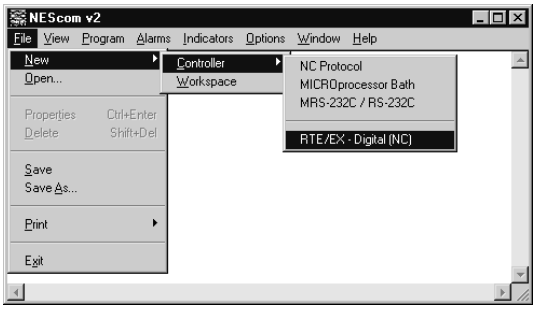
NEScom Software allows you to write custom temperature programs for our Digital or Microprocessor based temperature control apparatus. Choose upper or lower temperature limits and monitor system status with an alarm. NEScom can also record your results on a user selectable graph. NesCom must be used with an IBM or 100% compatible computer.

Select from easy to use product icons.

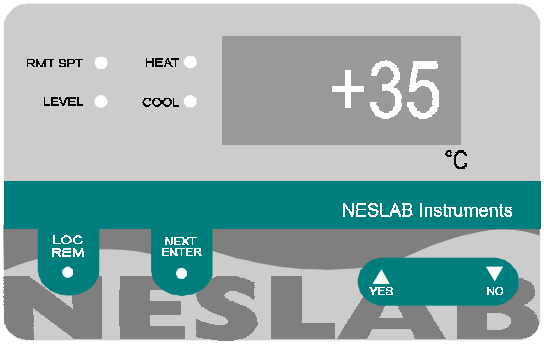
Create graphs and charts.

Easily configure ramping functions that set the setpoint over time.

View pop-up alarm windows that display if an alarm condition occurred.



Select software functions from the easy to use pulldown menus.



View a virtual controller screen which allows remote monitoring and operation of product control panel.

Appendix C Serial Communications Protocol

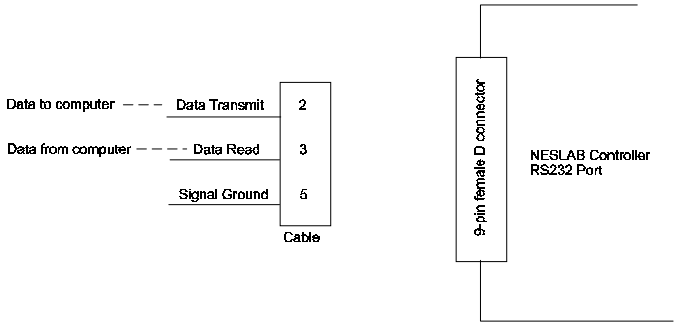
NOTE: This appendix assumes you have a basic understanding of communications protocols.

All data is sent and received in binary form, do not use ASCII. In the following pages the binary data is represented in hexadecimal (hex) format.

The Neslab Serial Communications Protocol, NC, is based on a master-slave model. The master is a host computer, while the slave is the bath's controller. Only the master can initiate a communications transaction (half-duplex). The slave ends the transaction by responding to the master's query. The protocol uses an RS-232 serial interface with the parameters: 9600 baud, 8 data bits, 1 stop bit and no parity.

NOTE: Before the unit will communicate, RS232 must be turned on in the controller's Setup Loop.

The unit can be controlled through your computer's serial port by using the unit's standard 9-pin RS-232 connection. Data read of the serial port connects to the data transmit (pin 2) of the unit. Data transmit of the serial port connects to data read (pin 3) of the unit.



Communication cables are available from NESLAB. Contact our sales department for additional information.

All commands must be entered in the exact format shown in the tables on the following pages. The tables on on the last two page of this Appendix show all commands available, their format and responses. Controller responses are either the requested data or an error message. The controller response *must* be received before the host sends the next command.

The host sends a command embedded in a single communications packet, then waits for the controller's response. If the command is not understood or the checksums do not agree, the controller responds with an error command. Otherwise, the controller responds with the requested data. If the controller fails to respond within 1 second, the host should resend the command.

NEScom Serial Communications Protocol

NOTE: All byte values are shown in hex, hex represents the binary values that must be sent to the bath. **Do not use ASCII.**

The framing of the communications packet in both directions is:

	Checksum region						
Lead char CA	Addr-MSB 00	Addr-LSB 01	Command	n d-bytes	d-byte 1 ...	d-byte n	Checksum

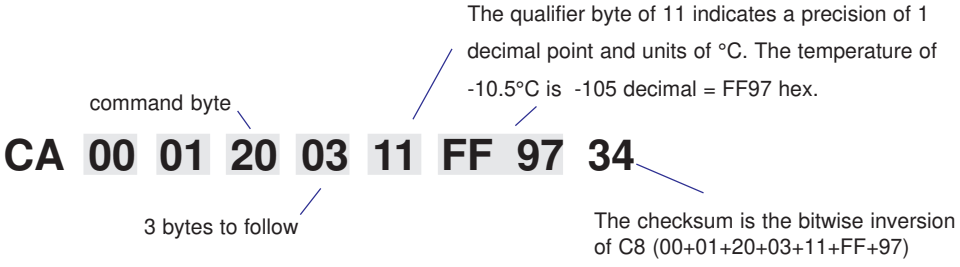
Lead char	CA (hex).
	Device address is 1
Addr-msb	Most significant byte of device address is 00 hex.
Addr-lsb	Least significant byte of device address is 01 hex.
Command	Command byte (see Table 1).
n d-bytes	Number of data bytes to follow (00 to 03 hex).
d-byte 1	1st data byte (the qualifier byte is considered a data byte).
...	...
d-byte n	nth data byte.
Checksum	Bitwise inversion of the 1 byte sum of bytes beginning with the most significant address byte and ending with the byte preceding the checksum. (To perform a bitwise inversion, "exclusive OR" the one byte sum with FF hex.)

The master requests information by sending one of the Read Functions as shown in Table 1. Since no data is sent to the bath during a read request, the master uses 00 for the number of data bytes following the command byte.

The bath will respond to a Read Function by echoing the lead character, address, and command byte, followed by the requested data and checksum. When the bath sends data, a qualifier byte is sent first, followed by a two byte signed integer (16 bit, MSB sent first). The qualifier byte indicates the precision and units of measure for the requested data as detailed in Table 2.

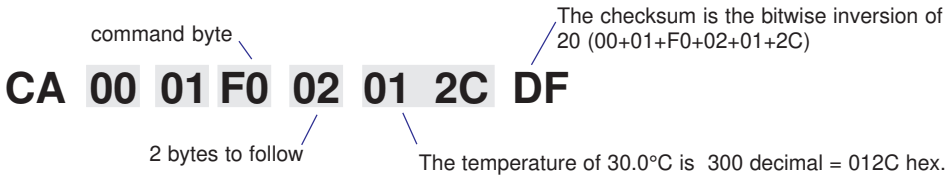
As an example, the master requests to read internal temperature by sending:

If the temperature is -10.5°C, the slave would reply:



The master sets parameters in the bath by sending one of the Set Functions as shown in Table 1. The master does not send a qualifier byte in the data field. The master should be preprogrammed to send the correct precision and units (it could also read the parameter of interest first to decode the correct precision and units needed).

For example, if the master wants to set the setpoint to 30°C, it would send :



The slave responds:

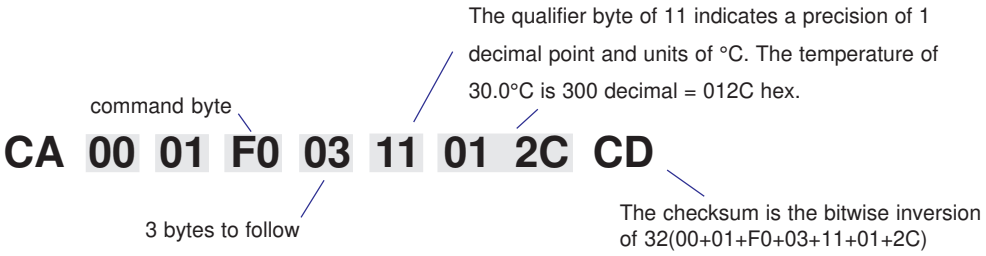


Table 1 Commands (All bytes are in hex)

FUNCTION	MASTER SENDS	UNIT RESPONDS
READ		
Read Internal Temperature	CA 00 01 **20** 00 DE	CA 00 01 **20** 03 qb d1 d2 cs

MISCELLANEOUS		
Request Acknowledge	CA 00 01 **00** 00 FE	CA 00 01 **00** 02 v1 v2 cs

command bytes shown in **bold**
qb = qualifier byte
d1,d2 = 16 bit signed integer of the value being sent or received
cs = the checksum of the string (see text)
ed = echo back of the command byte as received
v1,v2 = protocol version
* = limited to the range of the bath
xx = no valid data, include in checksum

Table 2
QUALIFIER BYTE

00 hex	0 precision, no units of measure
01 hex	0 precesion, °C
02 hex	0 precision, °F
10 hex	0.1 precision, no units of measure
11 hex	0.1 precision, °C units
12 hex	0.1 precision, °F units
13 hex	0.1 precision, LPM
14 hex	0.1 precision, GPM
08 hex	0 precision, MOhm-cm
18 hex	0.1 precision, MOhm-cm
20 hex	0.01 precision, no units of measure

Example: The temperature of 45.6°C would be represented by the qualifier 11 hex, followed by the 2 bytes 01 C8 hex (456 decimal).

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

APPENDIX A - INTERNATIONAL QUICK REFERENCE GUIDES
APPENDIX B - 380V WYE MODIFICATION

WARRANTY

Water-Cooled HX Series Quick Reference Operating Procedures

Installation
Position the unit in a clean environment with easy access to facility cooling water and a drain. The facility water requirements must meet those specified in the instruction or unit performance will be derated.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled TAP WATER, DRAIN, SUPPLY and RETURN. Remove the plastic protective plugs from all the plumbing connections. Connect the TAP WATER fitting to the facility cooling water and the DRAIN fitting to a drain. Connect the SUPPLY fitting to the inlet of your application and the RETURN fitting to the outlet of your application.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within one inch of the top. If the fluid capacity of your application and recirculation lines are significant, have extra fluid on hand.

Tap water is the recommended fluid for operation from +8°C to +80°C. Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Operation
Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

Ensure the facility water is turned on.

On models HX-200 through HX-750, the unit must be connected to the power source for at least 12 hours to allow the oil to be heated and separated from the refrigerant

To start the unit, place the Power Switch to the ON position. The Cool and Idle LEDs on the front panel indicate the status of the refrigeration system. Cool is on when the unit is removing heat from the cooling fluid, Heat is on when the unit is in the hot gas by-pass mode. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Analog Controller Temperature Adjustment
To adjust the temperature setpoint, turn the °C dial on the front of the unit to the desired temperature.

Digital Controller Temperature Adjustment
To display the temperature setpoint, press and hold the DISPLAY switch. To adjust the temperature setpoint, press and hold the DISPLAY switch and turn the ADJUST knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the DISPLAY switch. The display will now indicate the temperature of the fluid in the reservoir.

Flow Control
The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the “+” position you receive full flow, the “-” position is no flow.

Periodic Maintenance
Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend avisual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

For complete information, including troubleshooting procedures, please refer to the instruction manual.

Air-Cooled HX Series Quick Reference Operating Procedures

Installation
Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Avoid excessively dusty areas and institute a periodic cleaning schedule. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled SUPPLY and RETURN. These connections are ¾ inch FPT. Remove the plastic protective plugs from both plumbing connections. Connect the SUPPLY fitting to the inlet of your application. Connect the RETURN fitting to the outlet of your application.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within one inch of the top. If the fluid capacity of your application and recirculation lines are significant, have extra fluid on hand.

Tap water is the recommended fluid for operation from +8°C to +80°C. Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Operation
Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

On models HX-200 through HX-750, the unit must be connected to the power source for at least 12 hours to allow the oil to be heated and separated from the refrigerant

To start the unit, place the Power Switch to the ON position. The Cool and Idle LEDs on the front panel indicate the status of the refrigeration system. Cool is on when the unit is removing heat from the cooling fluid, Heat is on when the unit is in the hot gas by-pass mode. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Analog Controller Temperature Adjustment
To adjust the temperature setpoint, turn the °C dial on the front of the unit to the desired temperature.

Digital Controller Temperature Adjustment
To display the temperature setpoint, press and hold the DISPLAY switch. To adjust the temperature setpoint, press and hold the DISPLAY switch and turn the ADJUST knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the DISPLAY switch. The display will now indicate the temperature of the fluid in the reservoir.

Flow Control
The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the “+” position you receive full flow, the “-” position is no flow.

Periodic Maintenance
Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

For complete information, including troubleshooting procedures, please refer to the instruction manual.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 1000-4-2:1995
	IEC 1000-4-3:1994
	IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition.

On units with a remote control box, the box is packed in a separate carton. Be sure to locate this separate carton; do not dispose of it by mistake.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

The unit has a warranty against defective parts and workmanship for one full year from date of shipment. Refer to the last page of this manual for complete warranty details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label on the rear of the case top to obtain the following information (see Section II, Description for the serial number label location):

- BOM number _____

- Serial number _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department for assistance (see Preface, After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Do not attempt to defeat any of the interlock switches or safety features built into the unit.

Observe all warning labels.

Never remove warning label.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the fluid reservoir.

Make sure the unit is off before connecting or disconnecting the power cord or other cables.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the fluid reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified NESLAB technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

Section II General Information

Description

The HX Series Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and volume.

The unit consists of an air-cooled or water-cooled refrigeration system, a fluid reservoir, a fluid recirculation pump, and a temperature controller.

HX units are available with a large number of options. This manual explains how to install, operate, and maintain a “standard” HX unit. This manual also explains some of the available options. Supplemental manuals are supplied with units equipped with options not covered in this manual.

Throughout the manual, you will be asked to consult the unit’s serial number label, or the pump identification label, or both, for specific information. The labels are located on the rear of the case top.

1. For additional dimensions see page 47.
2. HX-750 with a water-cooled refrigeration system has the same dimensions as the HX-500.

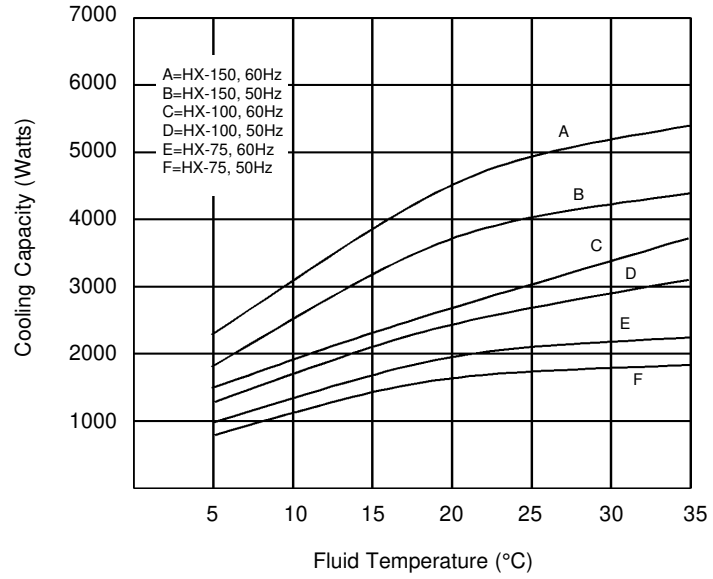
Cooling Capacity

Cooling capacity will vary depending on fluid temperature, ambient temperature, and cooling fluid.

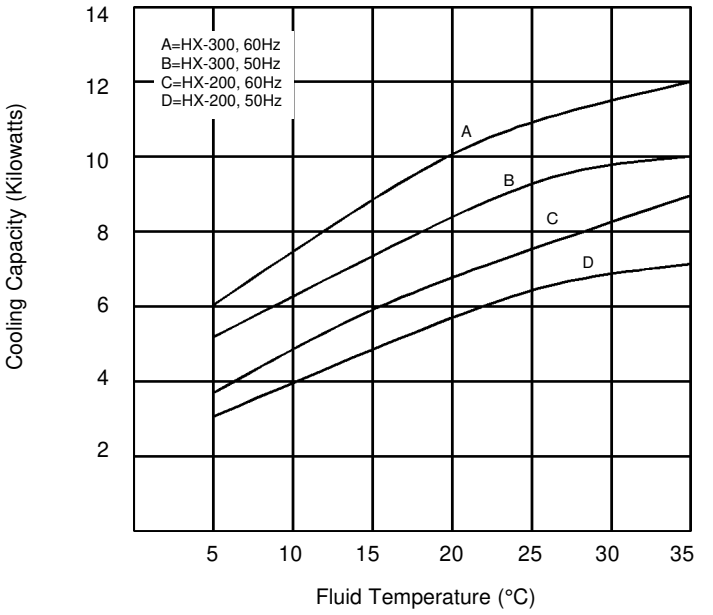
Cooling capacities for models HX-75 through HX-750 were obtained under the following conditions:

1. *air-cooled unit operating at +20°C (+68°F) ambient temperature.*
2. *cooling fluid with specific heat of 1.0 was used for fluid temperatures from +5°C to +35°C.*

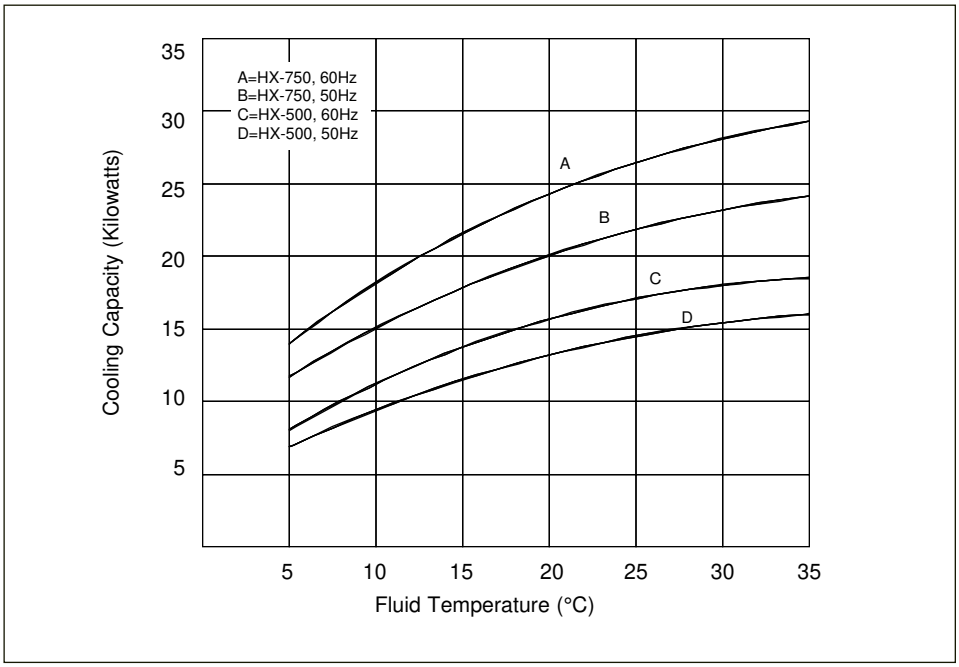
HX-75, 100, & 150



HX-200 & 300



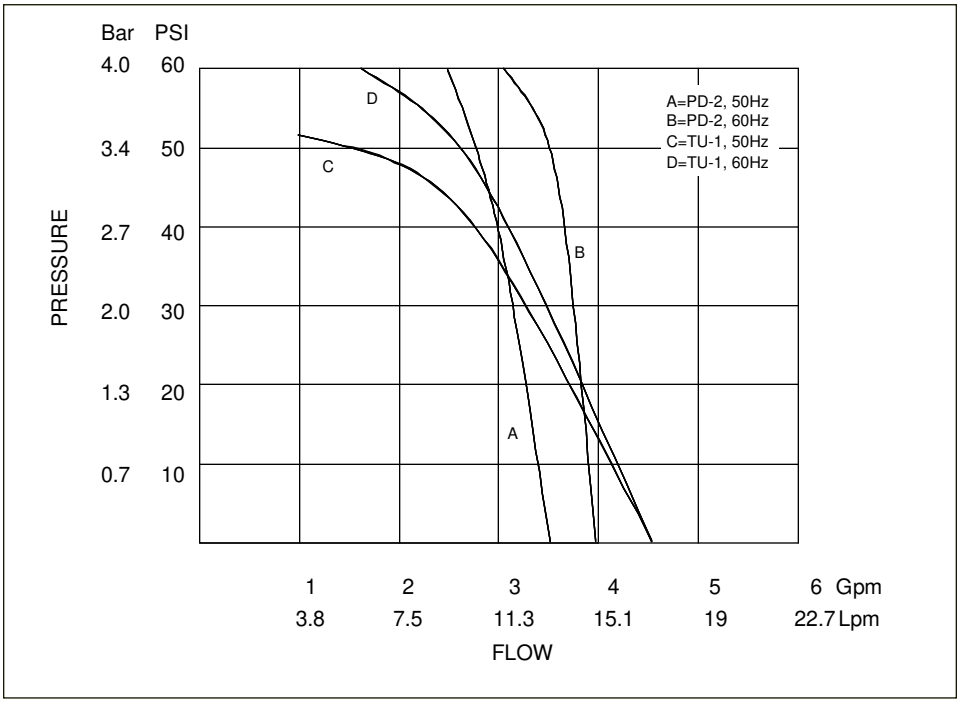
HX-500 & 750



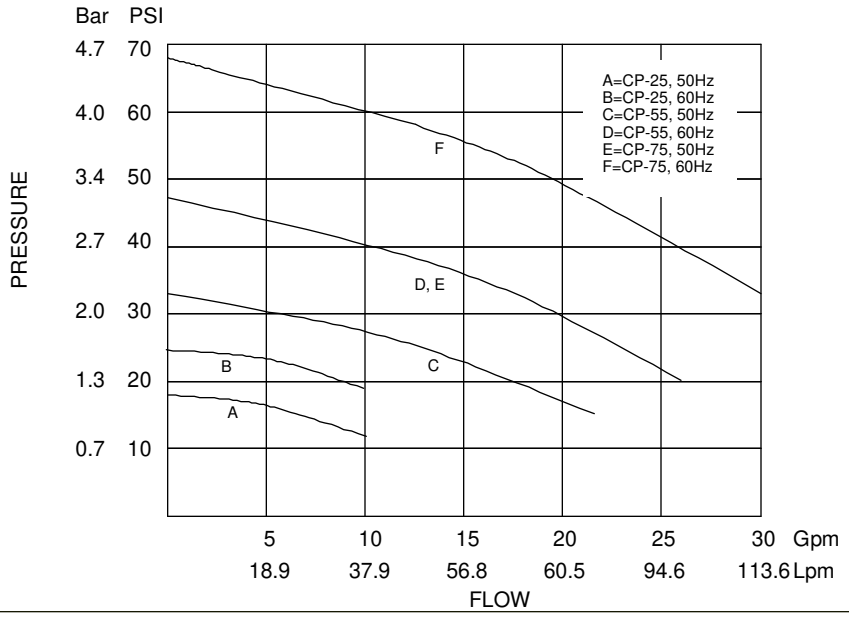
Pump Capacity

HX units are available with one of three standard pump types: positive displacement (PD), centrifugal (CP), and turbine (TU). Refer to the pump identification label on the rear of the case top or rear of analog temperature controller to identify the specific pump in your unit.

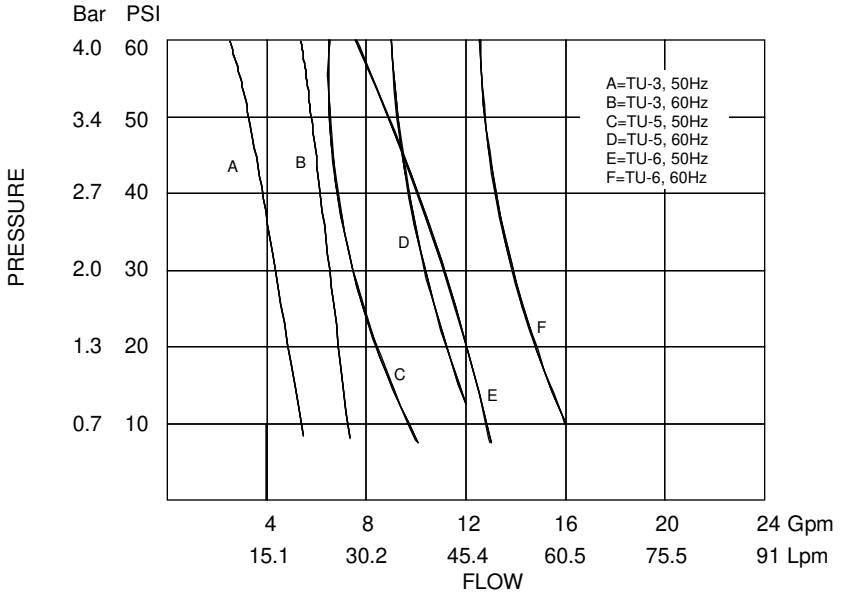
PD2 & TU1



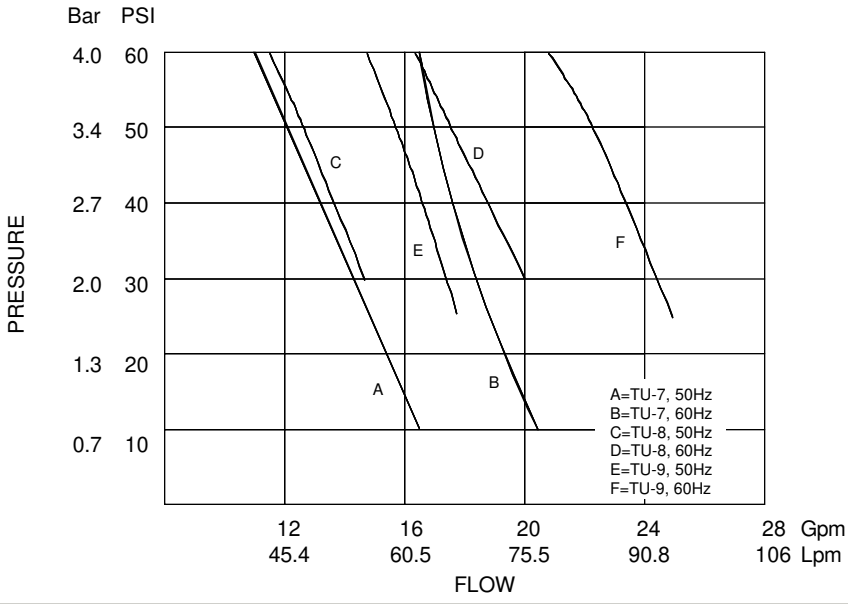
CP



TU-3, 5 & 6



TU-7, 8 & 9



Section III Installation

Site (Air-cooled Units)

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +55°F to +95°F (+13°C to +35°C).

The unit will retain its full rated capacity in ambient temperatures to approximately +75°F (+24°C). Above +75°F, derate the cooling capacity 1% for every 1°F above +75°F, to a maximum ambient temperature of +95°F. In degrees Celsius, derate the cooling capacity 1% for every 0.5°C above +24°C, to a maximum ambient temperature of +35°C.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. It must be positioned so the air intake and discharge are not impeded.

On models HX-75 through HX-150, air is drawn through the left side of the unit and discharged through the right and rear. A minimum clearance of 2 feet (0.6 meter) on these three sides is necessary for adequate ventilation.

On models HX-200 — HX-750, air is drawn through the front of the unit and discharged through the side and rear. A minimum of 5 feet (1.5 meters) on all four sides of the unit is necessary for adequate ventilation.

In some applications where space is at a premium, the minimum ventilation clearance can be compromised. However, consult our Sales Department before positioning the unit in a location with less minimum clearance than listed above. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section VII, Condenser Cleaning).

On digital models HX-100 through HX-750 the stirrer motor is located under the case top. (Models HX-500 and HX-750 have two stirrer motors.) Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation.

NOTE: Units with plate heat exchangers do not have stirrer motors.

Refer to the table below to determine the approximate amount of air intake required for the unit to retain its full rated capacity. If the air intake does not meet these standards, cooling capacity will be derated.

	HX-75	HX-100	HX-150	HX-200
Air Intake				
Cubic feet per minute	600	710	1050	2000
Liters per minute	17000	20100	29730	56640

	HX-300	HX-500	HX-750
Air Intake			
Cubic feet per minute	1900	5000	5600
Liters per minute	53800	141750	158800

Site (Water-cooled units)

The unit should be located in a laboratory or clean industrial environment with easy access to a facility cooling water supply and a drain.

All units are equipped with castors for easy movement. This allows the unit to be placed in a small area, as long as there is ample space for the unit to be moved for access on all four sides. A minimum access clearance of 3 feet (1 meter) on two adjacent sides is recommended.

The facility cooling water supply must meet or exceed the requirements listed in the table shown on the next page for the unit to operate at its full rated capacity. If the facility cooling water does not meet these standards, the cooling capacity will be derated.

As the temperature of the cooling water supply increases, the required flow rate and pressure of the cooling water supply increases.

For example, with a model HX-150, if the temperature of the cooling water supply is +65°F, the flow rate must be at least 1.5 gallons per minute, with a pressure differential of at least 3.5 PSI. However, if the temperature of the cooling water supply is +85°F, the flow rate must be at least 4.0 gallons per minute, with a pressure differential of at least 10 PSI.

If the unit is being used with a building water supply, the back pressure of the drain must be less than the supply pressure.

A water regulating valve, located in the TAP WATER line, regulates the flow rate of the cooling water supply as it enters the unit. The valve regulates the flow rate based on the heat load. Flow through the unit stops automatically when the unit is shut off.

On digital models HX-100 through HX-750 the stirrer motor is located under the case top. (Models HX-500 and HX-750 have two stirrer motors.) Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation. See illustration on previous page.

NOTE: Units with plate heat exchangers do not have stirrer motors.

Electrical Requirements

Refer to the table below to determine electrical requirements of your unit. Verify the requirements by reviewing the ratings listed on the serial number label on the rear of the case top or rear of analog temperature controller.

	HX-75	HX-100	HX-150
Volts		208/230 220/240	
Hertz		60 50	
Phase		1 1	
Plug		NEMA L6-30P or L6-20P	

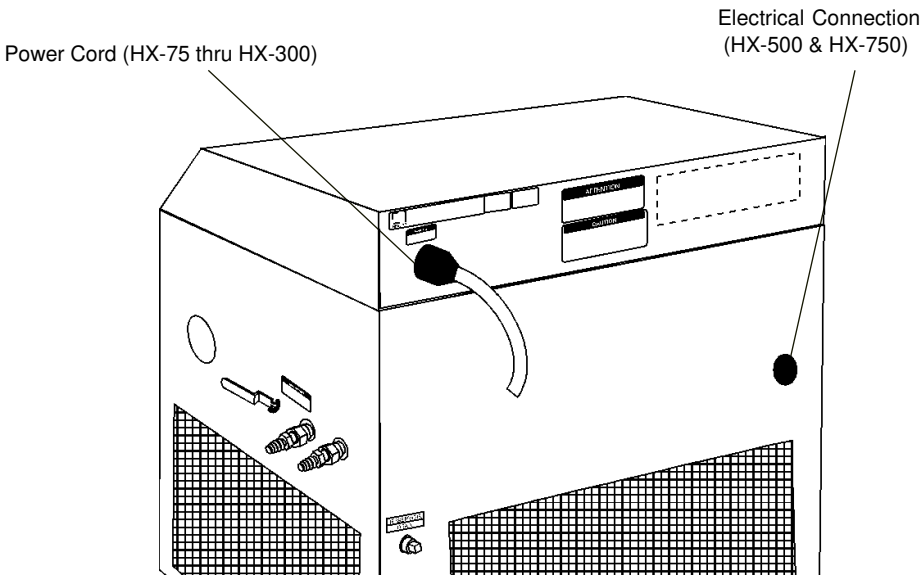
	HX-200	HX-300	Hx-500	HX-750
Volts	208/230 200/220 380/420		208/230	380/420
Hertz	60 50 50		60	50
Phase	3 3 3		3	3
Plug	NEMA L15-30P or L16-20P		N/A	

Make sure the voltage of the power source agrees with the unit's voltage and frequency rating. The unit is designed to tolerate deviations of ±10% from the rated line voltage.

Models HX-75 through HX-300 have an 8 foot (2.4 meter) power cord installed on the unit at the time of shipment.

NOTE: Custom units equipped with heaters may not have a power cord. See Section VI, Special Features.

NOTE: 380V WYE connections are shown in Appendix B.



The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Models HX-500 and HX-750 are not equipped with a power cable. Installation of the cable is the user's responsibility. Wire the unit in conformance to local, state, and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

Models HX-200 through HX-750 are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

Plumbing Requirements

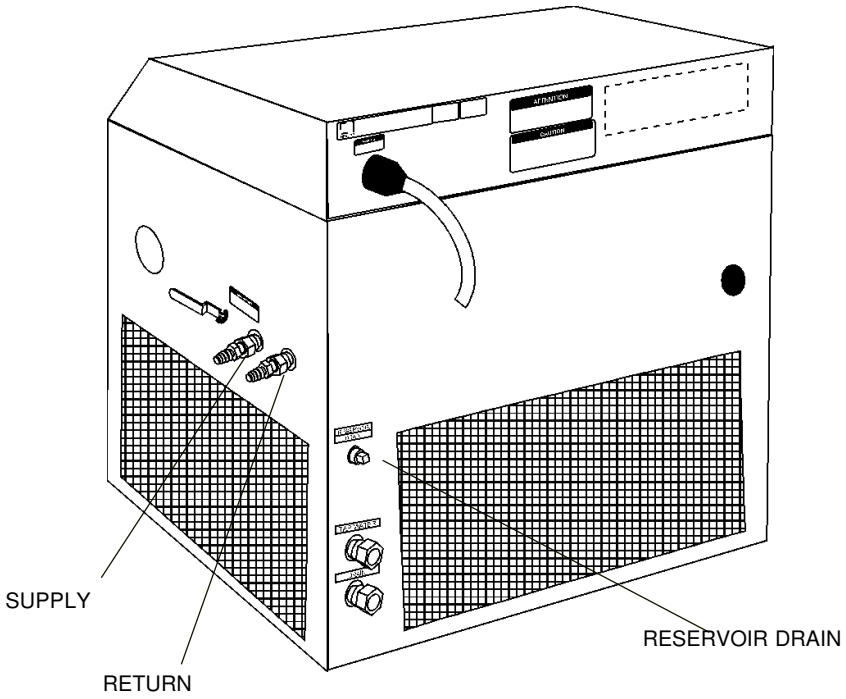
Air-cooled and water-cooled units

Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. Consult the manufacturer of the instrument for a cleaning fluid recommendation.

The plumbing fittings used to connect the HX to the instrument being cooled are located on the right side of the unit (labelled SUPPLY and RETURN). These connections are ¾ inch FPT.

Remove the protective plugs from the SUPPLY and RETURN connections. Connect the SUPPLY fitting to the inlet of the instrument being cooled. Connect the RETURN fitting to the outlet of the instrument being cooled.

The RESERVOIR DRAIN connection on the rear of the unit is a ½ inch FPT fitting connected internally to the unit's fluid reservoir. This fitting provides a means for draining the reservoir. The unit is shipped with a ½ inch MPT plug installed in this fitting. Remove the plug to drain the reservoir.



Two plumbing adapters (¾ inch MPT x 5/8 inch hose) are included with the unit. If the unit is being plumbed to the instrument being cooled using flexible tubing, install the adapters in the SUPPLY and RETURN plumbing ports. To prevent leaking, wrap the threads of the adapters with Teflon® sealing tape before installing them in the plumbing ports. The adapters will accept ½ or 5/8 inch ID flexible tubing.

If the unit is "hard plumbed" to the instrument being cooled or to the cooling water supply, damage can occur if the unit is bumped or jolted from its site. Provisions should be made to prevent the unit from being moved after installation. Once the unit is plumbed, secure the locking castors on the unit's base. If the unit is located in a heavy traffic area where the possibility of collision is imminent, it may be necessary to secure the unit to the site using blocks or mounting brackets.

Flexible tubing, if used, should be heavy wall or reinforced construction. All tubing should be rated to withstand 110 psi at +35°C. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter

reductions must be made, they should be made at the inlet and outlet of the instrument being cooled, not at the HX.

If substantial lengths of connecting tubing are required, they should be pre-filled with cooling fluid before connecting them to the unit.

Water-cooled units
The plumbing connections used to connect the water-cooled condenser in the HX to the facility cooling water supply are located at the rear of the unit (labelled TAP WATER and DRAIN). On models HX-75 through HX-300, these fittings are ½ inch FPT. On models HX-500 and HX-750, these fittings are 1 inch FPT.

Remove the plastic protective plugs from the TAP WATER and DRAIN connections. Connect the TAP WATER fitting to the facility cooling water supply. Connect the DRAIN fitting to a drain.

Fluids

The selected cooling fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

If your unit is equipped with a plate heat exchanger, do not use 100% water as a recirculating fluid. Due to the physical nature of a plate heat exchanger, and its response to temperature changes, using 100% water may cause the plate heat exchanger to rupture.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Tap water is the recommended fluid for operation from +8°C to +35°C.

Below +8°C, a non-freezing solution is required. A 50/50 mixture, by volume, of water and laboratory grade ethylene glycol is suggested.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer's warranty.

For units with extended temperature ranges above +35°C, tap water is the recommended fluid up to +80°C. Above +80°C, the user is responsible for the fluid(s) used.

Water Quality Recommendations

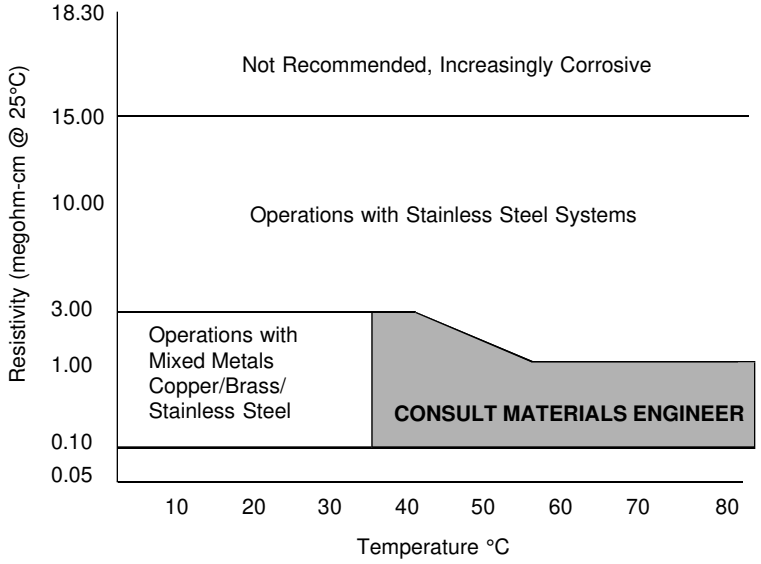
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (as NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (as NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated at 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated at 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated at 25°C).

The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



Water Quality Considerations

Filling Requirements

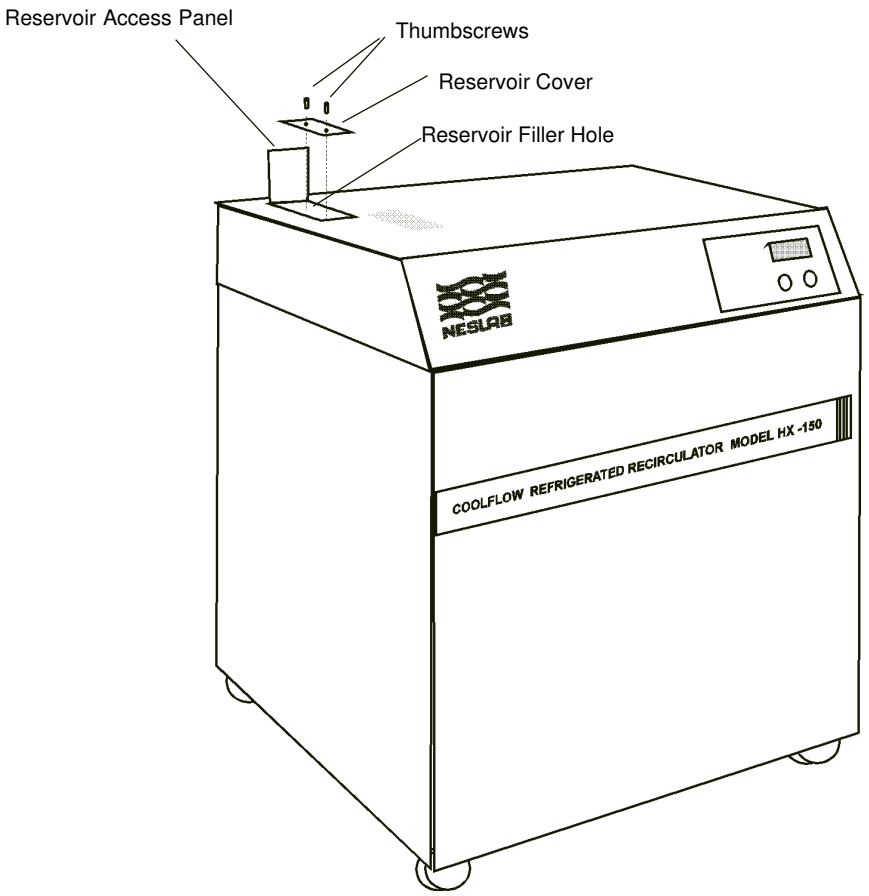
The reservoir access panel is located at the left rear corner of the case top, below an access panel. To open the access panel, slide the latch back (towards the rear of the unit) and lift.

Loosen the thumbscrews and remove the reservoir cover.

Fill the fluid reservoir with cooling fluid to within 1 inch of the top.

The fluid capacity of the instrument being cooled and the recirculation lines may be significant. To prevent the lowering of the fluid level in the reservoir below the operating level, have extra cooling fluid on hand to keep the reservoir filled to within 1 inch of the top.

When the recirculating system is full, replace the reservoir cover. Close the access panel.



Section IV Temperature Controllers

Temperature Controllers

The standard temperature controllers available with HX units are: Digital (Panel mounted or Remote) and Digital with Interlock. This section explains the installation (if applicable) and operation of the controllers.

Refrigeration Control

On “standard” units, the refrigeration compressor runs continuously, unless the fluid temperature exceeds +40°C. However, on some “custom” units equipped with an extended temperature range, the compressor may operate at higher temperatures. A hot gas by-pass system is used to maintain constant temperature in all units.

The Idle and Cool indicators, located on the control panel, indicate the status of the refrigeration system. The Idle indicator is lit when the unit is in the hot gas by-pass mode. The Cool indicator is lit when the refrigeration system is removing heat from the cooling fluid. As the fluid temperature approaches the temperature setpoint, the indicators cycle on and off to indicate the duty cycle of the system. The unit can be in Cool or Idle, but never both at the same time. A balance between Cool and Idle controls the temperature.

Start Up

Before starting, check all electrical and plumbing connections and make sure the recirculating system (the HX, your application, and the recirculation lines) has been properly filled with cooling fluid. Also, make sure the flow control valve is fully closed (see Section V, Flow Control). For CE Mark units ensure the circuit breaker on the right hand side of the unit is on.

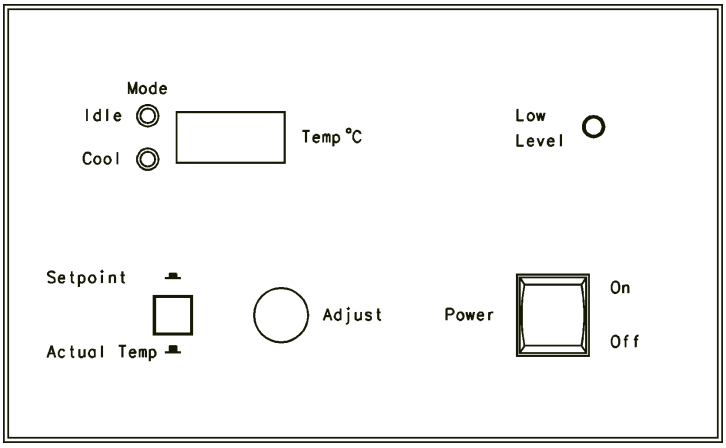
For water-cooled units — ensure that the facilty water is turned on.

Models HX-200 through HX-750 are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

To start the unit, place the Power On/Off switch in the On position. The pump and refrigeration system will start. The Temp°C display will indicate the reservoir fluid temperature. After starting recheck the fluid level, a "top off" may be needed. To shut the unit off, place the Power On/Off switch in the Off position.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Digital
(Panel mounted)

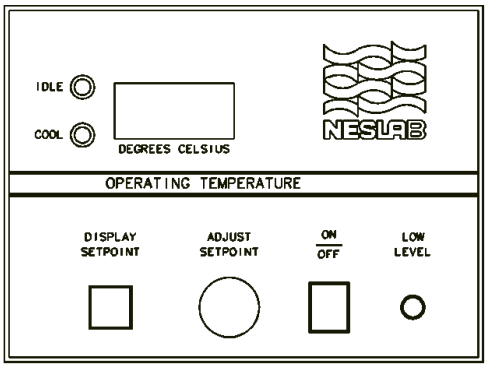


Digital Temperature Controller

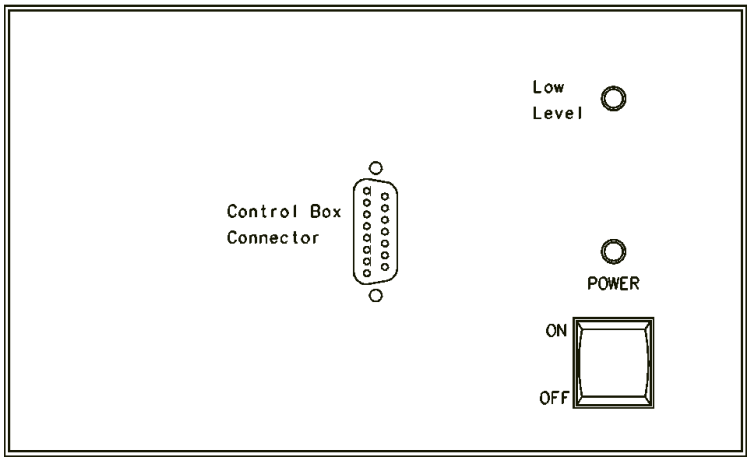
Temperature Adjustment
To display the temperature setpoint, press and hold the Setpoint/Actual Temp button. To adjust the setpoint, press and hold the Setpoint/Actual Temp button and turn the Adjust dial until the desired temperature setpoint is indicated on the Temp°C LED display. Once the setpoint is adjusted, release the Setpoint/Actual Temp button. The Temp°C LED display will indicate the temperature of the fluid in the reservoir.

NOTE: Inadvertent movement of the Adjust dial will result in a change in the setpoint. The change will not be immediately reflected on the Temp°C display unless the Setpoint/Actual Temp button is pressed. The display will eventually change as the unit responds to the new setpoint

Low Level Warning
The Low Level indicator is connected to a float switch in the reservoir. The indicator warns the user of a low cooling fluid level in the reservoir. A low fluid level condition occurs when the cooling fluid in the reservoir drops below the operating level. The indicator serves only as a warning. The unit will not shut down as a result of a low fluid level condition.



Digital Temperature Controller
(remote)



Digital Temperature Controller

Installation

Controller dimensions are 4¾" x 7¾" x 3¾" (H x W x D).

Connect the Digital remote box to the unit by securing the connector on the remote box's cable to the Control Box Connector receptacle on the operator panel on the front of the case top.

Start Up

To start the unit, place the ON/OFF switch on the operator panel of the unit in the ON position and press the ON/OFF button on the remote box. The pump and refrigeration system will start, the POWER indicator on the operator panel will light and the DEGREES CELSIUS display on the remote box will indicate the fluid temperature. Either ON/OFF switch will shut the unit off.

Temperature Adjustment

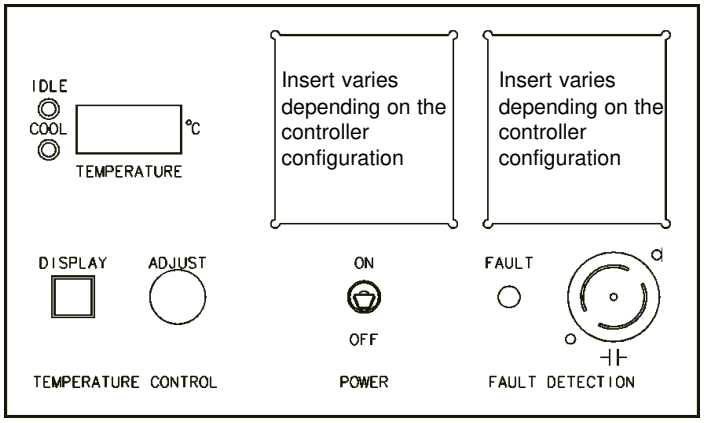
To display the temperature setpoint, press and hold the DISPLAY/SETPOINT button. To adjust the setpoint, press and hold the DISPLAY/SETPOINT button and turn the ADJUST SETPOINT dial until the desired temperature setpoint is indicated on the DEGREES CELSIUS LED display. Once the setpoint is adjusted, release the DISPLAY/SETPOINT button. The DEGREES CELSIUS LED display will indicate the temperature of the fluid in the reservoir.

NOTE: Inadvertent movement of the ADJUST SETPOINT dial will result in a change in the setpoint. The change will not be immediately reflected on the DEGREES CELSIUS display unless the DISPLAY/SETPOINT button is pressed. The display will eventually change as the unit responds to the new setpoint.

Low Level Warning

The LOW LEVEL indicator is connected to a float switch in the reservoir. The indicator warns the user of a low cooling fluid level in the reservoir. A low fluid level condition occurs when the cooling fluid in the reservoir drops below the operating level. The indicator serves only as a warning. The unit will not shut down as a result of a low fluid level condition.

Digital with Interlock



Digital with Interlock Temperature Controller

Description

The Digital with Interlock temperature controller is a Digital temperature controller with up to four monitoring options: low temperature, high temperature, low fluid level, and low flow. The controller can be built with any combination of these four monitors.

Temperature Adjustment
To display the temperature setpoint, press and hold the DISPLAY button. To adjust the temperature setpoint, press and hold the DISPLAY button and turn the ADJUST dial until the desired temperature setpoint is indicated on the TEMPERATURE °C LED display. Once the setpoint is adjusted, release the DISPLAY button. The TEMPERATURE °C display will indicate the temperature of the fluid in the reservoir.

NOTE: Inadvertent movement of the ADJUST dial will result in a change in the setpoint. The change will not be immediately reflected on the TEMPERATURE °C display unless the DISPLAY button is pressed. The display will eventually change as the unit responds to the new setpoint.

Fault Response
Controllers with a START switch are configured to shut off in the event that a fault occurs. Controllers NOT equipped with a START switch will allow the unit to continue to operate if a fault occurs. This option is available for customers who are willing to accept the risk of damage to the unit in order to continue to provide cooling fluid to the instrument being cooled.

With either controller configuration, the relay contacts connected to the controller receptacle will open and the FAULT indicator will light if a fault occurs. The cause of the fault must be identified and corrected before the unit can be restarted.

START Switch
If the controller is equipped with a START switch, a fault will cause the unit to shut down. Press the START switch to restart the unit after the fault has been corrected. If the fault has not been corrected, the unit will not start and the FAULT indicator will light when the START switch is pressed.

Temperature Monitors
The optional high and low temperature monitors are connected to sensors that monitor the temperature of the cooling fluid as it exits the reservoir. The monitors protect the system from exposure to excessively hot or cold cooling fluid. A temperature fault occurs when the fluid temperature exceeds the set temperature limit.

To adjust either temperature monitor, turn the appropriate calibrated dial to the desired temperature limit.

Low Fluid Level Monitor

The low fluid level monitor is connected to a float switch in the reservoir. If the controller is equipped with a LOW LEVEL indicator, the low level monitor is not connected to the fault circuit. The indicator will light if the reservoir cooling fluid drops below the operating level. The indicator serves only as a warning. A fault will not occur as a result of a low level condition.

If the controller is NOT equipped with a LOW LEVEL indicator, the low level monitor is connected to the fault current. A fault will occur if the reservoir cooling fluid level drops below the operating level.

Low Flow Monitor

The optional low flow monitor is connected to a flow switch in the RETURN line. A low flow fault occurs when the flow rate of the returning cooling fluid drops below 0.3 gallons per minute (1.0 liters per minute).

When starting a unit with a controller equipped with both a low flow monitor and a START switch, the START switch must be held in the ON position until the flow switch “closes” (2 or 3 seconds). If time is not allowed for the flow switch to close, the unit will stop when the START switch is released.

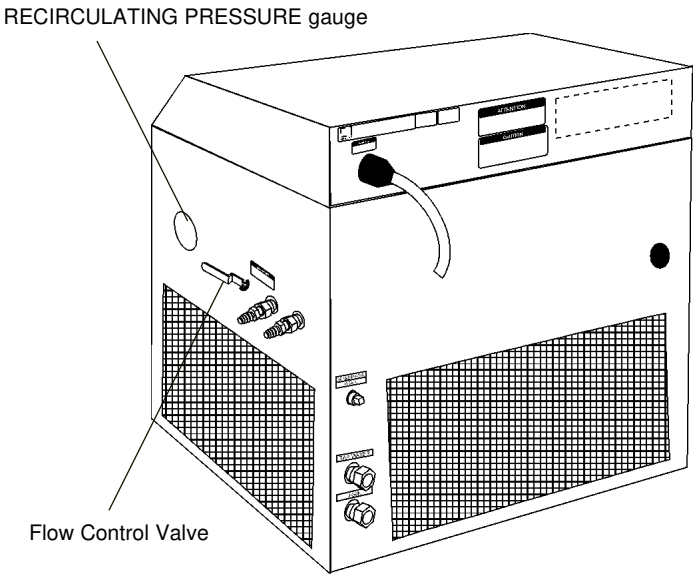
Interlock Relay Contacts

A set of contacts are connected to a receptacle on the operator panel. The contacts are rated 15A, 125V. This is not a power inlet or outlet. The receptacle is isolated from the circuitry. Its ground pin is connected to the chassis. The contacts are normally open: they are closed when the unit is running normally (no faults present), and they are open when the unit is off or when a fault occurs.

Section V Operation

Flow Control

The flow control handle is connected to a valve that controls the flow rate of the cooling fluid to the instrument being cooled. The handle is located on the right side of the unit and is labelled RECIRCULATING FLOW CONTROL.



When the handle is in the “+” position, the valve is open and all possible cooling fluid is supplied to the instrument being cooled. When the handle is in the “-” position, the valve is closed and no cooling fluid is supplied to the instrument being cooled. When the handle is between these two positions, the flow rate of the cooling fluid is between full flow and no flow. Use a flow meter on the SUPPLY line to adjust the desired flow rate.

Make sure the flow control handle is closed before starting the unit. Once the unit is running, use the handle to slowly open the valve until the desired flow rate is adjusted.

On units equipped to detect a low flow condition (Digital with Interlock temperature controllers equipped with a low flow monitor), the flow control valve must be opened slightly to allow fluid to circulate through the flow switch that monitors the flow rate. A flow rate of more than 0.3 gallons per minute (1.0 liters per minute) is necessary. If the flow is completely shut off, or if flow is not adequate, a low flow fault will occur and the unit will not start.

Never “crank” the valve wide open from the closed or slightly open position.

Pressure Gauge

The RECIRCULATING PRESSURE gauge is located next to the flow control handle. The gauge indicates the operating pressure of the system.

Pressure Relief Valve
(PD and TU Pumps Only)

Units with a PD-2 or any TU type pump have an adjustable pressure relief valve. Refer to the pump identification label on the rear of the case top or rear of analog controller to identify the specific pump in your unit.

The pressure relief valve establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The valve does not determine the actual operating pressure; the operating pressure of the system is determined by the back pressure of the connected equipment and the setting of the flow control valve. If adjustment seems necessary, consult our Service Department for assistance.

Before calling, refer to the serial number label on the rear of the case top to obtain the following:

- *unit part number*
- *unit serial number*

High Pressure Cutout
(Water-Cooled Units Only)

Should the unit's refrigeration discharge pressure become too high the high pressure cutout will activate and shut down the unit. High pressures can be caused by a lack of cooling water to the compressor or debris in the refrigeration lines.

Once the cause of the problem has been identified and corrected you must manually reset the cutout. The cutout location depends on the size of your unit. On the HX-75, it is behind the right side panel, on the HX-100 and HX-150 it is behind the left side panel, and on the HX-200 through HX-750 it is behind the rear panel.

Locate the white reset switch on the high pressure cutout. Press in on the switch until a "click" is heard. If the reset does not "click" the cutout was not activated and the unit shut down occurred for another reason.

Section VI Special Features

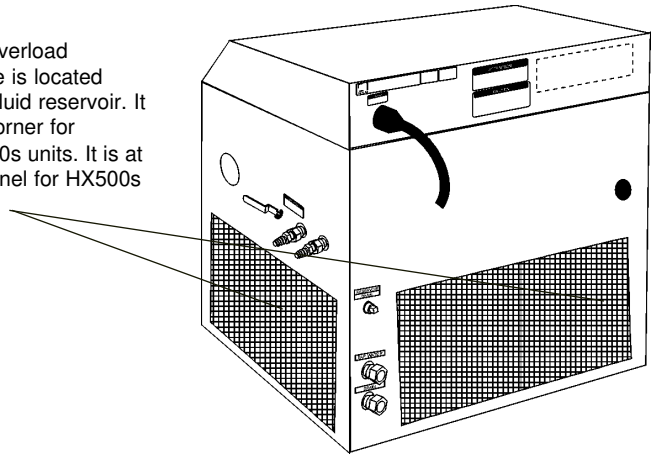
Pump Motor Overload Protector

Refer to the serial number label for the specific electrical requirements of your unit; specifically, identify the phase requirements of your unit.

The pump motor overload protector prevents the pump motor from exposure to excessive current. If an overload fault occurs, due, for example, to excessive pressure or flow, or excessive ambient temperature, the overload protector will shut off the pump motor. The overload protector will automatically reset after approximately one to two minutes.

If a fault occurs, a red lamp on the protector enclosure will light while the pump motor is off. The lamp goes out once the protector resets.

The pump motor overload protector enclosure is located directly under the fluid reservoir. It is at the left rear corner for HX200s and HX300s units. It is at the side access panel for HX500s and HX750s units.



The unit's fault response also varies depending on the unit's configuration.

If the unit has a Digital temperature controller and a single phase pump motor, the unit will continue to run if an overload fault occurs. The pump will restart as soon as the protector resets.

If the unit has a Digital controller and a three phase pump motor, the pump and refrigeration system will both shut down until the protector resets.

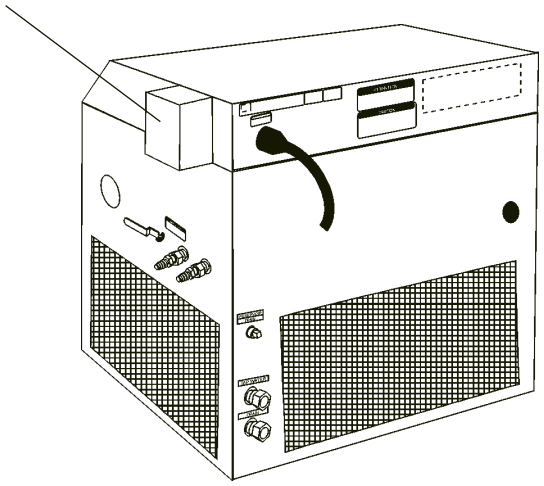
If the unit has a Digital with Interlock temperature controller with a low flow monitor, the unit will shut down due to a low flow fault. The unit must be manually restarted after the protector resets.

The overload protector can be adjusted to require manual resetting after an overload fault. If you are unsure of the phase of the pump motor in your unit, contact our Service Department (see Preface, After-sale Support).

Heater Package (Optional)

The heater package option consists of an immersion heater in the unit's fluid reservoir, a high temperature limit device, a solid state zero-crossing relay, a heater ENABLE/DISABLE switch and a FAULT indicator. The ENABLE/DISABLE switch and the FAULT indicator are located on a small control box appended to the right side of the case top. The FAULT indicator will light if the high temperature limit device is tripped. The high temperature limit device will disconnect power to the heater if the heater surface temperature exceeds a preset limit.

Heater Package Control Box (Typical)



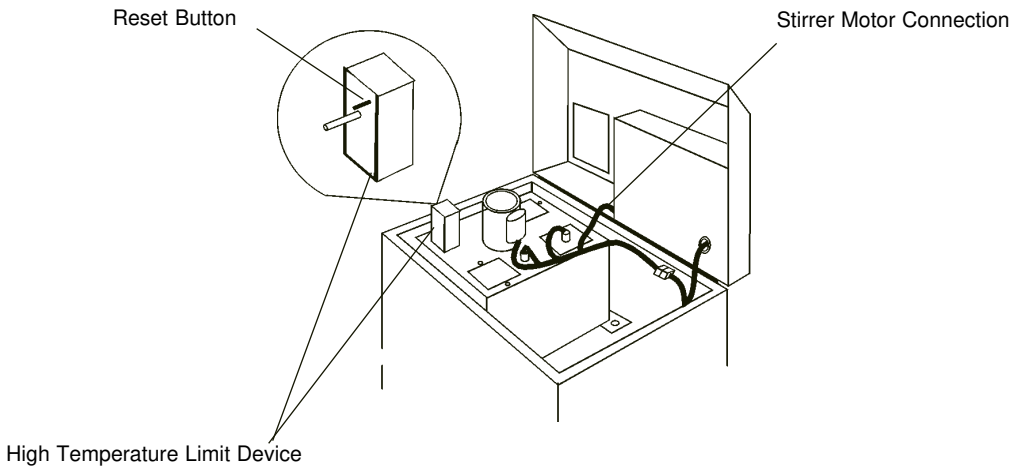
With the ENABLE/DISABLE switch set to ENABLE, the heater will cycle on and off under the control of the temperature controller. With the switch in the DISABLE position, the heater will remain off.

The heater high temperature limit device senses the surface temperature of the heater. If the heater temperature becomes too high, the limit device opens a mechanical relay to remove power from the heater.

The heater surface temperature may operate several degrees higher than the reservoir fluid. The limit device is factory set to a temperature above the upper limit of the temperature controller's range.

For personal safety and equipment reliability, the following procedure must only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

To reset a tripped temperature limit device, lift and open the case top. The case top is secured to the unit base by a hinge between the case top and the base (along the rear of the unit), and by two spring clips located at the front corners, see page 7. To gain access to the temperature limit device, disengage the spring clips with a flat bladed screw driver and lift the front of the case top and tilt it back. A support brace, located on the right side of the inner case, will stop and support the case top.



You must identify and correct the fault before restarting the unit.

The protection device and the heater power connections are located in a small stainless steel box on top of the fluid reservoir. The protection device has a reset button and a temperature limit adjustment shaft. Press the reset button to restore operation.

Some units equipped with heaters do not have a power cable. Installation of the cable is your responsibility. Wire the unit in conformance to local, state and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is your responsibility to assure a proper ground connection is provided. For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician.

To access the power cable connection box and install the cable:

- Lift the unit's bonnet.
- Remove the panel under the right half of the bonnet by removing the screws and the stirrer motor connection. (The stirrer motor connection is located at the lower left corner of the bonnet, see illustration above.)
- Remove the plastic plug on the rear of the bonnet. We recommend that you install an electrical conduit in place of the plastic plug.
- Insert your cable through the conduit.
- Locate the connection box and connect your cable to L1 and L2 (both connections are labeled) and to the ground stud (not labeled).
- Replace the panel and stirrer motor connection.

Remote Condenser (Optional)

Units with the optional remote air-cooled condenser are equipped with high and low refrigeration pressure monitors. The monitors are connected internally to a pressure gauge that monitors refrigeration pressure at the suction side of the compressor. The monitors protect the refrigeration system from operating under excessively high and low refrigeration pressures. A pressure fault occurs when the refrigeration pressure exceeds the set pressure limit.

The status of the monitors is indicated by the COMPRESSOR LOW PRESSURE and COMPRESSOR HIGH PRESSURE indicators located on the operator panel.

In the event of either a low or high refrigeration pressure fault, the unit will shut down. The unit must be manually restarted after the cause of the fault has been identified and corrected. If both indicators are lit simultaneously, an interruption in the main power supply has occurred.

Nitrogen Purge (Optional)

Units equipped with nitrogen purge valves are designed to accept a constant flow of dry nitrogen into the reservoir. The nitrogen blankets the cooling fluid reducing fluid evaporation.

Remove the reservoir cover by removing the screws. Fill the reservoir with fluid. Replace the reservoir cover and screws. Connect the nitrogen line to the valve on the reservoir cover.

A pressure regulator, set to 0.5 psig (0.35 kg/cm^3) or lower, should be used to prevent fluid overflow.

Particulate Filters (Optional)

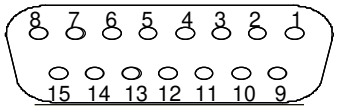
Some custom units are fitted with particulate filter assemblies attached to the supply side of the recirculation water. The frequency for cleaning/changing the filter depends on your usage. Should the unit's performance be degraded, check the filter.

Filters are available from NESLAB, contact our Customer Service Center. Before calling refer to the serial number label on the rear of the unit to obtain the following information:

-unit serial number
-unit part number

15 pin Accessory Connector (Optional)

Units with digital controllers may be modified with a 15 pin accessory connector. To enable the connector slide the LOCAL/REMOTE switch on the temperature controller to the REMOTE position. The pin out information is listed below.



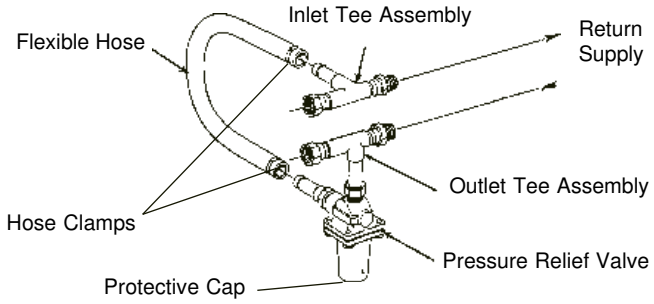
15 pin D-subminiature female receptacle

Pin #	Function
1	Chassis ground.
2	No connection.
3	Span +. Indicates the maximum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +350mV = +35.0°C).
4	Span -. Indicates the minimum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +50mV = +5.0°C).
5	No connection.
6	Analog ground. The analog ground is physically separated from the power ground throughout the unit. To prevent offsets that result from ground currents, the analog and power grounds are only connected at the unit's power supply. Analog ground should only be used as a reference pin .
7	Sensor temperature (current limited through 2.7K OHM resistor). The fluid temperature, as measured by the controller's sensor located in the reservoir, can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
8	Setpoint out. The present temperature setpoint can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
9	Power Ground.
10	Heater output. Will source 3V at 6mA.
11	No connection.
12	Digital display (input only). An external voltage can be displayed on the operator panel digital display by applying the voltage to this pin. The display has a low input resistance and a full scale rating of ±1.99VDC. Input is referenced to analog ground, pin 6. The maximum voltage applied to the display should be limited to ±2VDC.
13	- 5V. Power supply of -5VDC (15mA maximum).
14	+5V. Power supply of +5VDC (15mA maximum).
15	Setpoint in. The temperature setpoint can be controlled by applying a known voltage to this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +230mV = +23.0°C).

External Pressure Regulator (Optional)

For applications requiring a maximum pressure less than 55 psi, an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 psi. If the pressure of the fluid leaving the unit exceeds the valve setting the relief valve will bypass the fluid back into the unit to relieve the pressure. The pressure of the system is determined by the back pressure of the connected equipment and the flow rate of the recirculating fluid to your application.

Connect the EPR assembly as shown below. Tighten the hose clamps tight enough to prevent leakage. Do not over-tighten or the clamps will “bite” into the flexible tubbing and can cause excessive wear.



Connect the outlet tee assembly to the inlet of your application. Connect the inlet tee assembly to the outlet of your application.

Adjustment

When adjusting the relief valve some leaking may occur, place a container under the valve during adjustment.

Remove the protective cap and locate a threaded fitting with a slot for a large screwdriver. Hold the threaded fitting in place and loosen the lock nut on the valve body until it is almost flush with the threaded fitting. Unscrew the threaded fitting three to four turns. (If the threaded fitting unscrews completely from the valve housing, screw it back in two to three turns.)

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and your application. Monitor the operating pressure of the HX unit. Turn the threaded fitting until the desired relief pressure is set (the EPR valve cannot be set lower than the total back pressure of your instrument, or flow will not be received).

Tighten the locknut to secure the position of the threaded fitting. Open the hose between the EPR outlet tee assembly and your application.

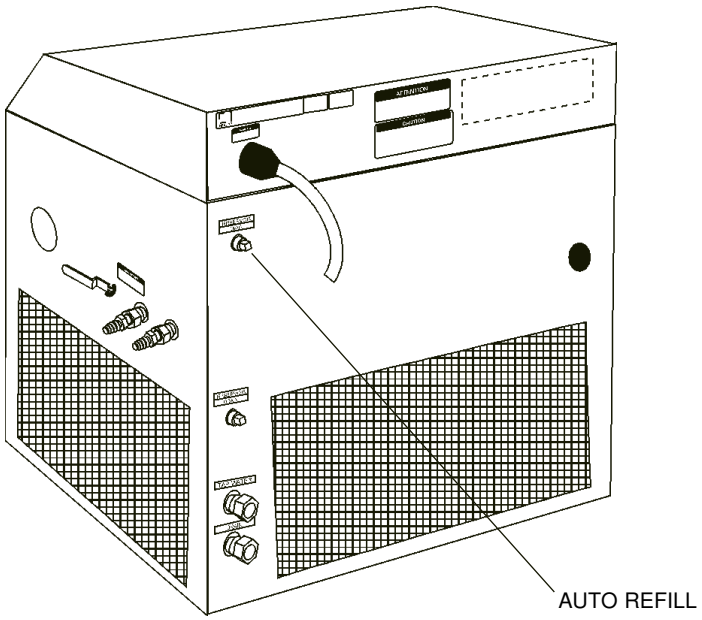
Automatic Refill Device (Optional)

The automatic refill device is designed to maintain the correct level of cooling fluid in the reservoir. The device consists of a float switch in the reservoir and a solenoid valve on top of the reservoir. If the cooling fluid level falls, the float switch will drop, opening the solenoid valve and allowing make-up fluid to fill the reservoir. Once the cooling fluid level reaches the proper level, the float switch will rise and the solenoid valve will close.

The plumbing connection for the refill device is located at the right rear corner of the unit and is labelled AUTO REFILL. This connection is a $^{3}/_{8}$ inch OD stainless steel barbed fitting.

Connect this fitting to a make-up fluid source using $^{5}/_{16}$ or $^{3}/_{8}$ inch ID flexible tubing. Make sure all tubing connections are securely clamped.

Tubing is available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).



Section VII Maintenance

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Condenser Cleaning (Air-cooled units only)

For proper operation, the unit needs to pull substantial amounts of air through a finned condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The frequency of cleaning depends on the operating environment. It is recommended that a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

For "standard" air-cooled units, periodic vacuuming of the fins on the condenser is necessary.

For units with the optional remote air-cooled condenser, remove any debris from around the condenser site. If a visible accumulation of dust or dirt is found on the condenser fins, the condenser should be cleaned with a condenser cleaning solvent and rinsed with water.

Exercise caution not to damage the condenser fins or coil. Condenser fin or coil damage can result in a loss of performance and, in extreme cases, refrigeration system failure.

Hoses

The unit's internal and external hoses and clamps should be inspected and tightened on at least a semiannual basis.

Algae

To restrict the growth of algae in the fluid reservoir, it is recommended that the reservoir cover be kept in place and that all recirculation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, one gram per gallon.

Section VIII Service

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Configuration

Case Top

The unit has a hinged case top to allow service access. The case top is secured to the top of the unit base by a hinge between the case top and base (along the rear of the unit), and by two spring clips located at the front corners, see illustration on page 7. To gain access to the pump assembly or the reservoir area, disengage the spring clips with a flat bladed screw driver and lift the front of the top cover and tilt it back. A support brace, located on the right side of the inner base, will stop and support the case top. Ensure the spring clips engage when the top is lowered back into position.

Reservoir Cover

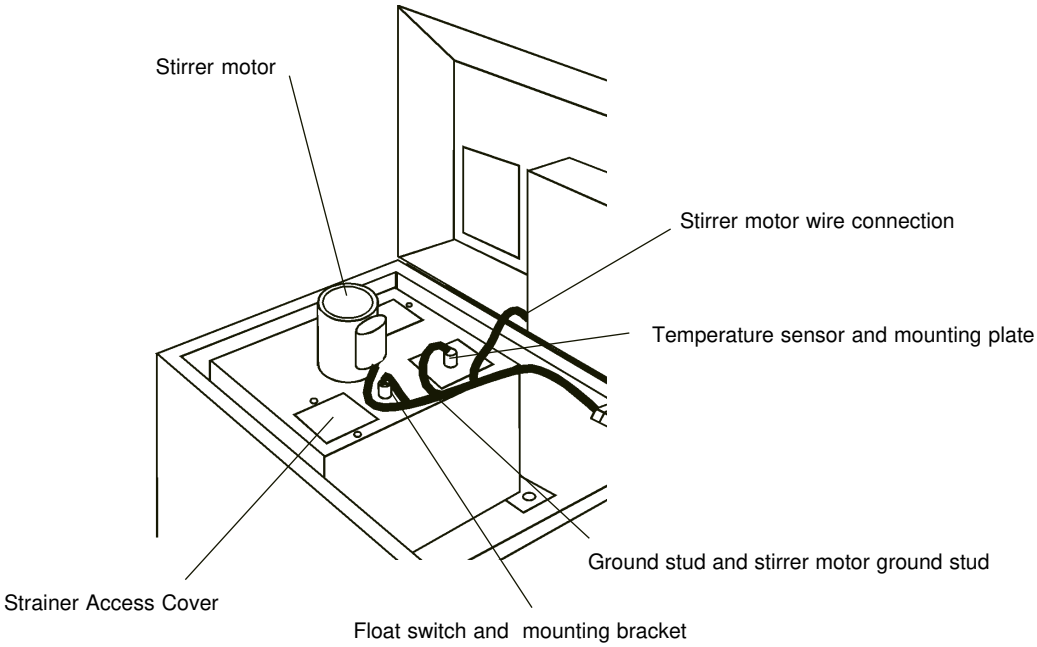
Access to the inside of the fluid reservoir is necessary to clean the reservoir. The figure on the next page illustrates a typical layout of the components mounted on top of the reservoir cover. The component layout varies depending on the unit size. If you are unable to identify the components on your unit's reservoir cover, contact our Service Department for assistance (see Preface, After-sale Support).

Disconnect the unit from its power source before removing the reservoir cover.

Locate the reservoir stirrer motor (units with plate heat exchangers and HX-75s do not have a stirrer motor; HX-500s and HX-750s have two stirrer motors). Disconnect the motor wires at the plug located on the side of the electrical box cover. Also disconnect the green ground wire that connects the ground stud on the reservoir cover to the unit's grounding bar.

Locate the float switch mounting bracket. Remove the two stainless steel screws that secure the bracket to the reservoir cover. Carefully remove the mounting bracket and place the assembly in an area adjacent to the reservoir. Make sure not to strain the connecting wires.

Locate the temperature sensor mounting plate. Remove the two stainless steel screws that secure the bracket to the reservoir. Carefully remove the sensor mounting plate with the sensor(s) attached and place the assembly in a protected area adjacent to the reservoir. Make sure not to damage the sensor(s) or strain the connecting wires.



Remove the stainless steel screws that secure the reservoir cover to the reservoir. Remove the cover and place it to one side in a manner that protects the stirrer motor blades from being bent.

Service Access Panels

Service panels on your unit allow easy access to the pump and refrigeration assemblies. Panel location varies with the size and type of unit. The panels are designed to allow removal without disconnecting the HX from the instrument being cooled.

Disconnect the unit from its power source before removing any of the access panels.

Reservoir Cleaning

Periodic reservoir cleaning is necessary. It is recommended that a visual inspection of the reservoir be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Disconnect the unit from its power source and drain the reservoir before cleaning the reservoir.

Lift the top cover to access the reservoir. Remove the reservoir cover as described in Section VIII, Configuration.

Clean the reservoir with a cleaning fluid compatible with the recirculating system and the cooling fluid.

Do not use steel wool or other abrasive materials. They can scratch the stainless steel surface and initiate rusting.

When the reservoir is clean, re-assemble the cover assembly and close the case top.

Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Pump Strainer
(PD and TU Pumps Only)

If debris is drawn into the recirculating system, the strainer will prevent the material from being sucked into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged with debris and scale. Therefore, the strainer must be cleaned after the first week of use. After this first cleaning, a monthly visual inspection is recommended. After several months, the cleaning frequency will be established.

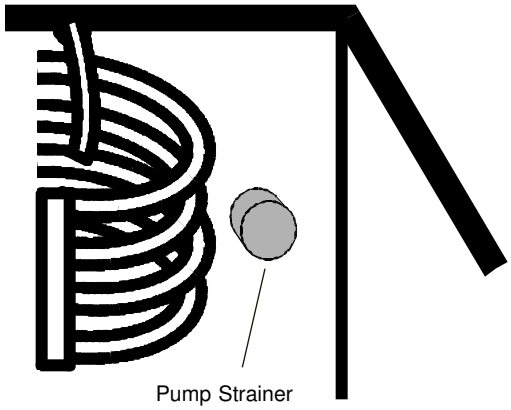
Disconnect the power cord from the power source and drain the fluid reservoir before cleaning the strainer. Do not operate the unit with the strainer removed.

PD-2 and TU Pumps

The wire mesh pump strainer is located in the reservoir on the pump suction line. Remove the strainer access panel located on top of the reservoir cover to access the strainer.

Cover the strainer with a plastic bag to help catch any debris which may become free.

Unscrew the strainer and rinse it with water. Replace the strainer. Refer to Section III, Filling Requirements for instructions on replacing fluid.



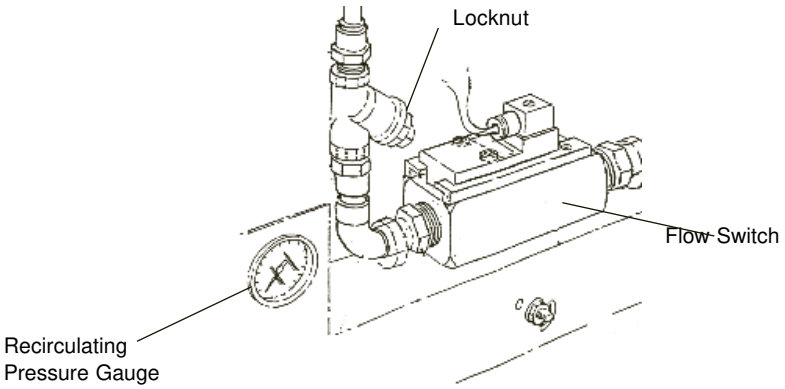
Reservoir cover deleted for clarity

Flow Filter Strainer (Optional)

Unit's equipped with flow switches have flow filter strainers located behind the top right access panel on the inlet side of the flow switch.

Unscrew the locknut and remove the screen. Clean the screen by rinsing it with water.

Replace the strainer and locknut. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.



Phase Rotation

Refer to the serial number label on the rear of the case top or rear of analog controller for the specific electrical requirements of your unit; specifically, identify the phase requirements of your unit.

Three phase units with three phase pump motors have a phase rotation interlock. The interlock prevents the unit from starting if the phase rotation is wrong. If the unit will not start, see Section IX, Checklist. If the options in the checklist are not applicable, the problem may be phase rotation.

Disconnect the unit from its power source, remove the rear panel and the junction box cover (if so equipped). Reverse any two line conductors on the line side of the relay.

Never remove the green ground wire.

Replace the junction box and the rear panel. Reconnect the unit to its power source. If the unit will not start, contact our Service Department.

If you are unsure whether your three phase unit has a three phase pump motor, contact our Service Department (see Preface, After-sale Support).

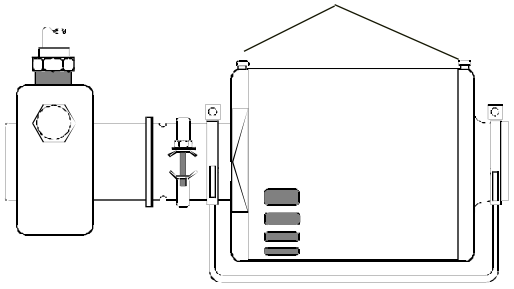
Pump Lubrication

Units with PD-2 pumps require pump motor lubrication. Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit.

Motors used to drive the pump are manufactured by several companies. These motors use sleeve type bearings with large oil reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil in each fill hole on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years

Fill Holes (Typical)



Suction Discharge Pressure Speed Check

Air-Cooled Standard and High Temperature Units (All Pump Types)[1]

Unit	Suction(psi)	Discharge(psi)	Speed Check(°C/Minute)
HX-75	77 - 84	225 - 250	1.5 - 1.7
HX-100	75 - 83	245 - 265	1.3 - 1.6
HX-150	70 - 73	240 - 270	2.0 - 2.5
HX-200	85 - 105	230 - 255	1.6 - 1.9
HX-300	84 - 105	270 - 305	2.4 - 2.7
HX-500	80 - 90	215 - 235	2.0 - 2.4
HX-750	65 - 75	185 - 215	

Water-Cooled Standard and High Temperature Units (All Pump Types)[2]

Unit	Suction(psi)	Discharge(psi)
HX-75	72	170
HX-100	86 - 92	180
HX-150	65	175
HX-200	85 - 90	180
HX-300	73 - 78	180
HX-500	75 - 82	150
HX-750	50 - 60	180

1. 27°C unit temperature, water in reservoir, access panel removed.
2. 25°C unit temperature, water in reservoir.

NOTE: For low temperature units please call NESLAB.

Section IX Troubleshooting

Checklist

Unit will not start

For CE Mark units, check the position of the circuit breaker on the right side of the unit.

Check power source for correct voltage output. Refer to the serial number label on the rear of the unit or rear of analog temperature controller for the specific electrical requirements of your unit. Power source must be specified voltage, ±10%.

Check house circuit breaker.

On three phase units with three phase pump motors, the phase rotation may be reversed (see Section VIII, Phase Rotation).

On water-cooled units, make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection. Ensure the facility water is turned on.

Check the High Pressure Cutout, it may need to be reset (see Section V, Operation).

Unit will not circulate fluid

Check the tubing between the unit and your application for obstructions.

The pump strainer may require cleaning (PD and TU pumps only). Refer to the pump identification label on the rear of the case top or rear of analog temperature controller to identify the specific pump in your unit. For instructions on cleaning the pump strainer, see Section VIII, Pump Strainer.

On units with CP type pumps, if the back pressure of the instrument being cooled is greater than the maximum pressure of the pump, adequate flow may not be obtained. Check for obstructions in the tubing.

Inadequate temperature control

Make sure the installation of the unit is in compliance with the conditions described in Section III.

Make sure the heat load of the instrument being cooled is not greater than the cooling capacity of the unit.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

- *unit part number*
- *unit serial number*

APPENDIX A INTERNATIONAL QUICK REFERENCE GUIDES

HX - Serie luftgekühlt Kurzbedienungsanleitung

Installation

Das Gerät muß so plaziert werden, daß weder das Ansaugen noch Ausströmen von Luft behindert wird. Bei ungenügender Ventilation wird die Kühlleistung reduziert und kann in extremen Situationen zu einem Ausfall des Kühlsystems (Kompressors) führen.

Aufstellorte mit hoher Staubentwicklung sollten vermieden werden, und es sollte eine regelmäßige Reinigung des Gerätes durchgeführt werden. Um einwandfrei zu funktionieren, muß das Gerät große Luftmengen durch den Kondensor ansaugen. Bei Staub- und Schmutzablagerungen auf dem Kondensorheizkörper kommt es zu einem Verlust von Kühlleistung.

Das Gerät behält seine maximale Kühlleistung bis zu einer Umgebungstemperatur von ca. +24°C.

Vergewissern Sie sich, daß die Spannung Ihrer Stromanschlüsse mit der für das Gerät vorgesehenen Spannung übereinstimmt (±10%).

Die Schlauchanschlüsse (3/4 Zoll FPT) des Gerätes befinden sich an der Rückseite und sind mit SUPPLY und RETURN bezeichnet. Bitte entfernen Sie die Gummiabdichtung von beiden Anschlüssen. Schließen Sie den SUPPLY-Anschluß an den Eingang Ihres Instruments und den RETURN-Anschluß an den Ausgang Ihres Instruments an.

Um das Reservoir zu füllen, öffnen Sie die Abdeckplatte in der linken hinteren Ecke der Gehäuseoberseite und entfernen Sie die Reservoirabdeckung, indem Sie die Flügelschrauben lösen. Füllen Sie das Reservoir bis 1 Zoll unterhalb des Randes mit sauberer Kühlflüssigkeit. Wenn das zu kühlende Instrument und die Zirkulationsleitungen sehr viel Kühlflüssigkeit aufnehmen können, sollten Sie zusätzliche Kühlflüssigkeit zur Hand haben, um gegebenenfalls nachfüllen zu können.

Für den Betrieb im Arbeits-Temperaturbereich von +8°C bis +80°C empfiehlt NESLAB Leitungswasser als Kühlmittel, bei niedrigeren Temperaturen als +8°C muß eine nicht gefrierende Flüssigkeit verwendet werden. Wir empfehlen eine Mischung aus Leitungswasser und Labor Ethylen Glykol.

Inbetriebnahme

Vor Inbetriebnahme des Gerätes vergewissern Sie sich bitte, daß die elektrischen Anschlüsse und die Rohr- u. Schlauchanschlüsse sachgemäß installiert sind und daß das gesamte System mit Kühlflüssigkeit gefüllt ist.

Die Modelle HX-200 bis HX-750 müssen vor dem Starten mindestens 12 Stunden an die Stromversorgung angeschlossen werden, damit das Öl im Kompressor erwärmt werden kann und sich von der Kühlflüssigkeit abscheiden kann.

Um das Gerät einzuschalten, müssen Sie den Hauptschalter auf „ON“ stellen. Die „COOL“- und „IDLE“-Anzeigen auf der Steuertafel geben den Status des Kühlsystems an. Die COOL-Anzeige leuchtet, wenn das Kühlsystem der Kühlflüssigkeit Wärme entzieht. Die HEAT-Anzeige leuchtet, wenn sich das Gerät im Hot Gas Bypass Modus befindet. Wenn die Temperatur der Kühlflüssigkeit sich der gewünschten Temperatur nähert, blinken die Anzeigen, um den Arbeitszyklus des Systems anzugeben.

Nach dem Ausschalten des Gerätes sollten Sie vor dem Wiedereinschalten ca. 5 Minuten warten, damit das Kühlsystem einen Druckausgleich durchführen kann. Beachtet man diese Wartezeit nicht, kommt es zu kurzen Schaltfrequenzen des Kompressors und eine Kühlung ist nicht möglich.

Einstellung der Analog-Temperatursteuerung

Um die Temperatur einzustellen (setpoint), drehen Sie den °C-Schalter an der Vorderseite des Gerätes auf die gewünschte Temperatur.

Einstellung der Digital-Temperatursteuerung

Um sich den Temperatur-Setpoint anzeigen zu lassen, drücken Sie den DISPLAY-Schalter und halten Sie ihn gedrückt. Um den Temperatur-Setpoint einzustellen, drücken Sie den Display-Schalter, halten diesen, und drehen gleichzeitig den ADJUST-Schalter so lange, bis die gewünschte Temperatur in der Digitalanzeige angezeigt wird. Wenn die Temperatur eingestellt ist, lassen Sie den Display-Schalter los. Die Digitalanzeige zeigt dann die Temperatur der Kühlflüssigkeit im Reservoir an.

Flußsteuerung
Der RECIRCULATION FLOW CONTROL Hebel kontrolliert die Durchflußmenge der Kühlflüssigkeit zu Ihrer Anwendung. In der „+“-Stellung wird die gesamte verfügbare Kühlflüssigkeit an die Anwendung abgegeben, in der „-“-Stellung wird keine Kühlflüssigkeit an die Anwendung abgegeben.

WHX - Serie wassergekühlt Kurzbedienungsanleitung**Installation**
Stellen Sie das Gerät in einer sauberen Umgebung mit einfachem Zugang zu einem Gebäudewasseranschluß und einem Abfluß auf. Das Gebäudewasser muß den in der Anleitung festgelegten Anforderungen genügen, sonst wird die Leistung des Gerätes herabgesetzt. Unzureichende Wasserzufuhr kann zu einer Überhitzung des Kompressors und so zu einem Ausfall des Gerätes führen.

Vergewissern Sie sich, daß die Spannung Ihrer Stromanschlüsse mit der für das Gerät vorgesehenen Spannung übereinstimmt (± 10%).

Die Schlauchanschlüsse des Gerätes befinden sich an der Rückseite und sind mit TAP WATER, DRAIN, SUPPLY und RETURN bezeichnet. Bitte entfernen Sie die Gummiabdichtung von allen Anschlüssen. Schließen Sie den TAP WATER-Anschluß an das Gebäudewasser und den DRAIN-Anschluß an den Abfluß an. Schließen Sie den SUPPLY-Anschluß an den Eingang Ihres Instruments und den RETURN-Anschluß an den Ausgang Ihres Instruments an.

Um das Reservoir zu füllen, öffnen Sie die Abdeckplatte in der linken hinteren Ecke der Gehäuseoberseite und entfernen Sie die Reservoirabdeckung, indem Sie die Flügelschrauben lösen. Füllen Sie das Reservoir bis 1 Zoll unterhalb des Randes mit sauberer Kühlflüssigkeit. Flußsteuerung
Der RECIRCULATION FLOW CONTROL Hebel kontrolliert die Durchflußmenge der Kühlflüssigkeit zu Ihrer Anwendung. In der „+“-Stellung wird die gesamte verfügbare Kühlflüssigkeit an die Anwendung abgegeben, in der „-“-Stellung wird keine Kühlflüssigkeit an die Anwendung abgegeben.

Wartung
Überprüfen Sie regelmäßig die Kühlflüssigkeit im Reservoir. Sollte eine Säuberung notwendig sein, spülen Sie das Reservoir mit einer speziellen Reinigungsflüssigkeit, die mit dem Umlaufsystem und der Kühlflüssigkeit kompatibel ist.

Das Kühlmittel sollten Sie regelmäßig erneuern. Wenn Sie das Gerät bei niedrigen Temperaturen betreiben, erhöht sich mit der Zeit der Wasseranteil in der Kühlflüssigkeit. Dies führt zum Verlust von Kühlkapazität.

Regelmäßiges Absaugen des Kondensor-Heizkörpers ist erforderlich. Die Reinigungshäufigkeit hängt von der Betriebsumgebung ab. Eine monatliche Überprüfung des Kondensors ist empfehlenswert. So werden Sie nach einigen Monaten einen Reinigungsrhythmus gefunden haben.

Geräte mit PD- und TU-Pumpen sind mit einem Pumpenfilter ausgestattet. Der Filter sorgt dafür, daß kleine Teilchen und Schmutzablagerungen nicht in die Pumpe gelangen und so die Pumpflügel beschädigen können.

Nach der Erstinstallation kann es zu einer Blockierung des Filters kommen. Die erste Reinigung sollte daher nach einer Woche erfolgen. Danach empfehlen wir eine monatliche Überprüfung des Filters. So können Sie nach einiger Zeit abschätzen, wie oft der Filter gereinigt werden muß.

Bevor Sie den Filter reinigen, ziehen Sie den Netzstecker aus der Steckdose und leeren Sie das Reservoir.

Luftkølet HX-serie Kvik referance.

Installation:
Opstilles i rene omgivelser.

Steder med meget støv skal undgåes, og periodisk rensning skal udføres, hvis utilsigtet nedbrud skal undgåes. Opbygning af støv vil medføre fald i kølekapasiteten og i værste fald overophedning af systemet.

Check at netspændingen er den nominelle 240V ± max. 10%.

Slangetilgang er på bagsiden mærket „Supply“ til indgang på dit emne og „Return“ på udgangen.

Ledningsvand (ionbyttet) kan anvendes mellem +8 til 80^0 C, under $+8^0$ C skal væsken blandes op med ethylenglycol.

Fyldning af reservoiret foregår ved at fjerne panelet, som er forsynet med fingerskruer, og påfyld egnet rent kølevæske, max 5 cm fra toppen

Betjening:
Før opstart checkes elektriske forbindelser, slangeforbindelser, væske stand og brugsvand er tilsluttet.

Analog temperatur kontrol:
Drej på knappen mærket C til den rigtige temperatur.

Digital temperatur kontrol:
Setpunktet vises ved at holde „Display“ tasten inde, skal temperaturen ændres drejes herefter på „Adjust“ knappen. Slip „Display“ knappen og aktuel temperatur vises.

Flow kontrol:
Drej på „RECIRCULATING FLOW CONTROL“ + for at åbne og - for at lukke.

Periodisk vedligeholdelse:
Check standen af væske periodisk. Check med mellemrum vakuumet på pumpesiden, rens systemet og check for aflejringer, vækst, utætheder, check vakuumpumpen med kondenser og evt. filtre. Husk åben aldrig instrumentet uden strømmen er afbrudt, og strømkablet er taget ud!

Check standen af væske periodisk. Check med mellemrum vacuummet på pumpesiden, rens systemet og check for aflejringer, vækst, utætheder, check vacuumpumpen med kondenser og evt. filtre. Husk åbn aldrig instrumentet uden strømmen er afbrudt og strømkablet er taget ud!

Watergekoelde HX Series, Handleiding voor snelle installatie-procedures

Installatie
Plaats het apparaat in een ruimte waar gebouwenwater en de mogelijkheid tot afvoer daarvan binnen handbereik zijn. De eisen van de waterfaciliteiten moeten overeenkomen met die gespecificeerd in de handleiding, anders zal het apparaat onvoldoende prestaties leveren. Onvoldoende watertoevoer kan ertoe leiden dat de compressor oververhit raakt en het apparaat uitgeschakeld wordt.

Let erop dat de netspanning gelijk is aan ht aangegeven voltage, ±10%.

De slangaansluitingen zijn bevestigd aan de achterkant van het apparaat en zijn voorzien van de labels TAPWATER, DRAIN, SUPPLY en RETURN. Verwijder de plastic beschermingspluggen van alle slangaansluitingen. De TAPWATER plug dient aangesloten te worden aan de watertoevoer en de DRAIN plug dient te worden aangesloten aan de afvoer. Bevestig de SUPPLY plug aan de ingang van uw applicatie en bevestig de RETURN plug aan de uitgang van uw applicatie.

Om het reservoir te vullen dient men het toegangspaneel aan de linkerachterkant te openen en het reservoir door middel van het losdraaien van de duimschroeven te verwijderen. Vul nu het reservoir tot maximaal 1 inch aan de bovenkant.Indien de vloeistof level van uw toepassingen en de toe- en afvoer leidingen voldoende zijn, dient u altijd extra vloeistof achter de hand te houden.

Kraanwater is aan te bevelen bij een arbeidsproces van 8C. tot +80C. Beneden de +8°C. dient men een non-freezing vloeistof te gebruiken. Een combinatie van kraanwater en laboratorium gerichte ehtylene glycol wordt in het algemeen aanbevolen.

Operationeel gebruik
Alvorens het apparaat te starten, dient men de elektrische- en slangaansluitingen te controleren. Controleer tevens of het systeem gevuld is met koelvloeistof.

De modellen HX-200 tot HX-750 dienen 12 uur aangesloten te zijn aan de netspanning, zodat de olie verhit kan worden en gescheiden kan worden van de koelvloeistof.

Om het apparaat te starten moet men de schakelaar op “ON” zetten. De “Cool” en “Idle LEDs” aan de voorkant van het apparaat geven de status van het koelsysteem weer. “Cool” is in werking wanneer het apparaat warmte van de koelvloeistof onttrekt, “Heat” is in werking wanneer het apparaat in de Hot Gas Bypass stand is gesteld. Indien de ingegeven temperatuur bereikt is, zal de LED switchen.

Wanneer het apparaat uitgeschakeld is, gelieve 5 minuten te wachten alvorens u het apparaat weer in werking stelt. Deze tijd is nodig voor de drukken in het koelsysteem. Indien dit niet gebeurt, zal er short-cycle optreden binnen de compressor en er vindt geen koeling plaats.

Analog ControllerTemperature Adjustment
Om de temperatuur set-point aan te passen, gelieve de Gr.C. knop aan de voorkant van het apparaat te draaien naar de gewenste temperatuur.

Digital ControllerTemperature Adjustment
Om de temperatuur set-point aan te duiden, houdt u de “DISPLAY” knop ingedrukt. Om de temperatuur set-point aan te passen, houdt u de “DISPLAY” knop ingedrukt en draait u de “ADJUST” knop totdat de gewenste temperatuur set-point af te lezen is van de display. Als de set-point is aangepast, kunt u de “DISPLAY” knop loslaten. De display zal nu de temperatuur weergeven van de vloeistof in het reservoir.

Flow Control
Met de RECIRCULATING FLOW CONTROL kunt u het debiet van uw applicatie regelen. De “+” positie geeft u een volledig debiet weergegeven, de “-” positie geeft geen debiet.

Periodiek Onderhoud
De vloeistof in het reservoir dient regelmatig gecontroleerd te worden. Indien reiniging noodzakelijk is, zal het reservoir schoongespoeld moeten worden met een vloeistof welke gelijk is aan het circulatiesysteem en de koelvloeistof..

De koelvloeistof dient periodiek vervangen te worden. Wanneer u werkt met lage temperaturen, zal de concentratie van het water in de koelvloeistof gedurende die tijd toenemen, wat verlies van koelcapaciteit tot gevolg kan hebben.

Het periodiek luchtvrij maken van de condensor is noodzakelijk. Het aantal malen dat dit moet gebeuren hangt af van de omgeving waar het apparaat staat opgesteld en tevens gebruikt wordt. Wij raden een algemene maandelijkse inspektie van de condensor aan na de installatie. Na enkele maanden zal duidelijk zij hoe vaak men de condensor moet reinigen.

Apparaten met PD en TU pompen hebben een afvoer. Indien vuil aanwezig is in het systeem, zal de afvoer ervoor zorgen dat het materiaal niet in de pomp terecht komt en daardoor de pompleidingen niet beschadigd.

Nadat het apparaat geinstalleerd is, zou de afvoer verstopt kunnen raken. De afvoer zal in de eerste week na de installatie schoongemaakt moeten worden. Nadien is een maandelijkse inspektie aan te raden. Na enkele maanden zal duidelijk zijn hoe vaak men de afvoer moet reinigen.

Alvorens de afvoer te reinigen, gelieve het apparaat uit te schakelen en het reservoir te ledigen.

Luchtgekoelde HX Series, Handleiding voor snelle installatie-procedures

Installatie
Plaats het apparaat op een dusdanige manier dat luchttoevoer en afvoer niet wordt belemmerd. Inadequate ventilatie kan leiden tot afname van koelcapaciteit en, in extreme gevallen, tot het niet functioneren van de compressor.

Het is aan te raden stoffige ruimtes te vermijden en de condensor regelmatig schoon te houden.

Voor een juiste werking moet het apparaat een voldoende hoeveelheid lucht aanzuigen door middel van een condensor. Een opeenhoping van stof en vuil op de condensor kan leiden tot een verlies van koelcapaciteit.

Het apparaat behoudt haar integrale capaciteit bij een omgevingstemperatuur tot ongeveer +24°C.

Let erop dat de netspanning gelijk is aan het aangegeven voltage, ±10%.

De slangaansluitingen zijn bevestigd aan de achterkant van het apparaat en zijn voorzien van het label SUPPLY en RETURN. Deze aansluitingen zijn 3/4 inch FPT. Verwijder de plastic beschermingspluggen van beide slangaansluitingen. Bevestig de SUPPLY plug met de ingang van het apparaat welke gekoeld wordt. Bevestig de RETURN plug aan de uitgang van van uw applicatie.

Om het reservoir te vullen, gelieve het toegangspaneel te verwijderen door middel van het losdraaien van de duimschroeven. Vul nu het reservoir tot 2 inches van het maximum wanneer het apparaat de gewenste temperatuur heeft bereikt. Indien het vloeistof level van uw toepassingen de toe-afvoer leidingen voldoende zijn.

Kraanwater wordt in het algemeen aanbevolen, indien men werkt met temperaturen van +8°C tot +80°C.

Beneden de +8°C. moet een non-freezing vloeistof gebruikt worden. Een combinatie van kraanwater en ethylene glycol wordt aanbevolen.

Operationeel gebruik
Alvorens het apparaat in gebruik te nemen, gelieve eerst alle elektrische- en slangaansluitingen te controleren. Controleer ook of het systeem gevuld is met koelvloeistof.

De modellen HX-200 tot HX-750 dienen 12 uur aangesloten te zijn aan de netspanning, zodat de olie verhit en gescheiden kan worden van de koelvloeistof.

Om het apparaat te starten moet men de schakelaar op “ON” zetten. De “Cool” en “Idle LEDs” aan de voorkant van het apparaat duiden de status van het koelsysteem aan. “Cool” is in werking wanneer het apparaat warmte van de koelvloeistof ontlucht, “Heat” is in werking wanneer het apparaat in de Hot Gass Bypass stand is gesteld. Indien de ingegeven temperatuur bereikt is, zal de LED switchen.

Wanneer het apparaat uitgeschakeld is, gelieve 5 minuten te wachten alvorens u het apparaat weer in werking stelt. Deze tijd is nodig om de drukken in het koelsysteem. Indien dit niet gebeurt, zal er short-cycle binnen de compressor optreden en er vindt geen koeling plaats.

Analog Controller Temperature Adjustment
Om de temperatuur set-point aan te passen, gelieve de Gr.C. knop aan de voorkant van het apparaat te draaien naar de gewenste temperatuur.

Digital Controller Temperature Adjustment
Om de temperatuur set-point aan te duiden, houdt u de “DISPLAY” knop ingedrukt. Om de temperatuur set-point aan te passen, houdt u de “DISPLAY” knop ingedrukt en draait u de “AD-JUST” knop totdat de gewenste temperatuur set-point af te lezen is van de display. Als de set-point is aangepast, kunt u de “DISPLAY” knop loslaten. De display zal nu de temperatuur weergeven van de vloeistof in het reservoir.

Flow Control
Met de RECIRCULATING FLOW CONTROL kunt u het debiet van uw applicatie regelen. De “+” positie geeft u een volledig debiet, de “-” positie geeft geen debiet.

Periodiek Onderhoud
De vloeistof in het reservoir dient regelmatig gecontroleerd te worden. Indien reiniging noodzakelijk is, zal het reservoir schoongespoeld moeten worden met een vloeistof, welke gelijk is aan het circulatiesysteem en de koelvloeistof.

De koelvloeistof dient perdiodiek vervangen te worden. Wanneer u werkt met lage temperaturen, zal de concentratie van het water in de koelvloeistof gedurende die tijd toenemen, wat verlies van koelcapaciteit tot gevolg kan hebben.

Periodiek luchtvrij maken van de condensor is noodzakelijk. Het aantal malen dat dit moet gebeuren hangt af van de omgeving waar het apparaat staat opgesteld en gebruikt wordt. Wij raden een algemene maandelijkse inspektie van de condensor na de installatie aan. Na enkele maanden zal duidelijk zijn hoe vaak men het apparaat moet reinigen.

Apparaten met PD en TU pompen hebben een afvoer. Indien vuil aanwezig is in het systeem, zal de afvoer ervoor zorgen dat het materiaal niet in de pomp terecht komt en daardoor de pompleidingen niet beschadigd.

Nadat het apparaat geinstalleerd is, zou de afvoer verstopt kunnen raken. De afvoer zal in de eerste week na de installatie schoongemaakt moeten worden. Nadat dit gebeurd is, is een maandelijkse inspektie aan te raden. Na enkele maanden zal duidelijk zijn hoe vaak men de afvoer moet reinigen.

Alvorens de afvoer te reinigen, gelieve het apparaat uit te schakelen en het reservoir te ledigen.

Kortfattad Bruksanvisning för Vattenkyld HX-serie

Installation
Ställ maskinen i en ren miljö med lätt tillgång till kylningsvatten och ett vattenavlopp. Kylningsvattnet måste möta de krav som är specifierade i instruktionerna annars minskas maskinens prestations förmåga.

Försäkra att spänningen är den samma som den som är given i instruktionerna ±10%.

Röranslutningarna finns på baksidan av maskinen och är märkta “TAP WATER, DRAIN SUPPLY/ RETURN”. Ta bort de skyddande plast bitarna. Anslut “TAP WATER” inpassningen till byggnads vattnet och “DRAIN” inpassningen till avloppet. Anslut “SUPPLY” inpassningen till insläppet av din anordning och “RETURN” inpassningen till utsläppet av din anordning.

För att fylla tanken, öppna luckan på den bakre vänstra delen av toppen på maskinen och lösgör skruvarna som håller den undre luckan på plats. Fyll tanken tills 2,5 cm återstår. Var beredd att fylla på om din anordning kräver extra vätska.

Vanligt kran vatten är den rekommenderade vätskan vid en temperatur mellan +8°C och +80°C. Under +8°C måste en vätska som inte fryser användas. En blandning av vanligt vatten och etylenglykol (laboratorie kvalitet) föreslås.

Användning
Innan maskinen startas, kontrollera alla elektriska och alla rör anslutningar. Se till att cirkulations systemen har fyllts med vätska.

Var säker på att byggnads vattnet är påsatt.

På alla modeller från HX-200 till HX-750 måste maskinen vara kopplad till energikällan minst 12 timmar innan användning så att oljan tillåts att värmas upp och separera från köldmedlet.

Sätt start knappen på ON för att starta maskinen. COOL och IDLE på framsidan visar statusen på kylningssystemet. Cool lyser när värme tas bort från köldmedlet. Heat är på när “the hot gas bypass mode” används. När temperaturen närmar sig den förbestämda önskade temperaturen kommer de två att växla.

Vänta 5 minuter innan maskinen sätts på igen efter att ha varit avstängd för att låta kylningstrycken att utjämnas. Ingen kylning kommer att utföras om inte trycken tillåts att utjämnas.

Analog Kontroll, Temperatur Ändring
För att ändra den önskade förbestämda temperaturen, vrid °C knappen på framsidan av maskinen tills den önskade temperaturen är nådd.

Digital Kontroll, Temperatur Ändring
Håll Display knappen intryckt för att visa den önskade temperaturen. Håll Display knappen intryckt och vrid Adjust knappen för att ändra den önskade temperaturen. Släpp Display knappen efter att den önskade temperaturen visas på kontroll panelen. Temperaturen på vätskan i tanken visas nu på kontroll panelen.

Flödeskontroll
“RECIRCULATING FLOW CONTROL” handtaget kontrollerar flödet till din anordning. i “+” positionen får man fullt flöde, “-” positionen innebär inget flöde.

Periodiskt Underhåll
Inspektera vätskan i tanken periodiskt. Om rengöring är nödvändigt, spola tanken med en rengörings vätska som är förenlig med cirkulationssystemet och kylvätskan.

Kylvätskan bör bytas periodvis. När enheten används vid låga temperaturer kommer vätskans koncentration av vatten att öka vilket leder till en minskad kylningskapacitet.

Periodisk rengöring av kondensorn är nödvändig. Hur ofta rengöring är nödvändig beror på miljön. Vi rekommenderar en visuell inspektion av kondensorn varje månad efter installation. Efter flera månader kan det avgöras hur ofta kondensorn måste rengöras i framtiden.

Maskiner med PD och TU pumpar har ett filter. Filtret måste rengöras efter en veckas användning. Efter första rengöringen bör filtret inspekteras varje månad. Efter flera månader kan det avgöras hur ofta filtret måsta rengöras.

Drag ur kontakten och töm tanken innan filtret rengörs.

Kortfattad Bruksanvisning för Luft Kyld HX-serie

Installation
Ställ maskinen så att luft intaget och uttaget inte är blockerade. Otillräcklig ventilation leder till minskad kylningskapacitet och vid vissa tillfällen kan kompressorn gå sönder.

Undvik dammiga områden och rengör maskinen periodvis. För att fungera ordentligt måste mycket luft passera genom kondensorn. Damm och smuts i kondensorn leder till minskad kylnings kapacitet.

Maskinen har full kylningskapacitet upp till en temperatur av +75°F (24°C).

Försäkra att spänningen är den samma som den som är given i instruktionerna ±10%.

För att fylla tanken, öppna luckan på den bakre vänstra delen av toppen på maskinen och lösgör skruvarna som håller den undre luckan på plats. Fyll tanken tills 2,5 cm återstår. Var beredd att fylla på om din anordning kräver extra vätska.

Innan maskinen startas, kontrollera alla elektriska och alla rör anslutningar. Se till att cirkulations systemen har fyllts med vätska.

Användning
Innan maskinen startas, kontrollera alla elektriska och alla rör anslutningar. Se till att cirkulations systemen har fyllts med vätska.

Innan filtret rengörs, drag ur kontakten och töm tanken.

NOTICE D'UTILISATION
REFROIDISSEURS TYPE HX VERSION *AIR*

NINSTALLATION
Ces appareils ont un système de réfrigération refroidi par air. L'air est aspiré sur le devant et rejeté à l'arrière et sur les côtés

Positionner l'appareil afin que l'admission et l'émission ne soient pas obstruées. Une ventilation insuffisante serait la cause d'une réduction de la capacité de refroidissement, voire, d'une défaillance du compresseur.

Dans une zone excessivement poussièreuse, le nettoyage périodique est recommandé. En mode de fonctionnement, l'appareil aspire de l'air à travers le condenseur. De la poussière et des particules sur la grille atténueraient sa capacité de refroidissement.

L'appareil conserve sa pleine puissance de refroidissement sur une plage de température allant de l'ambiante à + 24°C.

S'assurer que l'alimentation électrique soit celle requise à ±10%.

Les connections, d'un diamètre 0.75 pouce FPT, sont situées à l'arrière de l'appareil et sont référencées " SUPPLY " et " RETURN ".. Retirer les embouts plastiques. Connecter le tuyau enfiché sur " SUPPLY " vers l'entrée de l'équipement et celui sur " RETURN " vers la sortie.

Pour remplir le réservoir, ôter la tape à l'aide des deux vis. Dévisser le bouchon et remplir le réservoir avec un liquide approprié. L'eau du robinet est recommandée pour un fonctionnement entre + 8 °C et + 30°C; à une température inférieure, mieux vaut rajouter du glycol-éthylène.

MISE EN ROUTE
Vérifier les connections électriques, les tuyaux d'eau et le niveau de remplissage du liquide. Sur les modèles HX 200 à HX 750, il faut alimenter l'appareil 12 heures avant pour chauffer et séparer l'huile du refrigérant.

Mettre en route en appuyant sur " ON ". Un voyant s'allume qui indique que l'appareil est en fonctionnement. Pour l'éteindre, appuyer sur " OFF ".

Les voyants LED " Cool " et " IDLE " indiquent le mode de fonctionnement du système de réfrigération. " Cool " est allumé quand l'appareil évacue la chaleur du fluide, " HEAT " est allumé quand l'appareil est en mode de " By-pass ". Quand la température obtenue approche de la température souhaitée, le voyant s'allume et s'éteint.

Après avoir éteint l'appareil, attendre environ cinq minutes avant de le rallumer, pour un bon équilibrage des pressions.Autrement, le cycle au niveau du compresseur serait trop bref et le refroidissement n'aurait pas lieu.

REGLAGE DU CONTROLEUR DE TEMPERATURE ANALOGIQUE
Tourner le potentiomètre situé à l'avant jusqu'à ce que la température désirée coïncide avec la graduation.

REGLAGE DU CONTROLEUR DE TEMPERATURE NUMERIQUE
Pour afficher la température souhaitée, maintenir appuyé l'interrupteur et tourner le bouton de réglage jusqu'à ce que la température souhaitée soit affichée. Relâcher ensuite l'interrupteur. L'affichage indique alors la température du fluide dans le réservoir.

CONTROLEUR DE DEBIT
La poignée " Recirculating Flow conrol " règle le débit de recirculation. En position " + ", votre application reçoit un débit maximum; en position " - ", il n'y a plus de débit.

MAINTENANCE PREVENTIVE
Vérifier régulièrement le niveau du réservoir,

Changer de temps à autre le liquide utilisé,

En cas de nettoyage, rincer avec un produit de lavage compatible,

Aux basses températures, la concentration en eau a tendance à augmenter ce qui peut générer une perte de puissance de refroidissement,

Avant de changer de liquide, recirculer à une température plus élevée pour réchauffer le serpentin,

Nettoyer régulièrement selon les conditions de travail la grille d'aspiration. Nous recommandons d'effectuer la première inspection du condenseur un mois après l'installation,

Les modèles fonctionnant avec des pompes type PD ou TU sont équipés d'un filtre qui retient les impuretés. Il est recommandé de nettoyer ce filtre après la première semaine et, ensuite, une fois par mois. Ce nettoyage s'effectue après avoir débranché l'appareil et vidangé le réservoir

NOTICE D'UTILISATION
REFROIDISSEURS TYPE HX VERSION EAU

INSTALLATION
Installer l'appareil dans un environnement propre avec un accès facile à une arrivée d'eau. Cette source d'eau doit correspondre à ce qui est spécifié dans la notice pour ne pas altérer les performances de l'équipement. Une source non conforme pourrait causer une surchauffe du compresseur et un arrêt de l'appareil.

S'assurer que la tension électrique soit celle requise à ±10 %.

Les connections sont situées à l'arrière et référencées :
" TAP WATER "
" DRAIN "
" SUPPLY "
" RETURN "

Retirer les embouts plastique. Connecter le " Tap water " vers l'arrivée d'eau ; le " Drain " au robinet; " Supply " vers l'entrée de votre application et le " Return " à la sortie.

Utiliser un fluide antigel dont la viscosité doit être inférieure à 50 centistokes à la température la plus basse.

Pour remplir le réservoir, ouvrir la tape en haut à gauche et retirer le couvercle en dévissant. Remplir jusqu'à 1 " pouce " du sommet (niveau). Si le volume total à refroidir est important, il convient d'avoir une réserve de fluide immédiatement disponible sous la main pour ne pas désamorcer la pompe.

MISE EN ROUTE
Vérifier les connections électriques, les tuyaux d'eau et le niveau de remplissage du liquide. Sur les modèles HX 200 à HX 750, il faut alimenter l'appareil 12 heures avant pour chauffer et séparer l'huile du refrigérant.

Mettre en route en appuyant sur " ON ". Un voyant s'allume qui indique que l'appareil est en fonctionnement. Pour l'éteindre, appuyer sur " OFF ".

Les voyants LED " Cool " et " IDLE " indiquent le mode de fonctionnement du système de réfrigération. " Cool " est allumé quand l'appareil évacue la chaleur du fluide, " HEAT " est allumé quand l'appareil est en mode de " By-pass ". Quand la température obtenue approche de la température souhaitée, le voyant s'allume et s'éteint.

Après avoir éteint l'appareil, attendre environ cinq minutes avant de le rallumer, pour un bon équilibrage des pressions.Autrement, le cycle au niveau du compresseur serait trop bref et le refroidissement n'aurait pas lieu.

Changer de temps à autre le liquide utilisé,

Aux basses températures, la concentration en eau a tendance à augmenter ce qui peut générer une perte de puissance de refroidissement,

Avant de changer de liquide, recirculer à une température plus élevée pour réchauffer le serpentin,

Nettoyer régulièrement selon les conditions de travail la grille d'aspiration. Nous recommandons d'effectuer la première inspection du condenseur un mois après l'installation,

Les modèles fonctionnant avec des pompes type PD ou TU sont équipés d'un filtre qui retient les impuretés. Il est recommandé de nettoyer ce filtre après la première semaine et, ensuite, une fois par mois. Ce nettoyage s'effectue après avoir débranché l'appareil et vidangé le réservoir

PROCEDIMIENTOS DE OPERACION DE REFERENCIA RAPIDA PARA LA SERIE HX REFRIGERADA POR AGUA

INSTALACION
Sitúe la unidad en un entorno limpio con fácil acceso a la instalación de agua de enfriamiento y un desagüe. Los requerimientos de la instalación de agua deben adaptarse a las especificadas en el manual de instrucciones o el funcionamiento de la unidad se verá mermado. Un suministro de agua inadecuado podría causar que el compresor se sobrecalentara y se apagara la unidad.

Asegúrese de que el voltaje de la fuente de energía sea igual que el voltaje especificado, ±10%.

Las conexiones de tuberías están situadas en la parte trasera de la unidad y están marcadas como TAP WATER, DRAIN, SUPPLY y RETURN. Saque los protectores de plástico de todas las conexiones de tuberías. Conecte el adaptador TAP WATER a la instalación de agua de enfriamiento y el adaptador DRAIN a un desagüe. Conecte el adaptador SUPPLY a la entrada de su aplicación y el adaptador RETURN a la salida de su aplicación.

Para llenar el reservorio, abra el panel de acceso situado en la esquina trasera izquierda del tope de la caja y saque la tapa del reservorio desatornillando los tornillos. Llene el reservorio hasta una pulgada del tope. Si la capacidad de fluido de su aplicación y las lineas de recirculación son significativas, tenga fluido extra a mano.

Se recomienda el agua corriente como fluido para operar desde +8 ºC hasta +80 ºC. Por debajo de +8 ºC, debe utilizarse un fluido no congelador. Sugerimos una mezcla de agua corriente y etileno glicol de grado laboratorio.

OPERACION
Antes de poner en marcha la unidad, compruebe todas las conexiones eléctricas y de tuberías. Asegúrese de que el sistema circulador se ha llenado con fluido refrigerante.

En los modelos HX-200 hasta HX-750, la unidad debe conectarse a la red de energía durante al menos 12 horas para permitir que el aceite se caliente y se separe del refrigerante.

Para poner en marcha la unidad, ponga el interruptor de encendido en posición ON. Los LED Cool y Idle del panel frontal indican la situación del sistema de refrigeración. Cool está en marcha cuando la unidad está eliminando calor del fluido de enfriamiento. Heat está en marcha cuando la unidad está en el modo by-pass gas caliente. A medida que la temperatura de funcionamiento se aproxima al punto fijado, el LED ciclará.

Cuando se apaga la unidad, espere aproximadamente cinco minutos antes de volver a ponerla en marcha para permitir que las presiones de refrigeración se ecualicen. Si no se permite ecualizarse las presiones, el compresor se cortocicuitará y no enfriará.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR ANALOGICO
Para fijar el punto de ajuste de la temperatura, gire el dial ºC situado en el frontal de la unidad hasta la temperatura deseada.

AJUSTE DE LA TEMPERATURA CON EL CONTROLADOR DIGITAL
Para que el punto de ajuste de temperatura aparezca en pantalla, mantenga presionado el interruptor DISPLAY. Para fijar el punto de ajuste de temperatura, mantenga presionado el interruptor DISPLAY y gire el botón ADJUST hasta que la pantalla digital indique el punto de ajuste de temperatura deseado. Una vez fijado el punto de ajuste, suelte el interruptor DISPLAY. La pantalla indicará la temperatura del fluido en el reservorio.

CONTROL DE FLUJO
El mango RECIRCULATING FLOW CONTROL controla la escala de flujo a su aplicación. En la posición + recibirá flujo completo, en la posición - no hay flujo.

MANTENIMIENTO PERIODICO

Inspeccione periódicamente el fluido del reservorio. Si es necesaria una limpieza, rocíe el reservorio con un fluido de limpieza compatible con el sistema de circulación y el fluido refrigerante.

El fluido refrigerante debe sustituirse periódicamente. Cuando se funciona a baja temperatura, la concentración de agua en el fluido refrigerante aumentará con el tiempo, ocasionando una pérdida de capacidad refrigerante.

Es necesario un vaciado periódico de las aletas del condensador. La frecuencia de limpieza depende del entorno en que funciona el aparato. Recomendamos una inspección visual mensual del condensador después de la instalación inicial. Después de varios meses, quedará establecida la frecuencia de limpieza.

Las unidades con bombas PD y TU tienen un filtro. Si hay residuos en el sistema, el filtro prevendrá que el material entre en la bomba y dañe las paletas de la bomba.

Después de la instalación inicial, el filtro puede bloquearse. El filtro debe limpiarse después de la primera semana de la instalación. Después de esta primera limpieza, se recomienda una inspección visual mensual. Después de varios meses, se establecerá la frecuencia de limpieza.

Antes de limpiar el filtro, desenchufe el aparato y vacíe el reservorio.

PROCEDIMIENTOS DE OPERACION DE REFERENCIA RAPIDA PARA LA SERIE HX REFRIGERADA POR AIRE

INSTALACION
Sitúe la unidad para no impedir la entrada y descarga. Una ventilación inadecuada causará una reducción en la capacidad de enfriamiento y, en casos extremos, un fallo en el compresor.

Deben evitarse las zonas excesivamente polvorientas y debe instituirse un calendario de limpiezas periódicas. Para un funcionamiento adecuado, la unidad necesita empujar una cantidad sustancial de aire a través de un condensador. Un cúmulo de polvo o residuos en las aletas del condensador ocasionaría una pérdida de capacidad de enfriamiento.

La unidad retendrá su capacidad completa en temperaturas ambiente de hasta aproximadamente + 75 ºF.

Asegúrese de que el voltaje de la fuente de energía sea igual que el voltaje especificado, ±10%.

Las conexiones de tuberías están situadas en la parte trasera de la unidad y están marcadas como SUPPLY y RETURN. Estas conexiones son 3/4" FPT. Saque los protectores de plástico de ambas conexiones de tuberías. Conecte el adaptador SUPPLY en la entrada de su aplicación. Conecte el adaptador RETURN a la salida de su aplicación.

Para llenar el reservorio, abra el panel de acceso situado en la esquina trasera izquierda del tope de la caja y saque la tapa del reservorio desatornillando los tornillos. Llene el reservorio hasta una pulgada del tope. Si la capacidad de fluido de su aplicación y las lineas de recirculación son significativas, tenga fluido extra a mano.

Se recomienda el agua corriente como fluido para operar desde +8 ºC hasta +80 ºC. Por debajo de +8 ºC, debe utilizarse un fluido no congelador. Sugerimos una mezcla de agua corriente y etileno glicol de grado laboratorio.

OPERACION
Antes de poner en marcha la unidad, compruebe todas las conexiones eléctricas y de tuberías. Asegúrese de que el sistema circulador se ha llenado con fluido refrigerante.

En los modelos HX-200 hasta HX-750, la unidad debe conectarse a la red de energía durante al menos 12 horas para permitir que el aceite se caliente y se separe del refrigerante.

Para poner en marcha la unidad, ponga el interruptor de encendido en posición ON. Los LED Cool y Idle del panel frontal indican la situación del sistema de refrigeración. Las unidades con bombas PD y TU tienen un filtro. Si hay residuos en el sistema, el filtro prevendrá que el material entre en la bomba y dañe las paletas de la bomba.

APPENDIX B 380V WYE MODIFICATION.

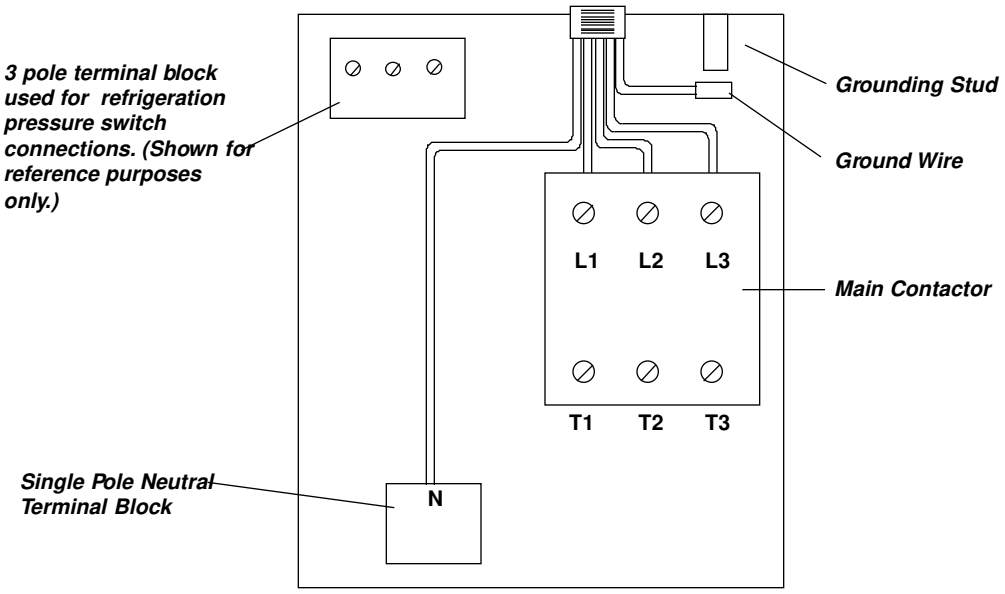
Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit.

For personal safety and equipment reliability, the following procedure should only be performed by a qualified service technician familiar with the safety precautions required for working inside an energized disconnect box.

Electrical connections are made in the electrical enclosure at the rear of the unit. Remove one of the “knock-outs” from the wall of the enclosure and install a conduit connector. Connect the line cord to the main contactor terminals labelled L1, L2, and L3. Connect the neutral wire (N) to the single pole terminal block labelled N. Connect the ground wire (G) to the grounding stud.

NOTE: Not all units require a neutral connector. Refer to the unit's serial number label on the rear of the unit and to your facility power source availability. Units not requiring a neutral connector use the same connection procedures except there will be no neutral wire or single pole terminal block.

NOTE: The HX-750 380/480V model contains a three phase condenser fan motor. It is possible to misconnect the main power and have the motor turn in the wrong direction resulting in incorrect airflow over the condenser. Proper airflow is achieved by exchanging any two main power connectors.



WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.

With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

NESLAB ONLINE

NESLAB ONLINE is your source for immediate service data, including service bulletins, refrigerant charging information, calibration instructions, and more for all catalog units. Now you can browse the same database our Technical Support representatives use - and this is available 24 hours a day, 7 days a week. NESLAB ONLINE is also your link into our e-mail system, news system, and technical reference library. All it takes is a Macintosh or Windows computer and modem. Please return the coupon for a copy of FirstClass Client - the software used to access the NESLAB ONLINE server. There are no restrictions on the duplication of FirstClass Client - it may be installed on multiple machines.

Download from sources on reverse side of page,
or request by e-mail to **neslab@lifesciences.com**
Specify which computer system you use.

NESLAB ONLINE
intranet - bbs

NESLAB ONLINE is a public intranet-bbs (bulletin board system) installed to provide automated service documentation 24 hours a day, seven days a week. It is installed and used just like any of the commercial bbs systems (America Online, Prodigy, CompuServe, etc). Our system software is "FirstClass®". The software required to connect to us (the FirstClass Server) is "FirstClass Client'. It is available in both Macintosh and Windows versions. It may be obtained from many public sources. There are no restrictions on copying it. It is freely distributable.

Why did NESLAB choose FirstClass? It is the only intranet-bbs software we found that provided full graphical access (that means icons and point-and-click) as well as universal access from DOS / Windows / Macintosh / Newton computers whether connected by modem or NESLAB's internal network.

Newton

Newton compatible.

Some sources for FirstClass Client

CAUTION

This section is intended for use by qualified refrigeration technicians only. Servicing refrigeration systems is hazardous and must be performed only by qualified persons.

Refrigeration systems contain various hazards, including (but not limited to) the following:

1. Refrigeration systems contain refrigerant gases at very high pressures, even when not running.

2. Sudden release of refrigerant gases will result in rapid expansion and severe frostbite hazard. Refrigerant gases will cause severe injury to unprotected flesh.

3. Refrigerant gases are not flammable and are chemically inert. However, they are heavier than air and will displace oxygen. They can cause suffocation if released in a confined area.

4. Refrigerant gases used in this product are classified as Ozone Depleting Chemicals by the US Environmental Protection Agency. While they pose no hazard sealed inside the refrigeration system, intentional release into the atmosphere is outlawed under the 1990 Clean Air Act.

5. Compressor start and run capacitors store hazardous levels of electricity, even when the unit is not running or plugged in.

6. Refrigeration system components operate at high temperatures and present a severe burn hazard.

THEORY OF OPERATION

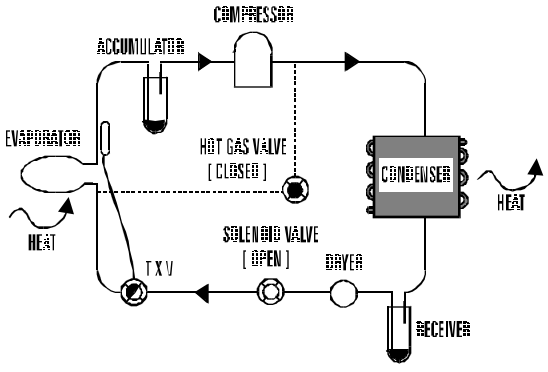
The chiller operates in two modes: COOL or HEAT/IDLE. The controller compares setpoint to actual temperature and decides which mode is required. This is a thermostatic (not proportional) control system. The compressor, pump, and fan motor all run continuously, regardless of mode.

The thermal transfer of the HEAT/IDLE mode is not as efficient as the COOL mode. This results in units running at little or no load to spend most of their time in the HEAT/IDLE mode with brief periodic COOL periods. A duty cycle of 20% COOL / 80% HEAT/IDLE may be typical for units running under no load. This duty cycle will reverse as increasing load is applied, reaching 100% COOL / 0% HEAT/IDLE at full load.

This system results in tighter temperature control than continually cycling the compressor on and off, as is typical in a household refrigerator.

The default mode is HEAT/IDLE. A failure of the temperature sensor or controller will generally result in the HEAT/IDLE mode. This prevents a possible freezing of the cooling fluid and resulting damage from fluid expansion.

COOL MODE

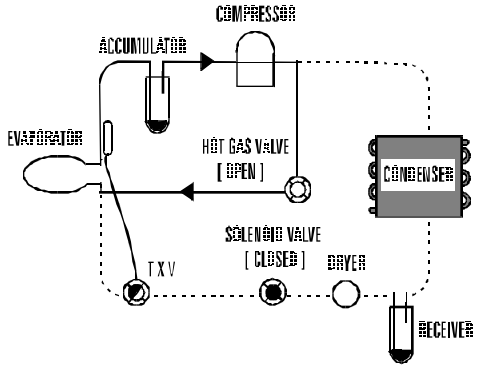


If the setpoint is below the actual temperature, the controller is in COOL mode. The controller triac output provides a closure to supply line voltage to the solenoid coil. The solenoid valve, which is normally-closed, is then pulled open by the coil and a standard refrigeration cooling loop exists.

Refrigerant, as a gas, is pressurized in the compressor. It then enters the condenser and changes to a liquid due to the cooling provided by the fan and condenser fins. Heat is given up to the air at this point. The liquid refrigerant exits the condenser and passes through a filter/dryer which traps contaminants and absorbs any water moisture in its desiccant element. The refrigerant then passes through the open solenoid valve and enters the capillary tube. The restriction of the tube meters the flow. The capillary tube ends at the evaporator.

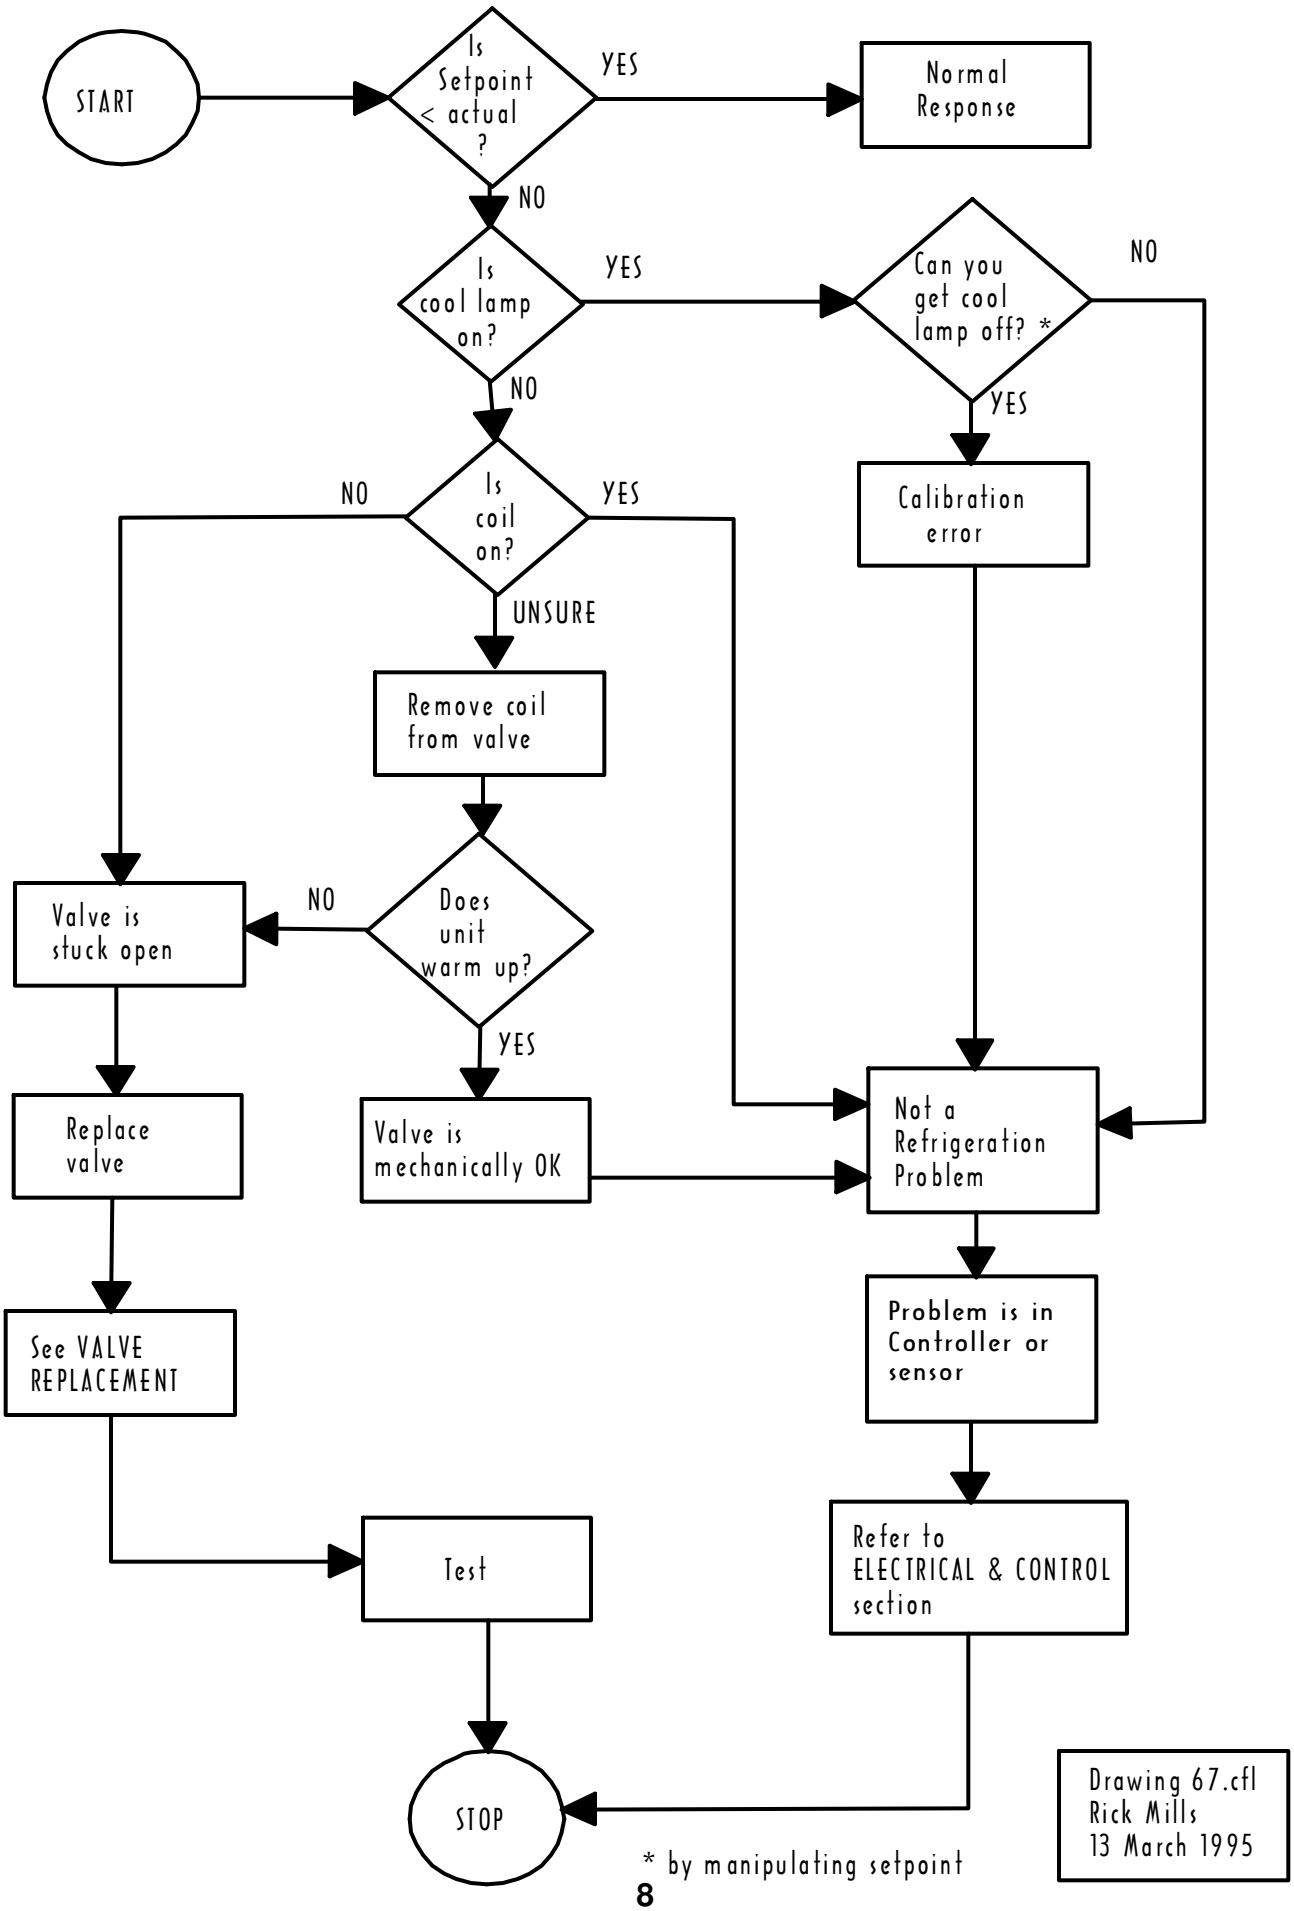
The evaporator is a coil located inside the fluid tank. As the liquid refrigerant encounters the increased volume of the evaporator, it expands tremendously, changing from a liquid to a gas, and absorbing heat from the fluid (cooling it) in the process. The refrigerant, now a gas, exits the evaporator and passes through the suction filter. The refrigerant then enters the compressor at low pressure and is re-compressed.

HEAT/IDLE MODE



If the setpoint is above the actual temperature, the controller is in HEAT/IDLE mode. The triac output opens, turning the solenoid coil off. The solenoid valve then drops closed. This stops the flow of refrigerant at that point. The resulting increase in discharge pressure causes the Hot Gas (also known as an ADR, or Automatic Discharge Relief) valve to open. The refrigerant gas is now routed directly to the evaporator. The gas is not allowed to condense, as it has bypassed the condenser completely. The hot gas passing through the evaporator coil adds some heat to the fluid, then returns directly through the suction filter to the compressor. This unloads the compressor, resulting in lower discharge pressure, higher suction pressure, and less power consumption. Observing the suction pressure in this mode will indicate the setting of the Hot Gas (ADR) valve.

Troubleshooting Chart: Runaway cold



Troubleshooting Chart: Runaway hot

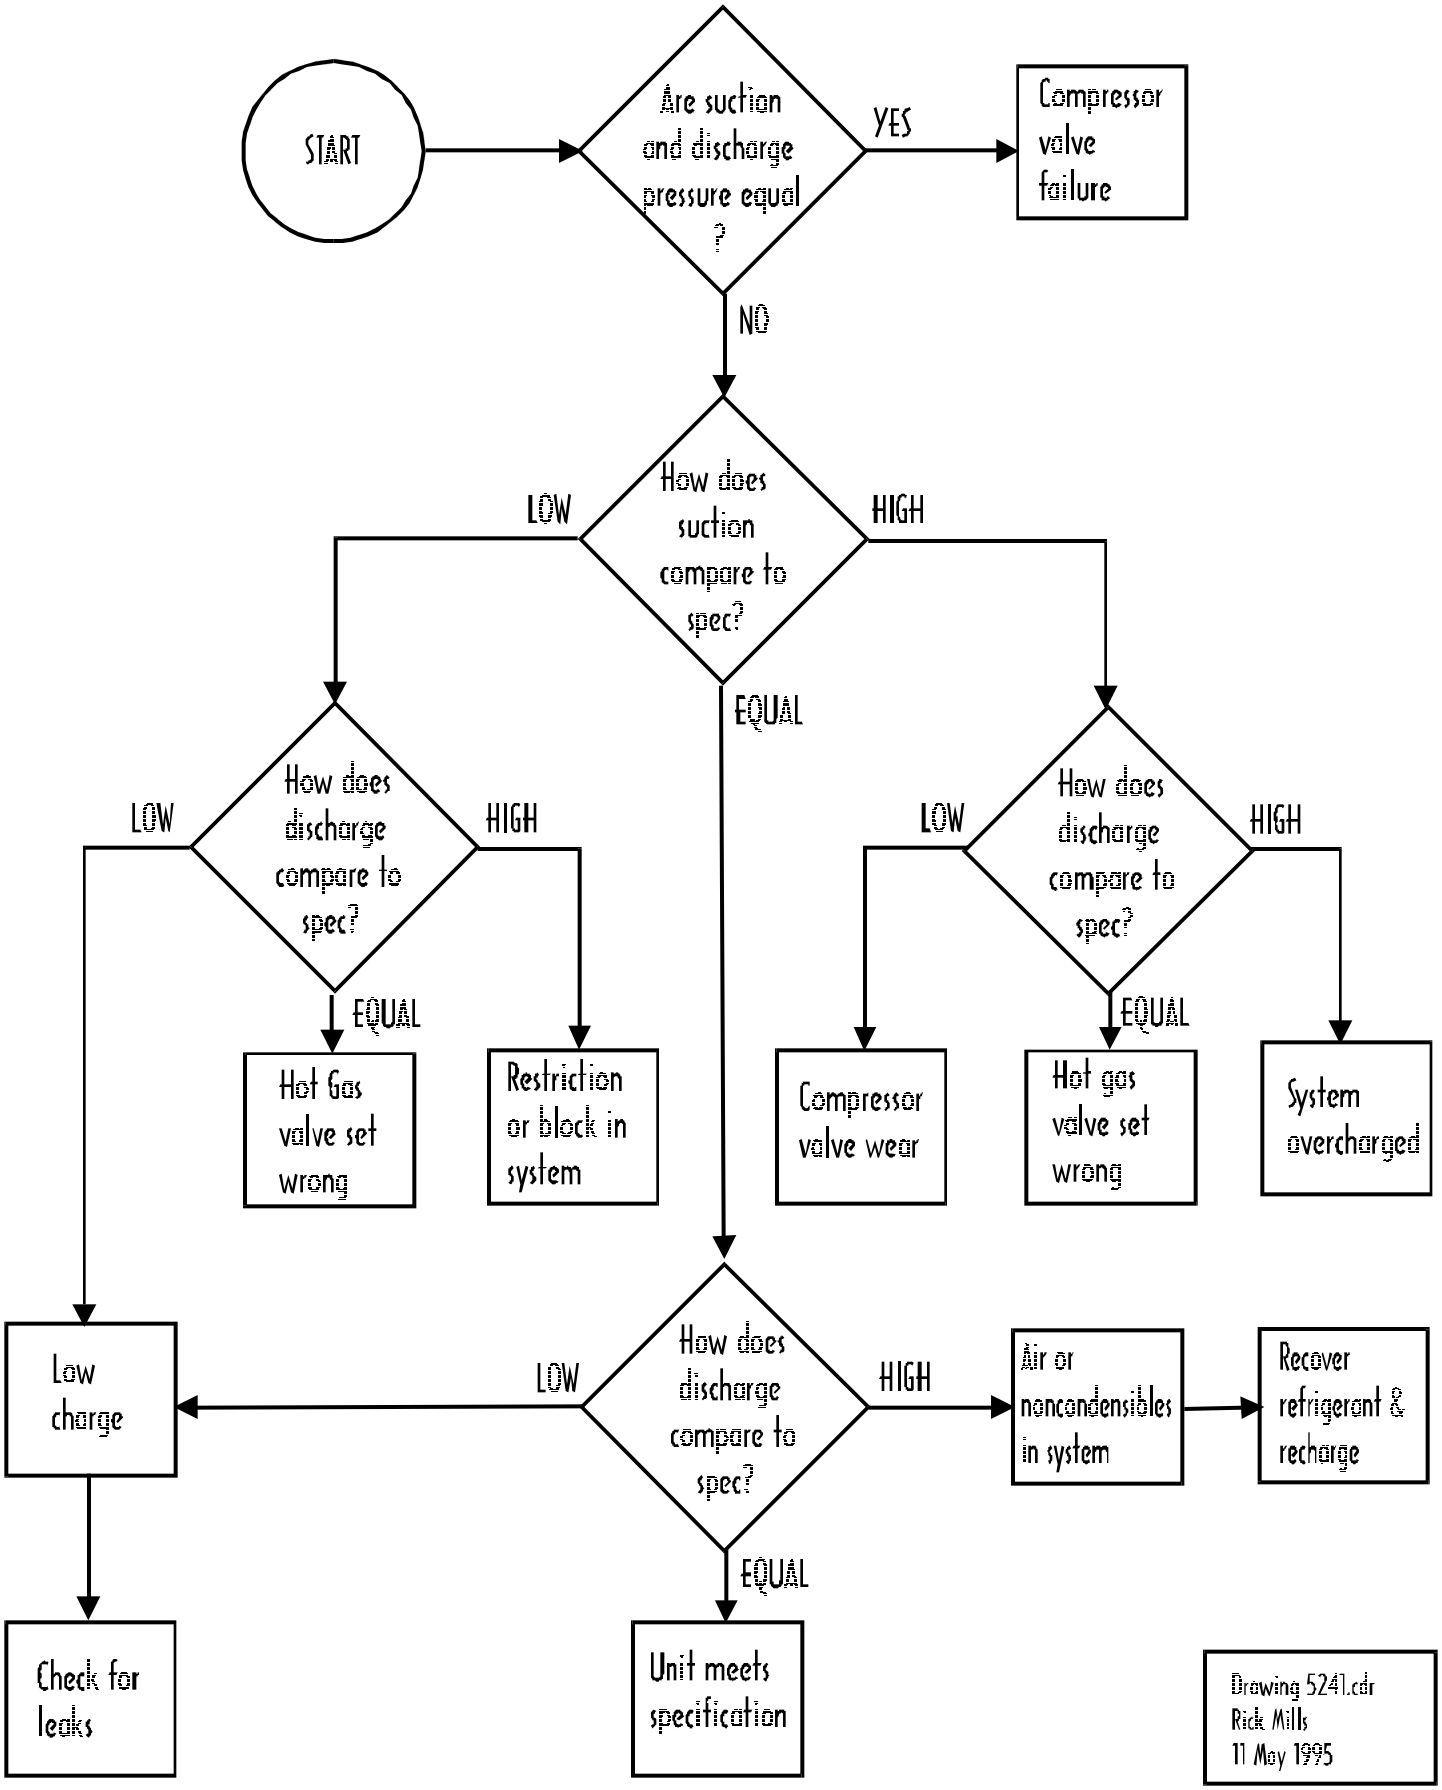
Troubleshooting Chart: Refrigeration pressures



Compressor replacement

1. Remove all access panels.

2. Confirm that the problem is not external to the compressor (electrical) before proceeding. If the compressor does not start/run, check the following:

    A. Is proper voltage present at the compressor terminals?

    B. Are all starting devices (capacitors, potential relays) good?

Disconnect the unit from line voltage

    C. Are the motor windings known to be good or bad? If in doubt, Ohmmeter readings of the windings may be compared to the replacement compressor.

3. Recover the system refrigerant.

4. Disconnect wires, starting devices, etc. from compressor.

5. Remove valve cores from both Shrader valves.

6. Remove the coil from the solenoid valve and move it out of the torch area. Wrap a damp rag around the solenoid valve body.

7. Unsolder and remove compressor and dryer.

    NOTE: If a compressor burnout is suspected, invert old compressor and drain out a small sample of oil. Test the oil for acidity, following the manufacturer's recommendations on the acid test kit. If the oil is acidic, the refrigeration system will need flushing to remove the acidic oil. Replace with new oil.

8. Unpack new compressor. Remove plugs from the ports.

Compressors are typically shipped pressurized with a dry nitrogen charge. Safety glasses are especially necessary when removing plugs. Orient compressor so the plug will exit the port pointing away from you and others.

NOTE: Replacement Copeland compressors already contain an adequate oil charge. It is not necessary to add any oil to the new compressor.

9. Remove the suction service port stem from the old compressor, and insert it into the new compressor.

10. Apply nitrogen purge gas to the stem.

11. Braze in place using BAg 28 (silver solder) compound.

12. Position the new compressor in place.

13. Position the new dryer in place. Ensure the flow direction arrow points toward the solenoid valve.

14. Wrap a damp rag around the dryer.

15. Apply nitrogen purge gas to the suction service port.

16. Braze the suction and discharge lines to the compressor, using BAg 28.

17. Braze the dryer in place, using BAg 28.

18. Insert new valve cores in the Shrader valves.

19. Pressurize system and leak check.

20. Evacuate system.

21. Charge system to specification.

22. Test system.

Fan Motor Replacement

1. **Disconnect unit from its electrical power supply.**
2. Remove access panels to gain access to the fan motor and electrical box. Remove the electrical box cover.
3. Note the location and orientation of the electrical wiring for installation.
4. Disconnect the electrical wiring from the electrical box.
5. Unbolt the fan cage from the fan shroud.
6. Remove the fan blade.
7. Unbolt the fan motor from the fan cage.
8. Vacuum dust and dirt from the area.
9. Install the new fan motor on to the fan cage.
10. Install the fan blade.
11. Bolt the fan cage to the fan shroud.
12. Install the electrical wiring as noted during removal.
13. Install the electrical box cover.
14. Test the fan motor for operation.
15. Install all access panels.

FILTER/DRYER REPLACEMENT

NOTE: The filter/dryer contains a desiccant which will absorb moisture from the atmosphere. The filter/dryer should be replaced whenever the refrigeration system has been opened and allowed to go to atmospheric pressure. Unsealing and installing the new filter/dryer should be left until the last possible minute to minimize contamination of its desiccant.

Disconnect the unit from line voltage

1. Recover the system refrigerant.
2. Remove all Shrader valve cores.
3. Remove solenoid valve internal components (See “Solenoid valve replacement procedure” for drawing) Wrap a damp rag around the solenoid valve body.
4. Apply purge gas to the system.
5. Desolder and remove old filter/dryer.
6. Place new filter/dryer in position, with direction-of-flow arrow pointing towards the liquid line solenoid valve.
7. Wrap the filter/dryer body in a damp rag.
8. Introduce nitrogen purge gas into the discharge service port.
9. Braze connections using BAg 28. Orient torch flame away from the filter/dryer body. Any bubbling of the paint on the filter/dryer indicates excessive temperature is being approached - stop and allow to cool if this occurs.
10. Remove the damp rags and the nitrogen supply.
11. Insert new schrader valve cores.
12. Assemble the solenoid valve (Do Not over tighten - Use two wrenches).
11. Pressurize and leak check.
12. Evacuate system.
13. Charge system.
14. Test.
15. Install any access panels removed.

Solenoid valve replacement:

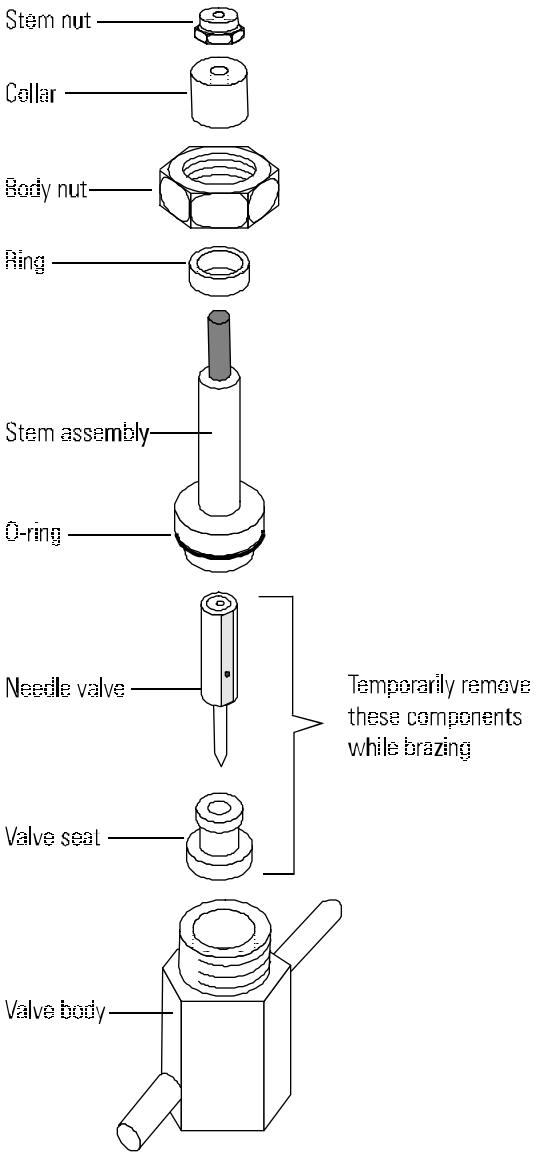
Disconnect the unit from line voltage

1. Recover refrigerant.

2. Remove coil.

3. Remove all valve cores from the Shrader valves.

4. Note the direction of flow so that the new valve can be properly positioned during assembly. Disassemble solenoid valve and remove internal components as shown below.



5. Protect all components that could be affected by the soldering flame with damp rags and metal shielding.

6. Apply a nitrogen purge gas to the system.

7. Unsolder the valve and dryer and remove.

8. Place new valve and dryer in position. Check that the flow direction arrows on both devices point towards the capillary tube.

9. Wrap a damp rag around the valve and dryer and protect any other components/wiring with damp rags and metal shields.

10. Apply nitrogen purge gas to the system.

11. Braze in place using BAg 28 compound (silver solder).

12. Remove rags and inspect brazing.

13. Install new valve cores in the Shrader valves.

14. Assemble solenoid valve assembly. (Use two wrenches and do not over tighten.)

15. Pressurize system and leak check. The solenoid valve is closed, so be sure to pressurize both sides.

12. Evacuate the refrigeration system.

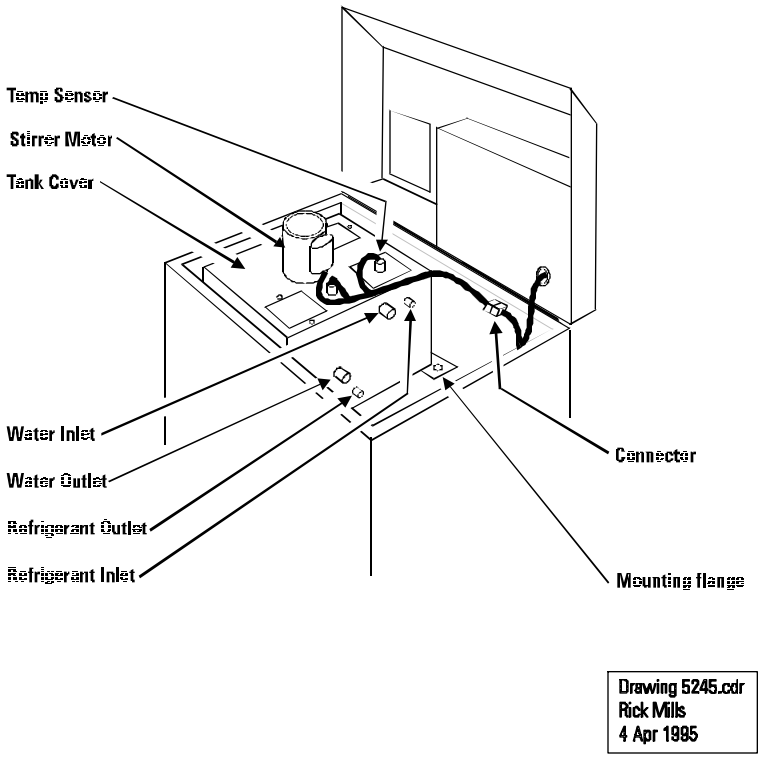
13. Install coil.

14. Charge system to specification.

15. Test system.

16. Install any access panels removed.

Tank Coil Assembly (TCA) replacement



NOTE: The evaporator coil and the water tank are one unit. They cannot be separated. The following procedure assumes that the pump along with its plumbing has been removed.

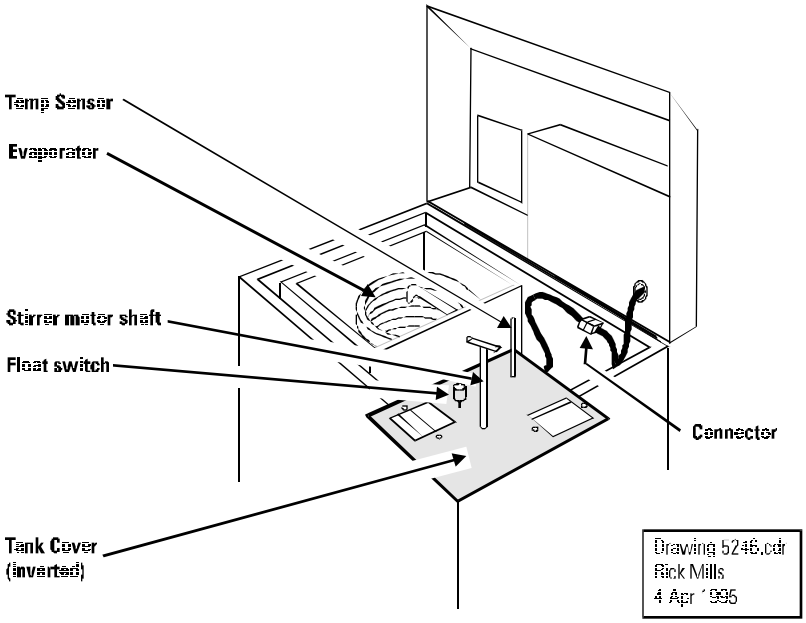
Disconnect unit from line voltage.

1. Recover refrigerant, if any remains.

2. Drain fluid from system.

3. Remove valve cores from both Shrader valves.

4. Remove screws from Tank Cover and lift it off the tank with all wires, motors, sensors, etc. intact. Invert it and place it to the side as shown. If more slack is required in the wires, unplug the connector shown.



5. Remove the two fluid hoses from the water inlet and outlet stubs.

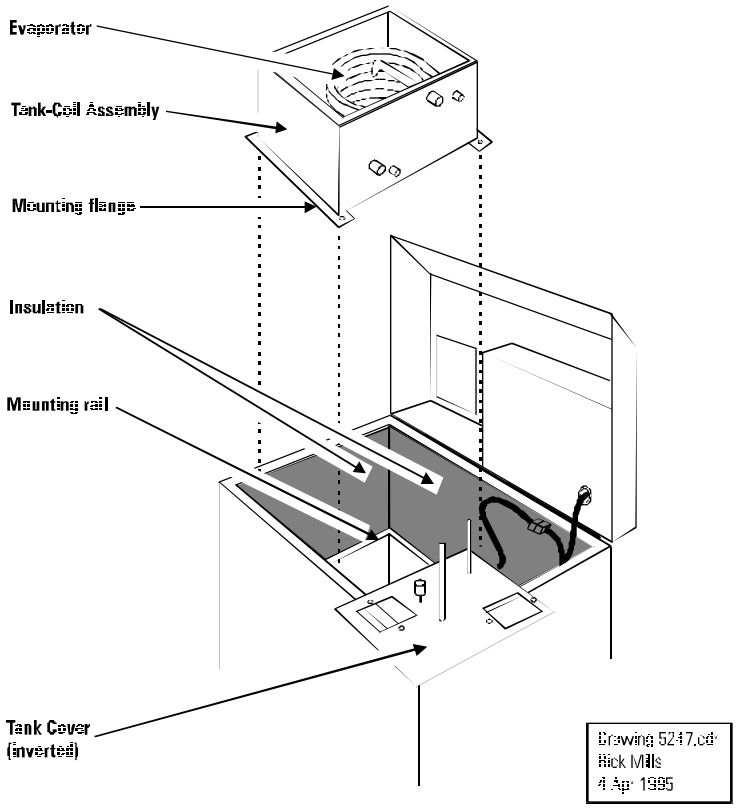
6. Remove the insulation from the refrigerant inlet and outlet lines.

7. Unsolder the refrigerant inlet and outlet lines.

CAUTION: The refrigerant inlet and outlet lines are stainless steel. They are easily damaged by excessive heat. Never apply the torch flame directly to the stainless. Warm the copper fittings up slowly and evenly until the solder liquefies.

8. Remove the four screws that hold the TCA mounting flange to the mounting rails.

9. Lift the TCA straight up out of the unit.



10. Inspect the insulation on the inside of the case walls while the TCA is removed. Replace any that is wet. Install insulation on the new TCA.

11. Transfer the strainer from inside the old TCA to the new TCA, if required.

12. Clean the refrigeration stubs on the new TCA carefully prior to installation. Clean the inside of the mating copper lines prior to installation.

13. Lower the TCA into place and secure the mounting flange to the mounting rails.

CAUTION: The refrigerant inlet and outlet lines are stainless steel. They are easily damaged by excessive heat. Solder the fittings as follows:

A. Ensure all fittings have been carefully cleaned.

B. Apply a paste-type flux.

C. Assemble fittings.

D. Apply nitrogen purge gas to the suction service port.

E. Warm the copper fittings slowly and evenly. Do not rush this procedure. Observe the flux change to a watery clear state.

CAUTION: Never apply the torch flame directly to the stainless.

F. Apply BAg 28 (silver) solder.

CAUTION: The stainless must never be hot enough to turn cherry red. This will cause oxidation and the solder will not wet the oxidized material. If this occurs, stop immediately. Allow fittings to cool. Polish the stainless fittings with emery cloth until all traces of dark oxidation are removed.

14. Disconnect nitrogen purge gas.

15. Install new valve cores in the Shrader valves.

16. Pressurize system and leak check.

17. Evacuate system.

18. Charge system to specification.

19. Test system.

WATER REGULATING VALVE: REPLACEMENT (present on water-cooled units only)

Disconnect unit from its electrical power supply.

1. Recover refrigerant charge.

2. Remove valve cores from both Shrader valves.

3. Apply nitrogen purge gas to the discharge service port.

4. Unbraze the valve's sensor pickup from the compressor discharge line.

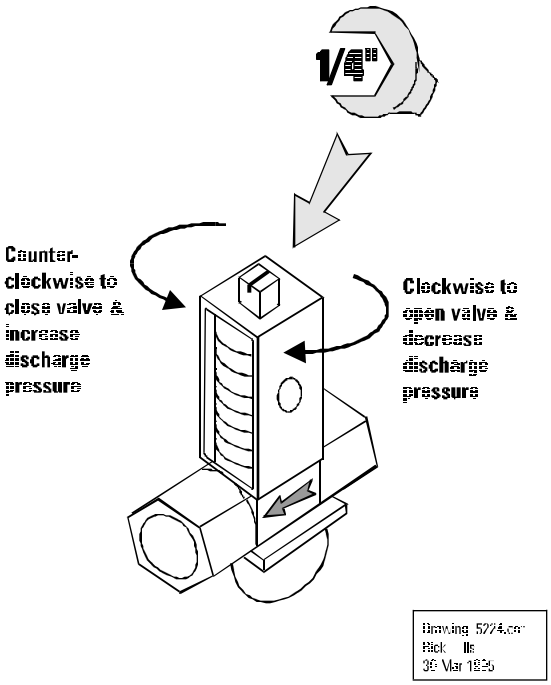
5. Braze the new valve's sensor pickup in place using BCuP3 or BCuP5 brazing compound. Silver-based solder is not recommended for this joint.

6. Remove nitrogen supply.

7. Install new valve cores.

8. Begin evacuation of refrigeration system.

9. While system is being pumped down, Turn the adjusting screw on the old valve fully closed (CCW). Count how many turns are required to close it.



10. Disassemble the two unions holding the original valve in place.

11. Remove original valve.

12. Transfer fittings to new valve.

13. Mount new valve using the two unions.

14. Turn the adjusting screw on the new valve fully closed.

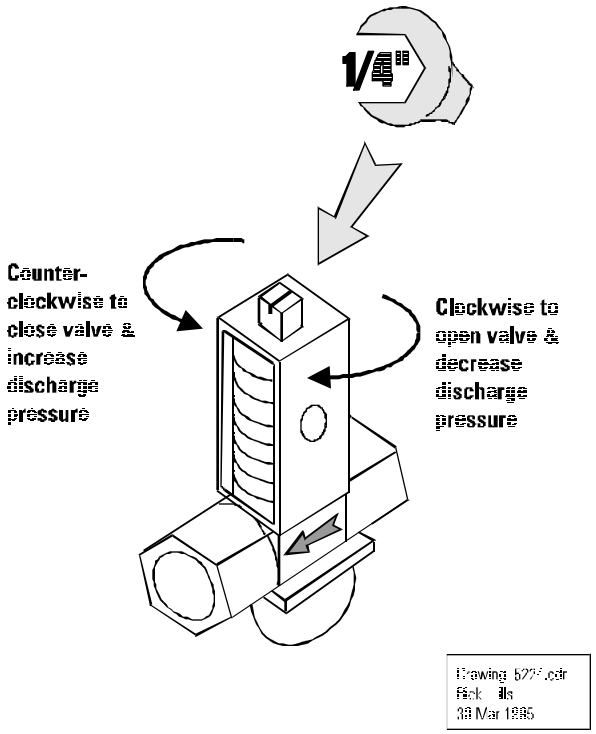
15. Now back it out the number of turns observed in the previous step. This will approximate the correct setting.

16. Pressurize system and leak check.

17. Evacuate system.

18. Recharge refrigeration system.

19. Test.



Refrigeration Components General Replacement Procedures

Note: Make note of the in/out orientation of all components before disassembly so that they may be correctly oriented during installation. The Filter/Dryer should always be changed along with any other refrigeration component or when the refrigeration system has been exposed to atmospheric moisture.

1. **Disconnect the unit from line voltage**

2. Remove access panels.

3. Recover system refrigerant.

4. Remove the valve cores.

5. Remove solenoid coil/s.

6. Disassemble solenoid valve/s (this procedure is shown in the "Solenoid valve replacement procedure") and remove the internal components (for purging). Place the nut and stem back on the valve and secure snugly.

7. Protect all components that could be damaged during brazing with damp rags and/or metal shielding.

8. Apply a slow nitrogen gas purge.

9. Unsolder all components being changed and remove.

10. Remove nitrogen purge.

    NOTE: All components should be clean and silver soldering flux applied. The Filter/Dryer should be the last component installed to prevent contamination.

11. Place new components into position. Check that the "IN" / "OUT" sides are in proper orientation in the system as notes before removal. If a new solenoid valve is being installed make sure that it is disassembled (see step 6 above).

12. Ensure that all components are protected from heat with damp rags and / or metal shields.

13. Apply a slow nitrogen gas purge.

14. Braze component/s in place using BAg 28 compound silver solder.

15. Remove all rags and metal shielding.

16. Inspect all brazing joints.

17. Assemble solenoid valve/s internal parts (this procedure is shown in the “Solenoid valve replacement procedure”).

18. Install new valve cores.

19. Pressurize the system and check for leaks. Be sure to pressurize both sides of any solenoid valve and the high and low side of the system.

20. Evacuate the refrigeration system.

21. Charge the refrigeration system to specifications.

22. Test the unit for proper operation.

23. Install all access covers.

Speed check

Speed Check is a term used to describe how fast a unit can cool across 20°C when it is running at maximum capacity. The unit of measure is “degrees per minute”. This will provide a number that is easy to obtain and compare.

1. Find the DROP figure from the table. (For example, the HX100 with a PD-1 pump has a drop of 1.4°C.)

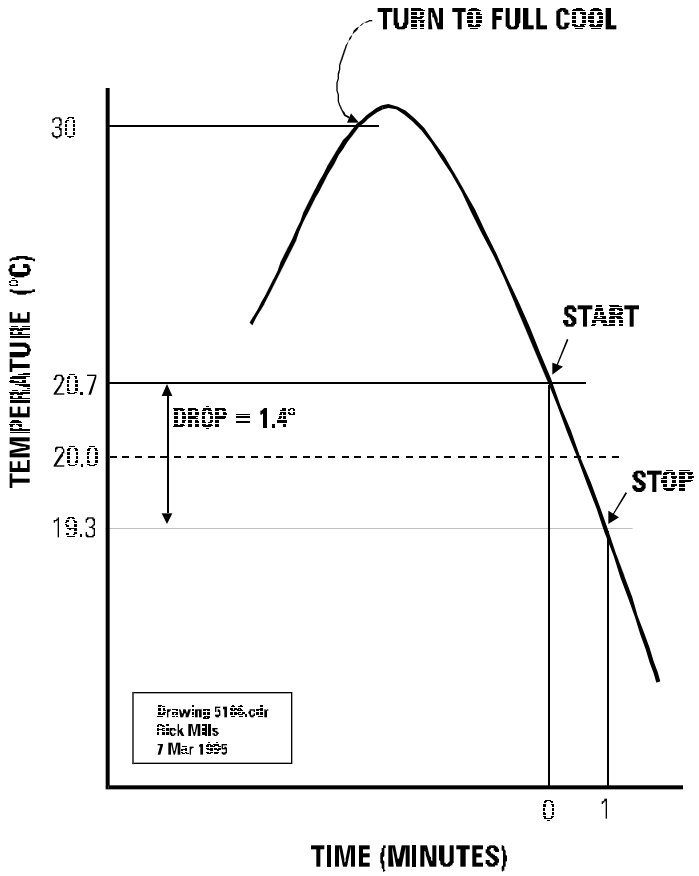
2. Divide the drop in half. (Example: 0.7°C)

3. Add this half to 20°C to find the START point. (Example: 20.7°C)

4. Subtract this half from 20°C to find the STOP point. (Example: 19.3°C). Now the entire drop is centered about 20°C.

5. Connect the unit’s inlet and outlet with as short a loop of hose as practical. Insert a thermometer with 0.1°C resolution in the loop.

SPEED CHECK TO PROVE 1.4°C/MINUTE



6. Ensure the fluid used is 100% water. Heat the fluid to at least 30°C, then turn unit to full cool.

7. Begin timing as soon as the START temp (20.7°C) is passed.

8. Stop timing when the STOP temp (19.3°C) is passed.

9. Elapsed time must be one minute or less.

Suction Discharge Pressure and Speed Check

Air-Cooled Standard and High Temperature Units (All Pump Types)[1]

Unit	Suction(psi)	Discharge(psi)	Speed Check(°C/Minute)
HX-75	77 - 84	225 - 250	1.5 - 1.7
HX-100	75 - 83	245 - 265	1.3 - 1.6
HX-150	70 - 73	240 - 270	2.0 - 2.5
HX-200	85 - 105	230 - 255	1.6 - 1.9
HX-300	84 - 105	270 - 305	2.4 - 2.7
HX-500	80 - 90	215 - 235	2.0 - 2.4
HX-750	65 - 75	185 - 215	Not Available

Water-Cooled Standard and High Temperature Units (All Pump Types)[2]

Unit	Suction(psi)	Discharge(psi)	
HX-75	72	170	Speed check times not established.
HX-100	86 - 92	180	
HX-150	65	175	
HX-200	85 - 90	180	
HX-300	73 - 78	180

HX-750	50 - 60	180	

1. 27°C unit temperature, water in reservoir, access panel removed.
2. 25°C unit temperature, water in reservoir.

NOTE: For low temperature units please call NESLAB.

Condenser, Air Cooled

The condenser should be cleaned periodically. The grille covering the condenser is removable. The best way to remove dust is to force it out in the opposite direction from which it entered. If compressed air is available, direct the air against the inside of the condenser. If a vacuum cleaner is used, apply the vacuum to the outside of the condenser. Straighten any bent fins using a fin comb.

Condenser, Water cooled

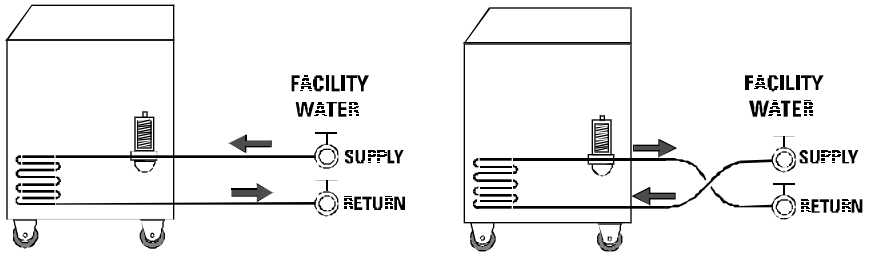
The water cooled condenser generally needs no maintenance. If the cooling water is particularly dirty, deposits may occur and cause flow restrictions. In this event flushing may be required. The procedure used depends on whether a closed facility water cooling system or a tap water system is used. The procedures are described on the following pages.

Flushing using a closed facility system

1. Turn HX off.

2. Close valves on cooling water supply and return lines.

3. Disconnect hoses from cooling water supply and return, and reverse them.



NORMAL CONNECTION FLUSHING CONNECTION

Flushing closed facility system (continued)

4. Open valves on cooling water supply and return lines.

5. Run HX normally for 10-15 minutes. Adjust setpoint so HX cycles between heat and cool. The condenser flow is now reversed. This reverse flow will tend to loosen any deposits. Cooling performance may be less, and the water regulating valve may make some vibration noise.

6. Turn HX off.

7. Close valves on cooling water supply and return lines.

8. Restore hoses to original configuration.

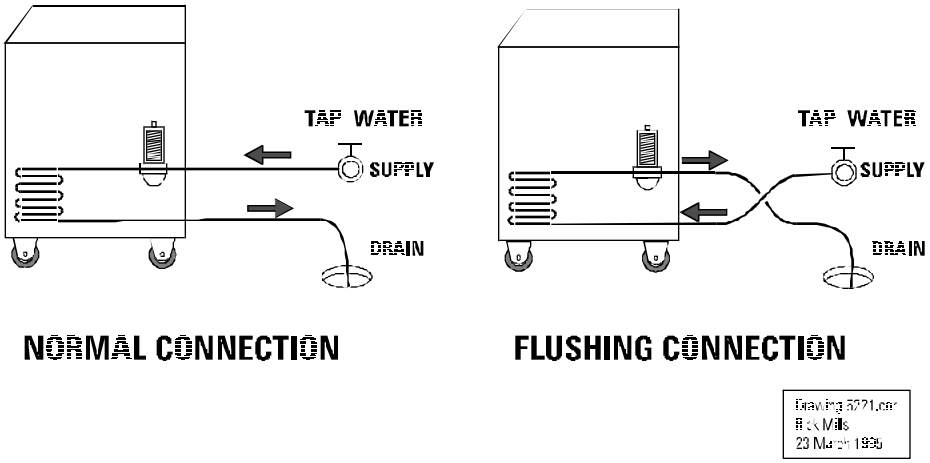
9. Open valves on cooling water supply and return lines.

Flushing using a tap water system

1. Turn HX off.

2. Close valve on cooling water supply line.

3. Disconnect hoses from cooling water supply and drain, and reverse them.



Flushing tap water system (continued)

4. Open valve on cooling water supply line.

5. Run HX normally for 10-15 minutes. The condenser flow is now reversed. This reverse flow will tend to loosen any deposits. Cooling performance may be less, and the water regulating valve may make some vibration noise.

6. Turn HX off.

7. Close valve on cooling water supply.

8. Restore hoses to original configuration.

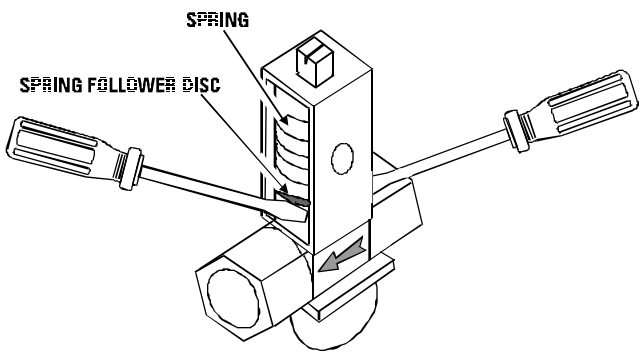
9. Open valve on cooling water supply line.

Flushing with unit turned off

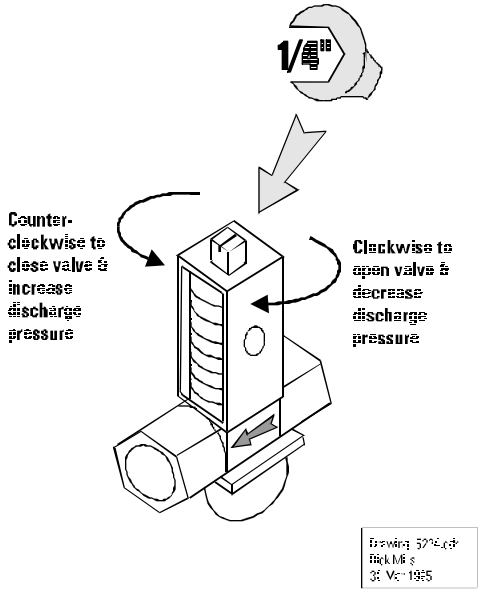
In either the closed facility or tap water system, it is possible to flush the condenser even if it not possible or convenient to turn the HX on. This method may be used, for example, if the HX is having other service or maintenance performed at the same time; or if electricity is not available.

It is necessary to manually open the regulating valve to allow flow through the condenser. There are two techniques.

A. The valve may be opened by prying up the spring follower disc using two flat-blade screwdrivers, one on each side. The valve will be open as long as the spring is compressed. This is practical for a momentary opening of the valve, as it does not disturb the adjustment.



Flushing with unit turned off (continued)



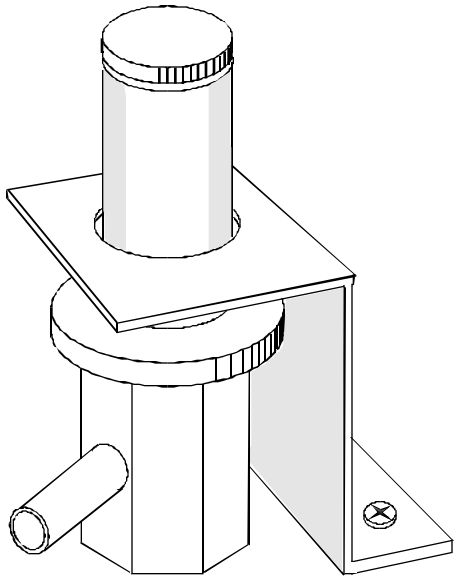
B. The second technique is to fully open the valve by turning the adjusting screw clockwise until it stops. Count how many turns are required so it may be restored later.

Commercial flushing chemicals

Commercial flushing chemicals may be used, provided the chemical is not harmful to copper. Examine and follow the container directions carefully.

HOT GAS VALVE

(also known as Automatic Discharge Relief valve)



The HX-200 thru 750 uses a base-mount type hot gas valve, mounted near the center of the base of the unit.

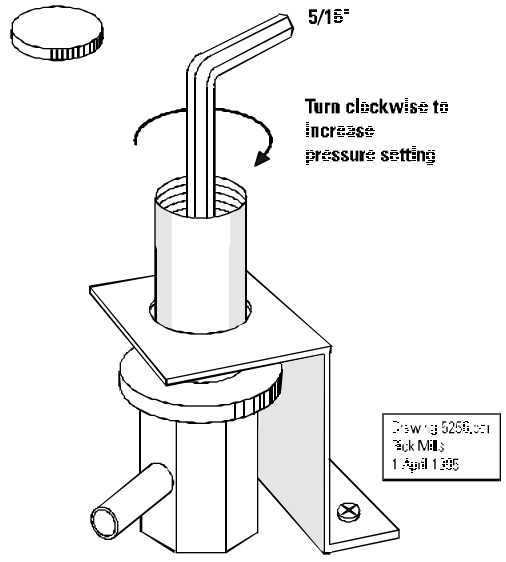
OPERATION

This valve is closed during the cool cycle. When the unit switches to heat cycle, the solenoid valve in the liquid line closes, and the resulting increase in discharge pressure opens the hot gas valve. This provides a path for refrigerant gas to enter the evaporator directly without going through a liquid phase, providing a heating effect.

SETTING

Observing the suction pressure (while the unit is running in the heat/idle cycle) will indicate the setting of the hot gas valve. The valve is set correctly when the suction gauge indicates 25 PSIG for any system using R-22 refrigerant.

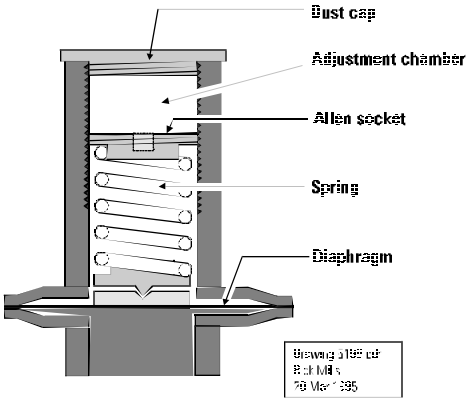
The setting is adjusted as shown in the illustrations. Turning the adjustment clockwise will increase the pressure setting on either type valve. Contact NESLAB Technical Service for setting specifications on systems using other refrigerants.



LEAK

The base mount type may develop a leak across the diaphragm. Refrigerant will escape into the adjustment chamber. The refrigerant will be trapped in the adjustment chamber (if the dust cap is in place). Over time, the adjustment chamber pressure will rise from ambient to whatever pressure is present in the refrigeration system. The pressure across the diaphragm will equalize. The diaphragm in the valve will cease to operate correctly, as it expects to have ambient air pressure on one side.

Hot gas valve (continued)



The result will be an open hot gas valve all the time. Refrigerant will flow through both heat and cool loops simultaneously. The hot gas and the liquid entering the evaporator will tend to cancel each other out. The unit will have essentially no cooling capacity at all, and the fluid temperature will tend to remain constant.

A leak can be verified as follows: Turn the unit off. Slowly unscrew the dust cap. If a leak exists, a puff of refrigerant will be observed to escape from the adjustment chamber when the cap is removed. Once the pressure is released, the valve will be able to operate normally. Start the unit and see if performance is restored. The unit can now be operated temporarily with the dust cover removed, but the leak still exists and needs repair.

Any further leak detection inside the adjustment chamber should only be done with an electronic sniffer type detector. Do not use liquid detection fluid.

RESONATION

It has been observed that certain base-mounted hot gas valves have a mechanical resonance point. If the valve is adjusted to that point, the valve will resonate with an audible whine or moaning sound whenever the unit is in the heat cycle.

If this is observed, it is recommended the setting be tweaked away from the resonance point. With the unit running in the heat cycle, turn the adjustment screw in either direction until the noise stops. Up to one complete turn in either direction is acceptable. This will not significantly change the performance of the unit.

SCHRADER VALVES

Refrigerant leaks may occur at the valve core of Schrader valves. These leaks may not be apparent due to the cover and/or any thread sealant used. NESLAB recommends leak checking all Schrader valves, especially any that have been accessed during service.

If the system is emptied of refrigerant, NESLAB recommends replacing the valve cores with new ones as a preventive measure.

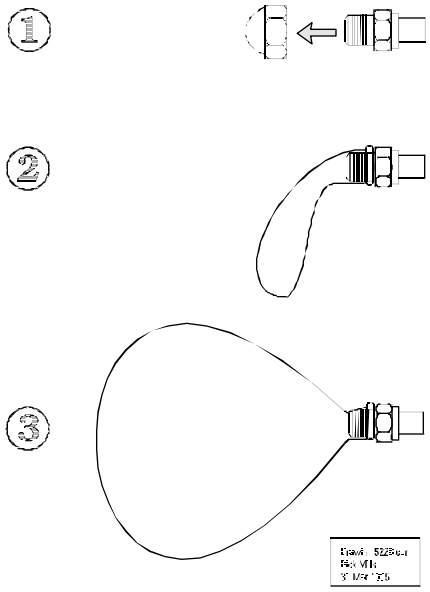
If a leak is suspected but cannot be confirmed with an electronic leak detector, NESLAB recommends using a party balloon to trap any escaping refrigerant. This will provide a visual confirmation of a leak.

BALLOON TEST

1. Remove valve cover, if installed.

2. Stretch a balloon over the Schrader valve threads.

3. A leak will inflate the balloon. Leave the balloon in place overnight if convenient.



SCHRADER VALVES (continued)

4. Replace valve core if a leak is indicated, and retest.

5. Replace valve cover.

   A. If it is the gasket type, replace with flare seal cap NESLAB part number 009121.

   B. Inspect flare surfaces on the valve and cap. They should be smooth and free of burrs.

   C. Apply one drop of the appropriate refrigeration oil to the flared surface of the cap to prevent galling. Do Not Over Oil - it will displace the sealant.

   D. Apply only one drop of sealant (Perma-Lok® LM012 recommended - NESLAB partnumber 013002) to the first thread of the valve and work it around at least half way, but no more than one complete turn.

   E. Hand tighten cap until is seats. Apply two wrenches - one on the valve body, one on the cap: and tighten ¼ turn only. **DO NOT OVERTIGHTEN!**

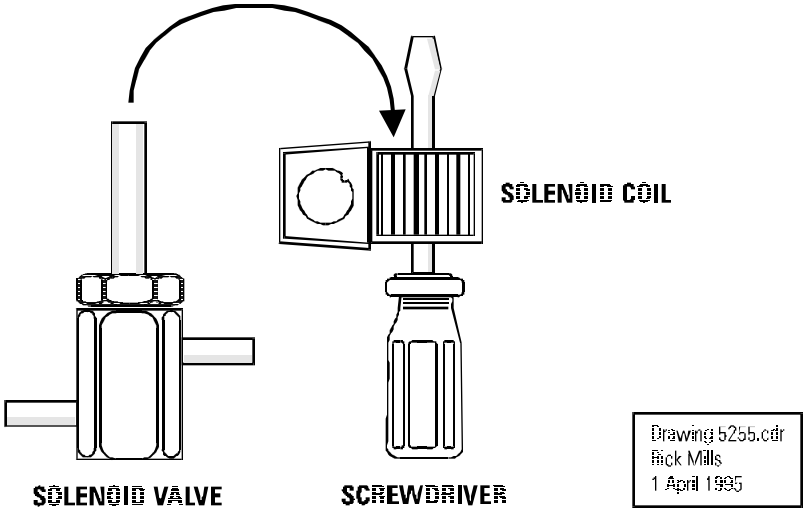
SOLENOID COIL

The solenoid coil should be energized in the cool cycle (opening the solenoid valve), and off in the heat cycle.

The coil can be tested by removing the coil from the valve and sliding the coil over a screwdriver shaft. Turn unit on and adjust setpoint up and down. You should feel the coil attract the screwdriver in the cool cycle, and release in the heat cycle.



If the coil never turns on, either the coil is open or the control voltage is missing. The coil can be tested for continuity using an Ohmmeter. Turn the unit off. Unplug the coil from the wiring harness and measure the coil resistance. It should be 750 - 850 Ohms.

Replacements are available as a coil only, or a coil assembly. The assembly includes the electrical connector. Refer to the parts list for part numbers.

If a coil is obtained locally, be sure it is type OMKC-1 and rated for 208VAC. **Do not substitute a DC coil.**

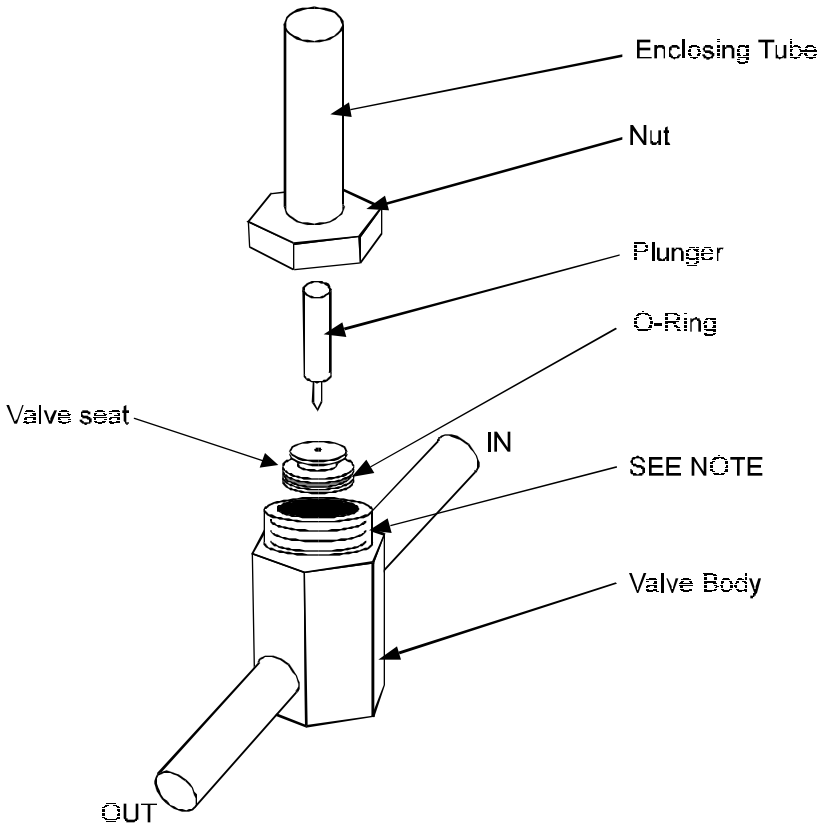
Solenoid valve rebuild

NOTE: Many times the solenoid valve can be rebuilt in place, completely avoiding any brazing and greatly reducing the time needed for repair.

Rebuild procedure:

See next page for illustration.

1. Recover refrigerant.
2. Remove coil.
3. Remove large nut from valve body.
4. Remove internal valve components.
5. Inspect interior of valve body for cleanliness and lack of burrs or wear.
6. Disassemble new valve, and transfer components to the existing valve body.
7. Install large nut onto valve body.
8. Pressurize system and leak check. As the valve is normally closed, be sure that both sides of the valve are pressurized.
9. Begin evacuation of system.
10. Install coil.
11. Charge system to specification.
12. Test system.



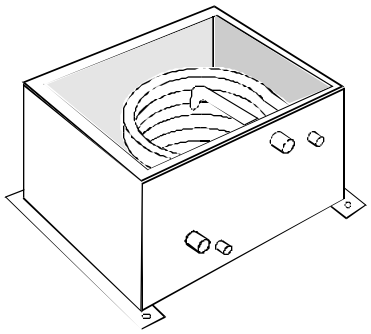
5569

Note: Apply hydraulic sealant (013002) to first two threads on valve body before tightening. Do not get sealant inside valve body!

Tank coil assembly failure

A hole developing in the evaporator of the Tank Coil Assembly can cause serious problems if not detected quickly. Once a hole occurs, refrigerant will escape into the circulating fluid. Once the refrigerant is exhausted, circulating fluid will be drawn in and contaminate the refrigeration system.

A hole in the evaporator may be recognized by a stream of (refrigerant) bubbles coming to the surface of the circulating fluid in the tank. If this is observed, it is vital to immediately shut the system down and drain the circulating fluid until it is below the level of the leak. This will prevent fluid from being drawn into the refrigeration system.



Tank Coil Assembly (TCA) repair

A hole occurring in the evaporator may be repaired, provided the hole is accessible and the capacity exists to weld stainless steel. A bead of weldment can be placed over the hole. The most practical method may be to remove the TCA as outlined in the “Tank Coil Assembly (TCA) replacement” procedure, and take the TCA to a local welding shop. Advise the welder the coil is type 304 stainless steel.

If the hole is inaccessible, or no welding capability exists, the entire TCA should be replaced.

Water regulating valve setting

The correct setting of the valve is easily determined.

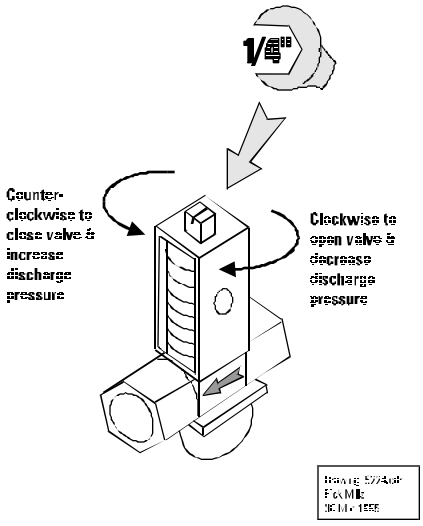
1. Supply cooling water to HX.

2. Direct the outlet hose into a bucket or drain.

3. Turn the HX on.

4. Turn the setpoint to minimum. The HX should enter the cool cycle. Observe full flow from the outlet hose. Allow it to run until all air is displaced.

5. Turn setpoint to maximum. The HX should enter the heat cycle.



6. Adjust the valve stem closed (CCW) until the flow stops.

7. Slowly open the valve stem (CW) until a small but constant trickle is exiting the outlet hose. This is the point where the valve is just beginning to crack open. This is the correct setting.

8. Turn setpoint to minimum. The HX should enter the cool cycle. Full flow should again be observed from the outlet hose.

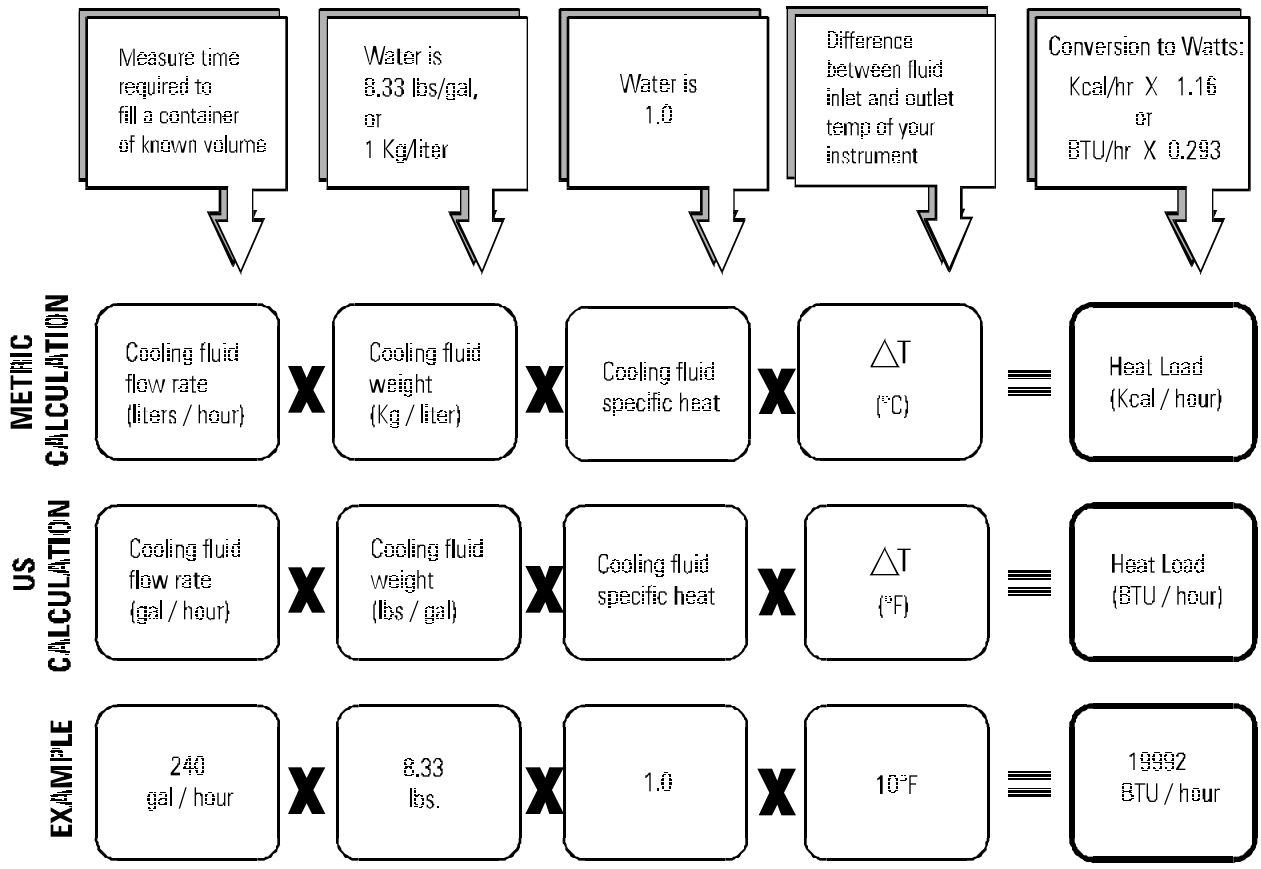
HEAT LOAD CALCULATION



CONDENSER REQUIREMENTS: AIR COOLED UNITS

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +55°F to +95°F (+13°C to +35°C). The unit will retain its full rated capacity in ambient temperatures to approximately +75°F (+24°C). Above +75°F, derate the cooling capacity 1% for every 1°F above +75°F, to a maximum ambient temperature of +95°F. The Celsius deration is 1% for every 0.5 °C above 24 °C, to a maximum ambient temperature of +35°C.

The unit must be positioned so the air intake and discharge are not impeded. Air is drawn in through the left side of the unit and discharged through the right and rear. A minimum clearance of 2 feet (0.6 meter) on these three sides is necessary for adequate ventilation. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted.

Refer to the table to determine the approximate amount of air intake required for the unit to retain its full rated capacity.

HX200: 2000 cfm (56640 lpm)

HX300: 1900 cfm (53800 lpm)

HX500: 5000 cfm (141750 lpm)

HX750: 5600 cfm (158800 lpm)

CONDENSER REQUIREMENTS: WATER COOLED UNITS

The facility cooling water supply must meet or exceed the requirements shown below for the unit to operate at its full rated capacity.

As the temperature of the cooling water supply increases, the required flow and pressure of the cooling water supply increases.

Example: On the HX-300, if the temperature of the cooling water supply is 65°F (18°C), the flow rate must be at least 4.0 gpm (15.1 lpm), with a pressure differential of at least 8 psi (55 kPa). However, if the temperature of the cooling water supply rises to 85°F (29°C), the flow rate must be at least 11.0 gpm (42 lpm), with a pressure differential of at least 25 psi (172 kPa).

A water regulating valve, located in TAP WATER line, regulates the flow rate of the cooling water supply as it enters the unit. The valve regulates the flow rate based on the heat load. Flow through the unit stops automatically when the unit is shut off.

HX 200

	55°F (13°C)	65°F (18°C)	75°F (24°C)	85°F (29°C)

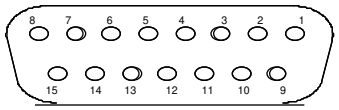
15 pin Accessory Connector (Optional)

Units with digital controllers may be modified with a 15 pin accessory connector. To enable the connector slide the LOCAL/REMOTE switch on the temperature controller to the REMOTE position. The pin out information is listed below.



15 pin D-subminiature female receptacle

Pin #	Function
1	Chassis ground.
2	No connection.
3	Span +. Indicates the maximum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6(example: +350mV = +35.0°C).
4	Span -. Indicates the minimum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +50mV = +5.0°C).
5	No connection.
6	Analog ground. The analog ground is physically separated from the power ground throughout the unit. To prevent offsets that result from ground currents, the analog and power grounds are only connected at the unit's power supply. Analog ground should only be used as a reference pin .
7	Sensor temperature (current limited through 2.7K OHM resistor). The fluid temperature, as measured by the controller's sensor located in the reservoir, can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
8	Setpoint out. The present temperature setpoint can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
9	Power Ground.
10	Heater output. Will source 3V at 6mA.
11	No connection.
12	Digital display (input only). An external voltage can be displayed on the operator panel digital display by applying the voltage to this pin. The display has a low input resistance and a full scale rating of ±1.99VDC. Input is referenced to analog ground, pin 6. The maximum voltage applied to the display should be limited to 2VDC.
13	- 5V. Power supply of -5VDC (15mA maximum).
14	+5V. Power supply of +5VDC (15mA maximum).
15	Setpoint in. The temperature setpoint can be controlled by applying a known voltage to this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +230mV = +23.0°C).

WARRANTY

Quick Start Procedures Air-Cooled Models

Installation

Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Avoid excessively dusty areas and institute a periodic cleaning schedule. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the right side of the unit and are labelled SUPPLY and RETURN. These connections are ¾ inch FPT, 1 inch FPT for units with a CP-75 or TU-9 pump. Remove the plastic protective plugs from both plumbing connections. Connect the SUPPLY fitting to the inlet of your application. Connect the RETURN fitting to the outlet of your application.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within one inch of the top. If the fluid capacity of your application and recirculation lines is significant, have extra fluid on hand.

Thermo NESLAB recommends using distilled/deionized water with a 0.05 to 0.1 megohm-cm reading. If you do not have access to distilled/deionized water we recommend using filtered tap water.

Operation

Before starting the unit, double-check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

On models HX-300 through HX-750, the unit must be connected to the power source for at least 12 hours to allow the compressor oil to heat and separated from the refrigerant.

To start the unit first connect it to main power. On units equipped with a circuit breaker, place it to the on position. The MAIN POWER LED will illuminate. Place the ON/OFF switch to the ON position. The COOL and IDLE LEDs on the front panel indicate the status of the refrigeration system. COOL is on when the unit is removing heat from the cooling fluid, IDLE is on when heat is being added to the fluid reservoir. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Temperature Adjustment

To display the temperature setpoint, while displaying the reservoir temperature press the NEXT ENTER key. To adjust the temperature setpoint use the YES/NO keys as described in this manual.

Flow Control

The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the full vertical position you receive full flow, the full horizontal position is no flow.

Periodic Maintenance

Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend making a monthly visual inspection of the condenser after initial installation. After several months, the cleaning frequency will be established.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual ins-pection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Quick Start Procedures Water-Cooled Models

Installation

Position the unit in a clean environment with easy access to facility cooling water and a drain. The facility water requirements must meet those specified in the instruction or unit performance will be reduced.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear and right side of the unit and are labelled TAP WATER, DRAIN, SUPPLY and RETURN. Remove the plastic protective plugs from all the plumbing connections. Connect the TAP WATER fitting to the facility cooling water and the DRAIN fitting to a drain. Connect the SUPPLY fitting to the inlet of your application and the RETURN fitting to the outlet of your application. On HX-75s through HX-300s, the TAP WATER and DRAIN fittings are ½ inch FPT. On HX-500s and HX-750s, these fittings are 1 inch FPT. The SUPPLY and RETURN connections are ¾ inch FPT, 1 inch FPT for units with a CP-75 or TU-9 pump.

To fill the reservoir open the access panel on the left rear corner of the case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within one inch of the top. If the fluid capacity of your application and recirculation lines is significant, have extra fluid on hand.

Thermo NESLAB recommends using distilled/deionized water with a 0.05 to 0.1 megohm-cm reading. If you do not have access to distilled/deionized water we recommend using filtered tap water.

Operation

Before starting the unit, double-check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

Ensure the facility water is turned on.

On models HX-300 through HX-750, the unit must be connected to the power source for at least 12 hours to allow the compressor oil to heat and separated from the refrigerant.

To start the unit first connect it to main power. On units equipped with a circuit breaker, place it to the on position. The MAIN POWER LED will illuminate. Place the ON/OFF switch to the ON position. The COOL and IDLE LEDs on the front panel indicate the status of the refrigeration system. COOL is on when the unit is removing heat from the cooling fluid, IDLE is on when heat is being added to the fluid reservoir. As the operating temperature approaches the setpoint, the LEDs cycle.

When the unit is shut off, wait five minutes before restarting to allow time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle and no cooling will occur.

Temperature Adjustment

To display the temperature setpoint, while displaying the reservoir temperture press the NEXT ENTER key. To adjust the temperature setpoint use the YES/NO keys as described in this manual.

Flow Control

The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the full vertical position you receive full flow, the full horizontal position is no flow.

Periodic Maintenance

Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

On units with a remote control box, the box is packed in a separate carton. Be sure to locate this separate carton; do not dispose of it by mistake.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact Thermo NESLAB for more information.

After-sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label on the rear of the case top to obtain the following information (see Section II, Description for the serial number label location):

- BOM number _____

- Serial number _____

- Software version (see page 40) _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department for assistance (see Preface, After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Do not attempt to defeat any of the interlock switches or safety features built into the unit.

Observe all warning labels.

Never remove warning label.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the fluid reservoir.

Make sure the unit is off before connecting or disconnecting the power cord or other cables.

Always turn off the unit and, if applicable, disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the fluid reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified Thermo NESLAB technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

The lightning flash with arrow symbol, within an equilateral triangle, is intended to alert the user to the presence of non-insulated "dangerous voltage" within the unit's enclosure. The voltage may be of significant magnitude to constitute a risk of electrical shock.

Section II General Information

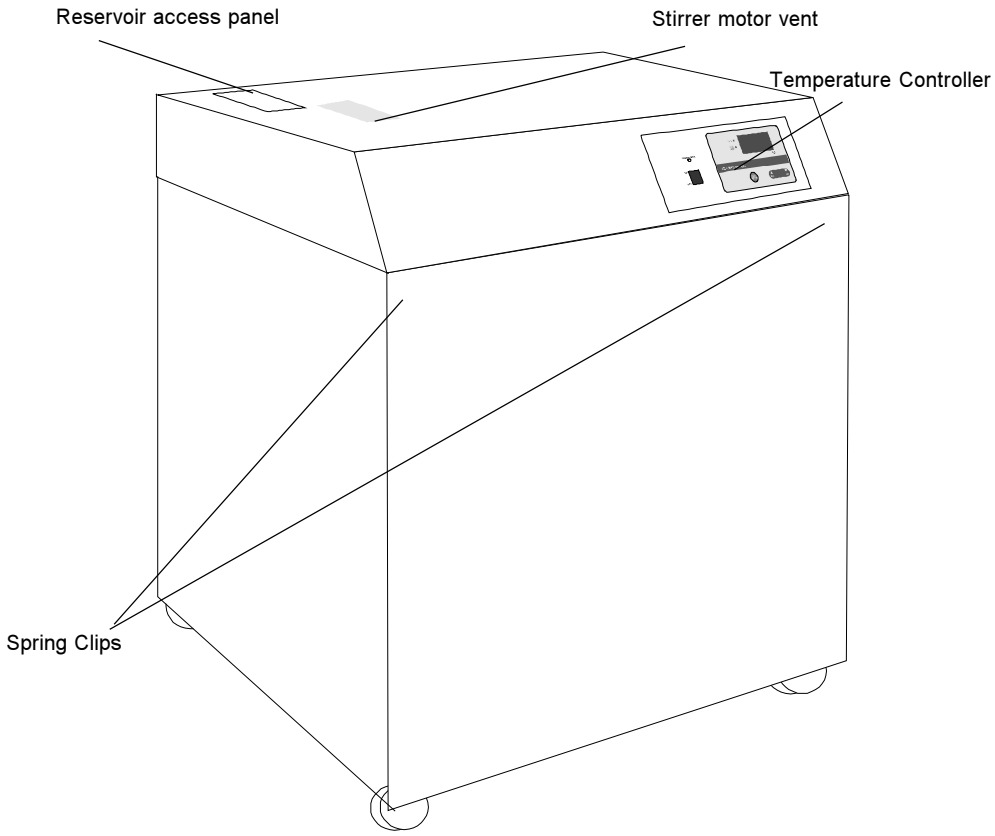
Description

The HX Series Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and volume.

The unit consists of an air-cooled or water-cooled refrigeration system, a fluid reservoir, a fluid recirculation pump, and a digital temperature controller. Optional remote temperature controllers and remote probes are also available.

HX units are available with a large number of options. This manual explains how to install, operate, and maintain a “standard” HX unit. This manual also explains some of the available options. Supplemental manuals are supplied with units equipped with options not covered in this manual.

Throughout the manual, you will be asked to consult the unit’s serial number label, or the pump identification label, or both, for specific information. Both labels are located on the rear of the case top.



Specifications

1. Modified temperature ranges from -15°C to +90°C are available.
2. Model HX-750 with a water-cooled refrigeration system has the same dimensions as the HX-500. For additional dimensions see page 44.

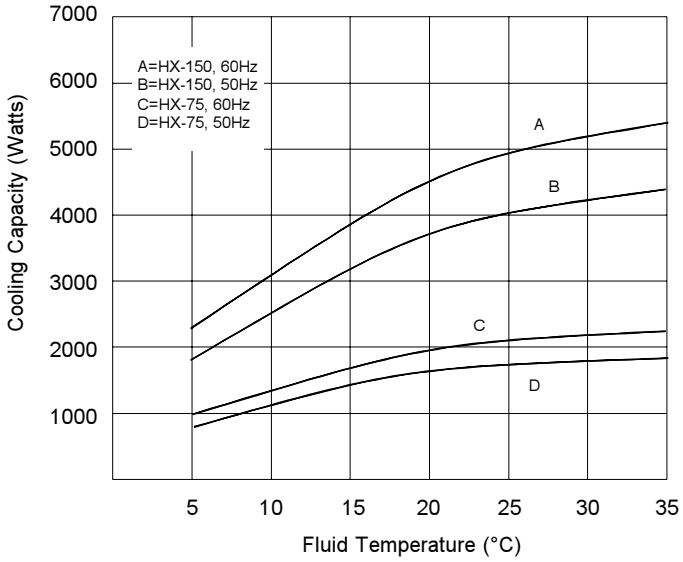
Cooling Capacity

Cooling capacity will vary depending on fluid temperature, ambient temperature, and cooling fluid.

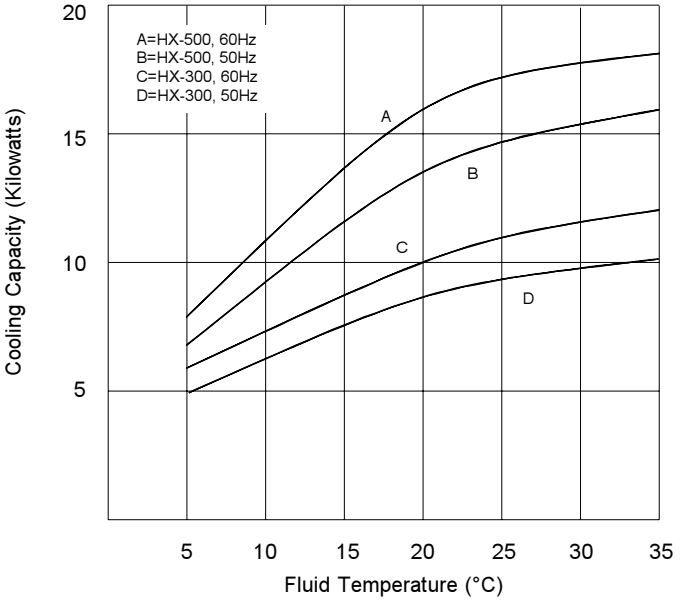
Cooling capacities were obtained under the following conditions:

1. *air-cooled unit operating at +20°C (+68°F) ambient temperature.*
2. *cooling fluid with specific heat of 1.0 was used for fluid temperatures from +5°C to +35°C.*

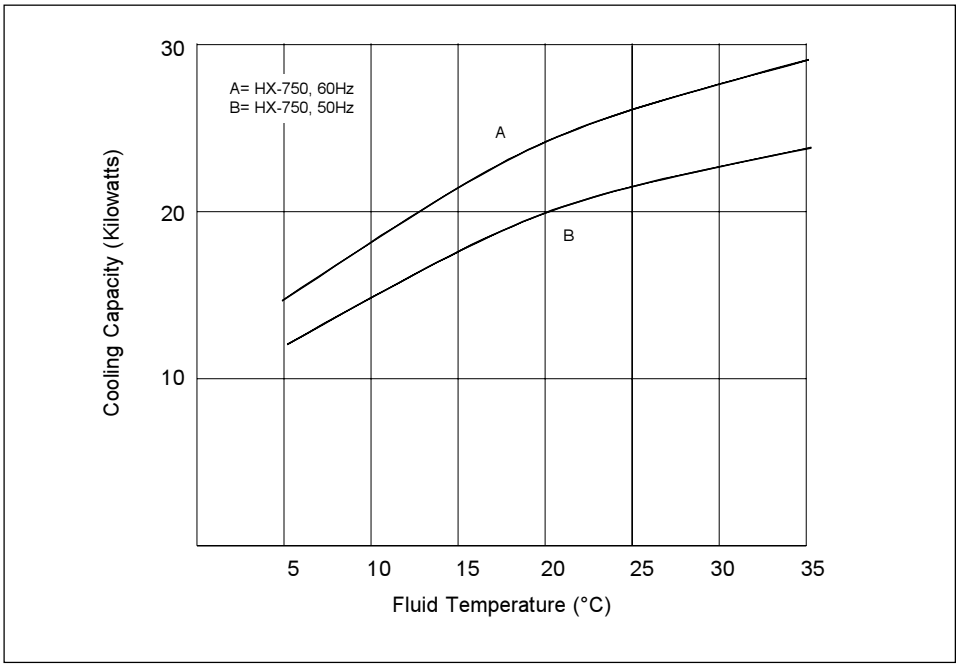
HX-75 & HX-150



HX-300 & HX-500



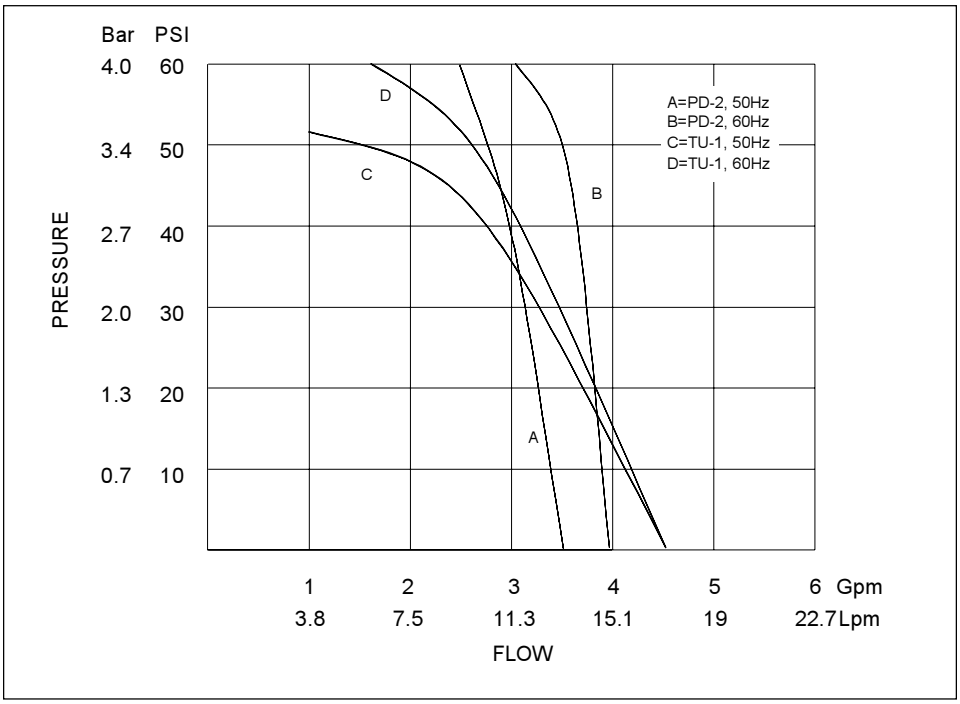
HX-750



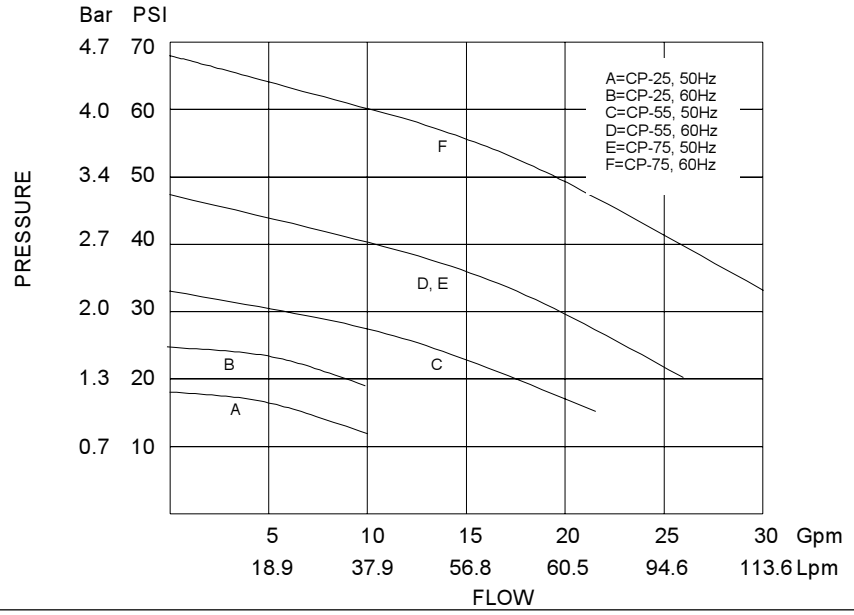
Pump Capacity

HX units are available with one of three standard pump types: positive displacement (PD), centrifugal (CP), and turbine (TU). Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit.

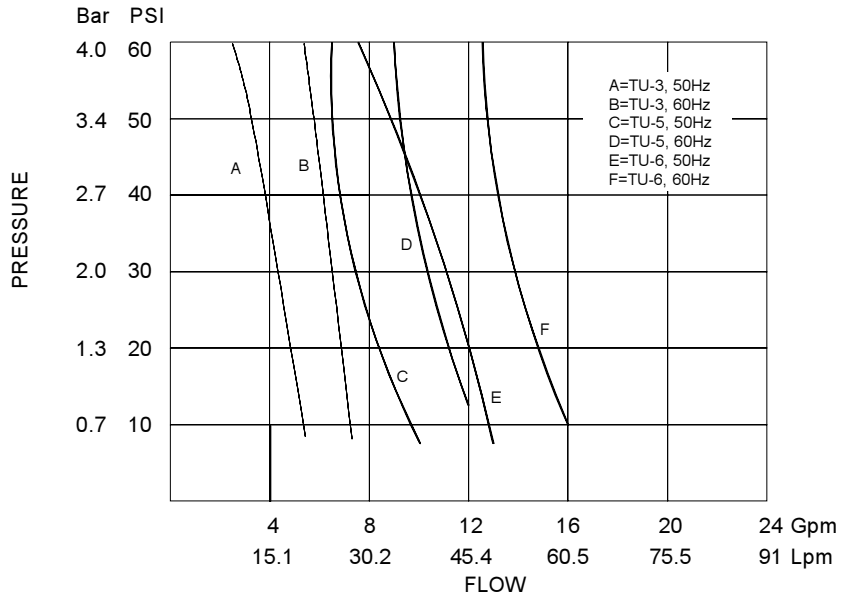
PD2 & TU1



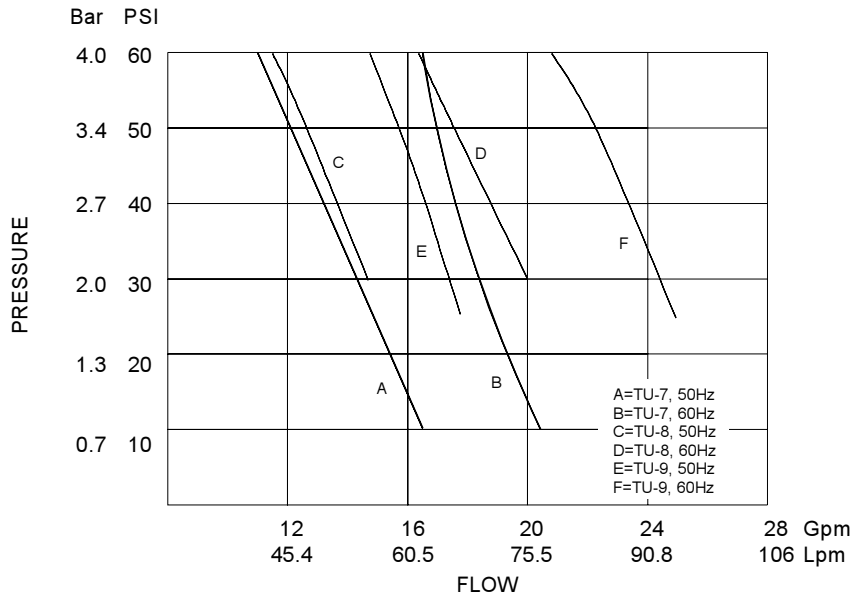
CP



TU-3, 5 & 6



TU-7, 8 & 9



Section III Installation

Site (Air-cooled Units)

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +55°F to +95°F (+13°C to +35°C).

The unit will retain its full rated capacity in ambient temperatures to approximately +75°F (+24°C). Reduce the cooling capacity 1% or every 1°F above +75°F, to a maximum ambient temperature of +95°F. In °C, reduce the cooling capacity 1% for every 0.5°C above +24°C, to a maximum ambient temperature of +35°C.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. It must be positioned so the air intake and discharge are not impeded.

On models HX-75 and HX-150, air is drawn through the left side of the unit and discharged through the right and rear. A minimum clearance of 2 feet (0.6 meter) on these three sides is necessary for adequate ventilation.

On models HX-300 through HX-750, air is drawn through the front of the unit and discharged through the side and rear panels. A minimum of 5 feet (1.5 meters) on all four sides of the unit is necessary for ventilation.

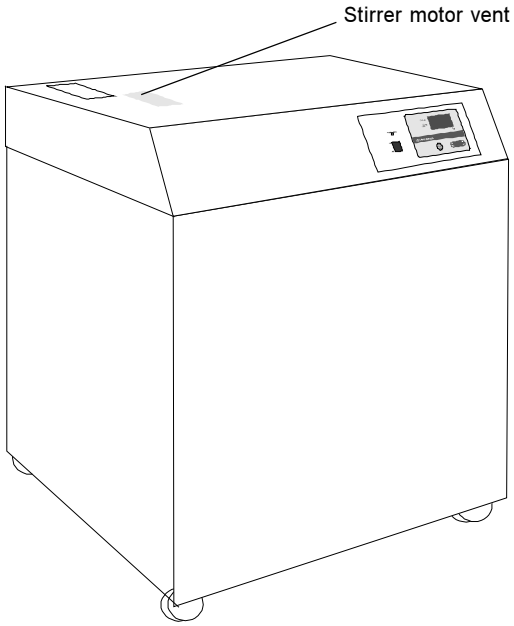
On models with a three-phase condenser fan motor, it is possible to connect the main power and have the motor turn in the wrong direction resulting in incorrect airflow over the condenser. Proper airflow is achieved by exchanging any two main power connectors so air is drawn into the fan. See page 29.

In some applications where space is at a premium, the minimum ventilation clearance can be compromised. However, consult our Sales Department before positioning the unit in a location with less minimum clearance than listed above. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Avoid excessively dusty areas and institute a periodic cleaning schedule (see Section VII, Condenser Cleaning). If the compressor is allowed to overheat the unit's High Pressure Cutout (HPC) will cycle the unit on and off until cleaning is done and proper airflow is restored. This cycling will eventually damage the unit's compressor.

On models HX-150 through HX-750 a stirrer motor is located under the case top. (Models HX-500 and HX-750 have two stirrer motors.) Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation.

NOTE: HX-75s and units with plate heat exchangers do not have stirrer motors.



Refer to the table below to determine the approximate amount of air intake required for the unit to retain its full rated capacity. If the air intake does not meet these standards, cooling capacity will be reduced.

	HX-75	HX-150	HX-300
Air Intake			
Cubic feet per minute	600	1050	1900
Liters per minute	17000	29730	53800

	HX-500	HX-750
Air Intake		
Cubic feet per minute	5000	5600
Liters per minute	141750	158800

Site (Water-cooled units)

The unit should be located in a laboratory or clean industrial environment with easy access to a facility cooling water supply and a drain.

All units are equipped with castors for easy movement. This allows the unit to be placed in a small area, as long as there is ample space for the unit to be moved for access on all four sides. A minimum access clearance of 3 feet (1 meter) on two adjacent sides is recommended.

The facility cooling water supply must meet or exceed the requirements listed in the table shown on the next page for the unit to operate at its full rated capacity. If the facility cooling water does not meet these standards, the cooling capacity will be reduced.

As the temperature of the cooling water supply increases, the required flow rate and pressure of the cooling water supply increases.

For example, with a model HX-150, if the temperature of the cooling water supply is +65°F, the flow rate must be at least 1.5 gallons per minute, with a pressure differential of at least 3.5 PSI. However, if the temperature of the cooling water supply is +85°F, the flow rate must be at least 4.0 gallons per minute, with a pressure differential of at least 10 PSI.

If the unit is being used with a building water supply, the back pressure of the drain must be less than the supply pressure.

To prevent damage to the unit's inlet and outlet valves, maximum static facility water pressure should not exceed 150 psig and available supply-to-return differential pressure must not exceed 35 psid across the rated flow range. See next page.

A water-regulating valve, located in the TAP WATER line, regulates the flow rate of the cooling water supply as it enters the unit. The valve regulates the flow rate based on the heat load. Flow through the unit stops automatically when the unit is shut off.

On models HX-150 through HX-750 a stirrer motor is located under the case top. (Models HX-500 and HX-750 have two stirrer motors.) Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation. See illustration on page 13.

NOTE: HX-75s and units with plate heat exchangers do not have stirrer motors.

	Temperature of cooling water supply

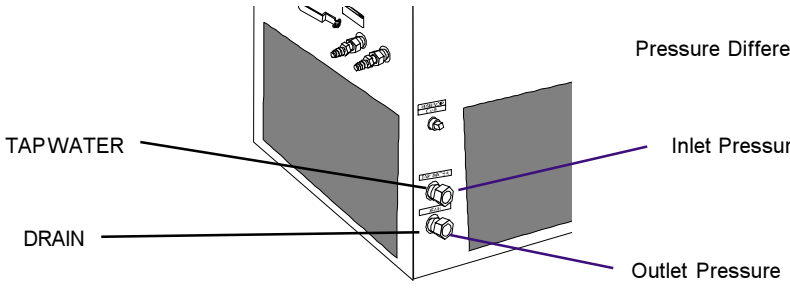
*Estimated Value
** Operating at this condition may lead to valve "chatter" under some operating conditions.

Facility Water Maximum Inlet Pressure must not exceed 150 PSIG.

Facility Water Maximum Pressure Differential must not exceed 35 PSID under any condition.



Pressure Differential = Inlet Pressure - Outlet Pressure

Electrical Requirements

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is your responsibility to assure a proper ground connection is provided.

Refer to the table below to determine the unit's electrical requirements. Verify the requirements by reviewing the ratings listed on the serial number label on the rear of the case top.

	HX-75 & HX-150		HX-300		
Volts	208-230	220-240	208-230	200-220	380-420
Hertz	60	50	60	50	50
Phase	1	1	3	3	3
Plug	NEMA L6-30P or L6-20P		NEMA L15-30P or L16-20P		

	HX-500 & HX-750	
Volts	208-230	380-420
Hertz	60	50
Phase	3	3
Plug	NA	NA

Make sure the voltage of the power source agrees with the unit's voltage and frequency rating. The unit is designed to tolerate deviations of ±10% from the rated line voltage.

Models HX-75 through HX-300 rated 24 Amps or less have an 8 foot (2.4 meter) power cord installed on the unit at the time of shipment.

HX-500s and HX-750s and some units equipped with heaters do not have a power cable. Installation of the cable is your responsibility. See page 29 for additional information.

Plumbing Requirements

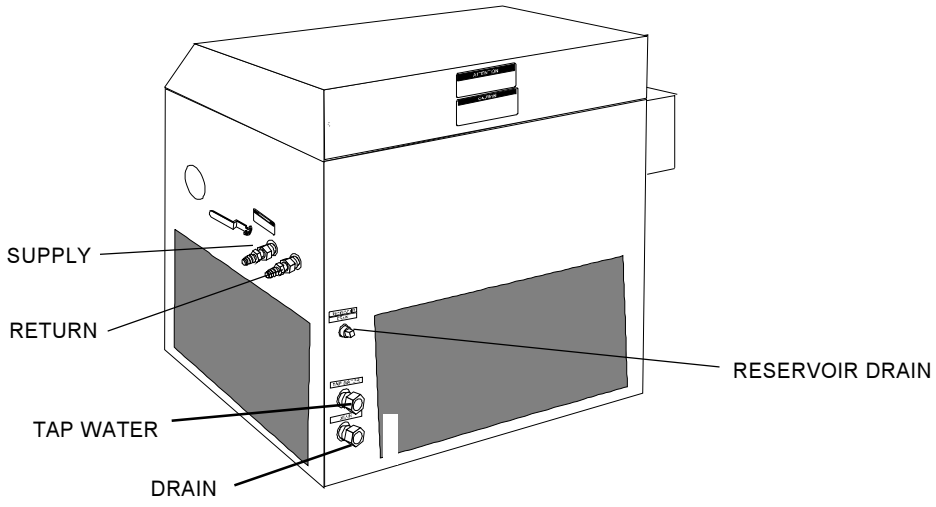
Air-cooled and water-cooled units

Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. Consult the manufacturer of the instrument for a cleaning fluid recommendation.

The plumbing fittings used to connect the HX to your application are located on the right side of the unit (labelled SUPPLY and RETURN). These connections are ¾ inch NPT, 1 inch NPT for units with CP-75 or TU-9 pumps.

Remove the protective plugs from the SUPPLY and RETURN connections. Connect the SUPPLY fitting to the inlet of your application. Connect the RETURN fitting to the outlet of your application.

The RESERVOIR DRAIN connection, located on the rear of the unit, is a ½ inch FPT fitting connected internally to the unit's fluid reservoir. This fitting is for draining the reservoir. The unit is shipped with a ½ inch MPT plug installed in this fitting. Remove the plug to drain the reservoir.



Two plumbing adapters (¾ inch MPT x 5/8 inch hose) are included with the unit. If the unit is being plumbed to the instrument being cooled using flexible tubing, install the adapters in the SUPPLY and RETURN plumbing ports. To prevent leaking, wrap the threads of the adapters with Teflon® sealing tape before installing them in the plumbing ports. The adapters will accept ½ or 5/8 inch ID flexible tubing.

Flexible tubing, if used, should be heavy wall or reinforced construction. All tubing should be rated to withstand 110 psi at the unit's highest possible operating temperature. Make sure all tubing connections are securely

clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from Thermo NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

If the unit is "hard plumbed" to the instrument being cooled or to the cooling water supply, damage can occur if the unit is bumped or jolted from its site. Provisions should be made to prevent the unit from being moved after installation. Once the unit is plumbed, secure the locking castors on the unit's base. If the unit is located in a heavy traffic area where the possibility of collision is imminent, it may be necessary to secure the unit to the site using blocks or mounting brackets.

It is important to keep the distance between the unit and your application as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, they should be made at the inlet and outlet of your application, not at the HX.

If substantial lengths of connecting tubing are required, they should be pre-filled with cooling fluid before connecting them to the unit.

Water-cooled units

The plumbing connections used to connect the water-cooled condenser in the HX to the facility cooling water supply are located at the rear of the unit (labelled TAP WATER and DRAIN). On HX-75s through HX-300s, these fittings are ½ inch FPT. On HX-500s and HX-750s, these fittings are 1 inch FPT.

Remove the plastic protective plugs from the TAP WATER and DRAIN connections. Connect the TAP WATER fitting to the facility cooling water supply. Connect the DRAIN fitting to a drain.

Fluids

Never use flammable or corrosive fluids with this unit. Do not use automotive antifreeze. Commercial antifreeze contains silicates that can damage the pump seals. Use of automotive antifreeze will void the manufacturer's warranty.

Thermo NESLAB recommends using distilled/deionized water with a 0.05 to 0.1 megohm-cm reading. See Appendix A for additional informantion.

Highly distilled/deionized water, above the 3 megohm-cm region, may become aggressive and is not recommended for use with units with wetted parts other than stainless steel. Distilled/deionized water in the 15 megohm-cm region is definitely aggressive and should not be used. Units operating in these regions should be closely monitored. See Water Quality Standards and Recommendations in this section.

If you do not have access to distilled/deionized water we recommend using filtered tap water. Thermo NESLAB cannot recommend any custom fluids, these fluids are too dependent on your particular application.

If your unit is equipped with a plate heat exchanger do not use 100% water as a recirculating fluid. Due to the physical nature of a plate heat exchanger, and its response to temperature changes, using 100% water may cause the plate heat exchanger to rupture.

Below +8°C, a non-freezing solution is required. A 50/50 mixture, by volume, of distilled/deionized water and laboratory grade ethylene glycol is suggested. The selected cooling fluid must have a viscosity of 50 centistokes or less.

Ethylene glycol (EG) is hygroscopic, it will absorb water from its environment. This can affect the freezing point and boiling point of the fluid over time. This may result in system failure.

When using EG/water top-off with EG/water. Do not top-off with plain water. Topping-off with plain water can severely effect the freezing point and boiling point of the fluid. This may result in system failure.

Do not use a Deionization (DI) filter with Inhibited EG. A DI filter will remove inhibitors from the solution rendering the fluid ineffective against corrosion protection. Also, inhibitors increase fluid conductivity.

For units with extended temperature ranges above +35°C, we recommend distilled/deionized water up to +80°C. Above +80°C, you are responsible for the fluid(s) used.

Water Quality Standards and Recommendations

	Permissible (PPM)	Desirable (PPM)
Microbiologicals		
(algae, bacteria, fungi)	0	0
Inorganic Chemicals		
Calcium	<40	0.6
Chloride	250	<25
Copper	1.3	1.0
Iron	0.3	<0.1
Lead	0.015	0
Magnesium	<12	0.1
Manganese	0.05	<0.03
Nitrates\Nitrites	10 as N	0
Potassium	<20	0.3
Silicate	25	<1.0
Sodium	<20	0.3
Sulfate	250	<50
Hardness	17	<0.05
Total Dissolved Solids	50	10
Other Parameters		
pH	6.5-8.5	7-8
Resistivity	0.01*	0.05-0.1*

* Megohm-Cm (Compensated to 25°C)

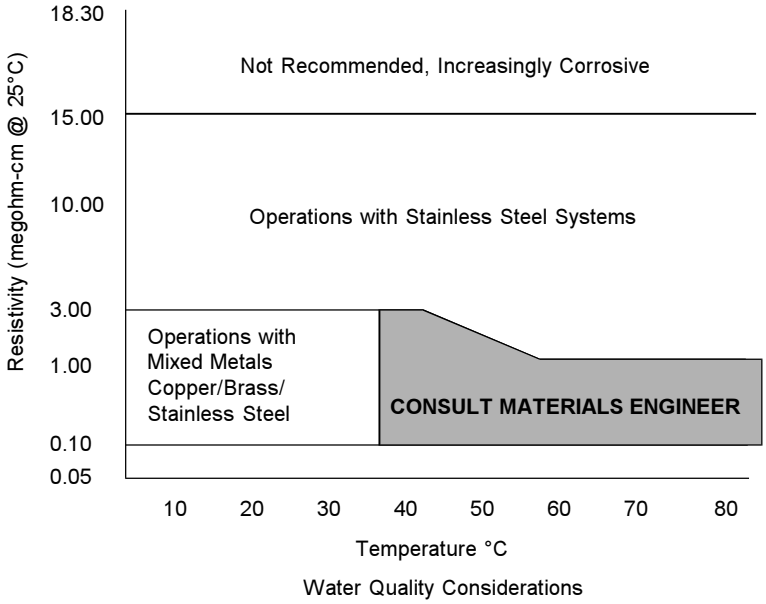
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (of NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (of NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water, as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated to 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated to 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated to 25°C).

These two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



Water Quality Considerations

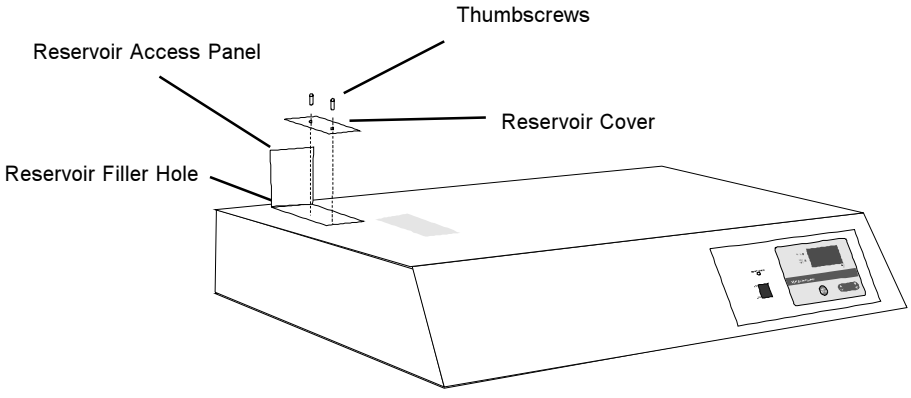
Filling Requirements

The reservoir access panel is located at the left rear corner of the case top. To open the access panel, slide the latch back (towards the rear of the unit) and lift.

The reservoir cover is located below the access panel. Loosen the thumbscrews and remove the reservoir cover. Fill the fluid reservoir with cooling fluid to within 1 inch of the top.

The fluid capacity of the instrument being cooled and the recirculation lines may be significant. To prevent the lowering of the fluid level in the reservoir below the operating level, have extra cooling fluid on hand to keep the reservoir filled to within 1 inch of the top.

When the recirculating system is full, replace the reservoir cover and the access panel.



Section IV Operation

Start Up/Shut Down

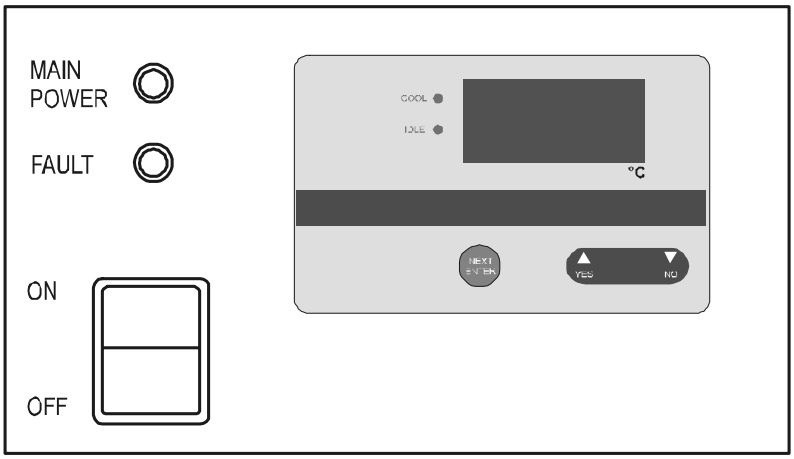
Before starting, check all electrical and plumbing connections and make sure the recirculating system (the HX, your application, and the recirculation lines) has been properly filled with cooling fluid. Also, make sure the flow control valve is properly set (see Flow Control in this section). For CE Mark units ensure the circuit breaker on the right hand side of the unit is on.

For water-cooled units — ensure that the facility water is turned on.

HX-300s through HX-750s are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

To start the unit, place the ON/OFF switch in the ON position. The pump and refrigeration system will start. The °C display will indicate the reservoir fluid temperature. After starting recheck the fluid level, a "top off" may be needed.

NOTE: For optional remote start capability see Interlock Package on page 27.



The COOL and IDLE LEDs indicate the status of the refrigeration system. COOL illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the temperature setpoint, the COOL LED will extinguish.

IDLE illuminates to indicate the refrigeration system is not removing heat from the cooling fluid because the tempetature has dropped below the setpoint. For units equipped with an optional heater package the LED also indicates the heater is on. When the reservoir temperature approaches the setpoint the LED will flash. When the temperature reaches the setpoint the LED will extinguish.

To shut the unit off, place the ON/OFF switch in the OFF position.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Digital Controller

The digital controller controls temperature using a PID (Proportional-Integral-Derivative) algorithm. It is designed with self-diagnostic features and easy to use operator interface.

NEXT ENTER

Use this key to accept and save changes.

YES, ▲
This key is used to increase numerical values.

NO, ▼
This key is used to decrease numerical values.

Setpoint

When the controller is powered it displays the reservoir fluid temperature. Press the **NEXT ENTER** key to view the setpoint. The display flashes between **SP** and the actual setpoint number. If desired, use the **YES** and **NO** keys to change the setpoint. The display flashes as soon as either key is depressed. Once the desired setpoint is displayed, press **NEXT ENTER**.

NOTE: The new value will not be used by the controller until **NEXT ENTER** is depressed and the display stops flashing. The controller will not allow you to enter a value above the maximum or below the minimum value, or any illegal value. If you try to enter an illegal value the display will revert to its original value when the last digit was entered.

If **NEXT ENTER** is not depressed within one minute, the controller will time out and the new value will not be accepted. The controller will revert to the previous value.

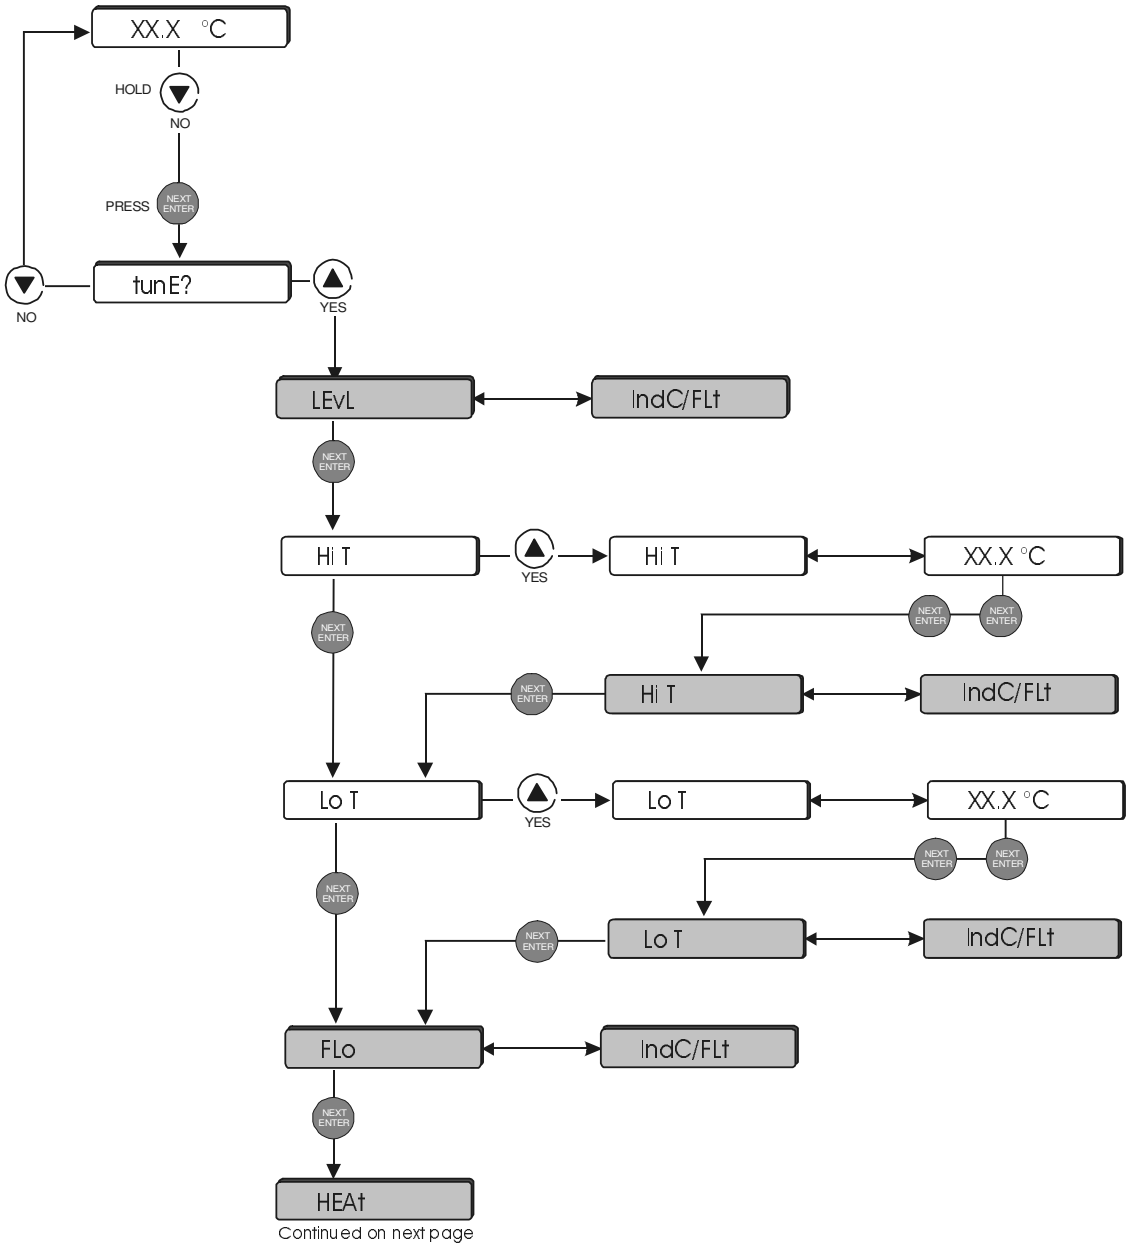
NOTE: Error codes are addressed in Section VIII, Service.

Setup Loop

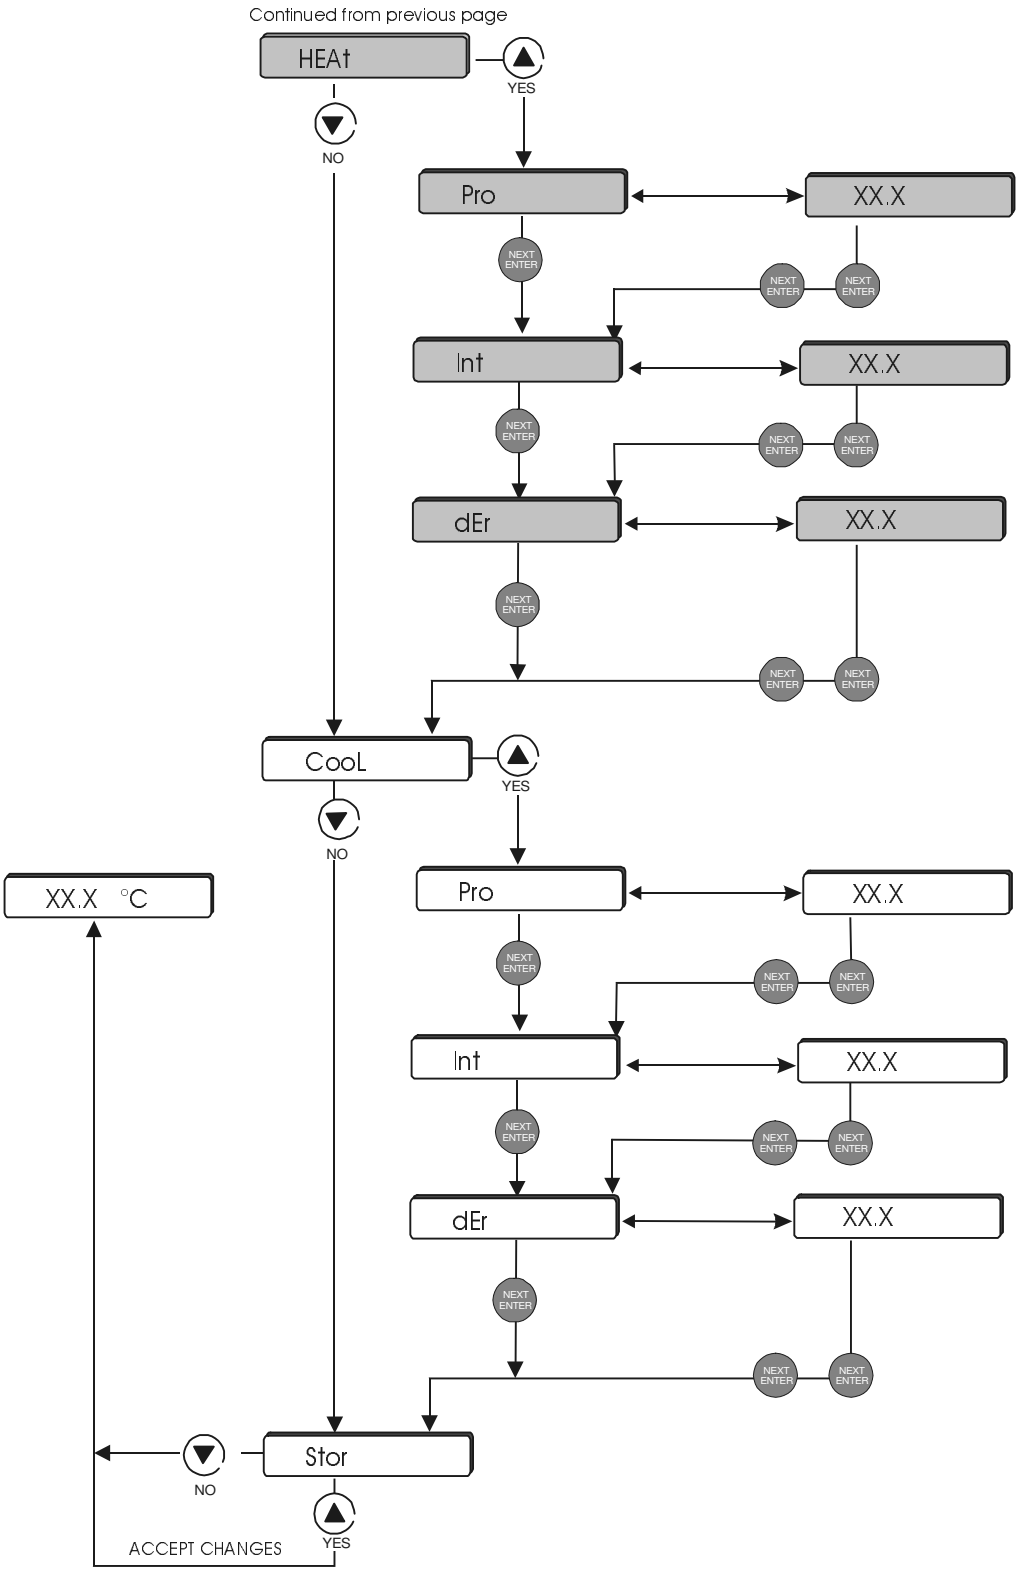
The controller is used to view the unit's configuration, and to set temperature limits and PID parameters. Thermo NESLAB recommends that only a qualified technician change the PID values. Values can be changed using the YES and NO keys. Press the NEXT key twice to accept the new value.

The highlighted displays are optional. IndC/FLT only shows on unit's having an interface package (see page 27). Select IndC to configure the unit to keep running in the event of a fault, select FLt to configure the unit to shut down. The HEAt display only shows on units having a heating package (see page 28).

NOTE: Units without the interlock package are configured to keep running.



Setup Loop (1 of 2)



Setup Loop (2 of 2)

NOTE: Should you desire to return to the temperature display and abort *all* changes, keep pressing NEXT until the display reads **Stor**. Press **NO.**

Flow Control

The RECIRCULATING FLOW CONTROL handle, located on the right-hand side of your unit, is connected to a valve that controls the flow rate of the cooling fluid to the instrument being cooled.

When the handle is in the full vertical "**+**" position, the valve is open and all possible cooling fluid is supplied to the instrument being cooled. When the handle is in the full horizontal "**-**" position, the valve is closed and no cooling fluid is supplied to the instrument being cooled. When the handle is between these two positions, the flow rate of the cooling fluid is between full flow and no flow. Use a flow meter on the SUPPLY line to adjust the desired flow rate.

The handle is normally closed for start up. Once the unit is running slowly open the valve for the desired flow rate. If the unit is equipped with an optional flow sensor, the flow control valve must be opened slightly on start up to allow fluid to circulate through the flow rate sensor. For small pumps, a flow rate of more than 0.3 gpm (1.0 lpm) is necessary. For large pumps, a 1.0 gpm (3.8 lpm) is needed.

Never rapidly move the valve wide open from the closed or slightly open position.

Pressure Gauge

The RECIRCULATING PRESSURE gauge is located next to the flow control handle. The gauge indicates the operating pressure of the system.

Section VI Optional Features

Interlock Package

Two interlock packages are available: SentryOne and SentryTwo. SentryOne allows you to set the high and low temperature limits, and low fluid level, as faults. SentryTwo is the same but adds a low flow switch to detect low flow conditions. Both packages have a female 15-pin interface connector located on the rear of the unit. The connector is also a status relay contact and a remote on/off control.

A status relay energizes when the unit is powered. When an error occurs this relay de-energizes. If the unit is IndC configured, press any controller key to clear the error message. If the unit is FLt configured, cycle the MAIN POWER ON OFF switch to clear the error message. See Setup Loop on page 24.

To use the remote start, place the ON/OFF LOCAL REMOTE switch to the REMOTE position, place the MAIN POWER ON OFF switch to ON, and then apply a 24VAC ±10% signal to the interface. The unit will stop when the MAIN POWER switch is turned OFF or when the signal is removed.

The pin out information is:

Pin 1	Chassis ground
Pin 9	Status relay contact open on error
Pin 10	Status relay contact closed on error
Pin 11	Status relay common
Pin 13	On/off relay coil
Pin 14	On/off relay coil

The status relay is rated 3 amps at 250 Volts and <=0.8 Ohms contact resistance. The on/off relay coil is rated 24VAC ± 10%.

Automatic Refill Device

The automatic refill device is designed to maintain the correct level of cooling fluid in the reservoir. The device consists of a solenoid valve and a reservoir float switch. If the cooling fluid level falls, the float switch drops, opening the solenoid valve and allows makeup fluid to fill the reservoir. The controller will display Add. Once the cooling fluid level reaches the proper level, the float switch rises and the solenoid valve closes. The controller will display the reservoir fluid temperature.

The plumbing connection for the refill device is located at the right rear corner of the unit and is labelled AUTO REFILL. This connection is a $^{3}/_{8}$ inch OD stainless steel barbed fitting.

Connect this fitting to a makeup fluid source using $^{5}/_{16}$ or $^{3}/_{8}$ inch ID flexible tubing. Make sure all tubing connections are securely clamped.

Tubing is available from Thermo NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

Heater Package

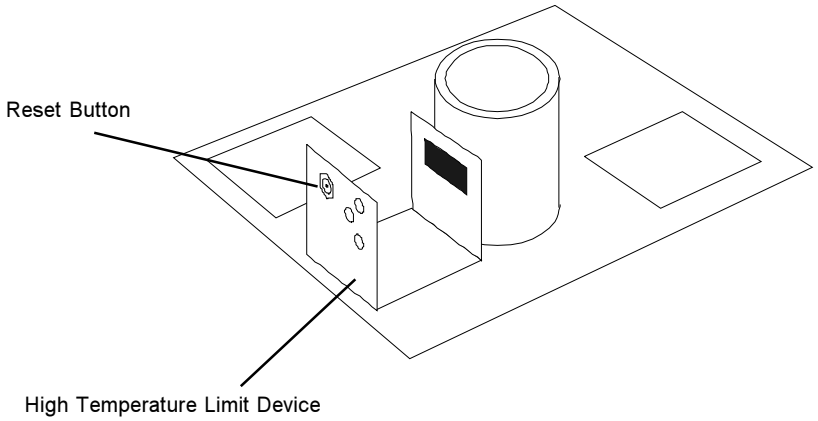
The heater package option consists of an immersion heater in the unit's fluid reservoir, a high temperature limit device, a low-level switch, and a solid state zero-crossing relay. A HTC FAULT message on the controller will light if the high temperature limit device is tripped. The low-level switch will disconnect power to the heater if the heater surface is exposed to air.

The heater surface temperature may operate several degrees higher than the reservoir fluid. The limit device is factory set to a temperature above the upper limit of the temperature controller's range.

For personal safety and equipment reliability, only a qualified technician should perform the following procedure. Contact our Service Department for assistance (see Preface, After-sale Support).

To reset a tripped temperature limit device, lift and open the case top. The case top is secured to the unit base by a hinge between the case top and the base (along the rear of the unit), and by two spring clips located at the front corners, see illustration on page 7. To gain access to the temperature limit device, disengage the spring clips with a flat bladed screw driver and lift the front of the case top and tilt it back. A support brace, located on the right side of the inner case, will stop and support the case top.

You must identify and correct the fault before restarting the unit. The protection device and the heater power connections are located on top of the fluid reservoir. The protection device has a small, black reset button. Press the reset button to restore heater operation and clear the HTC fault. Cycle the MASTER POWER ON OFF switch to clear the flashing HTC FAULT indication.



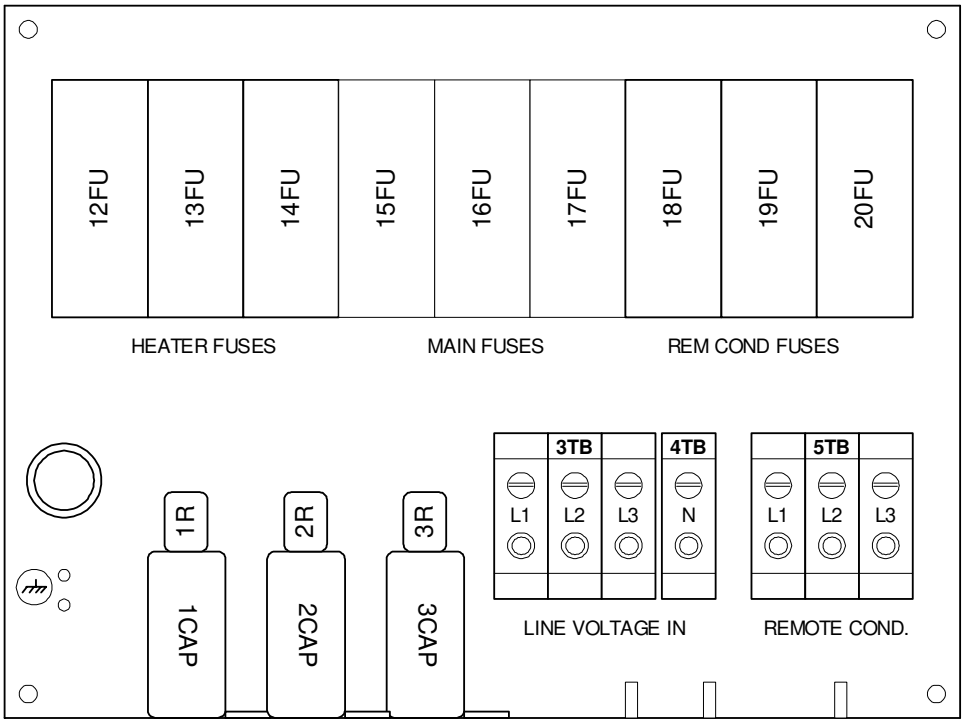
Some units equipped with heaters do not have a power cable. Installation of the cable is your responsibility. Wire the unit in conformance to local, state and federal electrical codes. Double check all wiring to make sure it is properly connected and protected from the elements.

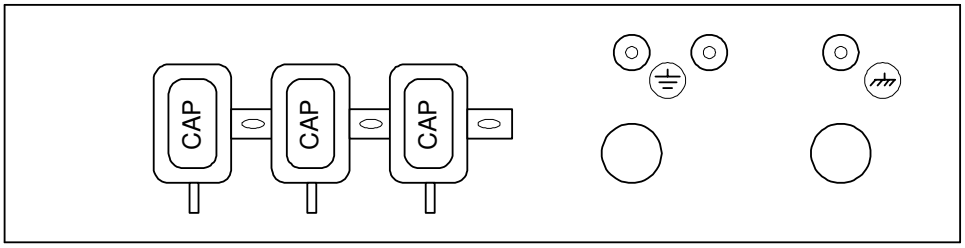
The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is your responsibility to assure a proper ground connection is provided. For personal safety and equipment reliability, only a qualified technician should perform the following procedure.

To access the connections open the pullbox.

- Insert your cable through the conduit.
- Locate 3TB and 4TB and connect your cable.
- Close the pullbox.

Note: Pullbox shown with heater and remote condenser options.

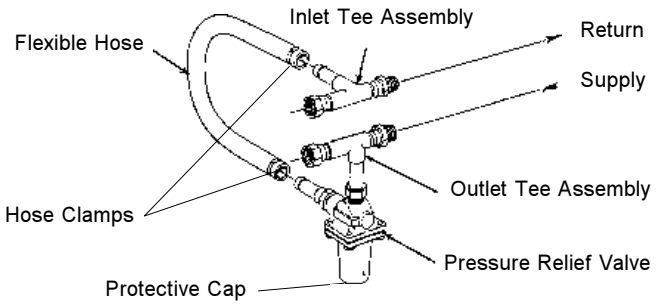




External Pressure Regulator

For applications requiring a maximum pressure less than 55 psi, an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 psi. If the pressure of the fluid leaving the unit exceeds the valve setting the relief valve will bypass the fluid back into the unit to relieve the pressure. The back pressure of the connected equipment and the flow rate of the recirculating fluid to your application determine the pressure of the system.

Connect the EPR assembly as shown below. Tighten the hose clamps tight enough to prevent leakage. Do not overtighten or the clamps will “bite” into the flexible tubing and can cause excessive wear.



Connect the outlet tee assembly to the inlet of your application. Connect the inlet tee assembly to the outlet of your application.

Adjustment

When adjusting the relief valve some leaking may occur, place a container under the valve during adjustment.

Remove the protective cap and locate a threaded fitting with a slot for a large screwdriver. Hold the threaded fitting in place and loosen the lock nut on the valve body until it is almost flush with the threaded fitting. Unscrew the threaded fitting three to four turns. (If the threaded fitting unscrews completely from the valve housing, screw it back in two to three turns.)

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and your application. Monitor the operating pressure of the HX unit. Turn the threaded fitting until the desired relief pressure is set (the EPR valve cannot be set lower than the total back pressure of your instrument, or flow will not be received).

Tighten the locknut to secure the position of the threaded fitting. Open the hose between the EPR outlet tee assembly and your application.

Nitrogen Purge

Units equipped with nitrogen purge valves are designed to accept a constant flow of dry nitrogen into the reservoir. The nitrogen blankets the cooling fluid reducing fluid evaporation.

Remove the reservoir cover by removing the screws. Fill the reservoir with fluid. Replace the reservoir cover and screws. Connect the nitrogen line to the valve on the reservoir cover.

A pressure regulator, set to 0.5 psig (0.35 kg/cm^3) or lower, should be used to prevent fluid overflow.

Particulate Filters

Particulate filter assemblies attach to the supply side of the recirculation water. Refer to the separate manual attached to the filter assembly.

The frequency for cleaning/changing the filter depends on your usage. Should the unit's performance be degraded, check the filter.

Filters are available from Thermo NESLAB, contact our Customer Service Center. Before calling refer to the serial number label on the rear of the unit to obtain the following information:

-BOM number
-Serial number

Section VII Maintenance

Service Contracts

Thermo NESLAB offers on-site Service Contracts designed to provide extended life and minimal downtime for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Condenser Cleaning (Air-cooled units only)

For proper operation, the unit needs to pull substantial amounts of air through a finned condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

Eventually the compressor will overheat and the High-Pressure Cutout (HPC) will activate and temporarily shut down the unit. The HPC will cycle the unit on and off until the condenser is cleaned. After a period of time, this cycling will damage the unit's compressor.

The frequency of cleaning depends on the operating environment. We recommend making a monthly visual inspection of the condenser after initial installation. After several months, the frequency of cleaning will be established.

For "standard" air-cooled units, periodic vacuuming of the fins on the condenser is necessary. For units with the optional remote air-cooled condenser, remove any debris from around the condenser site. If a visible accumulation of dust or dirt is found on the condenser fins, the condenser should be cleaned with a condenser cleaning solvent and rinsed with water.

Exercise caution not to damage the condenser fins or coil. Condenser fin or coil damage can result in a loss of performance and, in extreme cases, refrigeration system failure.

Hoses

The unit's internal and external hoses and clamps should be inspected and tightened on at least a semiannual basis.

Algae

To restrict the growth of algae in the fluid reservoir, we recommend the reservoir cover be kept in place and that all recirculation lines be opaque. This will eliminate the entrance of light, which is required for the growth of most common algae.

Thermo NESLAB recommends the use of Chloramine-T, 1 gram per 3.5 liters. Other algicides can be harmful to the unit's internal components. Contact Thermo NESLAB for additional information.

Section VIII Service

For personal safety and equipment reliability, only a qualified technician should perform the following procedure. Contact our Service Department for assistance (see Preface, After-sale Support).

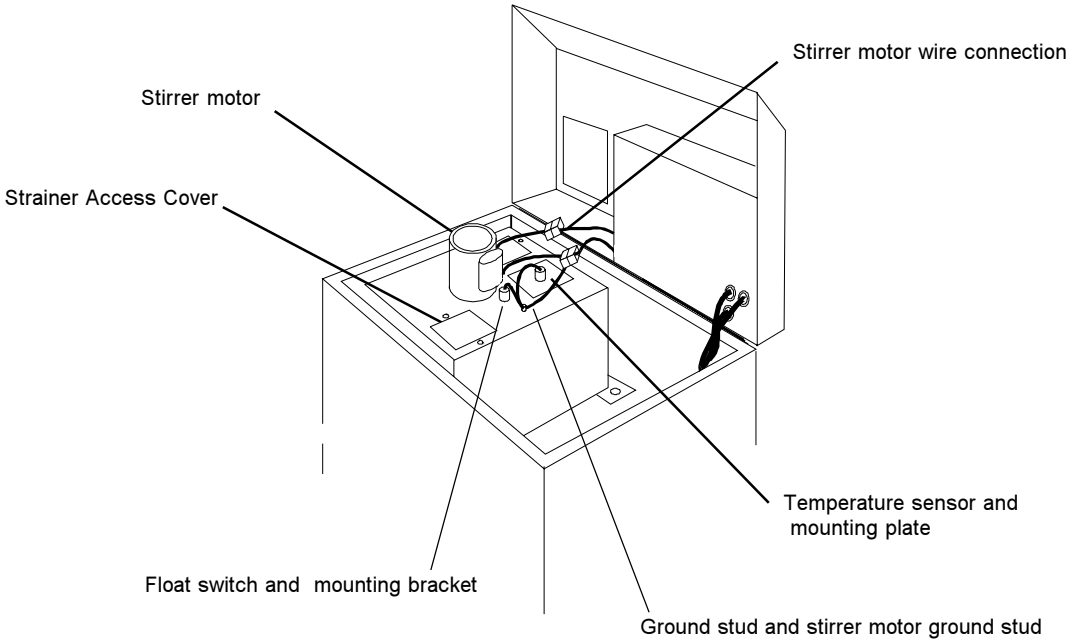
Configuration

Case Top

The unit has a hinged case top to allow service access. The case top is secured to the top of the unit base by a hinge between the case top and base (along the rear of the unit), and by two spring clips located at the front corners, see illustration on page 7. To gain access to the pump assembly or the reservoir area, disengage the spring clips with a flat bladed screw driver and lift the front of the top cover and tilt it back. A support brace, located on the right side of the inner base, will stop and support the case top. Ensure the spring clips engage when the top is lowered back into position.

Reservoir Cover

Access to the inside of the fluid reservoir is necessary to clean the reservoir. The figure below illustrates a typical layout of the components mounted on top of the reservoir cover. The component layout varies depending on the unit size. If you are unable to identify the components on your unit's reservoir cover, contact our Customer Service Department for assistance (see Preface, After-sale Support).



Disconnect the unit from its power source before removing the reservoir cover.

Locate the reservoir stirrer motor (units with plate heat exchangers and HX-75s do not have a stirrer motor; HX-500s and HX-750s have two stirrer motors). Disconnect the motor wires at the plug located on the side of the electrical box cover. Also disconnect the green ground wire that connects the ground stud on the reservoir cover to the unit's grounding bar.

Locate the float switch mounting bracket. Remove the two stainless steel screws that secure the bracket to the reservoir cover. Carefully remove the mounting bracket and place the assembly in an area adjacent to the reservoir. Make sure not to strain the connecting wires.

Locate the temperature sensor mounting plate. Remove the two stainless screws that secure the bracket to the reservoir. Carefully remove the sensor mounting plate with the sensor(s) attached and place the assembly in a protected area adjacent to the reservoir. Make sure not to damage the sensor(s) or strain the connecting wires.

Remove the stainless steel screws that secure the reservoir cover to the reservoir. Remove the cover and place it to one side in a manner that protects the stirrer motor blades from being bent.

Service Access Panels
Service access panels on your unit allow easy access to the pump and refrigeration assemblies. Panel location varies with the size and type of unit. The panels are designed to allow removal without disconnecting the HX from the instrument being cooled.

Disconnect the unit from its power source before removing any of the access panels.

Reservoir Cleaning

Periodic reservoir cleaning is necessary. We recommend making a monthly visual inspection of the reservoir after initial installation. After several months, the frequency of cleaning will be established.

Disconnect the unit from its power source and drain the reservoir before cleaning the reservoir.

Lift the top cover to access the reservoir. Remove the reservoir cover as described in Configuration. Clean the reservoir with a cleaning fluid compatible with the recirculating system and the cooling fluid.

Do not use steel wool or other abrasive materials. They can scratch the stainless steel surface and initiate rusting.

When the reservoir is clean, reassemble the cover assembly and close the case top. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Pump Strainer

Units with PD and TU pumps have pump strainers that require cleaning. If debris is drawn into the recirculating system, the pump strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

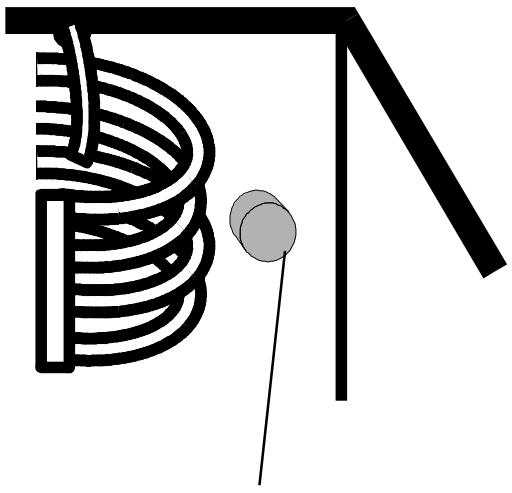
After initial installation, the strainer may become clogged with debris and scale. Clean the strainer after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Disconnect the power cord from the power source and drain the fluid reservoir before cleaning the strainer. Do not operate the unit with any strainer removed.

The wire mesh pump strainer is located in the reservoir on the pump suction line. Remove the strainer access panel located on top of the reservoir cover to access the strainer, see illustration on page 33.

Cover the strainer with a plastic bag to help catch any debris that may become dislodged during removal.

Unscrew the strainer and rinse it with water. Replace the strainer. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.



Pump Strainer

Error Codes

The controller also has the capability to display error codes. The codes are:

Display	Indication
Er00	ROM Checksum
Er01	RAM Test Fail
Er02	Keypad Test Failed
Er03	EEPROM Critical Parameters Checksum
Er04	EEPROM Noncritical Parameters Checksum
Er05 -13	Interrupt Error
Er14	Synchronous Error
Er15	Asynchronous Error
Er16	Bad Calibration Data
Er19/Lot	Low Temperature Alarm - Latching Error
Er20/Add	Level Warning (Optional) Self Clearing
Er21/Hit	High Temperature Alarm - Latching Error
Er22	High Temperature Limit (Fixed) - Latching Error
Er23	Shorted RTD2 (Optional/If Enabled) - Latching Error
Er24	Open RTD2 (Optional/If Enabled) - Latching Error
Er25	Shorted RTD1 - Latching Error
Er26	Open RTD1 - Latching Error
Er27/LoFL	Low Flow (Optional) - Latching Error
Er31/LLF	Low Level Fault
Er33	Low Temperature Limit (Fixed) - Latching Error
Er34/Htc	High temperature Cutout (Optional) - Self Clearing
Er50	Auxiliary Error (Optional) - Self Clearing
Er51/PrES	Pressure Cutout (Optional) - Self Clearing
Er52	System Error - Self Clearing

Self clearing errors clear after the error condition is corrected. Latching errors clear after the error is corrected and any key on the controller is pressed.

On units with the optional interlock package, if the unit is IndC configured, press any controller key to clear the error message. If the unit is FLt configured, cycle the MAIN POWER ON OFF switch to clear the error message.

The unit is supplied with two reservoir level switches. The first switch illuminates the Add display and activates the optional auto refill device. The second level switch is a safety interlock. It illuminates the LLF display and shuts down the optional heater package.

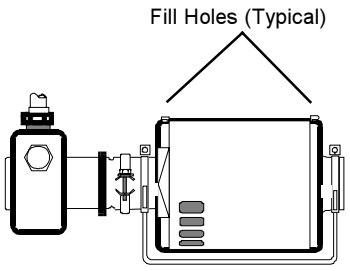
The unit may be supplied with an optional flow sensor. The error setpoint may be preset or adjustable.

Pump Motor Lubrication

Some units with PD pumps require pump motor lubrication. Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit.

Several companies manufacture motors used to drive the pump. These motors use sleeve type bearings with large oil reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil in each fill hole on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



Phase Rotation

Three-phase units with three-phase pump motors are equipped with a phase rotation interlock. Refer to the serial number label on the rear of the case top for the specific electrical requirements of your unit. The interlock, located behind the access panel under the bonnet, prevents the unit from starting if the phase rotation is wrong and causes an Er52 display on the controller. If the unit will not start, see Section IX, Checklist. If the options in the checklist are not applicable, the problem may be phase rotation.

If phase rotation is the problem, disconnect the unit from its power source, remove the pullbox cover. Reverse any two line conductors on the line side of the relay. See page 29.

Never remove the green ground wire.

Replace the pullbox cover. Reconnect the unit to its power source. If the unit will not start, contact our Customer Service Department.

High/Low Pressure Cutouts

All units, except air-cooled HX-75s, have a high pressure cutout. Should the unit's refrigeration discharge pressure become too high the high pressure cutout will activate and shut down the compressor and the controller will display Er52. High pressures can be caused by a lack of cooling water to the compressor or debris in the refrigeration lines.

Should the unit's refrigeration discharge pressure become too low the low pressure cutout will activate and shut down the compressor and the controller will display Er52. Low pressures can be caused by a leak in the refrigeration lines.

Once the cause of the problem has been identified and corrected you must manually reset the cutout. The cutout location depends on the size of your unit. On the HX-75, it is behind the right side panel, on the HX-150 it is behind the left side panel, and on the HX-300 through HX-750 it is behind the rear panel.

Locate the white reset switch on the high pressure cutout. Press in on the switch until a "click" is heard. If the reset does not "click" the cutout was not activated and the unit shut down occurred for another reason.

Pump Motor Overload Protector

Refer to the serial number label for the specific electrical requirements of your unit; specifically, identify the phase requirements of your unit.

The pump motor overload protector prevents the pump motor from exposure to excessive current. If an overload fault occurs, due, for example, to excessive pressure or flow, or excessive ambient temperature, the overload protector will shut off the unit and the controller will display Er52 until the overload is reset.

The protector is located behind the access panel under the bonnet.

Pressure Relief Valve
(PD and TU Pumps Only)

Units with a PD or TU pump have an adjustable pressure relief valve. Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit.

The pressure relief valve establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The valve does not determine the actual operating pressure; the back pressure of the connected equipment and the setting of the flow control valve determine the operating pressure of the system. If adjustment seems necessary, consult our Service Department for assistance.

Before calling, refer to the serial number label on the rear of the case top to obtain the following:

- BOM number
- Serial number

Suction Discharge Pressure Speed Check (R-22)

Air-Cooled Standard and High Temperature Units (All Pump Types)[1]

Unit	Suction (psi)	Discharge (psi)	Speed Check (°C/Minute)
HX-75	77 - 84	225 - 250	1.5 - 1.7
HX-150	70 - 73	240 - 270	2.0 - 2.5
HX-300	84 - 105	270 - 305	2.4 - 2.7
HX-500	80 - 90	215 - 235	2.0 - 2.4
HX-750	65 - 75	185 - 215	

Water-Cooled Standard and High Temperature Units (All Pump Types)[2]

Unit	Suction(psi)	Discharge(psi)
HX-75	72	170
HX-150	65	175
HX-300	73 - 78	180
HX-500	75 - 82	150
HX-750	50 - 60	180

1. 27°C unit temperature, water in reservoir, access panel removed.
2. 25°C unit temperature, water in reservoir.

NOTE: Refrigerant R-22. For low-temperature units please call Thermo NESLAB.

Section IX Troubleshooting

Displaying Software Version

To display the software version ensure the controller is displaying the reservoir fluid temperature. Depress and hold NO for at least 10 seconds. For example, 0507 displays software version digits to **left** of decimal. Note, the two leading zeros do not display. Press NEXT ENTER. 48 displays software version digits to **right** of decimal. Press NEXT ENTER. 1 displays software version revision letter (as its equivalent number - display cannot show letters. A=1, B=2, etc.) Press NEXT ENTER 0000 displays checksum - this can be disregarded. Press NEXT ENTER to return to reservoir fluid temperature.

Checklist

Unit will not start or cycles on and off

HX-300s through HX-750s are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

For CE Mark units, check the circuit breaker setting on the bonnet.

For units equipped with an optional EMO button, check its position.

For units equipped with an optional REMOTE LOCAL switch, check its position.

Check for a error message. Depress the NEXT ENTER button.

On air-cooled units, ensure the condenser fins are clean and that proper airflow is not restricted.

On water-cooled units, ensure the facility water is on and make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection. Check the High Pressure Cutout, it may need to be reset (see Section VIII, High/Low Pressure Cutouts).

Check power source for correct voltage output. Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit. Power source must be specified voltage, ±10%.
Check house circuit breaker.

On three phase units with three phase pump motors, the phase rotation may be reversed (see Section VIII, Phase Rotation).

Unit will not circulate fluid
Check the tubing, strainer, and any optional filters/cartridges between the unit and your application for obstructions or for cleaning/replacement.

Units with PD and TU type pumps may require pump strainer cleaning. Refer to the pump identification label on the rear of the case top to identify the specific pump in your unit. For instructions on cleaning the pump strainer (see Section VIII, Pump Strainer).

On units with CP type pumps, if the back pressure of the instrument being cooled is greater than the maximum pressure of the pump, adequate flow may not be obtained. Check for obstructions in the tubing.

Inadequate temperature control
Check/adjust the setpoint.

Make sure the installation of the unit is in compliance with the conditions described in Section III.

Make sure the heat load of the instrument being cooled is not greater than the cooling capacity of the unit.

When the unit is shut off, wait approximately five minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

The controller circuit board may be defective.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface). Before calling, please obtain the following information:

BOM number
Serial number
Voltage of unit
Voltage of power source
Temperature of facility water
Software version

Dimension H	2½	2½	2 3/8	2¼	2¼
Dimension I	25 7/8	28½	32½	36 1/8	36
Dimension J	48½	54	64 7/8	73½	86¼
Crate Dimensions (H x W x D)	46x30x27	49x33x29	55x40x33	61x54x36	74x54x36

* Air-cooled units. Water-cooled units are the same size as the HX-500 units.

1. Dimensions are given in inches, ±1/8 inch.
2. Model HX-750 with a water-cooled condenser has the same dimensions as an HX-500.
3. Dimension A is the distance from the floor to the center of the SUPPLY and RETURN connections.
4. Dimension B is the distance from the floor to the center of the DRAIN connection.
5. Dimension C is the distance from the floor to the center of the tap water outlet connection.
6. Dimension D is the distance from the center of the SUPPLY connection to the rear of the unit case.
7 Dimension E is the distance between the SUPPLY and RETURN connections
8. Dimension F is the distance between the center of the TAP WATER connections (upper inlet and lower outlet).
9. Dimension G is the distance from the edge of the unit case to the center of the three plumbing connections.
10. Dimension H is the distance from the floor to the bottom of the case, height of the castors (not shown).
11. Dimension I is the depth of the unit with the case top open (not shown).
12. Dimension J is the height of the unit with the case top open (not shown).

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. Thermo NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Thermo NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

Air-Cooled HX Series Quick Reference Operating Procedures

Installation
Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Avoid excessively dusty areas and institute a periodic cleaning schedule. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +24°C.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled SUPPLY and RETURN. These connections are ¾ inch FPT. Remove the plastic protective plugs from both plumbing connections. Connect the SUPPLY fitting to the inlet of your application. Connect the RETURN fitting to the outlet of your application.

To fill the reservoir open the hinged access panel on the left case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within to a level just below the perforated hand guard. If the fluid capacity of your application and recirculation lines are significant, have extra fluid on hand.

Tap water is the recommended fluid for operation from +8°C to +35°C. Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Operation
Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

The unit must be connected to the power source for at least 12 hours to allow the oil to be heated and separated from the refrigerant

To start the unit, place the Power On/Off switch to the On position. The Cool and Idle LEDs on the front panel indicate the status of the refrigeration system. Cool is on when the unit is removing heat from the cooling fluid, Heat is on when the unit is in the hot gas bypass mode. As the operating temperature approaches the setpoint, the LEDs cycle.

Temperature Adjustment
To display the temperature setpoint, press and hold the Setpoint Read button. To adjust the temperature setpoint, press and hold the Setpoint read button and turn the Adjust knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the Setpoint Read button. The display will now indicate the temperature of the fluid in the reservoir.

Flow Control
The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the “+” position you receive full flow, the “-” position is no flow.

Periodic Maintenance
Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Water-Cooled HX Series Quick Reference Operating Procedures

Installation
Position the unit in a clean environment with easy access to facility cooling water and a drain. The facility water requirements must meet those specified in the instruction or unit performance will be derated.

Ensure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled TAP WATER, DRAIN, SUPPLY and RETURN. Remove the plastic protective plugs from all the plumbing connections. Connect the TAP WATER fitting to the facility cooling water and the DRAIN fitting to a drain. Connect the SUPPLY fitting to the inlet of your application and the RETURN fitting to the outlet of your application.

To fill the reservoir open the hinged access panel on the left case top and remove the reservoir cover by unscrewing the thumbscrews. Fill the reservoir to within to a level just below the perforated hand guard. If the fluid capacity of your application and recirculation lines are significant, have extra fluid on hand.

Tap water is the recommended fluid for operation from +8°C to +35°C. Below +8°C, a non-freezing fluid must be used. A mixture of tap water and laboratory grade ethylene glycol is suggested.

Operation
Before starting the unit, double check all electrical and plumbing connections. Make sure the circulating system has been filled with cooling fluid.

Ensure the facility water is turned on.

The unit must be connected to the power source for at least 12 hours to allow the oil to be heated and separated from the refrigerant

To start the unit, place the Power On/Off to the On position. The Cool and Idle LEDs on the front panel indicate the status of the refrigeration system. Cool is on when the unit is removing heat from the cooling fluid, Heat is on when the unit is in the hot gas bypass mode. As the operating temperature approaches the setpoint, the LEDs cycle.

Temperature Adjustment
To display the temperature setpoint, press and hold the Setpoint Read button. To adjust the temperature setpoint, press and hold the Setpoint read button and turn the Adjust knob until the desired temperature setpoint is indicated on the digital display. Once the setpoint is adjusted, release the Setpoint Read button. The display will now indicate the temperature of the fluid in the reservoir.

Flow Control
The RECIRCULATING FLOW CONTROL handle controls the flow rate to your application. In the “+” position you receive full flow, the “-” position is no flow.

Periodic Maintenance
Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. When operating at low temperatures, the concentration of water in the cooling fluid will increase over time, leading to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a visual inspection of the condenser be made monthly after initial installation. After several months, the cleaning frequency will be established.

Units with PD and TU pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged. The strainer must be cleaned after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Before cleaning the strainer, disconnect the power cord from the power source and drain the reservoir.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 1000-4-2:1995
	IEC 1000-4-3:1994
	IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition.

On units with a remote control box, the box is packed in a separate carton. Be sure to locate this separate carton; do not dispose of it by mistake.

If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

The unit has a warranty against defective parts and workmanship for one full year from date of shipment. Refer to the last page of this manual for complete warranty details.

After-sale Support

NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit or the information in this manual, contact our Sales Department. If your unit fails to operate properly or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, please refer to the serial number label on the rear of the case top to obtain the following information (see Section II, Description for the serial number label location):

- BOM number _____

- Serial number _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department for assistance (see Preface, After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Do not attempt to defeat any of the interlock switches or safety features built into the unit.

Observe all warning labels.

Never remove warning label.

Never operate damaged or leaking equipment.

Never operate the unit without cooling fluid in the fluid reservoir.

Make sure the unit is off before connecting or disconnecting the power cord or other cables.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Always empty the fluid reservoir before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified NESLAB technician.

In addition to the safety warnings listed above, warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle with text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

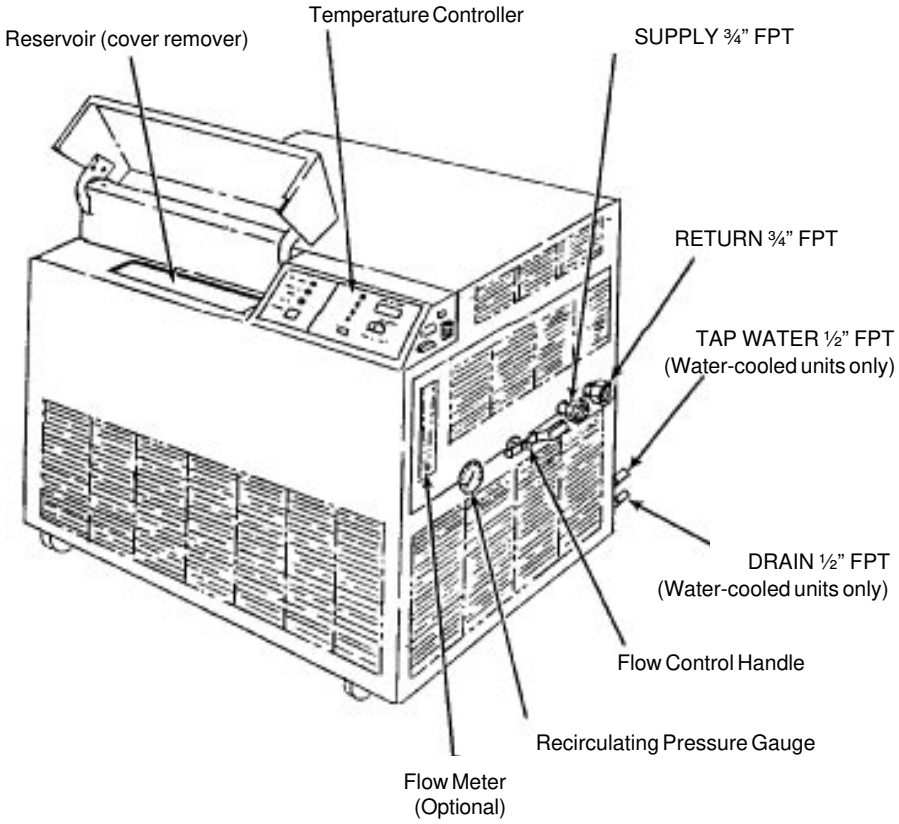
Section II General Information

Description

The HX Series Recirculating Chiller is designed to provide a continuous flow of cooling fluid at a constant temperature and volume. Each unit is listed by Underwriters Laboratories Inc., Standard for Commercial Refrigeration and Freezers, to comply with UL-471.

The unit consists of an air-cooled or water-cooled refrigeration system, a stainless steel fluid reservoir, a fluid recirculation pump, and a digital temperature controller.

Throughout the manual, you will be asked to consult the unit's serial number label, or the pump identification label, or both, for specific information. Both labels are located on the electrical enclosure door.



Specifications

	HX-200	HX-300
Temperature Range	+5°C to +35°C	
Temperature Stability	±0.1°C	
Cooling Capacity		
Watts	6200 @ 20°C	10000 @ 20°C
BTU/Hr	21140 @ 20°C	30690 @ 20°C
Pumping Capacity[1]		
Unit Dimensions (H x W x D)		
Inches	45⅝ x 33¾ x 24¼	
Centimeters	115.9 x 85.7 x 61.6	
Reservoir Volume		
Gallons	15.0	
Liters	56.8	
Shipping Weight		
Pounds	450	525
Kilograms	204	238

1. Refer to the pump identification label on the electrical enclosure door.

Section III Installation

Site (Air-cooled Units)

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +50°F to +104°F (+10°C to +40°C).

The unit will retain its full rated capacity in ambient temperatures to approximately +75°F (+24°C). Above +75°F, derate the cooling capacity 1% for every 1°F above +75°F, to a maximum ambient temperature of +95°F. In degrees Celsius, derate the cooling capacity 1% for every 0.5°C above +24°C, to a maximum ambient temperature of +35°C.

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. It must be positioned so the air intake and discharge are not impeded. Air is drawn through the front of the unit and discharged through the side and rear panels. A minimum of 5 feet (1.5 meters) on all four sides of the unit is necessary for ventilation.

In some applications where space is at a premium, the minimum ventilation clearance can be compromised. However, consult our Sales Department before positioning the unit in a location with less minimum clearance than listed above. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section VI, Condenser Cleaning).

A reservoir fluid stirrer motor is located under the case top. Heat generated by the stirrer motor is discharged through vents in the case top. Do not block the vents. A minimum clearance of 2 inches (5 centimeters) is necessary for adequate ventilation.

Site (Water-cooled units)

The unit should be located in a laboratory or clean industrial environment with easy access to a facility cooling water supply and a drain.

All units are equipped with castors for easy movement. This allows the unit to be placed in a small area, as long as there is ample space for the unit to be moved for access on all four sides. A minimum access clearance of 3 feet (1 meter) on two adjacent sides is recommended.

The facility cooling water supply must meet or exceed the requirements listed in the table below for the unit to operate at its full rated capacity. If the facility cooling water does not meet these standards, the cooling capacity will be derated.

As the temperature of the cooling water supply increases, the required flow rate and pressure of the cooling water supply increases. For example, if the temperature of the cooling water supply is +65°F, the flow rate for an HX-200 must be at least 2.5 gallons per minute, with a pressure differential of at least 6.0 PSI. However, if the temperature of the cooling water supply is +85°F, the flow rate must be at least 6.0 gallons per minute, with a pressure differential of at least 18.0 PSI.

If the unit is being used with a building water supply, the back pressure of the drain must be less than the supply pressure.

A water regulating valve, located in the TAP WATER line, regulates the flow rate of the cooling water supply as it enters the unit. The valve regulates the flow rate based on the heat load. Flow through the unit stops automatically when the unit is shut off.

	Temperature of cooling water supply		
	+65°F (+18°C)	**+75°F (+24°C)**	**+85°F (+29°C)**
HX-200			
Flow Rate			
Gallons per minute	2.5	3.5	6.0
Liters per minute	9.5	13.2	22.7
Pressure Drop			
PSI	6.0	7.0	18.0
Bar	0.41	0.48	1.24
HX-300			
Flow Rate			
Gallons per minute	4.0	6.5	11.0
Liters per minute	15.1	24.6	41.6
Pressure Drop			
PSI	8.0	13.5	25.0
Bar	0.55	0.93	1.72

Electrical Requirements

The unit construction provides extra protection against the risk of electric shock by grounding appropriate metal parts. It is the user's responsibility to assure a proper ground connection is provided.

Verify electrical requirements by reviewing the ratings listed on the nameplate on the electrical enclosure. Ensure the voltage of the power source agrees with the unit's voltage and frequency rating. The unit is designed to tolerate deviations of ±10% from the rated line voltage.

Install the unit in conformance with National Electric Code, UL, and all other local, state and federal electrical codes. Check all wiring to ensure it is both properly connected and protected from the elements.

Units are equipped with a compressor crankcase heater. The crankcase heater warms the oil in the compressor and prevents refrigerant from mixing with the oil. Before start up, the unit must be connected to its power source for at least 12 hours. This allows time for the oil to be heated and separate from the refrigerant.

NOTE: Whenever power is applied, the unit's Main Power indicator will be illuminated.

Plumbing Requirements

Air-cooled and water-cooled units

Before installing the unit to an instrument that previously used tap water as a cooling fluid, flush the instrument several times to remove any rust or scale that has built up. Consult the manufacturer of the instrument for a cleaning fluid recommendation.

The plumbing fittings used to connect the HX to the instrument being cooled are located on the right side of the unit (labelled SUPPLY and RETURN). These connections are ¾ inch FPT.

Remove the protective plugs from the SUPPLY and RETURN connections. Connect the SUPPLY fitting to the inlet of the instrument being cooled. Connect the RETURN fitting to the outlet of the instrument being cooled.

The RESERVOIR DRAIN connection, located on the rear of the unit, is a ½ inch FPT fitting connected internally to the unit's fluid reservoir. This fitting is for draining the reservoir. The unit is shipped with a ½ inch MPT plug installed in this fitting. Remove the plug to drain the reservoir.

Two plumbing adapters (¾ inch MPT x ⅝ inch hose) are included with the unit. If the unit is being plumbed to the instrument being cooled using flexible tubing, install the adapters in the SUPPLY and RETURN plumbing ports. To prevent leaking, wrap the threads of the adapters with Teflon® sealing tape before installing them in the plumbing ports. The adapters will accept ½ or ⅝ inch ID flexible tubing.

If the unit is "hard plumbed" to the instrument being cooled or to the cooling water supply, damage can occur if the unit is bumped or jolted from its site. Provisions should be made to prevent the unit from being moved after installation. Once the unit is plumbed, secure the locking castors on the unit's base. If the unit is located in a heavy traffic area where the possibility of collision is imminent, it may be necessary to secure the unit to the site using blocks or mounting brackets.

Flexible tubing, if used, should be heavy wall or reinforced construction. All tubing should be rated to withstand 110 psi at +35°C. Make sure all tubing connections are securely clamped. Avoid running tubing near radiators, hot water pipes, etc. If substantial lengths of tubing are necessary, insulation may be required to prevent loss of cooling capacity.

Tubing and insulation are available from NESLAB. Contact our Sales Department for more information (see Preface, After-sale Support).

It is important to keep the distance between the unit and the instrument being cooled as short as possible, and to use the largest diameter tubing practical. Tubing should be straight and without bends. If diameter reductions must be made, they should be made at the inlet and outlet of the instrument being cooled, not at the HX.

If substantial lengths of connecting tubing are required, they should be pre-filled with cooling fluid before connecting them to the unit.

Water-cooled units

The plumbing connections used to connect the water-cooled condenser in the HX to the facility cooling water supply are located at the rear of the unit (labelled TAP WATER and DRAIN). These fittings are ½ inch FPT.

Remove the plastic protective plugs from the TAP WATER and DRAIN connections. Connect the TAP WATER fitting to the facility cooling water supply. Connect the DRAIN fitting to a drain.

Fluids

The selected cooling fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Never use flammable or corrosive fluids with this unit. Distilled and deionized water may be aggressive and cause material corrosion. Please contact NESLAB before subjecting this unit to prolonged exposure to distilled or deionized water.

Tap water is the recommended fluid for operation from +8°C to +35°C.

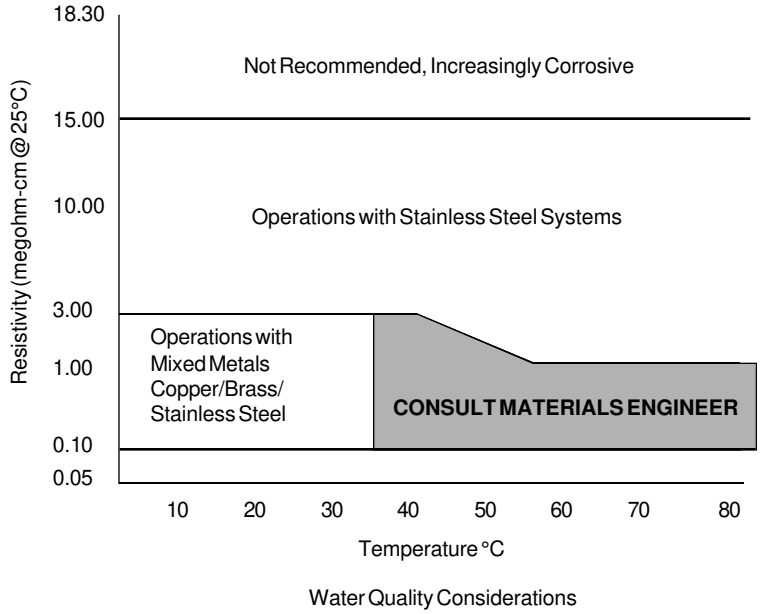
Below +8°C, a non-freezing solution is required. A 50/50 mixture, by volume, of water and laboratory grade ethylene glycol is suggested.

Do not use automobile anti-freeze. Commercial anti-freeze contains silicates that can damage the pump seals. Use of automobile anti-freeze will void the manufacturer's warranty.

Water Quality Recommendations

Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

As an example, raw water in the United States averages 171 ppm (as NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm



Water Quality Considerations

(as NaCl). Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water as the total ionized solids level may be too high. Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated at 25°C) by using a purification system. The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.

Filling Requirements

Before filling, ensure the unit's reservoir drain plug is properly installed.

The reservoir cover is located under the hinged access panel at the left of the case top, see illustration on page 6. Open the panel, loosen the two thumbscrews and remove the reservoir cover.

Fill the fluid reservoir with cooling fluid to a level just below the perforated hand guard at the top of the reservoir.

The fluid capacity of the instrument being cooled and the recirculation lines may be significant. To prevent the lowering of the fluid level in the reservoir below the operating level, have extra cooling fluid on hand to keep the reservoir filled to just below the hand guard.

When the recirculating system is full, replace the reservoir cover and close the access panel.

Section IV Temperature Controllers

Temperature Controllers

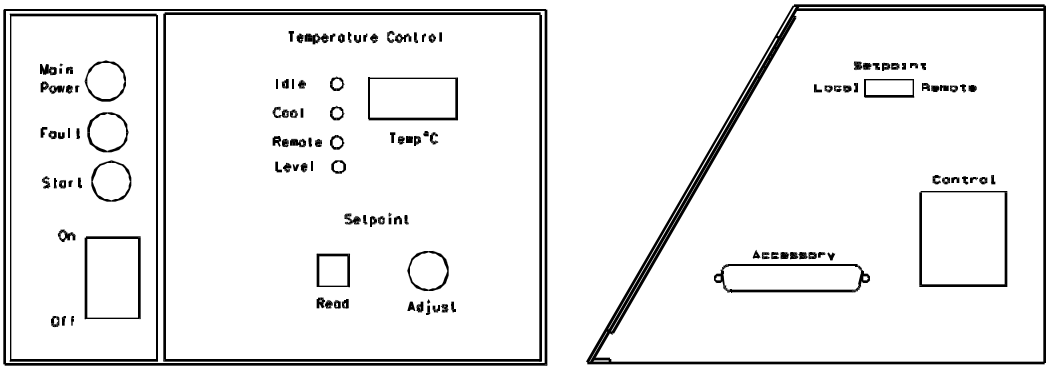
Three options are available, DL, DL+I (Interlocks), and DL+A (Alarm). Refrigeration control, start up and temperature adjustment work the same way with all three options

Refrigeration Control

The refrigeration compressor runs continuously while a hot gas bypass system, designed to eliminate compressor cycling and premature wear, is used to maintain constant temperature.

The Cool and Idle indicators, located on the control panel, indicate the status of the refrigeration system. The Idle indicator is lit when the unit is in the hot gas bypass mode. The Cool indicator is lit when the refrigeration system is removing heat from the cooling fluid. As the fluid temperature approaches the temperature setpoint, the indicators cycle on and off to indicate the duty cycle of the system. The unit can be in the Cool or the Idle mode, but never both at the same time. A balance between Cool and Idle is needed to control temperature.

All units are equipped with high and low refrigeration pressure switches. Should either pressure switch activate, the unit will shut down. After the cause of the fault is identified and corrected, the switch will have to be manually reset before you can restart the unit.



DL/DL+I Temperature Controller

Start Up

Before starting the unit, double check all electrical and plumbing connections and make sure the recirculating system (the HX, the instrument being cooled, and the tubing that connects them) has been properly filled with cooling fluid. Ensure the flow control valve is not fully closed (see Section V, Flow Control).

NOTE: For water-cooled units ensure the facility water is turned on.

The Main Power indicator on the controller illuminates only to indicate the unit's main power circuit is energized.

To start the unit, place the Power On/Off switch to the On position and then depress the Start switch. The pump and refrigeration will start and the Temp°C display will indicate the temperature of the reservoir fluid. To shut the unit off, place the Power On/Off switch to the Off position.

Temperature Adjustment

To display the temperature setpoint, press and hold the Setpoint Read button. To adjust the temperature setpoint, press and hold the Setpoint Read button and turn the Adjust dial until the desired temperature setpoint is indicated on the Temp°C LED display. Once the setpoint is adjusted, release the Setpoint Read button. The Temp°C LED display will indicate the reservoir fluid temperature.

Inadvertent movement of the Adjust dial will result in a change in the setpoint. The change will not be immediately reflected on the Temp°C LED display unless the Setpoint Read button is pressed. The display will eventually change as the unit responds to the new setpoint.

Level Indicator

The Level indicator on the DL and DL+I options is connected to a float switch in the reservoir. The indicator warns the user of a low cooling fluid level in the reservoir. A low fluid level condition occurs when the cooling fluid in the reservoir drops below the operating level. In addition to the indication the alarm, if installed, will sound. The indicator/alarm serves only as a warning. The unit will not shut down as a result of a low fluid level condition. The optional alarm can be muted using the Mute/Alarm toggle switch located inside the main electrical enclosure, see page 21.

DL Option

The Fault indicator illuminates when the compressor contactor is off. The cause of the fault must be found and corrected before restarting the unit.

DL+I Option

The Digital with Interlock temperature controller is a Digital temperature controller with up to four monitoring options: low temperature, high temperature, low fluid level, and low flow. The controller can be built with any combination of these four monitors. If an interlock detects a fault the Fault indicator illuminates and the alarm, if installed, will sound. The alarm can be muted using the Mute/Alarm toggle switch located inside the main electrical enclosure, see page 21.

Fault Response

Units are configured to shut off in the event that a fault. The relay contacts connected to the controller receptacle will open and the Fault indicator will light. The cause of the fault must be identified and corrected before the unit can be restarted.

You can allow the unit to operate if a fault occurs. This option is set by positioning the Bypass/Normal toggle switch in the main electrical enclosure to Bypass, see page 21 for additional information.

Temperature Interlocks

The optional high and low temperature interlocks are connected to sensors that monitor the temperature of the cooling fluid as it exits the reservoir. The monitors protect the system from exposure to excessively hot or cold cooling fluid. A temperature fault occurs when the fluid temperature exceeds the set temperature limit.

The temperature monitors are located in the main electrical enclosure. To adjust either temperature monitor, turn the appropriate calibrated dial to the desired temperature limit.

Low Fluid Level Interlock

The low fluid level interlock is connected to a float switch in the reservoir. A fault will occur if the reservoir cooling fluid level drops below the operating level.

Low Flow Interlock

The low flow monitor is connected to a flow switch in the RETURN line. A low flow fault occurs when the flow rate of the returning cooling fluid drops below 0.3 gallons per minute (1.0 liters per minute).

When starting a unit, the Start switch must be held depressed until the flow switch “closes” (approximately 5 seconds). If time is not allowed for the flow switch to close, the unit will stop when the Start switch is released.

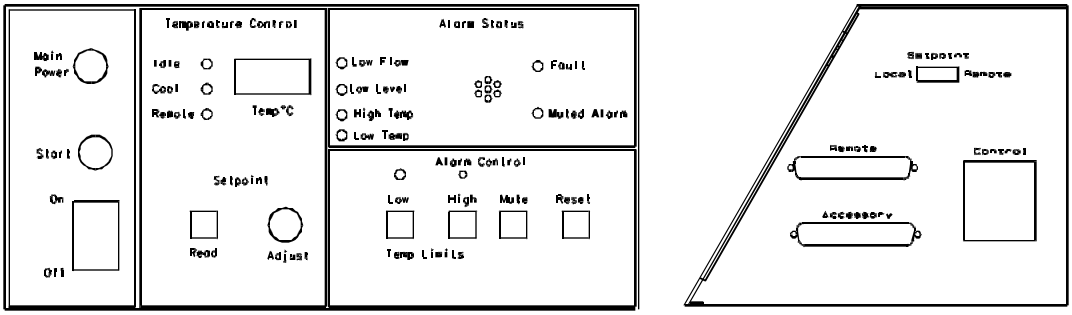
Interlock Relay Contacts

A set of 15A, 125V contacts are connected to a receptacle on the right side of the controller. This is not a power inlet or outlet. The receptacle is isolated from the circuitry. Its ground pin is connected to the chassis. The Normally Open and Normally Closed contacts are provided for customer use. The contacts will transfer when a fault condition occurs.

DL+A Option

Description

This option features an alarm function as well as additional monitoring capabilities. The monitoring feature will indicate which input caused a fault to be detected. This feature will aid you in troubleshooting your system. Additionally, the temperature display can be remotely monitored using the remote “D” connector on the right side of theremperature controller.



Alarm Control

Alarm Control adjusts the high and low temperature limits of the alarm, activates/deactivates the audible portion of the alarm., and resets the alarm.

To display the high or low temperature limit, press the corresponding button. When the button is pressed, the limit is indicated on the Temp°C display.

To adjust either temperature limit, press the corresponding button and turn the slotted potentiometer located directly above the button (a small screw-driver is required). Limits are adjustable from -45°C to +100°C. The high and low values must be at least 4°C apart for the unit to operate.

The alarm will sound when a limit is exceeded.

The Mute button on the Alarm Control panel alternately activates and mutes the audible alarm as indicated by the Muted Alarm indicator. When the alarm is muted, it will remain muted until the Mute button is depressed again, or until the Reset button on the Alarm Control panel is depressed.

The alarm annunciator can be disabled by moving a shorting plug on the alarm circuit board. When disabled, the Muted Alarm indicator will be illuminated at all times. See the Shorting Plug Positions section on page 30 for additional information.

The alarm does not automatically reset after a fault condition is corrected; you must manually reset the alarm using the Reset switch on the Alarm Control panel.

Alarm Status

The Alarm Status section indicates the status of the fault monitors. Four amber indicators display the status of the Low Level, High Temperature, Low Temperature, and Low Flow fault monitors. In the event of a fault, the cause of the fault must be identified and corrected before the unit can be restarted.

The FAULT TIME DELAY potentiometer (P4) allows adjustment of a preset time delay period following an initial “out of limits” condition. The potentiometer is on the alarm circuit board located behind the Temperature Control panel. The time delay can be set from 20 to 120 seconds. (See Potentiometer Adjustment on page 32 for additional information.)

If the red Fault indicator and any amber indicator are both on steady, a monitor has detected the indicated as outside limits. A fault will be declared only if the preset time limit is exceeded on the Fault Time Delay.

If a fault does occur, the red Fault indicator and the amber indicator will both start to flash. In addition the alarm, if enabled, will sound.

If the red Fault light extinguishes but the amber indicator continues to flash, the limit was exceeded but cleared itself prior to the preset time delay. (This advisory feature can also be defeated by repositioning a shoring plug located behind the controller panel, see Shorting Plug Positions on page 30 for additional information.)

Any subsequent operations occurring as a result of the fault will cause the appropriate indicator to illuminate in a steady state condition, i.e. a low flow causing a high temp. The indicator which caused the fault will continue to flash.

Monitoring Capabilities

The Low Level indicator is connected to a float switch in the reservoir. If a low cooling fluid level condition is detected, the Low Level indicator will light. If the condition is not corrected within 30 seconds the Fault indicator turns on and the audible alarm, if enabled, will sound. The unit will shut down and a set of relay contacts will open (the status of the relay contacts can be monitored using pins 14 and 15 of the Remote connector receptacle on the controller’s side panel, see Remote Connector on pages 27 and 28 for additional information.

The Low level indicator can be disabled by moving a shorting plug on the alarm circuit board. When disabled, the Muted Alarm indicator will be illuminated at all times. See the Shorting Plug Positions section on page 30 for additional information.

The Low Flow indicator is connected to a flow switch in the RETURN line. A low flow fault occurs when the flow rate of the returning cooling fluid drops below 0.3 gallons per minute (1.0 liters per minute). If a low flow condition is detected, the Low Flow indicator will light. If the condition is not corrected within several seconds a Fault occurs and the audible alarm, if enabled, will sound. The unit will shut down and the relay contacts will open.

This feature can also be disabled by moving a shorting plug on the alarm circuit board. When disabled, the Muted Alarm indicator will be illuminated at all times. See the Shorting Plug Positions section on page 30 for additional information.

The High/Low Temp indicators are connected to sensors that monitor the temperature of the cooling fluid as it exits the reservoir. The monitors protect the system from exposure to excessively hot or cold cooling fluid. The limits are set using the potentiometers on the temperature controller panel. If either limit is exceeded the applicable indicator will flash and the alarm, if enabled, will sound. In the event of a high or low temperature fault the unit will shut down and the relay contacts will open.

Main Electrical Enclosure

The Main Electrical Enclosure is located behind a hinged access panel located on the rear of the unit.

Disconnect the unit from its power source before opening the Main Electrical Enclosure.

PUMP O/L

The PUMP O/L indicator illuminates when the pump motor has shut down due to an overload condition. Manually reset the fault condition before restarting the unit. Reset the fault by depressing the grey reset switch on the 1MOL overload relay.

REMOTE/LOCAL

The REMOTE/LOCAL toggle switch allows you to select the source for starting and stopping the unit. When the switch is in the REMOTE position, control is derived from the input connected to the Control receptacle on the right side of the temperature controller. The Remote indicator on the temperature controller will illuminate. In the LOCAL position, the unit's Start switch is in control.

When the LOCAL/REMOTE switch is set to REMOTE, the controller's On/Off switch must be in the On position for the unit to operate. An external switch is necessary to complete the circuit and start the unit.

If the controller's On/Off switch is in the Off position and the toggle switch is in REMOTE, then external switches cannot start the unit. This allows an operator or service person to override the external controls and shut down the unit.

BYPASS/NORMAL

The BYPASS/NORMAL toggle switch determines the unit's response after a power loss. In the BYPASS position, the unit will start when power is restored. In the NORMAL position the unit will have to be manually restarted using the Start switch. On units with the DL+I option this switch is also used to bypass the interlocks so the unit will not shut down if a fault occurs.

RUN/OFF

The RUN/OFF toggle switch impacts the operation of the unit's pump. When the switch is in the RUN position, the pump will continue to operate regardless of the status of the compressor. In the OFF position, the pump will stop when the compressor is not operating.

MUTED/ALARM

The MUTED/ALARM switch is only on the DL and DL+I option. It is used to mute the optional alarm.

Section V Operation

Flow Control

The RECIRCULATING FLOW CONTROL handle, located on the right-hand side of your unit, is connected to a valve that controls the flow rate of the cooling fluid to the instrument being cooled.

When the handle is in the “+” position, the valve is open and all possible cooling fluid is supplied to the instrument being cooled. When the handle is in the “-” position, the valve is closed and no cooling fluid is supplied to the instrument being cooled. When the handle is between these two positions, the flow rate of the cooling fluid is between full flow and no flow. Use a flow meter on the SUPPLY line to adjust the desired flow rate.

On units with DL+I or DL+A options the flow control valve must be opened slightly to allow fluid to circulate through the flow switch that monitors the flow rate. A flow rate of more than 0.3 gallons per minute (1.0 liters per minute) is necessary. If the flow is completely shut off, or if the flow is not adequate, a low flow fault will occur and the unit will not start.

To prevent “water hammering” always move the flow control handle slowly.

Flow Meter (Optional)

An optional flow meter may be installed in the right side of the pump compartment. The meter measures the flow rate in gallons per minute. The flow rate range displayed depends on the type of pump installed in the unit.

Pressure Gauge

Units with PD or TU pumps are equipped with a pressure gauge. Refer to the pump identification label on the electrical enclosure to identify the specific pump installed in the unit.

The RECIRCULATING PRESSURE gauge is located next to the flow control handle. The gauge indicates the operating pressure of the system.

Pressure Relief Valve

Units with a PD or TU type pump have an adjustable pressure relief valve. Refer to the pump identification label on the electrical enclosure to identify the specific pump in your unit.

The pressure relief valve establishes the maximum operating pressure of the unit. If the pressure of the fluid leaving the pump exceeds the valve setting, the relief valve will bypass the fluid within the unit to relieve the pressure. The valve does not determine the actual operating pressure; the operating pressure of the system is determined by the back pressure of the connected equipment and the setting of the flow control valve. If adjustment seems necessary, consult our Service Department for assistance.

Pump Motor Overload Protector

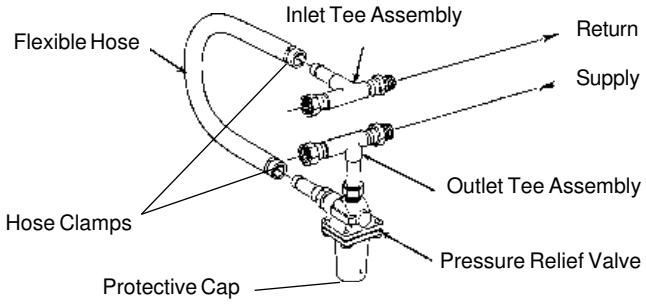
Three phase units with three phase pump motors are equipped with a pump motor overload protector. The overload protector prevents the pump motor from exposure to excessive current. If an overload fault occurs, due, for example, to excessive pressure or flow, or excessive ambient temperature, the overload protector will shut off the pump motor. The unit's compressor will continue to operate. The fault must be manually reset after the cause is identified and corrected (see Preface, After-sale Support).

The indicator and the overload relay (with reset switch) are both located in the main electrical enclosure. The indicator illuminates when a fault is detected.

External Pressure Regulator (Optional)

For applications requiring a maximum pressure less than 55 psi, an External Pressure Reducer (EPR) is available. An EPR allows an adjustable operating pressure of 10 to 50 psi. If the pressure of the fluid leaving the unit exceeds the valve setting the relief valve will bypass the fluid back into the unit to relieve the pressure. The pressure of the system is determined by the back pressure of the connected equipment and the flow rate of the recirculating fluid to your application.

Connect the EPR assembly as shown below. Tighten the hose clamps tight enough to prevent leakage. Do not overtighten or the clamps will “bite” into the flexible tubbing and can cause excessive wear.



Connect the outlet tee assembly to the inlet of your application. Connect the inlet tee assembly to the outlet of your application.

Adjustment

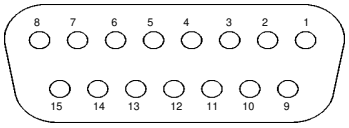
When adjusting the relief valve some leaking may occur, place a container under the valve during adjustment.

Remove the protective cap and locate a threaded fitting with a slot for a large screwdriver. Hold the threaded fitting in place and loosen the lock nut on the valve body until it is almost flush with the threaded fitting. Unscrew the threaded fitting three to four turns. (If the threaded fitting unscrews completely from the valve housing, screw it back in two to three turns.)

To simulate blockage, close (or pinch off) the hose between the EPR outlet tee assembly and your application. Monitor the operating pressure of the HX unit. Turn the threaded fitting until the desired relief pressure is set (the EPR valve cannot be set lower than the total back pressure of your instrument, or flow will not be received).

Tighten the locknut to secure the position of the threaded fitting. Open the hose between the EPR outlet tee assembly and your application.

Accessory Connector



15 pin D-subminiature female receptacle

Pin #	Function
1	Chassis ground.
2	No connection.
3	Span +. Indicates the maximum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +350mV = +35.0°C).
4	Span -. Indicates the minimum setpoint value the unit can be set to operate. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +50mV = +5.0°C).
5	No connection.
6	Analog ground. The analog ground is physically separated from the power ground throughout the unit. To prevent offsets that result ground currents, the analog and power ground are only connected at the power supply. Analog ground should only be used as a reference pin.
7	Sensor temperature (current limited through 2.7K OHM resistor). The fluid temperature, as measured by the controller's sensor located in the reservoir, can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
8	Setpoint out. The present temperature setpoint can be read at this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +150mV = +15.0°C).
9	Power ground.
10	Heater output. Will source 3V at 6mA.
11	No connection.
12	Digital display (input only). An external voltage can be displayed on the operator panel digital display by applying the voltage to this pin. The display has a low input resistance and a full scale rating of ±1.99VDC. Input is referenced to analog ground, pin 6. The maximum voltage applied to the display should be limited to ±2VDC.
13	-5V. Power supply of -5VDC (15mA maximum).
14	+5V. Power supply of +5VDC (15mA maximum).
15	Setpoint in. The temperature setpoint can be controlled by applying a known voltage to this pin. The temperature scale is 10mV/°C, referenced to analog ground, pin 6 (example: +230mV = +23.0°C.

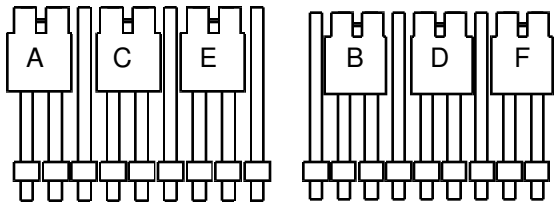
Shorting Plug Positions

Disconnect the unit from the main power source before repositioning any shorting plugs.

The Temperature Controller circuit board has shorting plugs used to modify the unit's operation. The circuit board is located behind the Temperature Controller face panel. You gain access to the circuit board by removing the two screws at the top of the panel and then carefully lowering the face of the panel. The plugs are directly behind the TEMP°C LEDs.

The figures below represent a typical 9-pin header plug. Use the following table to position the shorting plugs for the desired performance. (The pins on the circuit board are labeled.)

Position	Performance
A	LED displays tenths of degrees.
B	LED displays degrees.
C	Decimal point displayed.
D	Decimal point off.
E	Idle indicator reflects heater duty cycle.
F	Idle indicator reflects status of hot gas bypass mode.



Typical 9-Pin Header Plugs

The DL+A option contains some additional shorting plugs on the alarm portion of the Temperature Controller circuit board. There are three plugs on the top front of the circuit board. (The pins are not labelled. Viewing from the top, A is the full left position.)

Position	Performance
A	Alarm annunciator on.
B	Alarm annunciator off.
C	Amber fault indicator stays lit if fault clears before preset time delay.
D	Amber fault indicator extinguishes if fault clears before preset time delay.
E	Run to fail mode disengaged.
F	Run to fail mode engaged.

There are four additional shorting plugs on the back of the alarm circuit board. Three are located in the lower left hand corner, one in the upper right hand corner between two potentiometers. (The pins are not labelled. Viewing from the side, A is the top position.)

Position	Performance
A	Low flow fault disengaged.
B	Low flow fault engaged.
C	Low level indicator disengaged.
D	Low level indicator engaged.
E	Low level fault disengaged.
F	Low level fault engaged.

The single plug between the potentiometers is used to calibrate the High/Low Temp Limits display. Repositioning the plug allows you to use the Temp°C LED when you calibrated the temp limit potentiometers, see Potentiometer Adjustments/Calibration on the next page

Potentiometer Adjustments/ Calibration

TEMP °C Display

There are six potentiometers at the top of the Temperature Controller circuit board. Pots #1 and #2 are used to calibrate the temperature sensor. You can use the unit's reservoir to calibrate the sensor, or you can remove the sensor from the unit and immerse it in an external container of temperature controlled fluid.

Place a reference thermometer in the fluid and set the setpoint for 0°C. When the fluid approaches the setpoint, as measured by the reference thermometer, adjust pot #1 until the display equals the reference thermometer.

Reset the setpoint for 20°C. When the fluid approaches the setpoint, as measured by the reference thermometer, adjust pot #2 until the display equals the reference thermometer.

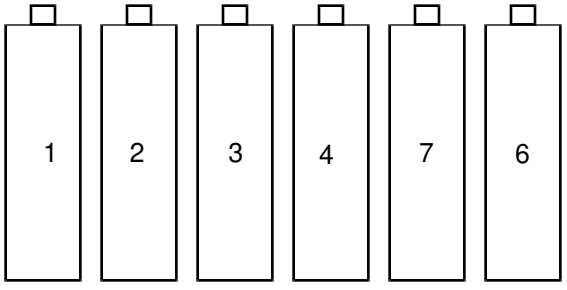
To complete the calibration reset the setpoint to 0°C. When the fluid approaches the setpoint adjust pot #1 until the display equals the reference thermometer.

Potentiometers #3 and #4 are used to set the maximum and minimum setpoint readings on the TEMP°C LED.

To set the maximum reading, turn the ADJUST dial fully *clockwise*, then depress and hold the SETPOINT switch. Adjust pot #3 until the desired temperature is displayed.

To set the minimum reading, turn the ADJUST dial fully *counter clockwise*, then depress and hold the SETPOINT switch. Adjust pot #4 until the desired temperature is displayed.

Potentiometers #7 and #6 are factory preset and require no adjustment.



TEMP°C LED Potentiometers

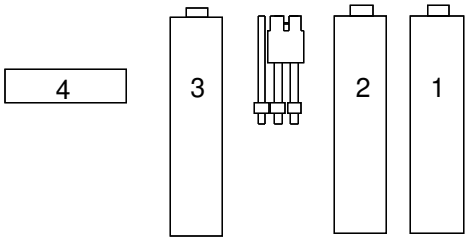
Alarm Calibration

The DL+A option has two potentiometers and a shorting plug are located on the back side of the alarm circuit board. They are used to calibrate the alarm temperature sensor. Again you can use the unit's reservoir, or you can remove the sensor and immerse it in an external container of temperature controlled fluid. Reposition the shorting plug as shown below. Place a reference thermometer in the fluid and set the setpoint for 0°C. When the fluid approaches the setpoint, as measured by the reference thermometer, adjust pot #1 until the display equals the reference thermometer.

Reset the setpoint for 20°C. When the fluid approaches the setpoint, as measured by the reference thermometer, adjust pot #2 until the display equals the reference thermometer.

To complete the calibration reset the setpoint to 0°C. When the fluid approaches the setpoint adjust pot #1 until the display equals the reference thermometer. Reposition the shorting plug to its original position.

Potentiometers #3 is used to adjust the proteud threshold. Potentiometer #4 adjusts the time for the fault delay.



DL+A Potentiometers

Section VI Maintenance

Service Contracts

NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal down-time for your unit. For more information, contact our Service Department (see Preface, After-sale Support).

Condenser Cleaning (Air-cooled units only)

For proper operation, the unit needs to pull substantial amounts of air through a finned condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The frequency of cleaning depends on the operating environment. It is recommended that a visual inspection of the condenser be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Exercise caution not to damage the condenser fins or coil. Condenser fin or coil damage can result in a loss of performance and, in extreme cases, refrigeration system failure.

Algae

To restrict the growth of algae in the fluid reservoir, it is recommended that the reservoir cover be kept in place and that all recirculation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

NESLAB recommends the use of Chloramine-T, one gram per gallon.

Section VII Service

For personal safety and equipment reliability, the following procedure should only be performed by a qualified technician. Contact our Service Department for assistance (see Preface, After-sale Support).

Configuration

Service Access Panels

Five service access panels (two on the rear, two on the right side and one on the top) allow easy access to the pump and refrigeration assemblies. The panels on the right side are designed to allow removal without disconnecting the HX from the instrument being cooled.

Disconnect the unit from its power source before removing any of the access panels.

Reservoir Cover

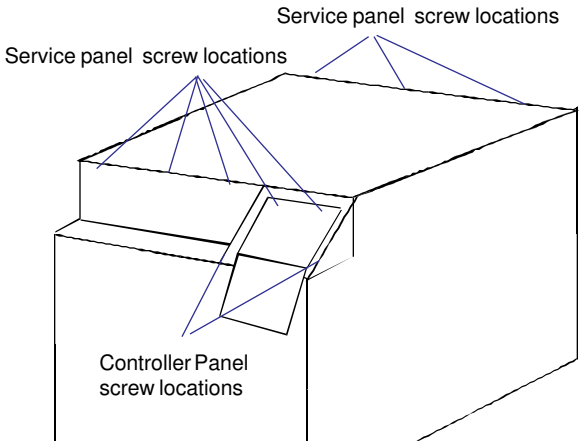
Access to the inside of the fluid reservoir is necessary to clean the reservoir.

Disconnect the unit from its power source before removing the reservoir cover.

Remove the top service panel. Screws are located inside the reservoir fill access door, behind the control panel, and on the rear of the unit. The controller panel has one screw on either side (one inside the reservoir fill access door) holding the panel in position.

The reservoir cover has two sections. Remove the screws holding the cover in position as well as the screws holding the two sections together. Lift the front section from the unit. You should now be able to carefully rotate the rear section away from the unit without disconnecting any of the wiring.

Care must be taken not to damage the switches, probes, and stirrer motor blades located under the reservoir cover.



Reservoir Cleaning

Periodic reservoir cleaning is necessary. We recommend that a visual inspection of the reservoir be made monthly after initial installation. After several months, the frequency of cleaning will be established.

Disconnect the unit from its power source and drain the reservoir before cleaning the reservoir.

Remove the top panel. Remove the reservoir cover as described in Configuration. Clean the reservoir with a cleaning fluid compatible with the recirculating system and the cooling fluid.

Do not use steel wool or other abrasive materials. They can scratch the stainless steel surface and initiate rusting.

When the reservoir is clean, reassemble the cover assembly and secure the case top. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Pump Strainer

Units with PD or TU pumps require pump strainer cleaning. Refer to the pump identification label on the electrical enclosure to identify the specific pump installed in your unit. If debris is drawn into the recirculating system, the pump strainer will prevent the material from being drawn into the pump and damaging the pump vanes.

After initial installation, the strainer may become clogged with debris and scale. Clean the strainer after the first week of installation. After this first cleaning, a monthly visual inspection is recommended. After several months, the frequency of cleaning will be established.

Disconnect the power cord from the power source and drain the fluid reservoir before cleaning the strainer. Do not operate the unit with any strainer removed.

The wire mesh pump strainer is located in the reservoir on the pump suction line. Remove the strainer access cover located on top of the reservoir cover to access the strainer.

Cover the strainer with a plastic bag to help catch any debris which may become free.

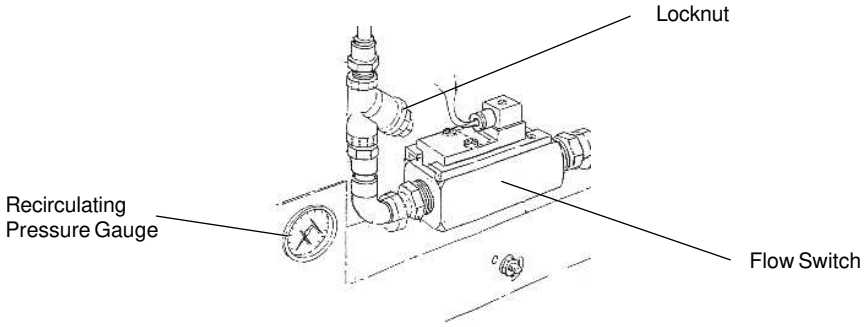
Unscrew the strainer and rinse it with water. Replace the strainer. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

Flow Switch Strainer (Optional)

The flow filter strainer is located behind the top right access panel on the inlet side of the flow switch.

Unscrew the locknut and remove the screen. Clean the screen by rinsing it with water.

Replace the strainer and locknut. Refer to Section III, Filling Requirements for instructions on replacing the cooling fluid.

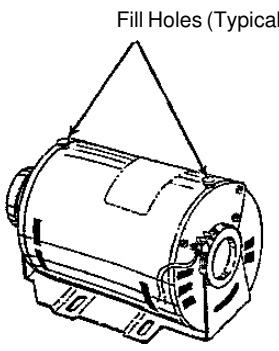


Pump Motor Lubrication

Units with PD pumps require pump motor lubrication. Refer to the pump identification label on the electrical enclosure to identify the specific pump in your unit.

Motors used to drive the pump are manufactured by several companies. These motors use sleeve type bearings with large oil reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil in each fill hole on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



Phase Rotation

Three phase units with three phase pump motors are equipped with a phase rotation interlock. Refer to the serial number label on the electrical enclosure for the specific electrical requirements of your unit. The interlock prevents the unit from starting if the phase rotation is wrong. If the unit will not start, see Section IX, Checklist. If the options in the checklist are not applicable, the problem may be phase rotation.

Disconnect the unit from its power source, open the rear panel and locate the junction box. Reverse any two line conductors on the line side of the relay.

Never remove the green ground wire.

Replace the rear panel. Reconnect the unit to its power source. If the unit will not start, contact our Customer Service Department.

Section VIII Troubleshooting

Checklist

Unit will not start

Verify main power circuit is energized. The green Main Power light on the controller panel should be lit when the unit is energized.

On units with DL+I and DL+A options, the flow control valve must be opened slightly to allow fluid to circulate through the flow switch that monitors the flow rate. A flow rate of more than 0.3 gallons per minute (1.0 liters per minute) is necessary. If the flow is completely shut off, or if flow is not adequate, a low flow fault will occur and the unit will not start.

On three phase units with three phase pump motors, the phase rotation may be reversed (see Section VIII, Phase Rotation).

On water-cooled units, ensure the facility water is on and make sure the cooling water supply is connected to the TAP WATER connection, not the DRAIN connection. Check the High Pressure Cutout, it may need to be reset (see Section V, Operation).

Check power source for correct voltage output. Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit. Power source must be specified voltage, ±10%.

Unit will not circulate fluid

Check the tubing between the unit and your application for obstructions or for cleaning/replacement.

Units with PD and TU type pumps may require pump strainer cleaning. Refer to the pump identification label on the electrical enclosure to identify the specific pump in your unit. For instructions on cleaning the pump strainer, see Section VIII, Pump Strainer.

On units with CP type pumps, if the back pressure of the instrument being cooled is greater than the maximum pressure of the pump, adequate flow may not be obtained. Check for obstructions in the tubing.

Inadequate temperature control

Make sure the installation of the unit is in compliance with the conditions described in Section III.

Make sure the heat load of the instrument being cooled is not greater than the cooling capacity of the unit.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, please obtain the following information:

- BOM number
- Serial number

Appendix DeltaTemp

DeltaTemp programming software is now available for free download from NESLAB ONLINE BBS (Bulletin Board System) at 603-427-2490.

DeltaTemp software allows you to write custom temperature programs for NESLAB digital units (any unit with a digital temperature readout AND a 10-15 pin INTERFACE port). The menu-driven program provides a table format for entering temperature parameters and a visual graph confirmation of the program you have designed. Program time can range from 0 to 999 minutes with unlimited looping. Choose upper and lower temperature limits and monitor system status with an audible alarm. DeltaTemp can also record your results on a printed graph or file. DeltaTemp is a DOS program, and requires an IBM or 100% compatible computer.

DeltaTemp may require use of a computer interface device, depending on which NESLAB unit is being used. Refer to the setup diagram in the DeltaTemp folder for full details.

To download the software, go to: CONFERENCES / SOFTWARE / DeltaTemp.

The folder also contains the operating manual, setup diagrams, application notes, and directions on making your own interface cable.

NESLAB ONLINE is a FirstClass® system accessible by general terminal software (Windows Terminal accessory, ClarisWorks Communications, Z-Term, Pro-Comm, or similar).

To use the full graphics and features of the BBS we recommend using FirstClass® Client software. FirstClass® Client is available for Macintosh or Windows platforms. It is available from many sources:

WARRANTY

NESLAB Instruments, Inc. warrants for 12 months from date of shipment any NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by NESLAB and found in the reasonable judgment of NESLAB to be defective in material or workmanship will be repaired at an authorized NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized NESLAB Repair Depot for warranty service will be paid for by the buyer. NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by NESLAB.

Preface

Compliance

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. This label indicates testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with UL 3101-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification EN 50082-1:1992 IEC 1000-4-2:1995 IEC 1000-4-3:1994 IEC 1000-4-4:1995

For any additional information refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for one full year from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact us for more information.

After-sale Support

Thermo NESLAB is committed to customer service both during and after the sale. If you have questions concerning the operation of your unit, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Customer Service

Department. Before calling, please obtain the following information from the unit's serial number label:

- BOM number _____

- Serial number _____

Section I Safety

Warnings

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, contact our Sales Department (see After-sale Support).

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged equipment.

Always turn off the unit and disconnect the line cord from the power source before performing any service or maintenance procedures.

Never operate equipment with damaged line cords.

Refer service and repairs to a qualified Thermo NESLAB technician.

Section II General Information

Description

The Portable Bath Coolers are designed to provide a refrigeration source for sub-ambient work in liquid baths. The PBC Coolers use mechanical refrigeration systems with full hermetic refrigeration compressors. On all models an insulated coaxial hose assembly is used to carry refrigerant to the nickel plated bronze cooling probe.

	IBC-4	PBC-2	PBC-75
Temperature Range	-25°C to +40°C		
Cooling Capacity[1] *Watts*	400 at +20°C	1000 at +20°C	1550 at +20°C
Hose Dimensions (Length x Diameter) *Inches* *Centimeters*	 42 x 1 106.7 x 2.5	 54 x 1¾ 137.2 x 4.4	 54 x 1¾ 137.2 x 4.4

1. 60 Hertz units, reduce capacity 17% for 50 Hertz units. Specifications obtained in a 2 liter container using cooling fluid with specific heat of 0.5 at 20°C ambient. Specifications subject to change.

Section III Installation

Site

The unit should be located in a laboratory or clean industrial environment where ambient temperatures are inside the range of +55°F to +95°F (+13°C to +35°C).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. The unit must be positioned so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section V, Cleaning).

The unit will retain its full rated capacity in ambient temperatures up to approximately +75°F (+24°C). Above +75°F, reduce the cooling capacity 1% for every 1°F above +75°F, up to a maximum ambient temperature of +95°F. In terms of Celsius, reduce the cooling capacity 1% for every 0.5°C above +24°C, up to a maximum ambient temperature of +35°C.

Electrical Requirements

Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit.

Ensure the voltage of the power source meets the specified voltage, ±10%.

Make sure an adequate ground connection is provided.

Fluids

The cooling probe is bronze with a nickel platting and should not be immersed in a bath fluid that will damage the probe. The selected fluid must have a viscosity of 50 centistokes or less at the lowest operating temperature.

Never use flammable or corrosive fluids with this unit.

Above +8°C, filtered tap water is the recommended fluid. Below +8°C, a non-freezing solution is required.

Cooling Probes

Place the cooling probe in the work area. For maximum cooling efficiency, the probe should be fully immersed in the fluid and should be located as close as possible to the agitator or stirrer motor (if so equipped).

Figure A shows the preferred probe placement. Do not operate the probe as shown in Figure B for extended periods of time, doing so will damage the compressor.

Care should be taken not to stretch or bend the probe beyond it limits. Bend the probe only at room temperatures. The bath coolers are not designed to cool hot fluids directly. The cooling probe should not be subjected to temperatures above 70°C.

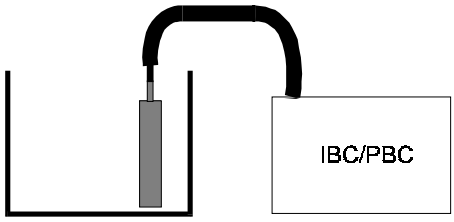

Figure A

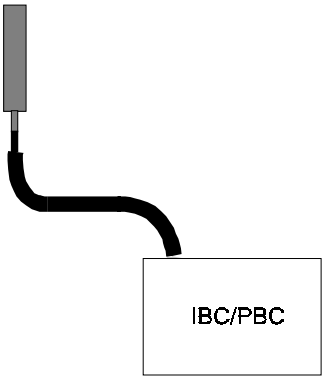

Figure B

Section IV Operation

Operation

Before starting the unit, double check all electrical connections and make sure the cooling probe is properly immersed in the work area.

The IBC-4 is operated by a single power switch and one cooling rate. A green light on the switch indicates power to the unit.

The PBC-2 and the PBC-75 have two switches, one for power to the compressor and the other for selection to two cooling rates. The position marked "MAX" is for maximum cooling capacity down to approximately 0°C. The position marked "MIN" is for operating below 0°C and for maintaining temperature constancy in baths with low heat loads. The red indicator light in the switch is on in the "MAX" position and off in the "MIN" position.

When the unit is shut off, wait approximately ten minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle (clicking sound) and no cooling will occur.

Temperature Adjustment

Once the bath cooler is switched on and is in full operation, it will reduce the temperature of the heat transfer fluid to the lowest achievable under existing load conditions. If temperature control is desired, a Cryotrol Temperature Controller is required. Refer to the Cryotrol Temperature Controller Instruction and Operation Manual for installation and operation instructions.

When maximum efficiency and temperature uniformity under load is desired, the vessel will show some temperature layering with the coldest, most dense zone at the bottom. We suggest that a small slow speed stirrer be used for agitation. This is extremely important when the cooler and Cryotrol are used.

Older Cryotrols are equipped with a round 8 pin connector. If you wish to connect your older Cryotrol unit to the bath cooler, an adapter cable is available from Thermo NESLAB. Contact our Customer Service Department for more information (see Preface, After-Sale Support).

Section V Maintenance

Service Contracts

Thermo NESLAB offers on-site Service Contracts that are designed to provide extended life and minimal downtime for your unit. For more information, contact our Customer Service Department (see Preface, After-sale Support).

Cleaning

For proper operation, the unit needs to pull substantial amounts of air through the condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. After initial installation we recommend a monthly visual inspection of the condenser. After several months, the cleaning frequency will be established.

Cooling Fluid

The cooling fluid in the work area should be periodically replaced when operating at low temperatures. At low temperatures, the cooling fluid may collect water vapor from the air. As the concentration of water in the cooling fluid increases, performance is adversely affected.

Section VI Troubleshooting

Checklist

Unit will not start.
Make sure the voltage of the power source meets the specified voltage, . ±10%. Refer to the serial number label on the rear of the unit for the specific electrical requirements of your unit.

Loss of cooling capacity.
Make sure the heat load in the work area is not greater than the cooling capacity of the unit. Refer to Section II, Specifications to review the cooling capacity specifications.

Check for ice build up on the cooling probe. A layer of ice will act as insulation and reduce the cooling capacity. Ice build up is often an indication that the cooling fluid needs replacing. Defrost the cooling probe and change the cooling fluid.

When the unit is shut off, wait approximately ten minutes before restarting. This allows time for the refrigeration pressures to equalize. If the pressures are not allowed to equalize, the compressor will short-cycle.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface,

After-sale Support). Before calling, please obtain the following information:

Part number
Serial number
Voltage of unit
Voltage of power source

Technical Support

Our Service Department can provide you with a complete list of spare parts for your unit (see Preface, After-sale Support). Before calling, please obtain the following information:

Part number
Serial number

WARRANTY

Thermo NESLAB Instruments, Inc. warrants for 12 months from date of shipment any Thermo NESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by Thermo NESLAB and found in the reasonable judgment of Thermo NESLAB to be defective in material or workmanship will be repaired at an authorized Thermo NESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized Thermo NESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized Thermo NESLAB Repair Depot for warranty service will be paid for by the buyer. Thermo NESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, Thermo NESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the Thermo NESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in Thermo NESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

Thermo NESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Thermo NESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND Thermo NESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

Thermo NESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of Thermo NESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by Thermo NESLAB.

Compliance

60 Hertz

CSA-C22.2 No 1010-1

UL-471, and UL-3101-1.

50 Hertz

Products tested and found to be in compliance with the requirements defined in the EMC standards defined by 89/336/EEC as well as Low Voltage Directive (LVD) 73/23/EEC can be identified by the CE label on the rear of the unit. The testing has demonstrated compliance with the following directives:

LVD, 73/23/EEC	Complies with IEC 1010-1:93
EMC, 89/336/EEC	EN 55011, Class A Verification
	EN 50082-1:1992
	IEC 61000-4-2:1999
	IEC 61000-4-3:1998
	IEC 61000-4-4:1995
	IEC 61000-4-5:1995
	IEC 61000-4-6:1996

For any additional information, refer to the Letter of Compliance that shipped with the unit (Declaration of Conformity).

Unpacking

Retain all cartons and packing material until the unit is operated and found to be in good condition. If the unit shows external or internal damage, or does not operate properly, contact the transportation company and file a damage claim. Under ICC regulations, this is your responsibility.

Warranty

Units have a warranty against defective parts and workmanship for 24 months from date of shipment. See back page for more details.

NES-care Extended Warranty Contract

- Extend parts and labor coverage for an additional year.
- Worry-free operation.
- Control service costs.
- Eliminate the need to generate repair orders.
- No unexpected repair costs.

Other contract options are available. Please contact ThermoNESLAB for more information.

After-sale Support

ThermoNESLAB is committed to customer service both during and after the sale. If you have questions concerning the unit operation, contact our Sales Department. If your unit fails to operate properly, or if you have questions concerning spare parts or Service Contracts, contact our Service Department.

Before calling, *please* obtain the following information:

*- unit BOM number*_____

- unit serial number _____

- unit software version _____

- voltage of power source _____

The unit's BOM and serial number label are located on the label rear of the unit. See page 25 for instructions on how to display the software version.

See page 29 for instructions on how to decode your unit's BOM number.

Section I Safety

Warnings

Warnings are posted throughout the manual. These warnings are designated by an exclamation mark inside an equilateral triangle and text highlighted in bold. Read and follow these important instructions. Failure to observe these instructions can result in permanent damage to the unit, significant property damage, or personal injury or death.

The lightning flash with arrow symbol, within an equilateral triangle, is intended to alert the user to the presence of non-insulated "dangerous voltage" within the unit's enclosure. The voltage may be of significant magnitude to constitute a risk of electrical shock.

Make sure you read and understand all instructions and safety precautions listed in this manual before installing or operating your unit. If you have any questions concerning the operation of your unit or the information in this manual, please contact our Sales Department (see After-sale Support).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

Never connect the inlet or outlet fitting to your building water supply or any water pressure source.

Never use flammable or corrosive fluids with this unit. Highly distilled and deionized water may be aggressive and cause material corrosion. Please contact ThermoNESLAB before subjecting this unit to prolonged exposure to highly distilled or deionized water.

Do not use automotive antifreeze. Commercial antifreeze contains silicates that can damage the pump seals. Use of automotive antifreeze will void the manufacturer’s warranty.

Additional Warnings

In addition to the specific warnings listed on the previous page the following general warnings apply to your unit:

Performance of installation, operation, or maintenance procedures other than those described in this manual may result in a hazardous situation and may void the manufacturer's warranty.

Transport the unit with care. Sudden jolts or drops can damage the refrigeration lines.

Observe all warning labels.

Never remove warning labels.

Never operate damaged or leaking equipment.

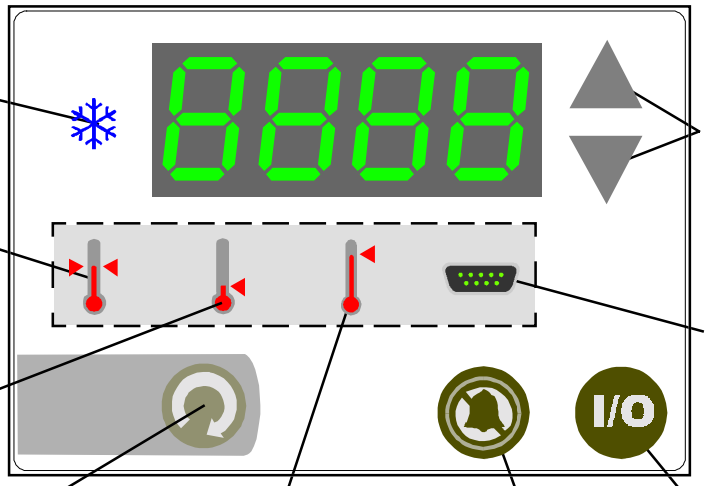
Never operate the unit without cooling fluid in the reservoir.

Always turn off the unit and disconnect the power cord from the power source before performing any service or maintenance procedures, or before moving the unit.

Never operate equipment with damaged power cords.

Refer service and repairs to a qualified technician.

Section II General Information



Indicates **refrigeration system status**. See page 16.

Press to **change** the displayed value. See page 16.

Indicates the controller is displaying the **setpoint**. Press the arrow keys to change the value. See page 17.

Optional. Indicates the unit is operating in the **serial communication** or remote start/stop mode. See page 17.

Indicates the controller is displaying the unit's **low temperature alarm setting**. Press the arrow keys to change the value. See page 17.

Press to **start/stop** the unit. See page 16.

Press to **sequence** through the four indicators and accept the displayed value. See page 16. **NOTE:** None of the four indicators are visible unless this key is pressed.

Indicates the controller is displaying the **high temperature alarm setting**. Press the arrow keys to change the value. See page 17.

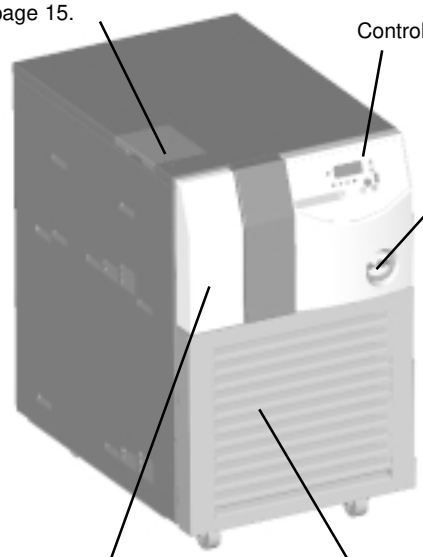
Press to **mute** the alarm. See page 16.

Reservoir Access Panel. See page 15.

Controller. See page 16.

Indicates a **Merlin Operating Tip**.

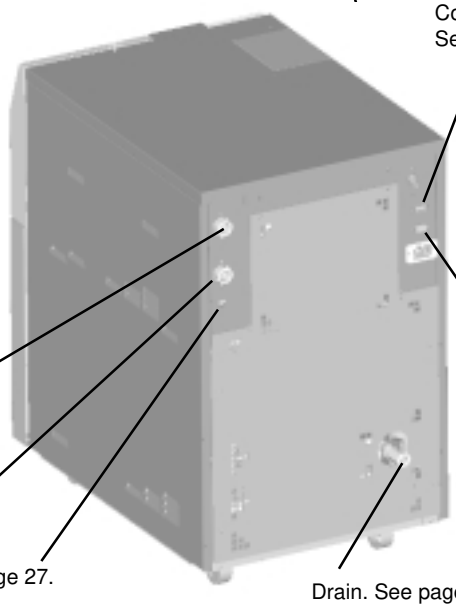
Pressure Gauge. See page 18.



Circuit Breaker. See page 18.

Optional

Communications Connector. See page 21.



Reservoir. See page 15.

Condenser Access Panel. See page 26.

Plumbing Return Connection. See page 14.

Plumbing Supply Connection. See page 14.

PD Pump Pressure Relief Valve. See page 27.

Optional

Remote Start/Stop Connector. See page 22.

Drain. See page 14.

Quick Reference Operating Procedures

Installation

The unit has an air-cooled refrigeration system. Air is drawn in the front of the unit and discharged through rear and sides. Position the unit so the intake and discharge are not impeded. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted. For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity.

The unit will retain its full rated capacity in ambient temperatures up to approximately +77°F (+25°C).

Make sure the voltage of the power source meets the specified voltage, ±10%.

The plumbing connections are located on the rear of the unit and are labelled and . These connections are ½ inch FPT (¾ inch FPT for units with CP-55 pumps). Remove the plastic protective plugs from both plumbing connections. Connect the fitting to the inlet of your application. Connect the fitting to the outlet of your application.

To fill the reservoir, remove the reservoir access panel and locate the reservoir cap. Remove the cap and fill the reservoir with clean cooling fluid.

For fluid recommendations refer to page 14.

Operation

Before starting the unit, double-check all electrical and plumbing connections. Make sure the circulating system is properly filled with cooling fluid. Place the circuit breaker located on the rear of the unit to the up position.

To start the unit, press I/O. To turn the unit off press I/O again.

The ❄ LED indicates the status of the refrigeration system. It illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the setpoint, the LED will flash.

Temperature Adjustment

To display the temperature setpoint, press on the controller. The indicator will illuminate and the display will flash the current setpoint value. To adjust the temperature setpoint, press the arrow keys until the desired temperature setpoint is indicated. Press again to confirm the change. The display will rapidly flash the new value for a short time and then return to the recirculating fluid temperature.

Periodic Maintenance

Periodically inspect the reservoir fluid. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. Frequency depends on the operating environment and amount of usage.

Before changing the cooling fluid ensure it is at a safe temperature.

Periodic vacuuming of the condenser fins is necessary. The frequency of cleaning depends on the operating environment. We recommend a monthly visual inspection of the condenser after initial installation. After several months, the cleaning frequency will be established.

Units with PD pumps have a strainer. If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes. A clogged strainer will also cause increased pump discharge pressure.

After initial installation, the strainer may become clogged. **Clean the strainer after the first week of installation.** After this first cleaning, we recommend a monthly visual inspection. After several months, the cleaning frequency will be established. Before cleaning, disconnect the power cord from the power source and drain the unit.

Description

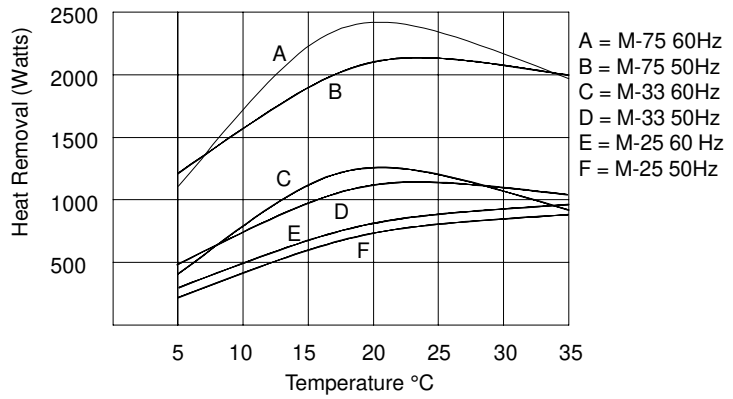
The Merlin Recirculating Chiller is designed to provide a continuous supply of cooling fluid at a constant temperature and volume. The unit consists of an air-cooled refrigeration system, plate heat exchanger, recirculating pump, polyethylene reservoir, and a microprocessor temperature controller.

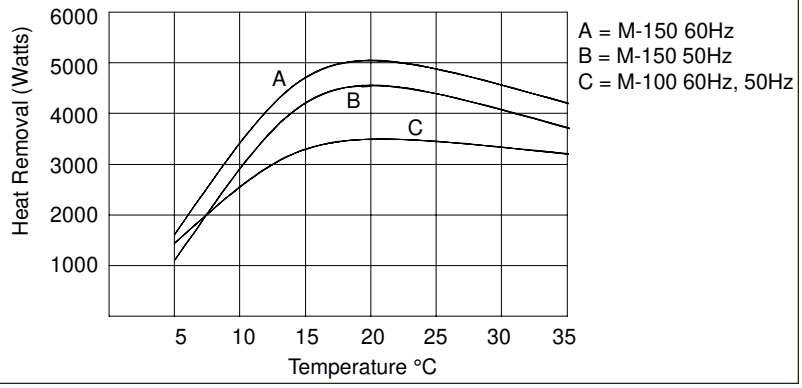
Throughout the manual, you will be asked to consult the unit's serial number label for specific information. The label is located on the rear of the unit.

Specifications

	M-25	M-33	M-75	M-100	M-150
Temperature Range[1,2]	+5°C to +35°C				
Temperature Stability[1,3,4]	±0.1°C		±0.15°C		
Reservoir Volume					
Gallons	0.5				
Liters	1.9				
Refrigerant[5]	R134a			R404a	

Cooling Capacity (Watts)[1,4]





1. Specifications subject to change.
2. Modified temperature ranges to either -15°C or to +90°C are available.
3. At the chiller. Display resolution 1.0°C. 0.1°C display resolution is available using the controller's Setup/Tuning Loop, see page 20.
4. Circulating water at 20°C ambient. Cooling capacity will vary depending on fluid temperature, ambient temperature, and cooling fluid.
5. Standard temperature range units.

Pump Options

Standard temperature range units

Unit	Standard	Optional
M-25	MD-30 or PD-1	None
M-33	MD-30 or PD-1	PD-2
M-75	PD-1	PD-2
M-100	PD-2	CP-55
M-150	PD-2	CP-55

High/Low temperature range units

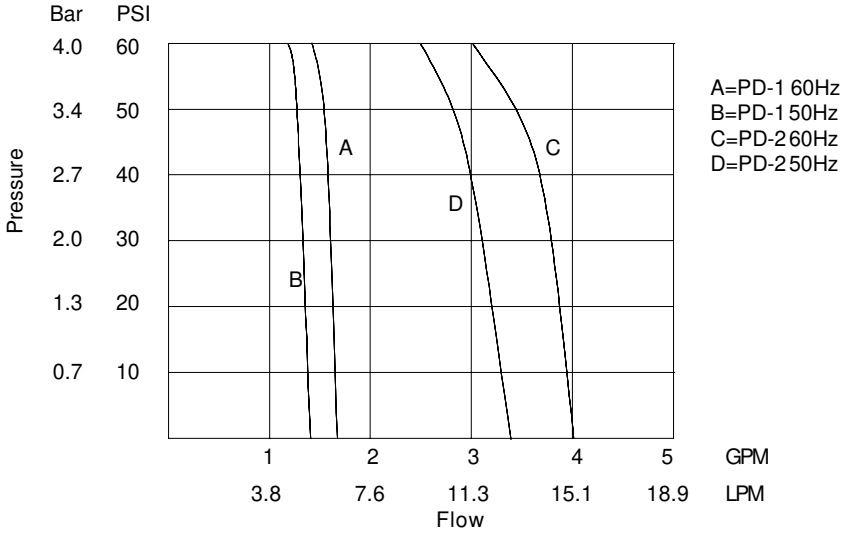
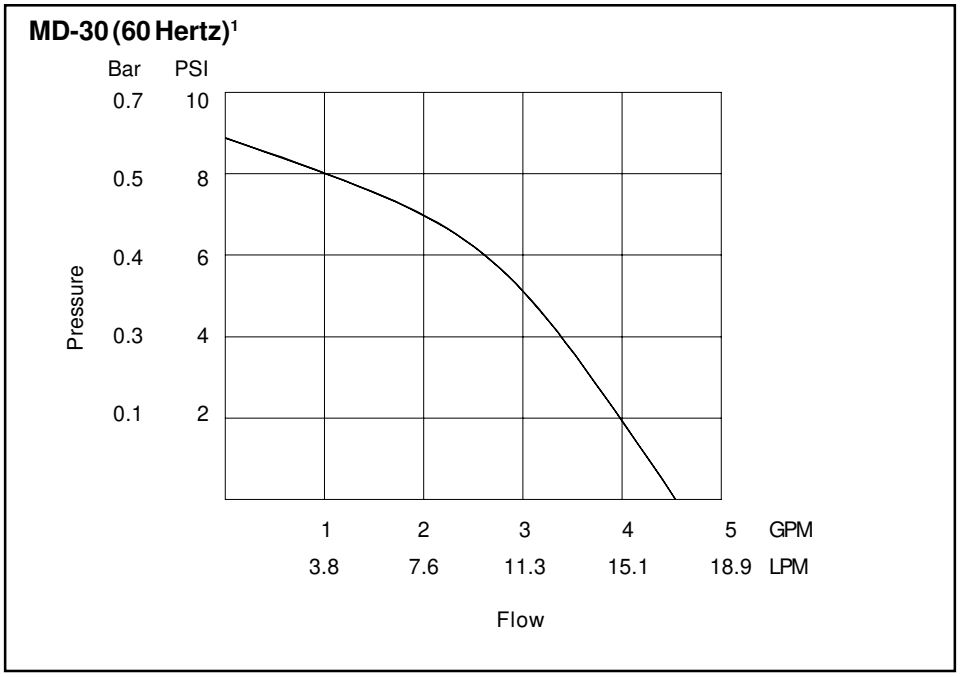
M-25	PD-1	None
M-33	PD-1	PD-2
M-75	PD-2	None
M-100	PD-2	CP-55
M-150	PD-2	CP-55

Pump Capacity

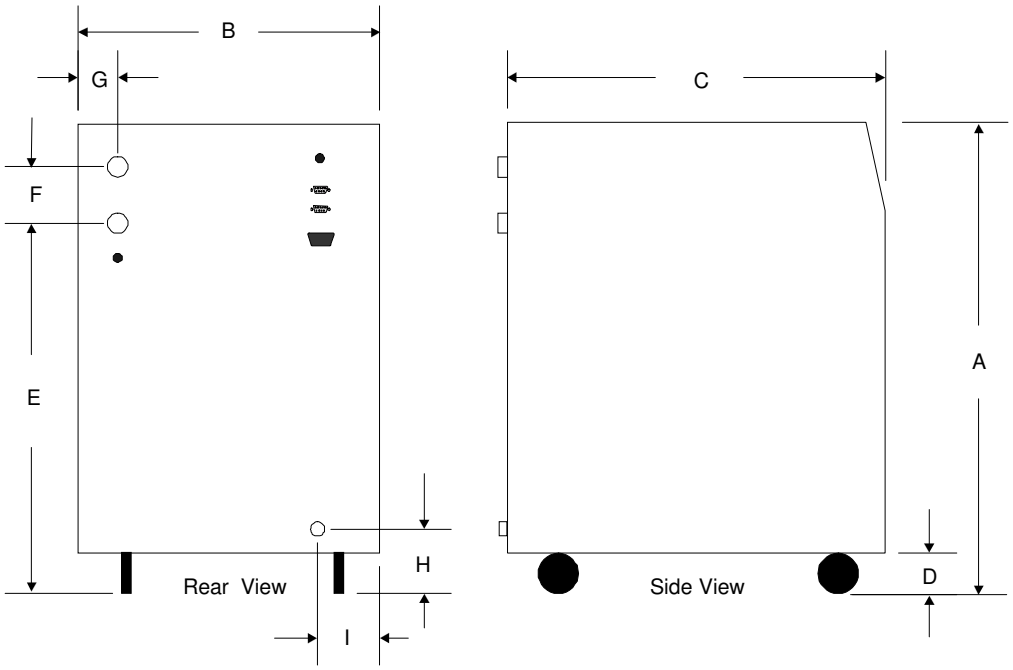
PD-1, PD-2





1. The MD-30 is not available for 50 Hertz units.

Unit Dimensions



Unit Dimensions	M-25	M-33	M-75	M-100	M-150
Dimension A[1]	23 7/8	23 7/8	26 5/8	30 1/4	30 1/4
Dimension B[1]	12 5/8	12 5/8	16 1/4	21 1/4	21 1/4
Dimension C[1]	20 1/8	20 1/8	23 3/8	28 5/8	28 5/8
Dimension D[2]	2	2	2	3	3
Dimension E[3]	18 7/8	18 7/8	21 1/8	24 3/4	24 3/4
Dimension F[4]	3	3	3	3	3
Dimension G[5]	3/4	3/4	2	1 1/2	1 1/2
Dimension H[6]	4	4	3	7 3/4	7 3/4
Dimension I[7]	4 1/4	4 1/4	3 1/2	5	5
Crate Dimensions (D x W x H)[8]	26x18½x36	26x18½x36	29¼x22¼x39	35¼x27x42	35¼x27x42
Shipping Weight[9]	150	150	200	290	290
Air Intake (ft³/min)[10]	178	178	385	755	755

1. Dimension A is the height of the unit. Units with CP-55 pumps are 6" higher. The unit width and depth (dimensions B and C) are the case dimensions, add approximately 1/2 inch to include the plumbing connections.
2. Dimension D is the distance from the floor to the bottom of the unit case (height of the casters).
3. Dimension E is the distance from the floor to the center of the outlet connection.
4. Dimension F is the distance between the center of the outlet and inlet connections.
5. Dimension G is the distance from the unit's side to the center of the outlet and inlet connections.
6. Dimension H is the distance from the floor to the center of the drain connection.
7. Dimension I is the distance from the unit's side to the center of the drain connection.
8. Crate dimensions for units with CP-55 pumps are 6 inches higher. All packages tested to ISTA 2B.
9. Shipping weight in pounds, ±10 pounds.
10. Air intake for 60 Hz units.

Rev 10/26/00

Section III Installation and Operation

Site

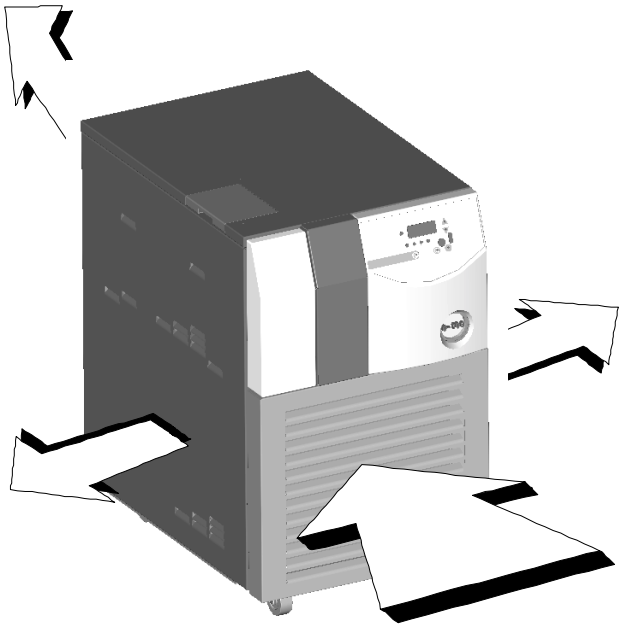
The unit should be located in a clean environment where ambient temperatures are inside the range of 10°C to 35°C (50°F to 94°F).

Never place the unit in a location where excessive heat, moisture, or corrosive materials are present.

The unit has an air-cooled refrigeration system. Air is drawn through the front of the unit and discharged through rear and side panels. The unit must be positioned so the intake and discharge are not impeded. A minimum clearance of 3 feet (1 meter) on all vented sides is necessary for adequate ventilation. Inadequate ventilation will cause a reduction in cooling capacity and, in extreme cases, compressor failure.

Excessively dusty areas should be avoided and a periodic cleaning schedule should be instituted (see Section IV, Maintenance and Service). Optional air filters are available, contact our Service Department. See Preface, After-Sale Support.

The unit will retain its full rated capacity in ambient temperatures up to approximately 25°C (77°F). Reduce the cooling capacity 1% for every 0.5°C (1°F) above 25°C (77°F), up to a maximum ambient temperature of 35°C (94°F).



Direction of Air Flow

Electrical Requirements

The unit construction provides extra protection against the risk of electrical shock by grounding appropriate metal parts. The extra protection may not function unless the power cord is connected to a properly grounded outlet. It is the user's responsibility to assure a proper ground connection is provided.

The following power options are available:

Unit	Voltage	Frequency	Phase	Circuit Capacity
M-25	115	60	1	11
	100	50	1	10
	230	50	1	6
M-33	115	60	1	15
	100	50	1	14
	200-230	60	1	7
	200	50	1	8
	230	50	1	8
M-75	200-230	60	1	12
	200	50	1	10
	230	50	1	10
M-100	200-230	60	1	17
	200	50	1	16
	400	50	3/5W	6
M-150	200-230	60	1	20
	200	50	1	19
	400	50	3/5W	7

Amperage based on extreme operating conditions. Operating in a 20°C ambient and at nominal voltage will result in a lower amperage draw.

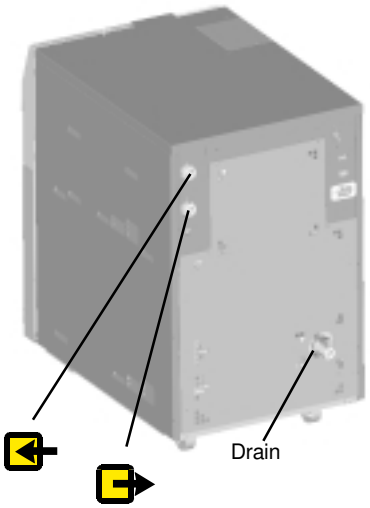
Refer to the serial number label on the rear of the unit for specific electrical requirements.

Plumbing Requirements

The plumbing connections are located on the rear of the unit and are labelled and . The connections are ½ inch Female Pipe Thread. For units with CP-55 pumps, the connections are ¾ inch Female Pipe Thread. Units with ½ inch fittings are supplied with ⅜ inch and ½ inch barbed adapters, units with ¾ inch fittings are supplied with ½ inch and ¾ inch barbed adapters.

Remove the plastic protective plugs from both plumbing connections. Install the barbed adapters to these connections.

Connect the fitting to the hose feeding the inlet of your application. Connect the fitting to the hose from the outlet of your application. Clamp all connections.



Never connect the fittings to your building water supply or any water pressure source.

NOTE: On units equipped with PD pumps, ensure your plumbing is rated to withstand 85 psi at the highest operating temperature.

It is important to keep the distance between the unit and the instrument being cooled as short as possible. Tubing should be straight and without bends. If diameter reductions must be made, they should be made at the inlet and outlet of your application, not at the chiller.

All units have a ball-valve reservoir drain located on the rear of the unit. Add the desired length of tubing to the drain valve. To help prevent any spillage from your application, consider installing external isolation valves on the supply and return lines.

Fluids

Never use flammable or corrosive fluids with this unit. Do not use automotive antifreeze. Commercial antifreeze contains silicates that can damage the pump seals. Use of automotive antifreeze will void the manufacturer's warranty.

Acceptable fluids and their normal operating temperature ranges are:

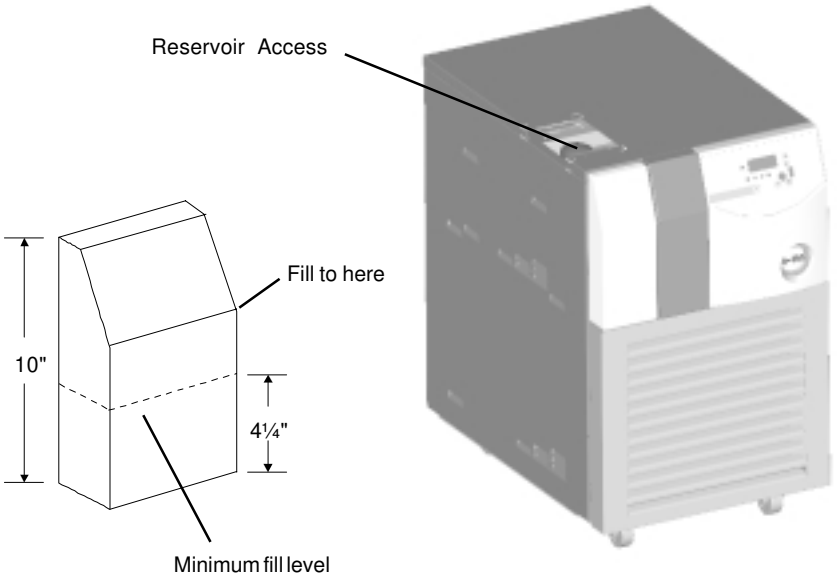
- Filtered/Single Distilled water, +5°C to +85°C
- 50/50 Uninhibited Ethylene Glycol/Water, -15°C to +60°C
- 50/50 Inhibited Ethylene Glycol/Water, -15°C to +90°C
- 50/50 Uninhibited Propylene Glycol/Water, -15°C to +60°C
- 50/50 Inhibited Propylene Glycol/Water, -15°C to +90°C
- Deionized water (1 - 3 megohm, compensated), +5°C to +85°C

Refer to Appendix A, Water Quality and Standards, for additional information.

Filling Requirements

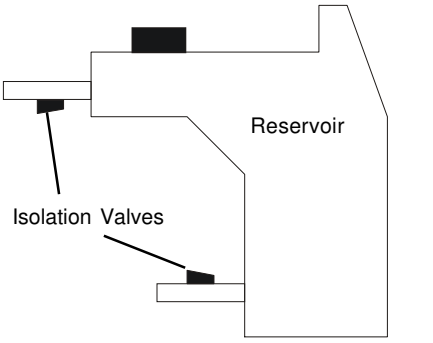
The polyethylene reservoir is translucent for easy fluid level monitoring. Remove the reservoir access panel. Locate and remove the reservoir cap. Fill the reservoir with clean cooling fluid, see previous page.

Since the reservoir capacity may be small compared to your application, have extra cooling fluid on hand to keep the system topped off when external circulation is started.



Reservoir Tank Isolation Valves

Units are equipped with two reservoir isolation valves. The valves are used to isolate the tank from the fluid flow to enable circulation to an open system or tank.



Upper Left Side of Unit, Panel Removed

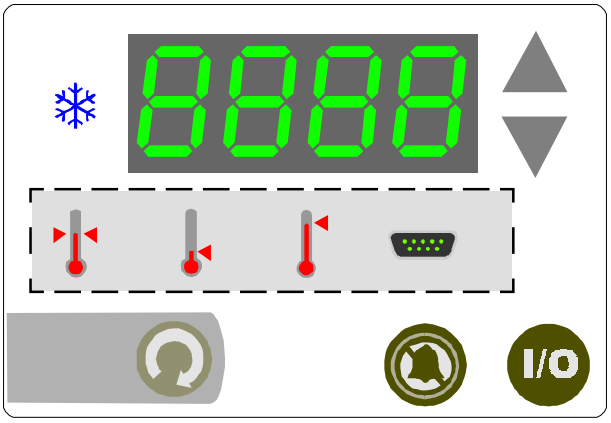
The units are factory shipped with the valves open for normal operation. If your application requires the process fluid to flow to an open tank above the unit, close the valves to prevent fluid siphoning and reservoir overflow. To close the valves you must remove the top and side access panels.

Ensure the valves are open when circulating to a closed system.

System temperature changes with the isolation valves closed, and while circulating to a closed system, can create a vacuum and/or high pressure conditions.

Controller

The controller controls temperature using a Proportional-Integral-Derivative (PID) algorithm. It is designed with self-diagnostic features and easy to use operator interface.



Controller

I/O Use this key to toggle the **unit on or off**.

Use this key to **scroll** through the controller's LEDs. It is also used to accept and save changes.

If the alarm sounds, use this key to toggle the **alarm off and on**.

NOTE: If the cause of the alarm is cleared but then reoccurs, the alarm will sound again.

Use this key to **increment numerical values** when setting values.

Use this key to **decrement numerical values** when setting values.

Indicates **refrigeration system status**. It illuminates to indicate the refrigeration system is removing heat from the cooling fluid. As the operating temperature approaches the temperature setpoint, the LED will flash. The indicator is off when heat is not being removed.

NOTE: The following indications are not visible until is depressed.

Indicates the controller is displaying the **setpoint**. Adjust the display value using the arrow keys. If neither arrow key is pressed within 10 seconds the display will return to the recirculating temperature display. Save the change using .

NOTE: You cannot adjust the setpoint closer than 2°C to either of the temperature limits discussed below. If is not pressed for 60 seconds the display will return to the recirculating temperature display and ignore any changes.

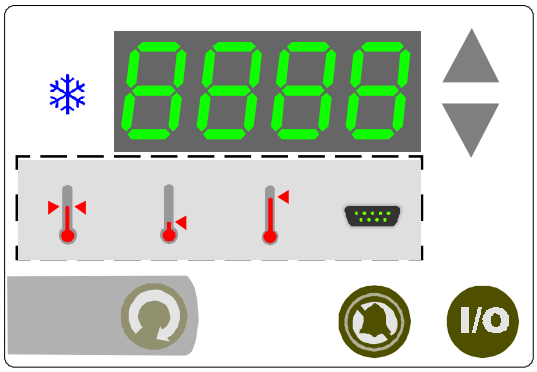
Indicates the controller is displaying the **low temperature alarm** setting. The indicator flashes and the alarm sounds if this limit is exceeded. Adjust the display value using the arrow keys. If neither arrow key is pressed within 10 seconds the display will return to the recirculating temperature display. Save the change using . If is not pressed for 60 seconds the display will return to the recirculating temperature display and ignore any changes.

Indicates the controller is displaying the **high temperature alarm** setting. The indicator flashes and the alarm sounds if this limit is exceeded. Adjust the display value using the arrow keys. If neither arrow key is pressed within 10 seconds the display will return to the recirculating temperature display. Save the change using . If is not pressed for 60 seconds the display will return to the recirculating temperature display and ignore any changes.

(Optional) Indicates the unit is in the **remote/serial communication** mode of operation. The indicator flashes if the unit is in the remote start/stop mode of operation. Toggle between the local and remote modes using the arrow keys. If neither arrow key is pressed within 10 seconds the display will return to the recirculating temperature display. Save the change using .

If is not pressed for 60 seconds the display will return to the recirculating temperature display and ignore any change.

Start Up/Shut Down



Controller

Pre-Start

Before starting the unit, double check all electrical and plumbing connections. Have extra recirculating fluid on hand.

Circuit Breaker

Place the circuit breaker located on the rear of the unit to the up position, the controller will flash and the alarm will momentarily sound.

The unit has automatic restart. If the unit was shutdown as a result of a power failure and power is restored, it will restart. If it was shut down using the circuit breaker, placing the circuit breaker up will restart the unit.

Starting

Press I/O. The controller will do a self-test (the controller will quickly sequence through its LEDs and momentarily sound the alarm) and then display the recirculating fluid temperature. The refrigeration system and the recirculation pump will then start. The RECIRCULATING PRESSURE gauge will display the pump operating pressure. If the pressure needs adjusting, refer to page 26.

NOTE: If on start up the unit's recirculating fluid is outside either temperature limit, the unit will operate but the appropriate indicator will flash until the fluid is within the limit.

Setpoint

To display/change the setpoint press until illuminates. The display will flash the current setpoint value. Use the arrow keys to change the value.

NOTE: If the arrow keys are not pressed within 10 seconds the display will return to the current reservoir temperature. The controller will not allow you to enter a setpoint closer than 2°C of either temperature alarm setting discussed on the next page. Trying to use a setpoint within 2°C causes the appropriate indicator to flash and sounds the audible alarm twice.

Once the desired setpoint is displayed, press again to confirm the change. The display will rapidly flash the new value for a short period and then return to the recirculating fluid temperature.

NOTE: If the new value is not confirmed within 60 seconds the display will return to the recirculating fluid temperature and ignore any changes.

Low Temp Alarm

To display/change the low temperature alarm setting press until illuminates. The display will flash the current limit value. Use the arrow keys to change the value. The range is 0°C (-15°C for low-temp units) to 30°C.

NOTE: If the arrow keys are not pressed within 10 seconds the display will return to the current reservoir temperature.

Once the desired setting is displayed, press again to confirm the change. The display will rapidly flash the new value for a short period and then return to the recirculating fluid temperature. See Error Codes on page 24.

NOTE: If the new value is not confirmed within 60 seconds the display will return to the recirculating fluid temperature and ignore any changes.

High Temp Alarm

To display/change the high temperature alarm setting press until illuminates. The display will flash the current setting value. Use the arrow keys to change the value. The range is 10°C to 40°C (90°C for high-temp units).

NOTE: If the arrow keys are not pressed within 10 seconds the display will return to the current reservoir temperature.

Once the desired limit is displayed, press again to confirm the change. The display will rapidly flash the new value for a short period and then return to the recirculating fluid temperature. See Error Codes on page 24.

NOTE: If the new value is not confirmed within 60 seconds the display will return to the recirculating fluid temperature and ignore any changes.

Remote/Serial Comm

(Optional) To enable or disable remote/serial communication press until illuminates. The display will flash the communication status. Use the up arrow key to enable, the down arrow to disable.

NOTE: If the arrow keys are not pressed within 10 seconds the display will return to the current reservoir temperature.

Once the desired status is displayed, press again to confirm the change. The display will rapidly flash the new status for a short period and then return to the recirculating fluid temperature.

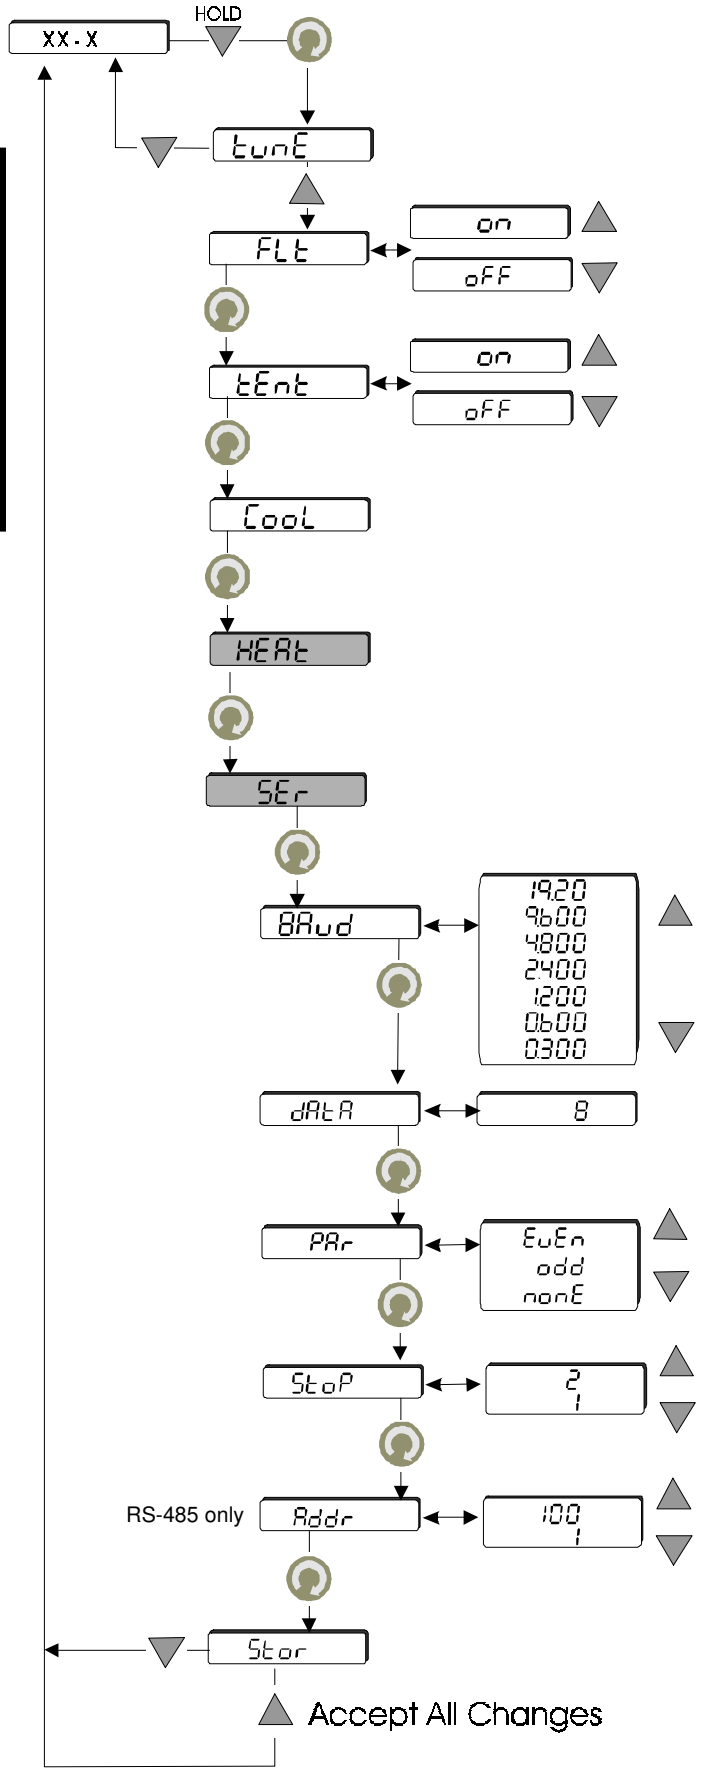
NOTE: If the new status is not confirmed within 60 seconds the display will return to the recirculating fluid temperature and ignore any change.

NOTE: Enabling serial communications disables the remote start/stop feature, see page 22. In either mode, the setpoint and alarm values can not be changed using the controller but they can still be viewed.

Stopping

To turn the unit off, press I/O.

Setup/Tuning Loop



The Setup/Tuning Loop is used to configure the controller temperature display and various operating parameters. To enter the loop you must be displaying the reservoir fluid temperature and then, while pressing and holding ▼, press ⟳. The display will indicate tunE. Use the arrow keys to enter/bypass the loop. Once in the loop press ⟳ to sequence through it. Use the arrow keys to change any display.

The loop is used to determine how the unit will react when a fault occurs (FLt) — either shut down (on) or continue to run (oFF). The unit is shipped configured to run.

It is also used to configure the temperature displays to indicate to a tenth of a degree (tEnt).

The loop can also be used to set the controller's PID parameters (CooL HEAt). The Thermo NESLAB factory preset values are:

COOL	P	I	D
STD TEMP UNITS	20	0.5	0.0
LOW TEMP UNITS	12	0.5	0.0
HIGH TEMP UNITS	7	0.5	0.0
HEAT			
ALL UNITS	5	0.5	0.0

Thermo NESLAB recommends that only a qualified technician change PID parameters. Incorrect PID values will hamper unit performance.

The heat PID is only applicable to units configured with a heater.

The loop is also used to adjust/verify serial communication parameters (SEr). This section of the loop is applicable only to units configured for serial communications capability.

Changes made in the Tuning/Setup Loop take affect when ▲ is pressed at the Stor prompt. Pressing ▼ at the prompt aborts *all* changes.

Section IV Options

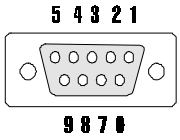
Communication Connector

A female 9-pin D-connector is located on the rear of the unit. The connector is used for either RS-232 or RS-485 serial communication (see Appendix B or C).

When the unit is controlled via serial communication the LED on the controller is illuminated.

When the unit is configured for serial communication the unit cannot be started using the local controller. However, the unit can be stopped using the local controller. To restart, send another start command.

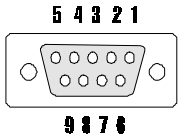
RS-232 (J-102) COMM Pin Connection



Pin #	Function
1	No connection
2	TX = Transmitted data from controller
3	RX = Received data to controller
4	No connection
5	GND = Signal ground
6	No connection
7	No connection
8	No connection
9	No connection

Hardware **Mating Connector**
AMP Part# 745492-2 or equivalent

RS-485 (J-103) COMM Pin Connections



Pin #	Function
1	No connection
2	No connection
3	No connection
4	No connection
5	No connection
6	No connection
7	No connection
8	TX = Transmitted data from controller
9	RX = Received data to controller

Hardware **Mating Connector**
AMP Part# 745492-2 or equivalent

Remote Start/Stop

A male 9-pin D-connector is located on the rear of the unit. The connector is used for either 12 - 24VAC or 12 - 24VDC remote start/stop; and as a status relay dry contact.

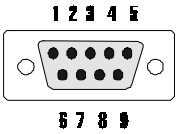
To start the unit from a remote location apply the correct voltage to J101, pins 4 & 5. When the unit is started by a remote start/stop voltage on the controller will flash.

Once started remotely, stop the unit by removing the applied voltage from J101 or by pressing I/O on the local controller. To restart remotely after stopping locally remove and reapply the remote start voltage to J101.

NOTES:
Enabling serial communications disables the remote start/stop feature.

Should the unit experience a high/low temperature warning/fault, a reservoir level warning/fault, or a low pump flow warning/fault, the status relay will de-energize.

(J-101) COMM Pin Connection



Pin #	Function
1	Status, NO
2	Status, NC
3	Status, Common
4	Remote On +
5	Remote On -
6	No Connection
7	No Connection
8	No connection
9	No connection

Hardware **Mating Connector**
AMP Part# 745491-2 or equivalent

Remote Start Input:
12 to 24 Volts DC ±10% maximum input current, 9ma.

12 to 24 Volts AC ±10% maximum input current, 5ma.

Absolute maximum input voltages:
40 volts rms. continuous.

56 volts peak.

Reservoir Level Warning/Fault

NOTE: This is a standard feature for high-temperature units.

Should the reservoir fluid level drop below normal the mutable alarm will sound, the status relay will de-energize, an error message will be displayed, and, depending on the unit's configuration, the unit will continue to run or shut down. Refill the reservoir and, if necessary, restart the unit.

The unit will not start without any fluid in the reservoir regardless of how it is configured.

The unit is configured to run or shut down using the controller's Setup/Tuning Loop on page 20.

Low Pump Flow Warning/Fault

NOTE: This is a standard feature for high-temperature units.

Should the pump flow drop below 0.25 gpm (1.0 gpm for units with a CP-55 pump) the mutable alarm will sound, the status relay will de-energize, an error message will be displayed, and, depending on the unit's configuration, the unit will continue to run or shut down.

Once the cause of the low flow is identified and corrected restart the unit, if necessary.

The unit is configured to run or shut down using the controller's Setup/Tuning Loop, see page 20

Additional Accessories

External Filtration Package
A partial flow liquid filter available in 5, 10, 25, and 40 micron filter sizes.

External DEI Package
Partial flow DEI package will maintain between 1 and 3 megohm/cm^2 water resistivity. A cartridge indicator lets you know when the filter needs changing.

Condenser Air Filter
An easy to install air filter protects the condenser in dusty environments.

Section V Maintenance and Service

Error Codes

On Start Up:

Er00 ROM ckecksum. Clear with key.

Er01 Test failure. Locks up the program.

Er02 Display board failure. Clears when display board is fixed.

Er03 Critical checksum failure. Clear with key.

Er 14 Synchronous comm

Er 15 Asynchronous comm

Er 16 Bad calibration data

Unusual Hardware Conditions

These errors will flash on the display and cannot be cleared. These are internal controller problems.

Er04 through Er 13 - Interrupt errors during runtime.

ConF BOM invalid

Functional/ Machine errors

These are the runtime/logic errors. These errors will clear themselves once the problem disappears.

Error Display	Indication
Lot	Low temp setpoint warning/fault
Add	Low level warning, fluid below minimum fill level, see page 15
Hit	High temp setpoint warning/fault
Er25	Shorted RTD1
Er26	Open RTD1
LoFL	Low process flow warning/fault
LLF	Fluid low level fault - unit shuts down
Er50	Low flow to heat exchanger fault - unit shuts down

Unit reaction to warning/fault errors depend on how the unit is configured, see Setup/Tuning Loop on page 20. The unit is shipped configured to continue running. If any other code appears contact Thermo NESLAB customer service.

Displaying Software Version Number

The controller can display the installed software version number. For example, for a unit with software version **026950.1A**:

1. Unit is running normally and displaying recirculating fluid temperature.
2. Press and hold ▼ for at least 10 seconds. The display will show the first two digits, for example: 02 .
3. Press
   The display will show the remaining digits to the left of the decimal, for example: 6950.
4. Press
   The display will show the decimal point and the digit to the right of the decimal point, for example, .1 .
5. Press
   The display will show the revision letter, as its equivalent number, for example, 1 = A.
6. Press
   Disregard this display.
7. Press
   The display returns to the recirculating fluid temperature.

Cleaning

Reservoir

Periodically inspect the fluid inside the reservoir. If cleaning is necessary, flush the reservoir with a cleaning fluid compatible with the circulating system and the cooling fluid.

The cooling fluid should be replaced periodically. Replacement frequency depends on the operating environment and amount of usage.

Before changing the cooling fluid ensure it is at a safe handling temperature.

NOTE: It will be necessary to use a wet-vac or siphon to completely drain the reservoir. Use care so as not to damage the reservoir float switch.

See page 15, Filling Requirements, for instructions on cooling fluid replacement.

Condenser

For proper operation, the unit needs to pull substantial amounts of air through a condenser. A build up of dust or debris on the fins of the condenser will lead to a loss of cooling capacity. Optional air filters are available, contact our Service Department. See Preface, After-Sale Support.

The lower front of the unit has a one-piece grille assembly. Using your hands gently pry the assembly off. Use care not to scratch the paint.

Periodic vacuuming of the condenser fins is necessary. The cleaning frequency depends on the operating environment. After initial installation we recommend a monthly visual inspection of the condenser. After several months, the cleaning frequency will be established.

Use care cleaning the condenser fins, they can easily bend.

Algae

To restrict the growth of algae in the reservoir, it is recommended that the reservoir cover be kept in place and that all circulation lines be opaque. This will eliminate the entrance of light which is required for the growth of most common algae.

ThermoNESLAB recommends the use of Chloramine-T, 1 gram per 3.5 liters. Other algicides can be harmful to the unit's internal components. Contact Thermo NESLAB for additional information.

Leaks

A very small leak between the pump and motor is normal. If this is a new pump, allow it to run for 24 hours and reinspect. A continuous leak will require pump replacement.

PD Pressure Relief Valve

Units with PD pumps have a Pressure Relief Valve. The valve is used to adjust the unit's fluid flow/pressure.

NOTE: The valve is factory preset for the most common applications and normally requires no further adjustment. Also, the unit's pump is factory preset not to exceed 80±5 psi (550±1 kPa).

Before adjusting the valve turn the unit off. Locate the circular relief valve opening on the rear of the unit.

Turn the threaded stem fully clockwise.

If the unit is not plumbed to an application, install a loop of hose equipped with a shut-off valve between the supply and return fittings.

Turn the unit on.

Use the pressure gauge to read the relief valve setting.

Back out the threaded stem on the relief valve counterclockwise. Continue until the gauge indicates 80 psi (550 kPa) or the desired setting.

NOTE: The relief valve may drip if the threaded stem is backed out too far.

PD Pump Strainer

Units with PD pumps have a strainer. Refer to the serial tag label on the rear of the unit and the BOM decoder on page 29 to identify the type of pump.

If debris is in the system, the strainer will prevent the material from being drawn into the pump and damaging the pump vanes. A clogged strainer will also cause increased discharge pump pressures.

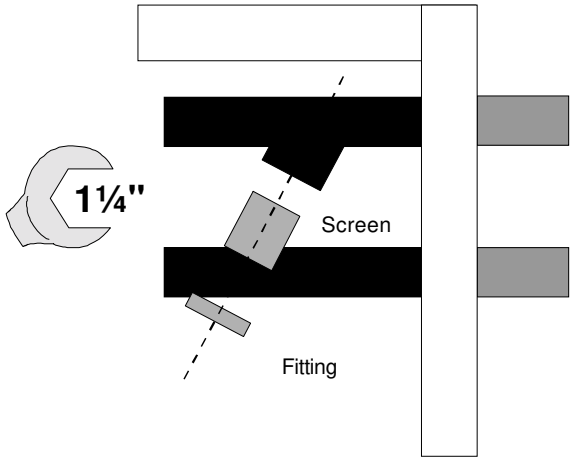
After initial installation, the strainer may become clogged with debris and scale. Therefore, **the strainer must be cleaned after the first week of installation**. After this first cleaning, we recommend a monthly visual inspection. After several months, the cleaning frequency will be established.

Before cleaning the strainer ensure the cooling fluid it is at a safe handling temperature. Disconnect the power cord from the power source and drain the unit.

PD pumps have a strainer located in the pump suction line. The strainer is located behind the right-side panel.

Remove the panel from the unit. Use one wrench to support the filter housing, and a second wrench to unscrew the 1¼ inch fitting. Remove the screen.

Clean the screen by rinsing it with water. When the screen is clean, replace it in the strainer, tighten the fitting and replace the panel. Refer to Section III for instructions on replacing the cooling fluid.

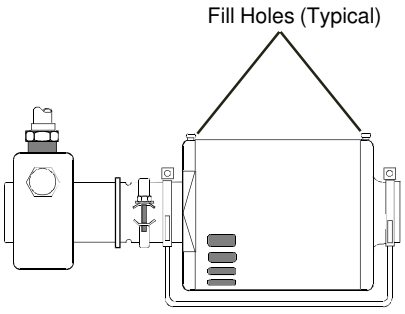


Right-side view

PD Pump Motor Lubrication

Some PD pumps use sleeve type bearings with large reservoirs. Oiling instructions are generally posted on each motor. In the absence of instructions, add approximately 30 to 35 drops of SAE 20 non-detergent oil to each bearing on the following schedule (SAE 20 = 142 CS viscosity):

Duty Cycle	Oiling Frequency
Continuous	Once every year
Intermittent	Once every 2 years
Occasional	Once every 5 years



BOM Decoder

The Bill of Material (BOM) number helps identify the configuration of your unit. The number is printed on the label located on the rear of the unit.

Digit# 1 2 3 4 5 6 7 8 9 10 11 12

Section VI Troubleshooting

Checklist

Unit will not start

Check the line cord; ensure it is plugged in.

Check the position of the circuit breaker on the rear of the unit.

Check the controller for error codes, see page 24.

NOTE: On units with a Low Flow Switch and configured to shut down with a low flow fault (LoFL), several starting attempts may be necessary.

On units with a Reservoir Level Switch check the reservoir level.

Optional serial communications or remote start/stop enabled.

Make sure power source voltage is within the unit rated voltage ±10%.

400 Volt, 50 Hertz units are equipped with a phase monitor. Ensure proper phase to the unit.

If is lit, the unit was shut off using serial communications. Start the unit using serial communications. To start the unit using the local controller press and hold both arrow keys for 10 seconds, the controller will power. Turn serial communications off using the procedure on page 17, and then press to turn off the controller. Press again to start the unit.

Unit will not circulate fluid

Check the reservoir level. Fill, if necessary.

Check the position of the reservoir tank valves. See Reservoir Tank Valves.

Check the instrument being cooled for restrictions in the cooling line.

Check the pump strainer (units with PD pumps).

The pump motor may be too hot. Allow it to cool.

Check the pressure gauge, adjust the relief valve as necessary (units with PD pumps).

Inadequate temperature control

Verify the setpoint.

If the temperature continues to rise, make sure your application's heat load does not exceed the rated specification, see Section II, Specifications.

Make sure the air intake and discharge are not impeded and the ambient temperature does not exceed +35°C.

Make sure the condenser is free of dust and debris, see Section V, Maintenance and Cleaning.

Verify the controller's PID values, see Setup/Tuning Loop.

No serial communications (optional)

All units are tested for serial communications before they leave the factory. Check the controller, ensure serial communication is enabled.

Check all communications commands, they *must be exact*. See Appendix B or C.

Check all wiring for proper connections or possible shorts.

Software to verify serial communication is available from Thermo NESLAB.

Service Assistance

If, after following these troubleshooting steps, your unit fails to operate properly, contact our Service Department for assistance (see Preface, After-sale Support). Before calling, *please* obtain the following information:

- *unit BOM number*
- *unit serial number*
- *software version*
- *voltage of power source*

Appendix A Water Quality Standard and Recommendations

	Permissible (PPM)	Desirable (PPM)
Microbiologicals		
(algae, bacteria, fungi)	0	0
Inorganic Chemicals		
Calcium	<40	0.6
Chloride	250	<25
Copper	1.3	1.0
Iron	0.3	<0.1
Lead	0.015	0
Magnesium	<12	0.1
Manganese	0.05	<0.03
Nitrates\Nitrites	10 as N	0
Potassium	<20	0.3
Silicate	25	<1.0
Sodium	<20	0.3
Sulfate	250	<50
Hardness	17	<0.05
Total Dissolved Solids	50	10
Other Parameters		
pH	6.5-8.5	7-8
Resistivity	0.01*	0.05-0.1*

* Megohm-Cm (Compensated to 25°C)

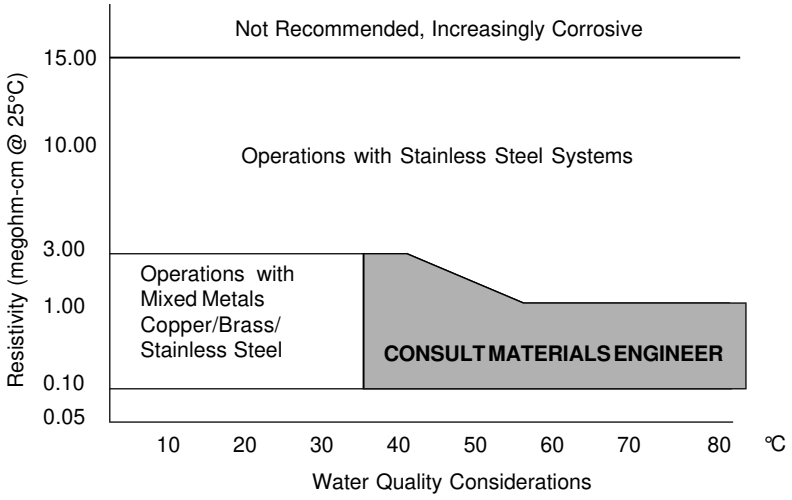
Unfavorably high total ionized solids (TIS) can accelerate the rate of galvanic corrosion. These contaminants can function as electrolytes which increase the potential for galvanic cell corrosion and lead to localized corrosion such as pitting which can be observed at the studs and on the outside surface of cooling coils. Eventually, the pitting will become so extensive that the coil will leak refrigerant into the water reservoir.

For example, raw water in the U.S. averages 171 ppm (of NaCl). The recommended level for use in a water system is between 0.5 to 5.0 ppm (of NaCl).

Recommendation: Initially fill the tank with distilled/deionized water. Do not use untreated tap water as the total ionized solids level may be too high.

Maintain this water quality at a resistivity of between 1 to 10 megohm-cm (compensated to 25°C) by using a purification system. Although the initial fill may be as high as 10 megohm-cm (compensated to 25°C), the desired level for long time usage is 1 to 3 megohm-cm (compensated to 25°C).

The above two recommendations will reduce the electrolytic potential of the water and prevent or reduce the galvanic corrosion observed.



Merlin Compatibility with Recommended Fluids

Filtered/Singled Distilled water, +5°C to +85°C
This fluid is recommended primarily because it has all microorganisms that cause biological fouling removed through vaporizing and condensing the water. However, distilled water does not remain pure for very long when exposed to the atmosphere. Air-born spores can contaminate the water and activate alga growth. Chloramine-T is a compatible algaecide that can be used to combat growth but a more effective maintenance plan would include switching out the fluid with newly distilled water every six month. The particulates that have been filtered out in the process are also preventative in keeping the system "clean" of contaminants. One thing to note is that distilling water that contains an additive could increase the concentration of that additive in the water.

50/50 Uninhibited Ethylene Glycol/Water (-15°C to + 60°C)
Ethylene glycol is used to depress the freezing point of water as a coolant. We are recommending to not use the inhibited (no corrosion additives) above 60°C because it breaks down into acidic by-products faster at high temperatures. These acidic by-products, especially carbonic acid, are corrosive to copper. The inhibitors are used to control the corrosion rates by passivating the metal surfaces with an inert film. Uninhibited ethylene is more corrosive to copper that plain water so therefor it should not be recommended unless it is required for the application.

50/50 Inhibited Ethylene Glycol/ Water (-15°C to +90°C)
Inhibited glycol can be used to increase the operating temperature range of the fluid but should not be used as a "pre-mixed anticorrosive" solution. Again, this fluid does break down over time at high temperatures. Dow uses a pH standard of 8 to base when the fluid has become corrosive. Dowtherm is an ethylene based product that contains dipotassium phosphates in a 4% concentration. The recommended use of Dowtherm is mixing with distilled or deionized water or water that contains less than 25 ppm chloride and sulfate and less than 100 ppm total hardness of CACO3. The general term, inhibited glycol/water, almost too close to meaning inhibited water. Inhibited water can have many types of additives including chromate that will foul our cooling system very quickly. Some inhibitor additives can release the bonding agent in the carbon graphite in the PD2 pumps and therefor are incompatible, such as Sodium Hydroxide.

50/50 Uninhibited Propylene Water (-15°C to + 60°C)
Although the use of this glycol similar to ethylene glycol, propylene glycol is considered "safe" to use in the food industry. Propylene is less dense than ethylene and therefor will have a tendency to weep more through mechanical seals.

50/50 Inhibited Propylene/ Water (-15°C to +90°C)
Same issues as with uninhibited propylene and inhibited ethylene glycol.

Deionized water (1-3 megohm, compensated, +5°C to 85°C)
This water has the ions controlled so that they will not conduct and cause galvanic corrosion between dissimilar metals. Deionized water is aggressive to metal when it is too pure since this is not the normal state of water. The leaching of metallic ions from the metal surface is seen in pitting.

NEVER use flammable or corrosive fluids with this unit. Do not use automotive anti-freeze. Commercial antifreeze contains silicates that can damage the pump seals. Use of automotive antifreeze will void the manufacturer's warranty.

Wetted Materials

PD PUMPS (Part Number 008806- PD2, Part Number 008816-PD1):
Carbon Graphite (Graphitar Type B)
Brass
303 Stainless Steel
Ceramic (85% Aluminum Oxide and Balance is Considered Glass)
Fluorocarbon (Viton equivalent)
Ultem (relief Valve Material)

MD-30 (Part Number 026922):
Polypropylene
Ceramic
Magnet
Buna-N

CP-55 PUMP (Part Number 026652):

Strainer (Part Number 009334):
Bronze
304 Stainless Steel Mesh

Tank Cap (Part Number 026992):
Nylon

Tank Body (Part Number 026933):
Polyethylene (LLPDE, Mobile NRP=135)

Hose Assemblies/Plumbing:
Buna-N (Parker Push-Lok O-ring)
Nitrile based synthetic rubber (Parker Push-Lok hoses) Part Number 026931
Brass Part Number 032688
Copper Part Number 003752

Ball Valve (Part Number 026981):
Viton
Chrome plated brass body and ball
PTFE

Sealants:
95/5 solder
Bcup5 Brazing
Anearobic Methacrylate Ester (Perma-Lok LM012) - 013002

Low Level/Low Flow Switches (Optiona1):
Polysulphone (Part Number 026900) Low Level
Brass (Part Number 026901) Low Flow

Appendix B RS-232 Serial Communications Protocol

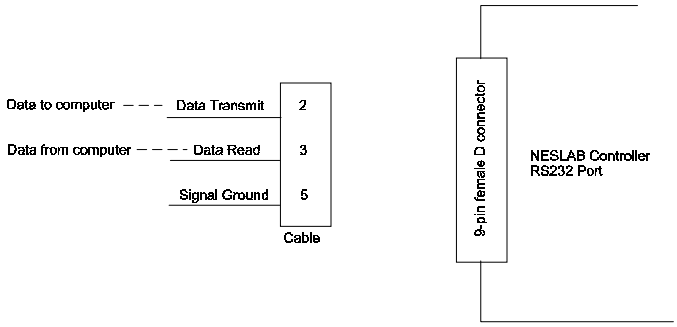
NOTE: This appendix assumes you have a basic understanding of communications protocols.

All data is sent and received in binary form, do not use ASCII. In the following pages the binary data is represented in hexadecimal (hex) format.

The Thermo NESLAB Serial Communications Protocol, NC, is based on a master-slave model. The master is a host computer, while the slave is the chiller's controller. Only the master can initiate a communications transaction (half-duplex). The slave ends the transaction by responding to the master's query. The protocol uses an RS-232 serial interface with the default parameters: 9600 baud, 8 data bits, 1 stop bit, no parity and no handshaking.

NOTE: Before the unit will communicate, RS-232 must be turned on using the controller. Ensure the indicator is illuminated.

The unit can be controlled through your computer's serial port by using the unit's standard 9-pin RS-232 connection. Data read of the serial port connects to the data transmit (pin 2) of the unit. Data transmit of the serial port connects to data read (pin 3) of the unit.



Communication cables are available from Thermo NESLAB. Contact our sales department for additional information.

All commands must be entered in the exact format shown in the tables on the following pages. The tables show all commands available, their format and responses. Controller responses are either the requested data or an error message. The controller response *must* be received before the host sends the next command.

The host sends a command embedded in a single communications packet, then waits for the controller's response. If the command is not understood or the checksums do not agree, the controller responds with an error command. Otherwise, the controller responds with the requested data. If the controller fails to respond within 1 second, the host should resend the command.

NC Serial Communications Protocol

NOTE: All byte values are shown in hex, hex represents the binary values that must be sent to the chiller. **Do not use ASCII.**

The framing of the communications packet in both directions is:

	Checksum region						
Lead char CA	Addr-MSB 0	Addr-LSB 1	Command	n d-bytes	d-byte 1 ...	d-byte n	Checksum

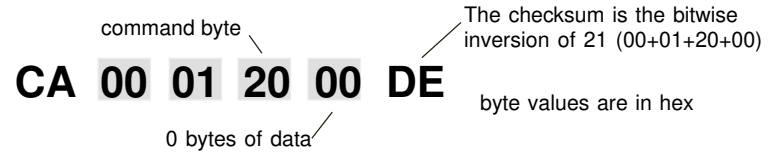
Lead char	CA (hex).
	Device address is 1
Addr-msb	Most significant byte of device address is 0.
Addr-lsb	Least significant byte of device address is 1.
Command	Command byte (see Table 1).
n d-bytes	Number of data bytes to follow (00 to 03 hex).
d-byte 1	1st data byte (the qualifier byte is considered a data byte).
...	...
d-byte n	nth data byte.
Checksum	Bitwise inversion of the 1 byte sum of bytes beginning with the most significant address byte and ending with the byte preceding the checksum. (To perform a bitwise inversion, "exclusive OR" the one byte sum with FF hex.)

The master requests information by sending one of the Read Functions as shown in Table 1. Since no data is sent to the chiller during a read request, the master uses 00 for the number of data bytes following the command byte.

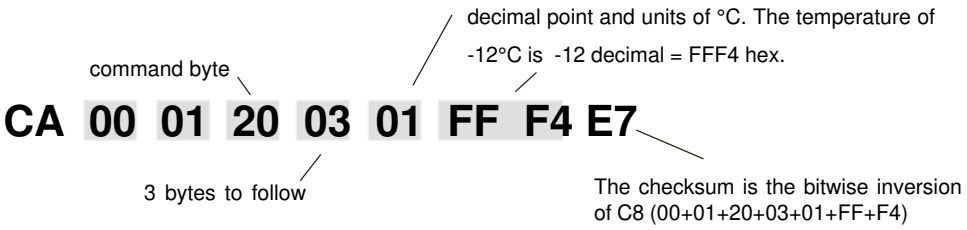
Appendix B

The chiller will respond to a Read Function by echoing the lead character, address, and command byte, followed by the requested data and checksum. When the chiller sends data, a qualifier byte is sent first, followed by a two byte signed integer (16 bit, MSB sent first). The qualifier byte indicates the precision and units of measure for the requested data as detailed in Table 2.

As an example, the master requests to read internal temperature by sending:

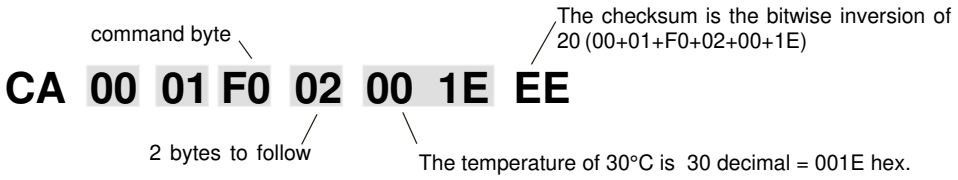


If the temperature is -12°C, the slave would reply:



The master sets parameters in the chiller by sending one of the Set Functions as shown in Table 1. The master does not send a qualifier byte in the data field. The master should be preprogrammed to send the correct precision and units (it could also read the parameter of interest first to decode the correct precision and units needed).

For example, if the master wants to set the setpoint to 30°C, it would send :



The slave responds:

11	1 precision, °C
20	2 precision, no units of measure

Example: The temperature of 45.6°C would be represented by the qualifier 11 hex, followed by the 2 bytes 01 C8 hex (456 decimal).

Table 3

REQUEST STATUS

BIT	d1	d2
b.7 = 1	0	Reserved
b.6 = 1	Reserved	Freeze Fault
b.5 = 1	Low Flow Warning	RTD1 Fault
b.4 = 1	Low Level Warning	0
b.3 = 1	High or Low Temp Warning	High Temp Fault
b.2 = 1	High or Low Temp Bypass	Low Temp Fault
b.1 = 1	Unit Faulted	Low Flow Fault
b.0 = 1	Unit Running	Low Level Fault

Appendix C RS-485 Serial Communications Protocol

NOTE: This appendix assumes you have a basic understanding of communications protocols.

All data is sent and received in binary form, do not use ASCII. In the following pages the binary data is represented in hexadecimal (hex) format.

The Neslab Serial Communications Protocol, NC, is based on a master-slave model. The master is a host computer, while the slave is the bath's controller. Only the master can initiate a communications transaction (half-duplex). The slave ends the transaction by responding to the master's query. The protocol uses an RS-485 serial interface with the default parameters: 9600 baud, 1 start bit, 8 data bits, 1 stop bit, no parity and a selectable address from 1 to 100.

NOTE: Before the unit will communicate, RS-485 must be turned on using the controller. Ensure the indicator is illuminated.

The unit can be controlled through your computer's RS-485 serial port by using the unit's 9-pin RS-485 connection. Communication cables are available from Thermo NESLAB. Contact our sales department for additional information.

All commands must be entered in the exact format shown in the tables on the following pages. The Tables on the last page of this Appendix show all commands available, their format and responses. Controller responses are either the requested data or an error message. The controller response *must* be received before the host sends the next command.

The host sends a command embedded in a single communications packet, then waits for the controller's response. If the command is not understood or the checksums do not agree, the controller responds with an error command. Otherwise, the controller responds with the requested data. If the controller fails to respond within 1 second, the host should resend the command.

NC Serial Communications Protocol

NOTE: All byte values are shown in hex, hex represents the binary values that must be sent to the bath. **Do not use ASCII.**

The framing of the communications packet in both directions is:

	Checksum region						
Lead char CC	Addr-MSB	Addr-LSB	Command	n d-bytes	d-byte 1 ...	d-byte n	Checksum

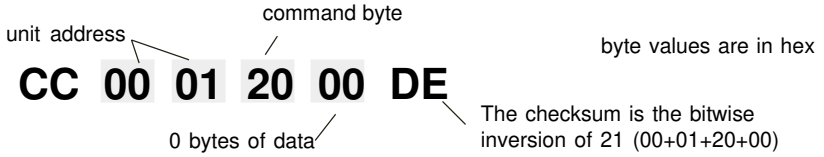
Lead char	CC (hex).
Addr-msb	Most significant byte of device address is 00 hex.
Addr-lsb	Least significant byte of device address in hex (01 to 63 hex).
Command	Command byte (see Table 1).
n d-bytes	Number of data bytes to follow (00 to 03 hex).
d-byte 1	1st data byte (the qualifier byte is considered a data byte).
...	...
d-byte n	nth data byte.
Checksum	Bitwise inversion of the 1 byte sum of bytes beginning with the most significant address byte and ending with the byte preceding the checksum. (To perform a bitwise inversion, "exclusive OR" the one byte sum with FF hex.)

The master requests information by sending one of the Read Functions as shown in Table 1. Since no data is sent to the bath during a read request, the master uses 00 for the number of data bytes following the command byte.

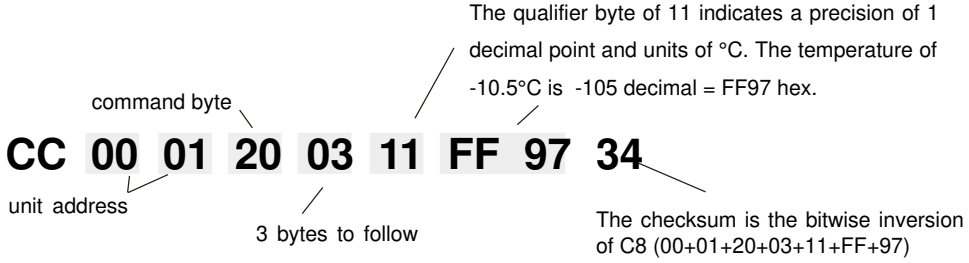
The bath will respond to a Read Function by echoing the lead character, address, and command byte, followed by the requested data and checksum. When the bath sends data, a qualifier byte is sent first, followed by a two byte signed integer (16 bit, MSB sent first). The qualifier byte indicates the precision and units of measure for the requested data as detailed in Table 2.

Appendix C

As an example, the master requests to read internal temperature unit address 01 by sending:

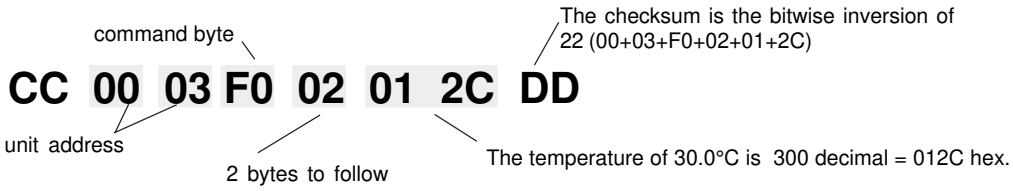


If the temperature is -10.5°C, slave #1 would reply:



The master sets parameters in the bath by sending one of the Set Functions as shown in Table 1. The master does not send a qualifier byte in the data field. The master should be preprogrammed to send the correct precision and units (it could also read the parameter of interest first to decode the correct precision and units needed).

For example, if the master wants to set the setpoint to 30°C for unit #3, it would send :



Slave #3 responds:

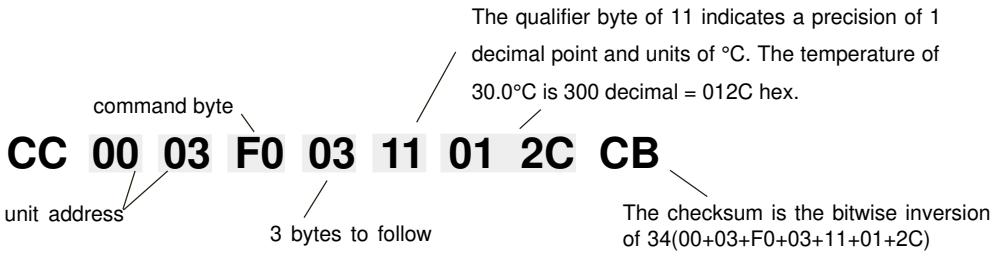


Table 1 Commands (All bytes are in hex)

FUNCTION	MASTER SENDS	UNIT RESPONDS
READ		
Read Acknowledge	CC 00 01 **00** 00 FE	CC 00 01 **00** 02 v1 v2 cs

Read Heat Proportional Band (P)	CC 00 01 **71** 00 8D	CC 00 01 **71** 03 qb d1 d2 cs
Read Heat Integral (I)	CC 00 01 **72** 00 8C	CC 00 01 **72** 03 qb d1 d2 cs
Read Heat Derivative (D)	CC 00 01 **73** 00 8B	CC 00 01 **73** 03 qb d1 d2 cs

command bytes shown in **bold**
qb = qualifier byte, see Table 2
d1,d2 = 16 bit signed integer of the value being sent or received
cs = the checksum of the string (see text)
* See Read Status, see Table 3

v = protocol version
ed = error data
en = error number 01: Bad command, 02: Bad data, 03: Bad checksum
xx = no valid data, include in checksum

Appendix C

Table 1 Commands (continued) (All bytes are in hex)

FUNCTION	MASTER SENDS	UNIT RESPONDS
SET		
Set Setpoint (control point)*	CC 00 01 **F0** 02 d1 d2 cs	CC 00 01 **F0** 03 qb d1 d2 cs
Set Low Temp	CC 00 01 **C0** 02 d1 d2 cs	CC 00 01 **C0** 03 qb d1 d2 cs
Set High Temp	CC 00 01 **E0** 02 d1 d2 cs	CC 00 01 **E0** 03 qb d1 d2 cs
Set Cool Proportional Band (P=1-99.9)	CC 00 01 **F4** 02 d1 d2 cs	CC 00 01 **F4** 03 qb d1 d2 cs
Set Cool Integral (I = 0-9.99)	CC 00 01 **F5** 02 d1 d2 cs	CC 00 01 **F5** 03 qb d1 d2 cs
Set Cool Derivative (D= 0-5.0)	CC 00 01 **F6** 02 d1 d2 cs	CC 00 01 **F6** 03 qb d1 d2 cs
Set Heat Proportional Band (P=1-99.9)	CC 00 01 **F1** 02 d1 d2 cs	CC 00 01 **F1** 03 qb d1 d2 cs
Set Heat Integral (I = 0-9.99)	CC 00 01 **F2** 02 d1 d2 cs	CC 00 01 **F2** 03 qb d1 d2 cs
Set Heat Derivative (D= 0-5.0)	CC 00 01 **F3** 02 d1 d2 cs	CC 00 01 **F3** 03 qb d1 d2 cs
Set On/Off Array**	CC 00 01 **81** 02 d1 d2 cs	CC 00 01 **81** 01 d1 cs
Turn Off	CC 00 01 **81** 01 00 7C	CC 00 01 **81** 01 d1 cs
Turn On	CC 00 01 **81** 01 01 7B	CC 00 01 **81** 01 d1 cs
Is On or Off?	CC 00 01 **81** 01 02 7A	CC 00 01 **81** 01 d1 cs

* = limited to the range of the chiller
command bytes shown in **bold**
qb = qualifier byte, see Table 2
d1,d2 = 16 bit signed integer of the value being sent or received
cs = the checksum of the string (see text)

** d1: 0 = Off (unit)
1 = On
2 = No change

Table 2

QUALIFIER BYTE

00	0 precision, no units of measure
01	0 precision, °C
10	1 precision, no units of measure
11	1 precision, °C
20	2 precision, no units of measure

Example: The temperature of 45.6°C would be represented by the qualifier 11 hex, followed by the 2 bytes 01 C8 hex (456 decimal).

Table 3

REQUEST STATUS

BIT	d1	d2
b.7 = 1	0	Reserved
b.6 = 1	Reserved	Freeze Fault
b.5 = 1	Low Flow Warning	RTD1 Fault
b.4 = 1	Low Level Warning	0
b.3 = 1	High or Low Temp Warning	High Temp Fault
b.2 = 1	High or Low Temp Bypass	Low Temp Fault
b.1 = 1	Unit Faulted	Low Flow Fault
b.0 = 1	Unit Running	Low Level Fault

WARRANTY

ThermoNESLAB Instruments, Inc. warrants for 12 months from date of shipment any ThermoNESLAB unit according to the following terms.

Any part of the unit manufactured or supplied by ThermoNESLAB and found in the reasonable judgment of ThermoNESLAB to be defective in material or workmanship will be repaired at an authorized ThermoNESLAB Repair Depot without charge for parts or labor. The unit, including any defective part must be returned to an authorized ThermoNESLAB Repair Depot within the warranty period. The expense of returning the unit to the authorized ThermoNESLAB Repair Depot for warranty service will be paid for by the buyer. ThermoNESLAB's responsibility in respect to warranty claims is limited to performing the required repairs or replacements, and no claim of breach of warranty shall be cause for cancellation or recision of the contract of sales of any unit.With respect to units that qualify for field service repairs, ThermoNESLAB's responsibility is limited to the component parts necessary for the repair and the labor that is required on site to perform the repair. Any travel labor or mileage charges are the financial responsibility of the buyer.

The buyer shall be responsible for any evaluation or warranty service call (including labor charges) if no defects are found with the ThermoNESLAB product.

This warranty does not cover any unit that has been subject to misuse, neglect, or accident. This warranty does not apply to any damage to the unit that is the result of improper installation or maintenance, or to any unit that has been operated or maintained in any way contrary to the operating or maintenance instructions specified in ThermoNESLAB's Instruction and Operation Manual. This warranty does not cover any unit that has been altered or modified so as to change its intended use.

In addition, this warranty does not extend to repairs made by the use of parts, accessories, or fluids which are either incompatible with the unit or adversely affect its operation, performance, or durability.

ThermoNESLAB reserves the right to change or improve the design of any unit without assuming any obligation to modify any unit previously manufactured.

THE FOREGOING EXPRESS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

ThermoNESLAB'S OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE COMPONENT PARTS AND ThermoNESLAB DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR IT ANY OTHER OBLIGATION.

ThermoNESLAB ASSUMES NO RESPONSIBILITY FOR INCIDENTAL, CONSEQUENTIAL, OR OTHER DAMAGES INCLUDING, BUT NOT LIMITED TO LOSS OR DAMAGE TO PROPERTY, LOSS OF PROFITS OR REVENUE, LOSS OF THE UNIT, LOSS OF TIME, OR INCONVENIENCE.

This warranty applies to units sold in the United States. Any units sold elsewhere are warranted by the affiliated marketing company of ThermoNESLAB Instruments, Inc. This warranty and all matters arising pursuant to it shall be governed by the law of the State of New Hampshire, United States. All legal actions brought in relation hereto shall be filed in the appropriate state or federal courts in New Hampshire, unless waived by ThermoNESLAB.

NESCOM software

NESLAB INSTRUMENTS, INC.

For Windows™

NESLAB temperature control software

- For use with NESLAB digital or microprocessor based controllers
- Select from easy to use product icons
- Create graphs and charts
- Easily configure ramping functions which set the setpoint overtime
- View pop-up alarm windows which display if an alarm condition occurs

About NEScom

NEScom Windows application provides a means for querying and controlling NESLAB products over an RS232 connection. The application bases all actions on controller icons. Once a controller icon is created, product parameters can be read and controlled.

Features include the capability to view and print a temperature and setpoint chart, configure and log alarms, run and save programs, and view indicators in the form of gauges and meters, all from menu bar selections.

NEScom Help will provide answers to the questions that will arise. Use keywords to obtain information in Help searches. Click on Help buttons for shortcuts to help topics. A glossary of terms is also located in the back of this manual.

Installing NEScom

The setup program installs NEScom and a run-time engine onto your system. Your system should have 3 -4MB disk space. Since the runtime engine requires a math coprocessor to run, we recommend installing NEScom on at least a 486 DX-33 PC with 8MB of RAM. Follow these instructions for the appropriate version of Windows:

Windows 3.x
Select Run from the File menu in the Program Manager
Type a:setup.exe (if installing from the A: drive).

Windows 95
Select Run from the Start menu.
Type a:setup.exe (if installing from the A: drive).

Setup allows you to name the installation directory to copy files. Change the destination directories by selecting Change (though we recommend you use the defaults). Once the directory names are approved select Finish to complete the installation.

Getting Started

RS232 Connection & Cables

NESLAB has cables and adapters to interface your computer to a NESLAB product. If you have a cable question, please check your configuration against the cabling suggested below. If your NESLAB product is not listed in this section call 800-NESLAB for assistance.

Computer Interface:
NESLAB suggests connecting the 25-pin male connector on your computer to a NESLAB product with the appropriate NESLAB cable listed below. Use NESLAB Adapter P/N 001935 to convert a 9-pin male port to a 25-pin male port.

NESLAB Product:
RTE, EX 110/210/220/410/510 (modbath digital/programmable):
NESLAB Cable P/N 001911 from computer to MRS232C.
MRS232C to bath.

RTE, EX 111/211/221/411/511 (bath93 digital and HX Series II controllers):
NESLAB Cable P/N 001911 from computer to MRS232C
MRS232C to bath.

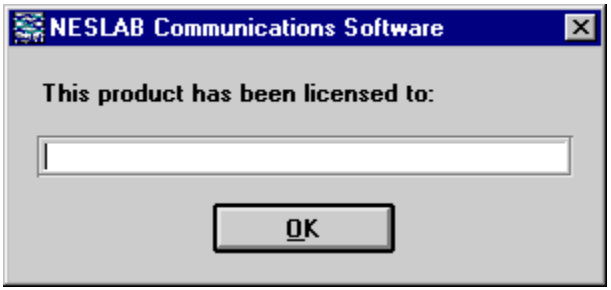
RTE, EX 111/211/221/411/511 (bath93 microprocessor):
NESLAB Cable P/N 001912 from computer to bath.

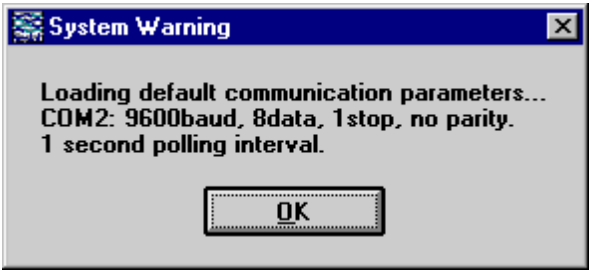
LT, ULT, EX250/251 (Digital Exatrol):
NESLAB Cable P/N 001911 from computer to RS232C
RS232C to bath.

Troubleshooting:
If there is a problem contacting the product check the cable connections and ensure the NESLAB product is powered and RS232 communications is enabled. Check the parameters in Configure COM port in the Options menu. Ensure the protocol being used by NEScom is supported on the NESLAB product.

Initialization

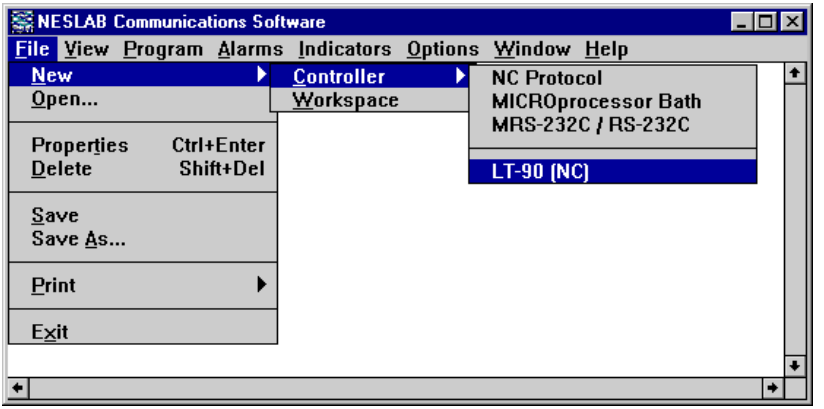
When NEScom is executed for the first time you are prompted to enter your name as the licensee. The program will then indicate the default communication parameters. (The only other time this is required is if the initialization file gets corrupted.)





File Menu

Select File from the menu bar to display the window shown below. This menu allows you to create, open, delete or save workspaces containing various controller configurations.



New

The options are Controller or Workspace.

Controller
Select to create a new Controller Icon. Icons are a graphical representation of a product. Up to eight (8) icons can be created for each workspace. All menu selections are based off of the active icon. An icon is active if it is highlighted. Select an icon with the mouse to make it active.

The background color of the active icon signifies its communication status.

Yellow means that NEScom is polling the device in an attempt to make contact.
Blue means that NEScom successfully contacted the device but is not currently communicating with the product.
Green indicates that NEScom is currently communicating with the product.

Red indicates that an error in communication occurred. Communication is resumed by manually enabling communications. See Properties or Enable Communications.

NOTE: Losing contact with the product does not result in a timeout error when NEScom is only requesting parameter values from the product. In this case, NEScom enters the polling mode (Yellow) and attempts to reconnect.

Select from the following icon types:

NC Protocol[1] - General support for NESLAB products that support the NC protocol.
MICROprocessor Bath[1] - General support for NESLAB Microprocessor line of baths (RTE/EX).
MRS232C/RS-232C[1] - General support for NESLAB Digital line of baths and chillers that utilize the MRS232C or RS-232C.
LT90 (NC) - Support for LT-90 utilizing the NC protocol.

Workspace
Define and configure a new workspace. A Workspace is made up of one or more controller icons. If one is already active, NEScom will prompt you to save the current workspace before a new one is defined or loaded. All icons are cleared when a new workspace is created. Once new controller icons are added, the workspace can be saved.

1. See glossary.

Open

Select this menu item to open a previously saved workspace.

File Name:
Type the file name in the space provided or select from the choices within the file list.

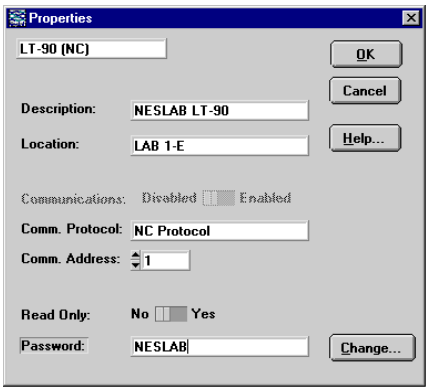
List Files of Type:
The default file type listed is *.nes. To list all files in the directory click on the text box and select All files (*.*).

Directories:
Choose from the default directory or browse through the directory structure.

Drives:
Choose from the default drive or select from other drive choices.

Properties

Select Properties to view the window below. Properties include: description, location/serial number, communications address and status, read only status and password.



Description:
If desired, enter a new description of the unit selected to communicate with NEScom. This description will appear on the icon and

any window panel associated with this icon. The description is referenced when logging alarms.

Location:
Enter the physical location of the unit (building, lab number ...) selected to communicate with NEScom. The location is referenced when logging alarms.

Communications: Disabled—Enabled
This control is available only when there is a communication error. Under error-free operating conditions this control is dimmed and gives the status of communications. If an error occurs which causes communications to stop, communication is re-enabled by setting the switch to Enable.

NOTE: Communication is normally disabled when NEScom is not requesting parameters from the product. Once you configure NEScom to request data from the product, communication is automatically enabled.

Comm. Protocol:
This displays the current communications protocol. This display cannot be changed.

Comm. Address:
This number is used by the NC protocol as a way to identify which unit NEScom is communicating with. This address is significant in protocols that support communications with multiple units (RS-485 or RS-422). NEScom and NESLAB products supporting the NC protocol and RS-485/RS-422 can be configured with a unique address (1-32767). Any data sent from NEScom to the NESLAB product, and any data received by NEScom carries this address. Default addresses are assigned automatically when icons are created.

NOTE: An address is not required for RS-232 communications. NEScom 1.0 does not support multi-unit communications.

Read Only: No—Yes
When in read only mode, NEScom can only query a product for information and not perform any intrusive setting of product parameters (like temperature setpoint). Read Only mode is disabled by entering the correct password and selecting No on the Read Only switch.

With Read Only mode selected:

Programs cannot be started.
Setpoint cannot be changed from Product Panels.
Product Panel buttons are disabled.

Password:
A password must be entered before the Read Only mode can be disabled. All software is shipped with the password "NESLAB" as a default. Select Change.... to change your password.

Delete

Select this menu item to delete the active product icon within the workspace. When an icon is deleted, the icon created first among those remaining becomes the active icon.

NOTE: NEScom prompts to confirm the deletion. The shortcut for delete is [Shift]+[Del].

Save

Select this menu item to save the current workspace. If the workspace has not been previously saved then a dialog box will appear prompting for file information.

File Name:
Type the file name in the space provided or select from the choices within the file list.

List Files of Type:
The default file type listed is *.nes. To list all files in the directory click on the text box and select All files (*.*).

Directories:
Choose from the default directory or browse through the directory structure.

Drives:
Choose from the default drive or select from other drive choices.

Save As

Select this menu item to save the current workspace under a new file name.

File Name:
Type the file name in the space provided or select from the choices within the file list.

List Files of Type:
The default file type listed is *.nes. To list all files in the directory click on the text box and select All files (*.*).

Directories:
Choose from the default directory or browse through the directory structure.

Drives:
Choose from the default drive or select from other drive choices.

Print

Select Print from the menu choices to print a hard copy of a graph of the program in memory, a snapshot of the strip chart, the product control panel or the contents of the alarm log.

Program:
After a Program is created and loaded into memory a hard copy can be made. You can print the program in the form of a graph or plain text. A Program must be viewed if printing in graph form.

Chart:
A chart must be viewed before it can be printed. Only the portion viewed will be printed.

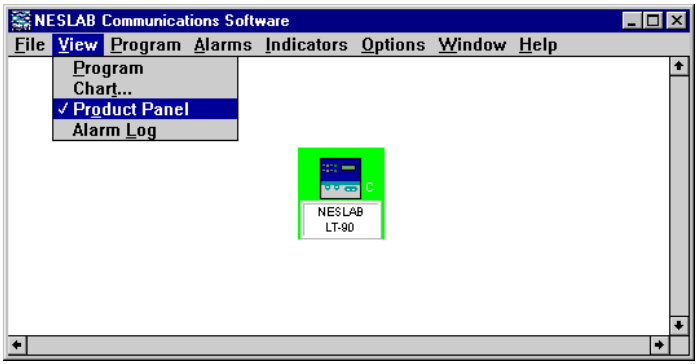
Control Panel:
A control panel must be viewed before it can be printed.

Alarm Log:
An Alarm Log must be opened before it can be printed. The output of the alarm log goes to the default printer.

Exit

Select Exit from the menu choices to exit the program. If the workspace has changed since the last save, a save-message prompt will appear before exiting.

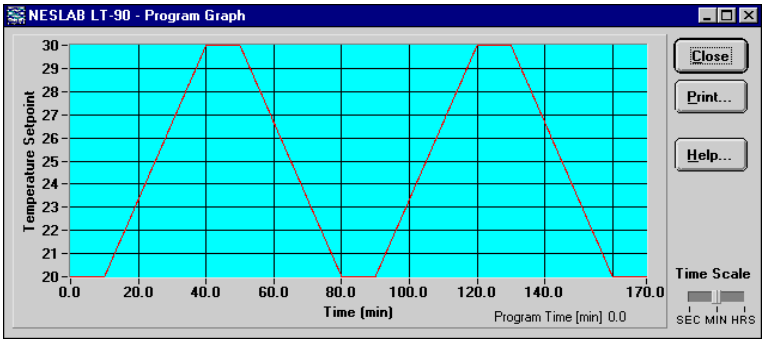
Select View from the menu bar to view program graphs, strip charts, product control panels and alarm logs.



Program

Select Program to view a graphic representation of the current program. The program graph panel can be maximized or minimized but not re-sized. Restore a minimized program graph by selecting the appropriate window panel from the Window menu bar selection. Real-time plotting of temperature occurs once a program is started.

NOTE: A program must first be stored in memory, then viewed in order to be printed.



Time Scale:
Select this to switch between time scales. Choose from seconds, minutes or hours. The program graph panel defaults to minutes.

Close:
Select this to close the program graph panel.

Print:
Select this to print the program graph panel. The program can also be printed from the File menu.

Help:
Select this to display this help topic.

NOTE: A check mark to the left of the menu item signifies that the program graph panel exists for the active controller icon. Selecting this menu item when checked closes the program graph panel.

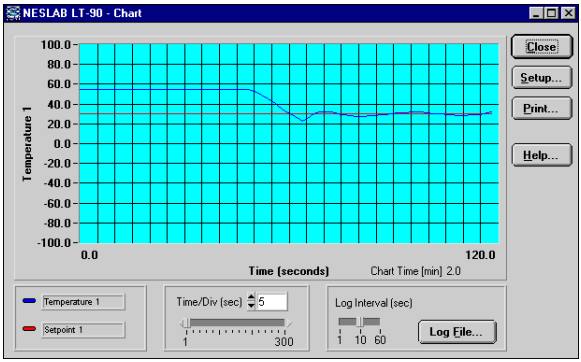
Chart

Select Chart to view a runtime plot of temperature and setpoint or, if the NC protocol is supported, any two product parameters. The strip chart can be maximized and minimized but not re-sized. Restore a minimized strip chart by selecting the appropriate window panel from the Window menu bar selection.

NOTE: A chart must be viewed in order to be printed.

When selecting this menu item, you are prompted with a pop-up panel for selecting which chart parameters to view and in what format to display the data, see figures on pages 14 and 16.

NOTE: A check mark to the left of the menu item signifies that the chart panel exists for the active controller icon. Selecting this menu item when checked closes the chart panel.



Time/division:
This selects the time interval for the x-axis divisions. There are always 24 divisions displayed along the x-axis. This time is in seconds unless the intervals are greater than five seconds. In this case the time scale for the x-axis is in minutes.

Log File... (Close File):
Select this to output data acquisition to a file. The file contains a column for time and a column for each parameter being sampled. Time is in seconds and starts with zero. The log interval is configurable, select 1, 10 or 60 seconds. Parameter headings are automatically logged to the file when it is first opened and data is written to the file as long as it is open. Close the file by clicking on "Close File" or by closing the chart panel.

Close:
Select this to close the chart panel. The operator is warned that the log file will also close (if open).

Setup:
Select this to bring up a panel for choosing which chart parameters to view and in what format to display the data.

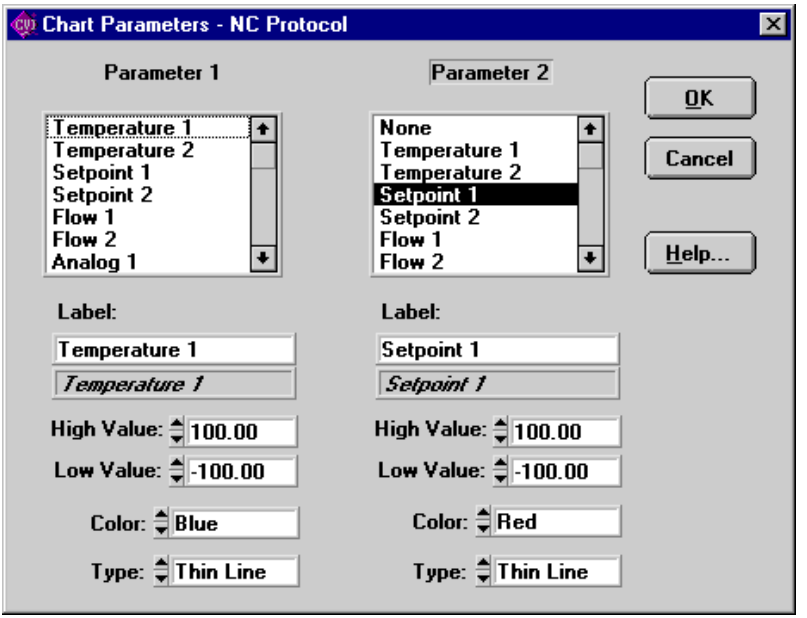
Print:
Select this to print the chart panel. The chart can also be printed from the File menu.

Help:
Select this to display this help topic.

Chart Parameters

Chart parameter selection and format precede the creation of a chart. Format and parameter selection can be modified once a chart exists by selecting Setup. Depending on which controller icon type is active, the look of the Chart Parameters pop-up panel may vary. Only those controller icons supporting the NC protocol provide the flexibility of selecting from a variety of parameters to chart. Of all the parameters supported in the NC protocol, only those parameters supported in the actual product can be plotted on the chart. Selecting a parameter that is not supported has no affect on the strip chart.

NC Protocol



Parameter 1/Parameter 2: Select from the list of parameters. Any parameter not supported is indicated in the reference text box below the label field. To create a chart, Parameter 1 must exist. Parameter 2 is optional.

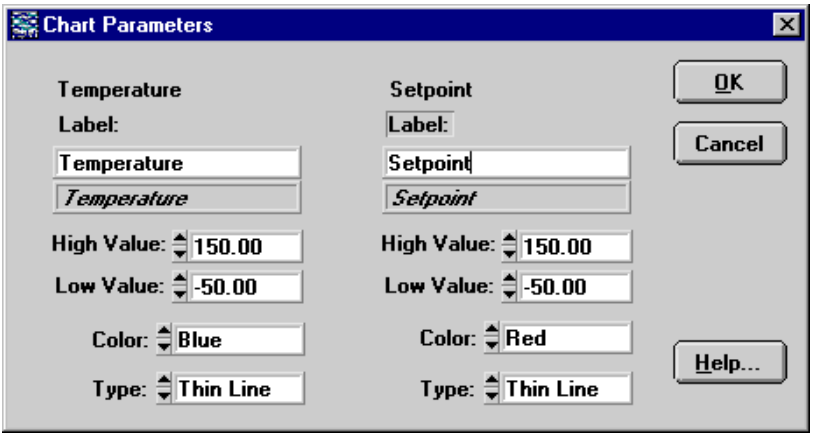
Label: By default, the parameter name appears in the Label field. This field can be edited and is limited to 30 characters. The label appears in the chart legend and as a title for the y-axis. If two parameters are charted, the label for the parameter with the widest range of y-values is used as the y-axis title.

High Value: Enter the upper limit for the parameter.

Low Value: Enter the lower limit for the parameter.

Color: Choose from 16 color choices.

Type: Choose a line style (thin line, thick line, or plotted points).



Parameters: Chart temperature and setpoint.

Label: This field can be edited and is limited to 30 characters. The label appears in the chart legend and as a title for the y-axis. The label for the parameter with the widest range of y-values is used as the y-axis title.

High Value: Enter the upper limit for the parameter.

Low Value: Enter the lower limit for the parameter.

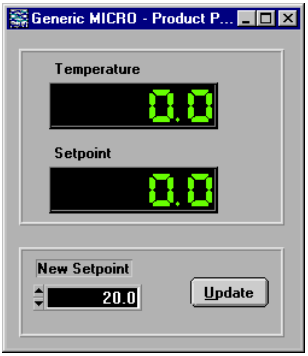
Color: Choose from 16 color choices.

Type: Choose a line style (thin line, thick line, or plotted points).

Product Panel

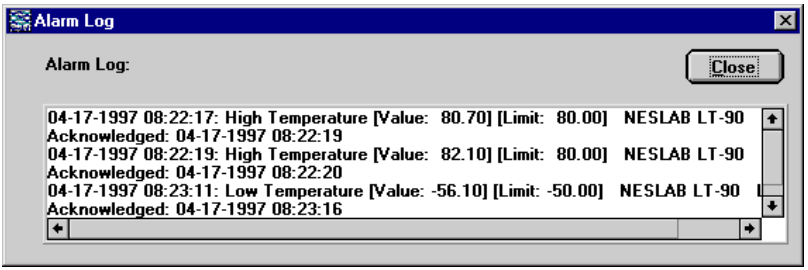
Select Product Panel from the View menu to view the control panel of the active product icon. All features of the product panel are disabled in the read-only mode. If attempting to perform a function that requires disabling read-only mode, you will be prompted with a message or a beep indicating that the unit is in read-only mode.

Generic Product Panel:
All Generic controller icons share a generic product panel which displays temperature and temperature setpoint. The temperature setpoint can be updated when read-only is disabled. This is done by entering a number in the “New Setpoint” field and clicking on the “Update” button.



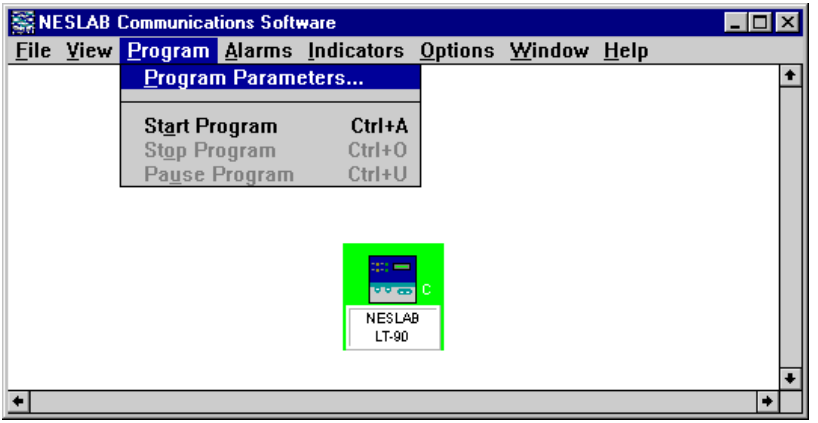
Alarm Log

Select Alarm Log from the View menu to view the contents of the alarm log in a pop-up window panel. An alarm log file must be opened in order to be viewed. Scroll through the alarm log with the vertical and horizontal scroll bars.



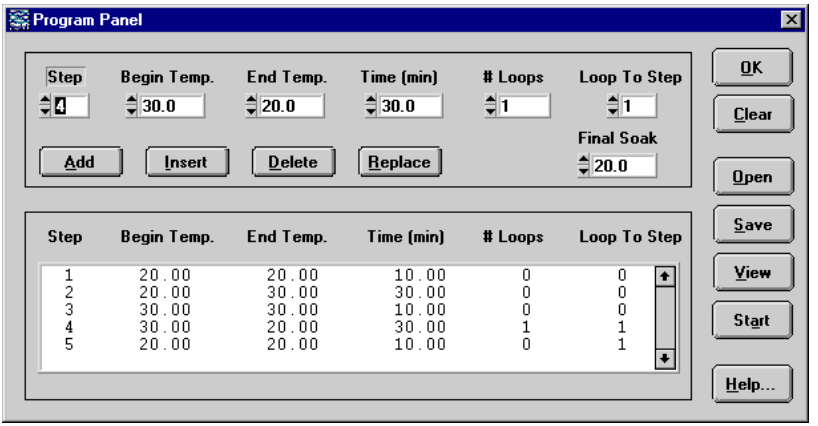
Program Menu

NEScom provides a means for programming temperature setpoints over time. Setpoint ramp and soak functions are entered as program steps. Any sequence of steps can be repeated up to 999 times with the program-loop feature.

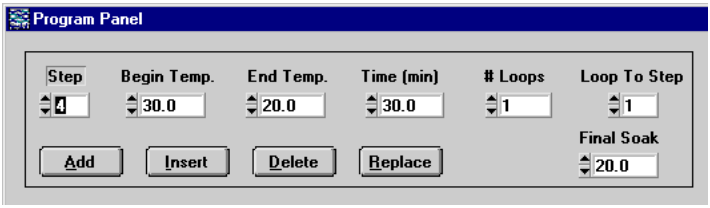


Program Parameters

Programs are built/edited, viewed and controlled using the Program Panel window. The panel is divided into the Program Edit Window (top), the Program View Window (bottom) and the Program Panel Buttons (side).



Program Edit Window
Program steps are defined by their step number. Use this window to enter program steps. Adding, inserting, deleting and replacing steps is accomplished by first choosing a step number.



Step: Up to 12 steps can be entered starting with step 1. This field cannot exceed the highest programmed step number.

Begin Temp: Enter the beginning temperature of the program step.

End Temp: Enter the ending temperature of the program step.

Time (min): Enter the duration of the program step in minutes. Setpoint soak is achieved by setting the start and end temperatures to the same value. Soak time is the period of time entered here. Once a step is completed, the program resumes to the next step in the program unless # Loops, see below, is set greater than zero. The maximum duration for a single step is 9999.9 minutes.

 # Loops: A sequence of steps can be repeated to create a program loop. A number other than zero entered in this field equals the number of times a sequence of steps is repeated. When a program encounters a nonzero number for # Loops, it will go to the step number entered in Loop To Step and repeat this action as many times as indicated. Once the number of loop repeats is reached, the program resumes to the next step in the normal sequence of the program. A loop can repeat up to 999 times.

Final Soak: The temperature that will be maintained once the program is completed or manually stopped.

NOTE: If a communication time-out occurs, the setpoint will remain at the last setpoint.

Add: After all parameters are entered into a program step, click Add to add this step into the program.

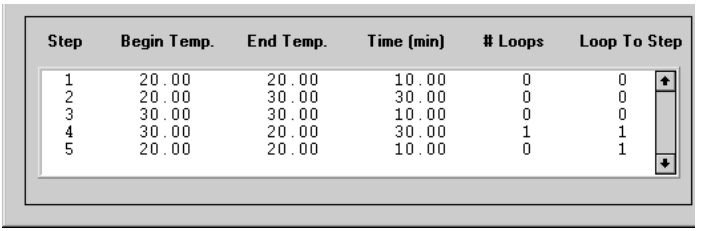
Insert: Inserts a program step into the program. The step number of the inserted step, as indicated by the Step value, remains the same and all step numbers greater than or equal to the inserted step number are incremented by one. When a step is inserted within a loop, the Loop To Step value for that loop is not changed. When a step is inserted prior to a loop, the Loop To Step value for that loop is incremented by one.

Delete: Deletes a program step from the program, as indicated by the Step value. All step numbers greater than or equal to the inserted step number are decremented by one. When a step is deleted within a loop, the Loop To Step value for that loop is not changed. When a step is deleted prior to a loop, the Loop To Step value for that loop is decremented by one.

Replace: Replaces the program step previously entered with the current program step.

Program View Window
This view-only portion of the window details each programmed step. Scroll the window using the vertical scroll bar.

NOTE: Highlighting program steps in this portion of the window has no affect on the Program Edit Window.



Program Panel Buttons

OK: Closes the Program Panel.

Clear: Clears the entire program currently loaded.

Open: Loads a program that has previously been saved to a file.

Save: Saves current program to the specified path and file name.

View: Displays a graphic representation of the current program.

Start: Starts the program. When communication is established the program begins executing and the controller icon turns green. The Start button changes to Stop on the program panel when the program is running.

Stop: Stops the program. Under conditions of normal program termination (stopped by the operator or completed as intended) the setpoint will be set to Final Soak. The Stop button on the Program panel changes to Start.

Help: Displays this help topic.

Start Program (Ctrl+A):

This menu selection is available only when a program has been stored in memory. This selection starts the program at the first program step. When the program is running, the controller icon is highlighted green indicating that communication is established.

If the program is successfully executing, this menu selection becomes unavailable to the operator and the Stop Program and Pause Program selections become available. The program control button on the program panel changes from Start to Stop. If communication fails the icon is highlighted in red.

Stop Program (Ctrl+O):

This menu selection becomes available once a program is stored in memory and started. Selecting this menu item stops the program. When stopped manually, the program sets the setpoint to the Final Soak value. The Stop button on the Program panel changes to Start when a program is stopped.

Pause Program (Ctrl+U):

This menu selection becomes available once a program is stored in memory and started. Selecting this menu item pauses the program. When paused, this menu item is checked and the program does not set the setpoint to any new values. To resume execution of the program, select pause again. A check mark at this menu item signifies that the program is paused. The program can be stopped when paused.

Sample Program

The following program ramps up from 20°C to 30°C in 30 minutes. It then soaks at 30°C for 10 minutes before it ramps back down to 20°C in 30 minutes. It is repeated two times for a total of three ramp-up/soak/ramp-down loops.

1) Enter "1" in the Step field.
2) Enter "20.0" in Begin Temp. and "30.0" in the End Temp. fields.
3) Enter "30" in the Time field and "0" in the #Loops field.
4) Select the Add button. This adds a line to the Program View Window.
5) Enter "2" in the Step field.
6) Enter "30" in the Begin Temp. and "30.0" in the End Temp. fields.
7) Enter "10" in the Time field and "0" in the #Loops field.
8) Select the Add button. This adds a second line to the Program View Window.
9) Enter "3" in the Step field.
10) Enter "30.0" in the Begin Temp. and "20.0" in the End Temp. fields.
11) Enter "30.0" in the Time field.
12) Enter "2" in the #Loops field and "1" in Loop To Step field.
13) Select the Add button. This adds a third line to the Program View Window.

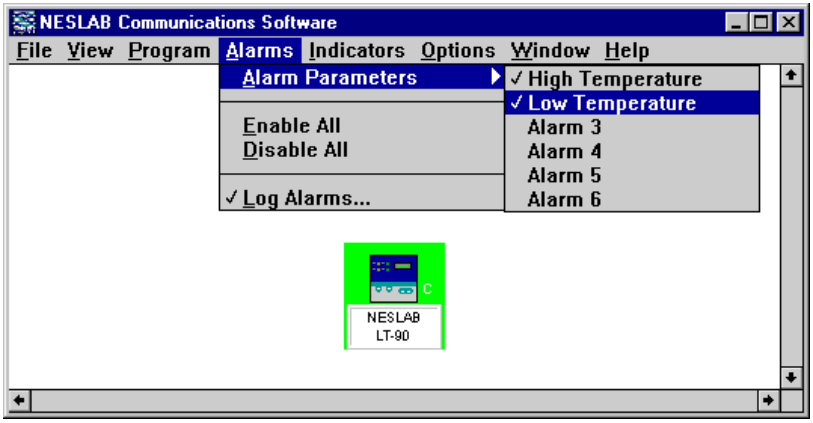
Select the View button to view and start the program.

Alarms Menu

NEScom can be configured to generate warning messages when alarm conditions occur. Alarm setup can vary depending on which communication protocol is in use. In all cases an alarm point is stored within the Windows application. This alarm point may not necessarily be the alarm point of the actual product. All alarms can be enabled or disabled with a single menu selection.

When an alarm occurs, you are prompted with a pop-up message. This message displays the alarm description, the value read from the product and the alarm limit. Messages also display the icon description and location entered under icon properties. You must acknowledge this message and then have the option to disable the alarm.

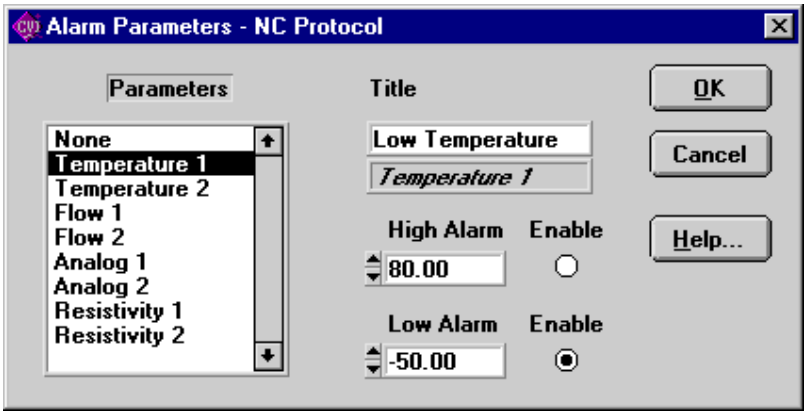
NOTE: In all cases an alarm point is stored within the Windows application. This alarm point may not necessarily be the alarm point of the actual product.



Alarm Parameters

NC Protocol

Select any alarm from the menu. The descriptions Alarm 1, Alarm 2, ... are default names which can be modified when configuring an alarm. Alarms are configured by first selecting a specific parameter from a list of ones supported, then entering a high limit and low limit for that parameter. Parameter units and precision match those of the actual product. High limit and low limit alarms can be later enabled or disabled by recalling the alarm from this menu. A check mark on an alarm description signifies that either limit or both limits are enabled.



Parameters: Select the alarm parameter. If the parameter is not supported by the product then the reference field will read Not Supported.

Title: Enter a descriptive title for each alarm. This will appear as the new description for this menu item.

High Alarm: Enter the high limit. The alarm will activate when the parameter in question exceeds this limit.

Low Alarm: Enter the low limit. The alarm will activate when the parameter in question is lower than this limit.

Enable: Individually enables or disables each alarm.

Cancel: Cancels all changes made since the last save.

OK: Confirms the alarm configuration.

Microprocessor Protocol
Select from High Temperature, Low Temperature, High Remote Temperature or Low Remote Temperature alarm. Parameter units and precision match those of the actual product. A check mark on an alarm description signifies that it is enabled. Selecting an alarm menu item with a check mark disables the alarm. If the menu item is not checked, then the operator will be asked to enter the alarm limit. For convenience, the alarm limit is added to the description of the menu item. Not entering a value for the alarm limit when prompted skips the alarm setting.

MRS232C Protocol
Select from High Temperature or Low Temperature alarm. Parameter units and precision match those of the actual product. A check mark on an alarm description signifies that it is enabled. Selecting an alarm menu item with a check mark disables the alarm. If the menu item is not checked, then the operator will be asked to enter the alarm limit. For convenience, the alarm limit is added to the description of the menu item. Not entering a value for the alarm limit when prompted skips the alarm setting.

Enable All

Enables all defined alarms. See Alarm Parameters for individually enabling alarms.

Disable All

Disables all defined alarms. See Alarm Parameters for individually disabling alarms.

Log Alarms

NEScom provides the means to log all alarm messages to file. Select this menu item to create a log file. A file selection dialog box allows the operator to easily open a file for automatic logging. A check mark on this menu item signifies that an alarm log has been opened. Selecting this menu item with a check mark closes the alarm log.

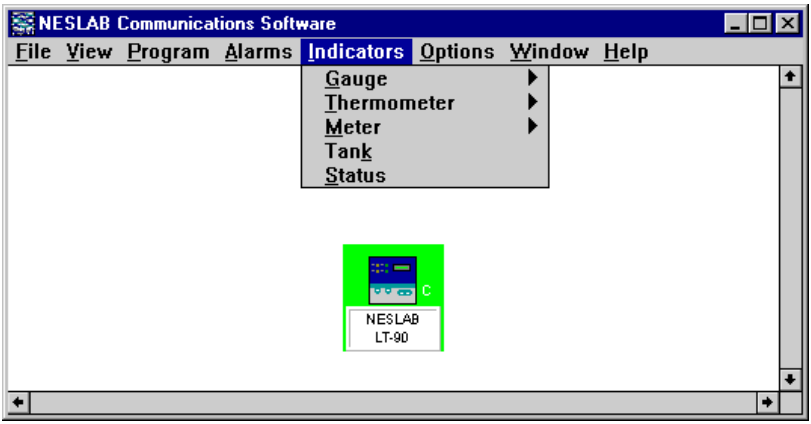
Alarm log entries are stamped with the date and time of the alarm occurrence and the contents of the alarm message. The alarm log also indicates when an alarm was acknowledge.

NOTE: View the contents of the alarm log by selecting Alarm Log from the View menu.

NOTE: Print the contents of the alarm log by selecting Print from the File menu.

Indicators Menu

Indicators are graphical representations of data. Graphical formats such as gauges, thermometers and meters are linked to product parameters for greater visibility. An indicator is created by selecting the specific indicator from the menu. A check mark on the indicator menu item signifies that the indicator exists. Selecting a checked menu item deletes the indicator.



All indicators reside in an indicator widow. The sizable window is displayed when the first indicator for a controller icon is created. There is a unique indicator window for each controller icon. Indicators are dimmed for all controller icons other than the selected active icon.

Indicators can be moved within the indicator window with the cursor keys and sized with +/- (overall adjust), W/w (width adjust), or H/h (height adjust).

Left-Double-Click an indicator to configure the indicator range and title.

Indicators are outlined in red when they are out of range.

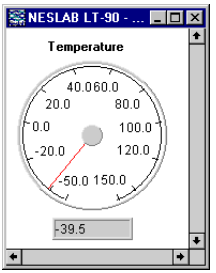
NC Protocol
Products supporting the NC protocol have greater flexibility when it comes to using indicators. These products support different subsets of the entire range of parameters supported in the NC protocol. Because of this, the operator has the ability to link any indicator to any parameter supported by the product.

Microprocessor Protocol
NESLAB's Microprocessor line of products provide temperature, setpoint, high limit and low limit values. Here, the thermometer indicators are linked to temperature and setpoint and the gauge indicators are linked to the temperature limit values.

MRS232C Protocol
Products supporting the MRS232C protocol only provide temperature and setpoint values so two thermometer indicators are available.

Gauge

A Gauge can be moved within the indicator window with the cursor keys and sized with +/- (overall adjust), W/w (width adjust), or H/h (height adjust). Left-Double-Click on a Gauge to configure its range and title.



NC Protocol
When selecting either 1 or 2 from the Gauge menu item, the operator will be prompted to link a NC protocol parameter to the indicator.

Parameters: Choose a parameter from the list choices. Parameters that are referenced as Not Supported will not be linked to an indicator.

Label: Type a label for the indicator.

High Value: Enter a high value for the indicator.

Low Value: Enter a low end for the indicator.

Values outside the entered range make the indicator go out of range. This is illustrated by a red outline on the indicator.

Microprocessor Protocol
High Temperature

Low Temperature

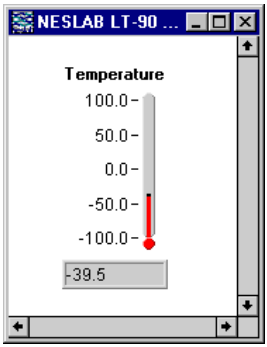
Not Supported

Thermometer



A Thermometer can be moved within the indicator window with the cursor keys and sized with +/- (overall adjust), W/w (width adjust), or H/h (height adjust). Left-Double-Click on a Thermometer to configure its range and title.

NC Protocol
When selecting either 1 or 2 from the Thermometer menu item, the operator will be prompted to link a NC protocol parameter to the indicator.

Parameters: Choose a parameter from the list choices. Parameters that are referenced as Not Supported will not be linked to an indicator.

Label: Type a label for the indicator.

High Value: Enter a high value for the indicator.

Low Value: Enter a low end for the indicator.

Values outside the entered range make the indicator go out of range. This is illustrated by a red outline on the indicator.

Microprocessor Protocol

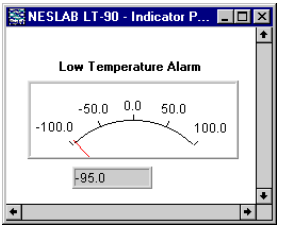
Setpoint

MRS232C Protocol
Temperature

Setpoint

Meter

A Meter can be moved within the indicator window with the cursor keys and sized with +/- (overall adjust), W/w (width adjust), or H/h (height adjust). Left-Double-Click on a Meter to configure its range and title.



NC Protocol
When selecting either 1, 2, 3 or 4 from the Meter menu item, the operator will be prompted to link a NC protocol parameter to the indicator.

Parameters: Choose a parameter from the list choices. Parameters that are referenced as Not Supported will not be linked to an indicator.

Label: Type a label for the indicator.

High Value: Enter a high value for the indicator.

Low Value: Enter a low end for the indicator.

Values outside the entered range make the indicator go out of range. This is illustrated by a red outline on the indicator.

Microprocessor Protocol

Not Supported

Tank

A Tank can be moved within the indicator window with the cursor keys and sized with +/- (overall adjust), W/w (width adjust), or H/h (height adjust). Left-Double-Click on a Tank to configure its range and title.

NC Protocol
When selecting the Tank menu item, the operator will be prompted to link a NC protocol parameter to the indicator.

Parameters: Choose a parameter from the list choices. Parameters that are referenced as Not Supported will not be linked to an indicator.

Label: Type a label for the indicator.

High Value: Enter a high value for the indicator.

Low Value: Enter a low end for the indicator.

Values outside the entered range make the indicator go out of range. This is illustrated by a red outline on the indicator.

Microprocessor Protocol
Not Supported

MRS232C Protocol
Not Supported

Status

Select Status from the Indicator menu bar to view a product's predefined status conditions. Status flags indicate faults, warnings and other system conditions, and typically vary from product to product. Reference the product owners manual for the definition of status bits.

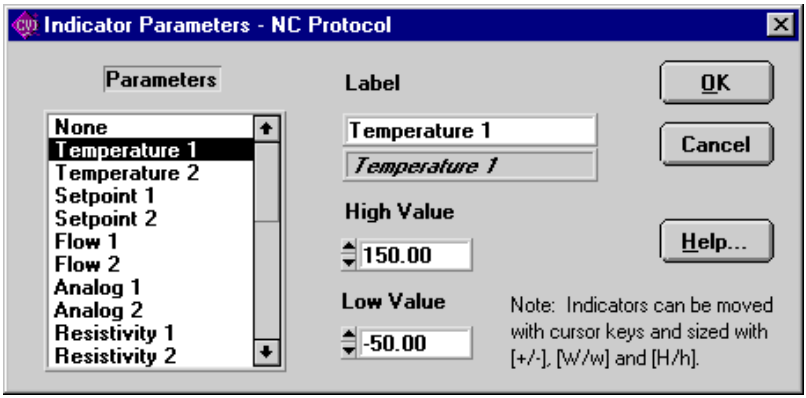
NC Protocol
Up to 16 status fields can be predefined for a product. These fields are labeled for specific products that report their status. When viewing status for a Generic NC icon, the operator will see that the labels for the status fields are generic as well. These labels can be modified by selecting the field and typing the status label name.

Microprocessor Protocol
Not Supported

MRS232C Protocol
Not Supported

NC Protocol Parameters

The NC protocol is designed to acquire all possible parameter values from NESLAB proprietary controllers. Most (if not all) products supporting the NC protocol use only a subset of the entire function set. When linking an indicator or chart parameter to a protocol parameter for a given product, only those parameters supported by the product are possible parameter choices.



Supported Parameters:

Temperature 1

Temperature 2

Setpoint 1

Setpoint 2

Flow 1

Flow 2 (future expansion to Flow 10)

Analog input 1

Analog input 2

Resistivity 1

Resistivity 2

Supported Alarm Points:

Temperature 1 (high low)

Temperature 2 (high low)

Flow 1 (high low)

Flow 2 (high low)

Analog input 1 (high low)

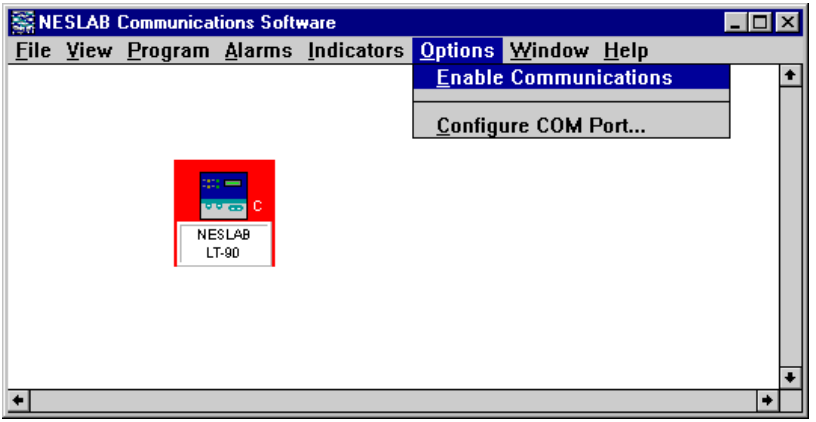
Analog input 2 (high low)

Resistivity 1 (high low)

Resistivity 2 (high low)

Options Menu

Select Options from the menu bar to configure and reset the COM port.



Enable Communications

Select this menu item to re-enable serial communications following a communications time-out error. This can also be done from the properties panel and the communications panel. A controller icon with a red background signifies that there has been a communications error. Once the COM port has been re-initialized, the product is polled by NEScom in order to establish contact. A controller icon with a yellow background signifies that it is polling the product. The icon will remain yellow until contact is made.

Configure COM Port

Select this menu item to configure the communications port. The control for enabling communications is available only when there has been a communications time-out error. Under normal operating conditions this control is dimmed and gives the current communication status. Enabling communications re-initializes the COM port.

Communication is normally disabled when NEScom is not requesting parameters from the product. Once you configure NEScom to request data from the product communication is automatically enabled.

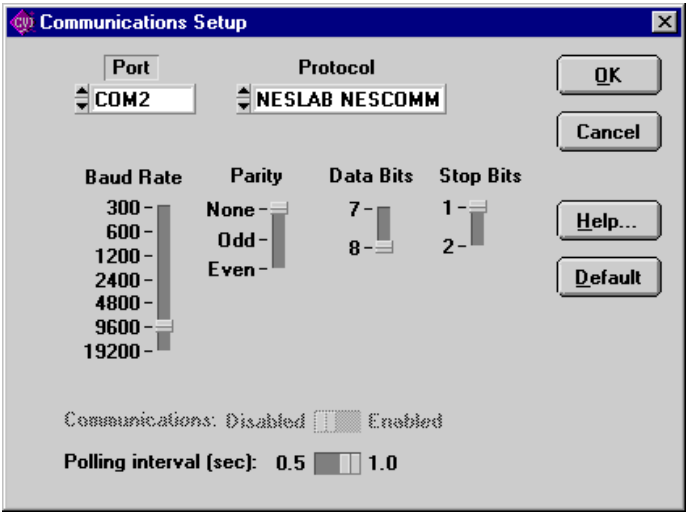
Select the Default button to set suggested RS232 settings for the protocol in use.

MRS232/RS232: 300 Baud, 8 data bits, 1 stop bit, no parity, polling interval 1.0 second.

MICROprocessor Bath: 4800 Baud, 8 data bits, 1 stop bit, no parity, polling interval 1.0 second.

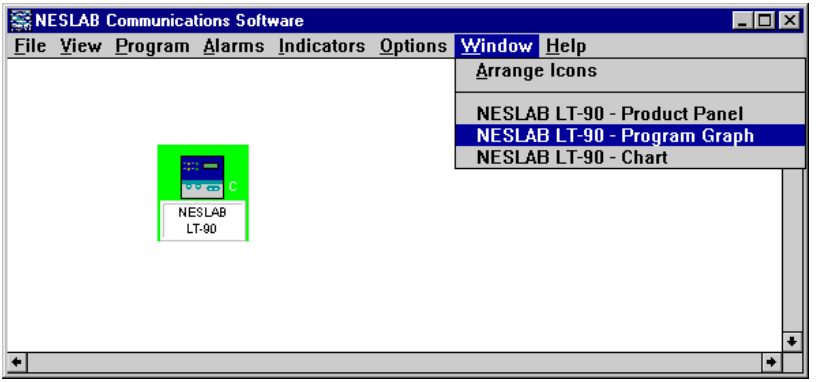
NC Protocol: 9600 Baud, 8 data bits, 1 stop bit, no parity, polling interval 1.0 second.

Start-up configuration: Port: COM2, 9600 Baud, 8 data bits, 1 stop bit, no parity, polling Interval 1.0 second.



Window Menu

Select Window from the menu bar for arranging icons and restoring window panels.



Arrange Icons

Select this menu to arrange controller icons in the NEScom main window panel.

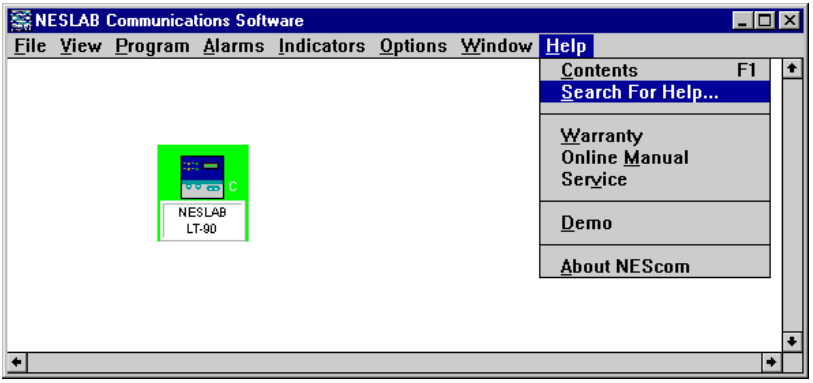
Moving an Icon
Icons can be moved within the main window. Clicking on the icon changes the cursor to a pointing finger cursor. Moving the cursor to the top edge of the icon changes the cursor back to the default style. When the cursor changes back to the default style, click and drag the icon to move it.

Window Panels

Lists all window panels opened. Click on the window panel description to bring the panel to the front or restore a panel when minimized. If there are no window panels opened then this section of the menu is empty.

Help Menu

Select this menu item for help in operating NEScom. Help is based on the menu selections of the program. Help buttons on various panels provide a shortcut to a help topic. Get to detailed information on a topic by clicking on help links.



Contents

The contents of Help is based on the menu bar of NEScom. Selecting this menu item brings up the HELP utility. Use the Tab key to scroll through the HELP contents or double-click on a topic to view that specific help screen.

Search

Search on a Help topic. Start by typing the first few letters of the word to search. Click on a topic within the list of topics appearing in the text box. Once a topic is selected, click on Display to get help on the topic.

Warranty

Select this menu item to read the NESLAB warranty statement for NESLAB products.

On Line Manual

NESLAB provides on-line manuals which can be downloaded to your computer.

Online documentation may be obtained 24 hours a day, 7 days a week from NESLAB ONLINE, our public, online service support system. NESLAB ONLINE is a FirstClass(r) system and we recommend using FirstClass(r) Client software (see below).

Access to NESLAB ONLINE is available in 13 simultaneous native languages: Brazilian (dialect of Portuguese), Danish, English, Finnish, French (Canadian), French (Parisian), German, Italian, Japanese, Norwegian, Portuguese, Spanish and Swedish.

Access is by direct dial-up only at (603) 427-2490.

We recommend using FirstClass(r) Client software (see below) to access NESLAB ONLINE. Generic VT-100 terminal emulation may be used by specifying 8-N-1 protocol, but be aware that the graphical user interface, color, fonts, sound, teleconferencing, some e-mail features, and native language access will not be available.

When connecting, you will be asked to establish a User ID and password. Whatever you choose will become your User ID and password.

Online operation manuals may be found at: Conferences / Operating Manuals

Online service manuals may be found at: Conferences /Service

FirstClass(r) Client software is free and available for Macintosh or Windows (3.x or '95). The software is available from many sources:

AMERICA ONLINE: go to keyword "SOFTARC" then select "FirstClass software"

COMPUSERVE: Mac client is at TWEUROPA /Teletools /fcmac.zip

Windows client is at PCBBS/BBS programs /FCC300.exe

WEB: download from http://www.softarc.com/try.htm

CD-ROM: Mac client is on the companion CD-ROM to the book "Macintosh Revelations" by Ken Maki.

Mac client is on the companion CD-ROM to the magazine "Mac Addict", Sept. 1996 issue.

Mac client is on most CD-ROMs produced by BMUG.

We are not aware of the Windows client on any CD-ROM.

NESLAB ONLINE: Mac client is at: Conferences / Software / Mac / FirstClass Client

Windows client is at: Conferences / Software / Windows / FirstClass English

By mail: let us know and we will mail you a disk. Specify Mac or Windows.

Note to MAC users: The application FirstClass Client may be run directly off the floppy. It need not be copied to your hard drive
